acidic, presumably because of steric hindrance of the pyridyl N by the close proximity of the 2 N atoms to each other. To test this view expts. have been undertaken to prep. salts with anions of very small ionic diameter to see whether in such cases the base can function as a bivalent cation. This seems to be true of the fluoride. The 2-pyridyl are also more stable than the 4-pyridyl salts. I has the properties of a salt of a strong base with a strong acid; it reacts neutral in water, is hardly attacked by  $\text{NH}_4\text{OH}$  even after boiling several hrs., and, unlike the 4-isomer, is not decompd. by  $\text{PhNH}_2$  alone. Preliminary expts. indicate that electrochem. oxidation of pyridine in  $\text{H}_2\text{SO}_4$  follows the same course as the persulfate oxidation. No 2-pyridylpyridinium salt has yet been obtained, but cleavage of the oxidation product with alkali and treatment with  $\text{PhNH}_2$ ,  $\text{HCl}$  gave II; under conditions other than those here described, electrochem. oxidation results in complete degradation (Yokoyama and Yamamoto, *C. A.* 26, 2194). 2-Pyridylpyridinium chloroplatinate, orange, m. 213–14° (decompn.).

**N-Alkylated 1,5-aminoketones and their conversion into piperidine derivatives.** C. Mannich and K. Th. Lesse. *Arch. Pharm.* 271, 92 7(1933). The syntheses herein described involve condensation of 1,3-aldehyde bases with ketones in alk. soln. Thus, from  $\text{Me}_2\text{NCH}_2\text{CMe}_2\text{CHO}$  and  $\text{Me}_2\text{CO}$  or  $\text{AcPh}$ :  $\text{Me}_2\text{NCH}_2\text{CMe}_2\text{CHO} + \text{Me}_2\text{CO} = \text{Me}_2\text{NCH}_2\text{CMe}_2\text{CH}=\text{CHCOR}$  (I), one obtains an unsatd., N-alkylated 1,5-amino ketone, which on catalytic hydrogenation passes into the corresponding satd. amino ketone:  $\text{Me}_2\text{NCH}_2\text{CMe}_2\text{CH}_2\text{CH}_2\text{COR}$  (II), the latter thereupon yielding on reduction with Na and  $\text{EtOH}$  the amino alc.:  $\text{Me}_2\text{NCH}_2\text{CMe}_2\text{CH}_2\text{CH}_2\text{CH}(\text{OH})\text{R}$  (III). When this alc. base is treated with  $\text{CS}_2$  there is formed the  $\text{HCl}$  salt of the halogenated base,  $\text{Me}_2\text{NCH}_2\text{CMe}_2\text{CH}_2\text{CH}_2\text{CHClR}$  (IV), in which the  $\text{NMe}_2$  group and the Cl atom occupy the 1,5-position with respect to one another. Caustic alkali ppt. the chlorinated base as an oil sol. in  $\text{Et}_2\text{O}$ , insol. in  $\text{H}_2\text{O}$ , shortly changing by mol. rearrangement into the  $\text{HCl}$  salt of a piperidinium base (V), which on heating suffers thermic di socn. into  $\text{MeCl}$  and a piperidine deriv. (VI, R = Me or Ph). The  $\text{HCl}$  salt of I m. 147°; the free base

forms a yellowish oil,  $b_D^{20}$  100.5°; the methiodide m. 172°; the oxime m. 60° ( $\text{HCl}$  salt, m. 177° (decompn.)); semicarbazone, m. 134° ( $\text{HCl}$  salt, m. 165°). The amino ketone (II, R = Me)  $b_D^{20}$  92°; its  $\text{HCl}$  salt, very hygroscopic, m. 100.1°; aurate, yellow needles, m. 118.5°; methiodide, m. 133°; oxime, m. 58.5° ( $\text{HCl}$  salt, hygroscopic); semicarbazone, m. 128° ( $\text{HCl}$  salt, m. 163°). The amino alc. (III, R = Me)  $b_D^{20}$  98°; its aurate m. 116°;  $\text{HCl}$  salt of p-nitrobenzoate ester, m. 162°. The piperidinium base ( $\text{HCl}$  salt of V, R = Me),  $\text{C}_{10}\text{H}_{12}\text{NCl}$ , m. above 260°; picrate, greenish yellow, m. 201°. 1,2,5,5-tetramethylpiperidine (VI, R = Me), b. 147.8° ( $\text{HCl}$  salt, m. about 221° decompn.); picrate of N-Me compd., greenish yellow, m. 201°. 1-Dimethylamino-2,2-dimethyl-5-keto-5-phenylpentane (I, R = Ph),  $b_D^{20}$  159.6° ( $\text{HCl}$  salt, yellowish leaves, m. 162–3°);  $\text{HCl}$  salt of the oxime, m. 178° (decompn.);  $\text{HCl}$  salt of semicarbazone, m. 195°. A secondary base,  $\text{C}_{23}\text{H}_{30}\text{O}_2\text{N}$ , was also isolated which b. 210–15°, and m. 102.3°, and represented apparently the condensation product of 1 mol. of the aldehyde and 2 mols. of  $\text{AcPh}$ . 1-Dimethylamino-2,2-dimethyl-5-phenylpentane (II, R = Ph),  $b_D^{20}$  105.70° ( $\text{HCl}$  salt, m. 119.50°);  $\text{HCl}$  salt of semicarbazone, m. 171° (decompn.). 1-Dimethylamino-2,2-dimethyl-5-phenylpentanol,  $b_D^{20}$  168.70°.  $\text{HCl}$  salt of the benzoate, m. 91.2°, and is weakly aromatic. 1-Dimethylamino-2,2-dimethyl-5-phenyl-5-chloropentane (V, R = Ph);  $\text{HCl}$  salt of the chloro base, m. 150°. 1,1,5,5-Tetramethyl-2-phenylpiperidinium chloride, m. above 250°; aurate, yellow needles, m. 118°.

1,5,5-Trimethyl-2-phenylpiperidine (VI, R = Ph),  $b_D^{20}$  145.7°;  $\text{HCl}$  salt, m. 148° (decompn.). 1-N-Piperidino-2,2-dimethylhexenone (condensation product of  $\beta$ -piperidino- $\alpha,\alpha$ -dimethylpropionaldehyde and  $\text{Me}_2\text{CO}$ ),  $b_D^{20}$  135.45°;  $\text{HNO}_3$  salt, m. 105° (base therefrom,  $b_D^{20}$  140.2°).

W. O. E.

**An optically active arsonic acid possessing molecular dissymmetry. Resolution of dl-spirobis-3,5-dioxane-4,4'-bis(phenyl-p-arsonic acid).** Charles S. Gibson and Barnett Levin. *Proc. Roy. Soc. (London)* A141, 494–501 (1933).—Benzaldehyde-p-arsonic acid in 30%  $\text{H}_2\text{SO}_4$ , when treated with pentaerythritol at 100° for 0.5 hr., gave dl-spirobis-3,5-dioxane-4,4'-bis(phenyl-p-arsonic acid) (I), m. above 200°. I was purified by crystn. of the dl- $\alpha$ -phenylethylamine salt from an aq.  $\text{EtOH-Me}_2\text{CO}$  mixt. (1:1:1). Resoln. of I with nor-d- $\psi$ -ephedrine gave the pure d-amine l-acid salt, decomp. 225°. [ $\alpha$ ] – 24.67°. Likewise the nor-l- $\psi$ -ephedrine yielded the pure l-amine d-acid salt, m. above 300°, [ $\alpha$ ] 23.69°. The tetra-Na salts of the 2 isomers of I gave [ $\alpha$ ]  $\pm 70.2^\circ$ . The optically active acids were not racemized by boiling alkali, but were by conversion into spiro-bis-3,5-dioxane-4,4'-bis(phenyldichloroarsine), m. 163°.

E. W. Scott

**Alkaloids from Heliotropium lasiocarpum.** G. Menshikov. *Khim. Farm. Prom.* 1933, 113–16; cf. *C. A.* 27, 3714. Heliotridine (the product of the sapon. of heliotrine) when treated in the cold with  $\text{SOCl}_2$ , made ammoniacal, extd. with ether, changed into the  $\text{HCl}$  salt, reduced according to Adams (Pt as catalyst), made alk. with  $\text{NaOH}$  and extd. with ether, forms chloroheliotridan,  $\text{C}_8\text{H}_{12}\text{NCl}$ ,  $b_D^{20}$  85°, [ $\alpha$ ] 133.5°. Heliotridene,  $\text{C}_8\text{H}_{12}\text{N}$ , is made by boiling chloroheliotridan with alc. and Na for 8 hrs., acidifying with  $\text{HCl}$ , boiling off the alc., making alk. with  $\text{NaOH}$  and distg. with steam; [ $\alpha$ ] – 10.5°. Heliotridan is made from heliotridene by reduction according to Adams, [ $\alpha$ ] – 68°. The picrate, methiodide and other salts are discussed.

L. Nasarevich

**Alkaloids from Anabasis aphylla.** A. P. Orekhov and S. S. Norkina. *Khim. Farm. Prom.* 1933, 109–13; cf. *C. A.* 27, 3477. 1-Aminooanabasin was made by reduction of 1-nitrooanabasin with  $\text{AcOH}$ ,  $\text{H}_2\text{O}$  and Zn dust at 10°. The mixt. was filtered on the 2nd day, made alk. with  $\text{NaOH}$  and extd. with ether. dl-Anabasin was made by heating anabasin sulfate in closed tubes at 200° for 120 hrs. and distg. in vacuo. Derivs. are discussed.

L. Nasarevich

**Separation of the opium alkaloids.** S. Busse and V. Busse. *Khim. Farm. Prom.* 1933, 127–9. The combined filtrate after the sepn. of the resins from 1 kg. of opium is treated with 200 g. of  $\text{AcONa}$  and 200 g. of  $\text{NaCl}$ . The pptd. papaverine resin is filtered, dissolved in  $\text{H}_2\text{O}$  and  $\text{AcOH}$ , neutralized, treated with 100 g. of  $\text{AcONa}$  and 100 g. of  $\text{NaCl}$ , the ppt. contg. papaverine is filtered off and the filtrates are combined. The resin (40–50 g.) is dissolved in  $\text{AcOH}$  and  $\text{NaCl}$ , filtered, redissolved and from the combined filtrates papaverine is pptd. with  $\text{NaOH}$ . The yield is 7–9 g. In the combined filtrates from the 1st pptn. thebaine is pptd. with  $\text{NH}_4\text{OH}$ , and purified as usual. The yield is 3–4 g. The filtrate from thebaine is acidified with  $\text{AcOH}$ , concd., dild. with alc. (50%) and after 2 days morphine is pptd. The main portion of the filtrate after thebaine contains codeine, which may be extd. with  $\text{C}_6\text{H}_6$ . The yield is 6–8 g.

L. Nasarevich

**The influence of light on the formation of chloroplast pigments.** H. Rudolph. *Ber. Verhandl. sachs. Akad. Wiss. Leipzig Math.-phys.* 85, 107–15(1933).—In this polarization spectrophotometric study the log of the extinction coeff. was plotted against wave lengths, expressed in  $\mu$ . Chlorophyll a showed a max. in the red at 660  $\mu$ , chlorophyll b, at 640. The resp. min. were in the green at 550 and at 565. Xanthophyll and carotene max. were at 450 and at about 443, resp. Protochlorophyll, in a somewhat pure form, gave a max. at about 625. To avoid difficulties with chlorophyll mutants the bush bean was selected as the exptl. plant. A 250-w.

Osram lamp with red, yellow-green and blue filters was used, and the light intensity was kept const. throughout the study. No chlorophyll was ever found in blanched plants, but protochlorophyll, xanthophyll and carotene were always present. The carotenoid content of blanched leaves was almost proportional to the leaf surface. The protochlorophyll content varied within narrow limits and was independent of the leaf surface. Per sq. cm., less chlorophyll was developed in older illuminated leaves than in the younger ones. Illumination of the blanched plants at first causes a rapid increase in the amt. of chlorophyll, in the 1st, and after the 4th hr. Its appearance is accompanied by a rapid diminution of the carotenoids. Possibly carotenoids are used in the production of chlorophyll. Subsequently carotenoids are again formed. In blue light about 3 1 times as much, in yellow-green light 2.7 times as much, and in red light no more carotenoid is produced than is formed in the dark. Less xanthophyll is produced, but the light-production ratio is about the same as for chlorophyll. Possibly a carotenoid precursor is used in making a chlorophyll-like one in red light. Chlorophyll is formed almost instantly upon exposure to light. Hence a chlorophyll precursor must be present. The significance of protochlorophyll in the living leaf is still an uncertainty; it may be a direct precursor of chlorophyll, or it may be something formed from such a precursor, but only in the dark, and it may not be directly convertible into chlorophyll. Settlement of this question awaits an accurate knowledge of the chem. nature of protochlorophyll. The constancy of the chlorophyll-carotenoid ratio, and the likelihood that phytol is derived from a carotenoid, makes the relation between the green and the yellow chloroplast pigments a question of importance. In blanched plants mitochondria abound and plastids are scarce. Improved development of the plastids takes place after 4 hrs., with the result that proportionately increased amts. of chlorophyll appear on further illumination.

G. A. Hill

**Selenium dehydrogenation of sitosterol.** L. Ruzicka, M. W. Goldberg, G. Thomann and E. Brandenberger. *Nature* **132**, 643 (1933); *Ch. J.* **27**, 4809. In response to the criticisms of Diels and Karsten (*Ch. J.* **24**, 2136), Diels (*Ch. J.* **27**, 4810), and Cook and Hewitt (*Ch. J.* **27**, 5335), the authors reiterate that the Se dehydrogenation of cholesterol and ergosterol gives 2 different hydrocarbons. The x-ray spectra of the 2 hydrocarbons are distinctly different. Moreover, if the 2 hydrocarbons were identical, sitosterol would furnish the same substance by Se dehydrogenation; instead it gives a new hydrocarbon,  $C_{27}H_{48}$ , m. 202.3°.

Louise Kelley

**Structural formula of ergosterol.** A. L. Bacharach. *Analyst* **58**, 605 (1933). The formula generally accepted is  $C_{28}H_{44}O$  or

W. T. H.

**Cinchol.** A. Windaus and M. Deppe. *Ber.* **66B**, 1689-90 (1933). Cinchol (I), the sterol-like substance present in cinchona bark (Hesse, *Ann.* **228**, 294 (1885); Liebermann, *Ber.* **18**, 1805 (1885)), was converted, after purification through the Ac deriv. (which gave a neg. test for a doubly unsatd. phytosterol of the type of stigmasterol), into the *m*-dinitrobenzoate, m. 200.2°,  $[\alpha]_D^{25}$  10.9° ( $\text{CHCl}_3$ ), whose compn.,  $C_{29}H_{46}OOCOC_6H_3(N-O)_2$ , excludes the formula  $C_{30}H_{48}O$  assigned to I by Hesse, and which is identical with the dinitrobenzoate of hammol (*Ch. J.* **27**, 5749). I, regenerated from the ester, m. 136-7°,  $[\alpha]_D^{25}$  -33.5° ( $\text{CHCl}_3$ ), it retains some water at 100° and on analysis gives C values 1.2% low. The acetate, m. 123°,  $[\alpha]_D^{25}$  -38.3° ( $\text{CHCl}_3$ ), however, has the calcd. compn. I therefore belongs to the group of sitosterols of the compn.  $C_{29}H_{46}O$ .

C. A. R.

**Conversion of a bile acid into a hydrocarbon derived from 1,2-benzanthracene.** J. W. Cook and G. A. D.

<sup>1</sup> Haslewood. *Chemistry & Industry* **1933**, 758 9; cf. Wieland and Dane, *Ch. J.* **27**, 5334. —Dehydrogenation of dehydronorcholene with Se gave the yellow "methylcholanthrene" (I), m. 171.2° (picrate, m. 176-7°), of W. and D. and a colorless hydrocarbon m. 132-4° (II). Oxidation of I with  $\text{Na}_2\text{Cr}_2\text{O}_7$  in AcOH followed by decarboxylation produced a quinone m. 229° whereas the product expected on the basis of W. and D.'s formula for I, 6-methyl-1,2-benzanthraquinone, m. 174°. II was not oxidized to a quinone.

E. W. Scott

Synthesis of *d*- and *l*-ascorbic acid (Reichstein, *et al.*)

<sup>11E</sup>. Purification of trinitrotoluene by  $\text{Na}_2\text{SO}_3$  (Meif) **24**. Formation of nitrodiazotoluenesulfonic acid (Bafik) **24**. Constituents of petroleum. II. Prepn. of the first homogeneous naphthenic acid (v. Braun, *et al.*) **22**. Polarity of chem. compds. (Higashi) **2**. Fractionation and purification of org. substances (Winterstein, Stein) **2**. Rotatory dispersion of certain classes of org. mols. (Biquard) **2**. Aromatic and unsatd. compds. (Huckel) **3**. CO and H mixt. [for the synthesis of MeOH] (Swiss pat. 162,458) **18**. C, H and hydrocarbons (Brit. pat. 395,893) **18**.

**Hydrocarbons.** Henry Dreyfus. *Fr.* 749,916, Aug. 1, 1933.  $\text{C}_2\text{H}_4$  or other hydrocarbons of low mol. wt. are prepd. by heating  $\text{CH}_4$  or gases contg. it, in the presence of a dehydrogenating catalyst, such as Ni, Co, Cu or Zn, and with or without an accelerator.

**Purifying hydrocarbons.** Pierre C. Petroff. *Fr.* 41,622, Feb. 15, 1933. Addn. to 727,048 (*Ch. J.* **26**, 5101). The oxidation of the impurities is carried out in the presence of O carriers, *e. g.*, salts, preferably org., of metals, such as Fe, Mn, V or others capable of different degrees of oxidation, or an org. compd. capable of forming a peroxide.

**Aromatic hydrocarbons.** Edward D. Kamm and Imperial Chemical Industries Ltd. *Brit.* 395,370, July 13, 1933. The hydrocarbons are prepd. by treatment of the corresponding phenols in the vapor phase with H at pressures below 15 atm. in the presence of catalysts contg. Mo or W sulfide, H<sub>2</sub>S being present in the gas mixt. The catalyst need not be originally present as sulfide, being converted thereinto by the H<sub>2</sub>S. Examples are given of the production of (1) PhMe by continuously passing *o*-cresol vapor, H and H<sub>2</sub>S over W sulfide and (2) a mixt. of  $\text{C}_6\text{H}_6$ , PhMe and xylene by passing a similar gaseous mixt. over a mixt. of oxides of Mo, Mg and Zn in equimol. proportions;  $(\text{NH}_4)\text{MoO}_4$  may replace the Mo oxide.

<sup>7</sup> **Brominated organic compounds.** Oskar Kasilitz. *U. S.* 1,932,590, Oct. 31. For producing brominated compds. from corresponding unsatd. compds., as in the production of  $\text{C}_6\text{H}_4\text{Br}_2$  from  $\text{C}_6\text{H}_6$ , the compd. to be brominated is washed with a dil. aq. soln. of elementary Br, and with some of the corresponding brominated compd. in countercurrent, the exhausted Br soln. is sep'd. from the brominated compd., and at least part of the latter is used in cycle.

<sup>8</sup> **Organic mercury compounds.** I. G. Farbenind. A.-G. (Karl Stuetz and Paul Fritzsche, inventors). *Ger.* 586,352, Oct. 20, 1933. Alkyl compds. of Hg are made to react with benzene derivs. which contain an acid group and a heterocyclic ring contg. the SH group. The effect of the reaction is to replace the H atom of the SH group by a -Hg-alkyl group. The alkali salts of the products are sol. in water and have antiseptic properties. Examples are given of the manuf. of products from  $\text{ClHgEt}$  and Na 2-mercaptopbenzoxazole-5-carboxylate (I), Na 2-mercaptopbenzimidazole-6-sulfonate, Na 2-mercaptopbenzimidazole-5-arsenate, and Na 2-mercaptopbenzothiazole-5-carboxylate; a product from I and  $\text{ClHgPr}$  is also described.

**Catalytic oxidation reactions such as oxidations of organic compounds.** Alphon O. Jaeger (to Selden Co.). *U. S.* 1,935,054, Nov. 14. A catalyst is used contg. a compd. of a metal of the 5th or 6th group of the

periodic system, such as a V compd. carried on a support of diatomaceous brick fragments. Various examples are given. Cf. *C. A.* 28, 172.

**Exothermic vapor-phase catalytic reactions such as oxidation of aromatic hydrocarbons, etc.** Alphons O. Jaeger (to Selden Research & Engineering Corp.). U. S. 1,935,053, Nov. 14. The reaction gases are passed through at least one catalytic zone and the exothermic heat of reaction is absorbed by a non-boiling liquid placed in heat-exchanging relation; the liquid is removed from the catalytic zone and its pressure is reduced to a point at which the liquid will boil at or only slightly below the temp. at which it leaves the catalyst zone; vapors given off are condensed and the condensate and unboiled liquid are returned to the catalytic zone at the pressure there existing (the circulation being accelerated by introducing an inert gaseous medium at a portion of the circuit where the normal circulation is upward). App. is described. Cf. *C. A.* 27, 3017.

**Catalytic hydrogenation of non-nitrogenous organic compounds such as linseed oil, naphthalene or acetylene.** Alphons O. Jaeger (to Selden Co.). U. S. 1,931,846, Oct. 24. A contact mass is used comprising when freshly prepd. a permutogenetic material with at least one effective catalytic component other than an exchangeable base such as one contg. Ni, Cu and Mn. Numerous details are given. Cf. *C. A.* 27, 3944.

**Diolefins.** Serge V. Lebedev. Ger. 577,630, June 3, 1933. MeOH, EtOH, PrOH or iso-PrOH, or mixts. of these are heated with a mixt. of catalysts which cause H or water to split off from the alc. mol. Catalysts obtained by reducing Cu compds. are excepted. ZnO is mentioned as a H-splitting catalyst and  $Al_2O_3 \cdot SiO_2 \cdot xH_2O$  as a water-splitting catalyst.

**Aromatic bases.** Soc. pour l'ind. chim. à Bâle. Fr. 749,964, Aug. 2, 1933. Polynuclear aromatic amino bases, the rings of which are joined directly or indirectly by CH<sub>2</sub> groups, in such a manner that the mol. proportion of CH<sub>2</sub> groups to aromatic amine groups is above 0.5 and less than 1, are prepd. by condensing primary aromatic amines, the *p*-position being free, with derivs. contg. active CH<sub>2</sub> groups, such as CH<sub>2</sub>O, anhydroformaldehydeaniline, anhydro-*p*-aminobenzyl alc., hexamethylenetetramine and methylal. The reaction is carried out in the presence of acid at a temp. not above 120° and avoiding a large excess of PhNH<sub>2</sub>. The products may be used as addns. to pickling acids, in the rubber industry and as starting materials for the prepn. of artificial resins.

**Liquid-phase oxidation of hydrocarbons to alcohols.** Martin Luther and Wilhelm Dietrich (to I. G. Farbenind. A.-G.). U. S. 1,931,501, Oct. 24. Oxidation such as that of paraffin wax or oil to form alcs., esters, etc., is effected by heating to about 160° under atm. pressure with a gaseous oxidizing agent such as air in the presence of an added acid such as HOAc having a dissoc. const. between  $10^{-4}$  and  $10^{-13}$  (the quantity of the acid added during the whole reaction being at least 2% by wt. of the initial hydrocarbon material and the reaction being stopped as soon as the saponification value of the reaction product is 70).

**Alcohols.** H. Th. Rohme A.-G. (Hermann Truckner, inventor). Ger. 576,387, May 12, 1933. Addn. to 571,834 (*C. A.* 27, 4539). See Brit. 385,488 (*C. A.* 27, 1240).

**Dehydrating and rectifying raw ethyl alcohol, etc.** Otto v. Kussler and Daniel Peters. U. S. 1,935,529, Nov. 14. A raw alc. contg. 2-4 C atoms and which may be of a 90-96% concn. but which still contains originally present impurities is treated with  $C_2H_5I$ ; the resulting azeotropic mixt. is distd., its vapors are condensed, the condensate is sepd. into 2 layers one of which contains substantially all the  $C_2H_5I$  and the other the alc.-water mixt. and substantially all the distd. impurities. The last-mentioned layer is rectified, simultaneously sepg. the low-boiling fraction of the impurities from the alc. and removing them as first runnings at the top of the rectification zone, and sepg. the higher-boiling fraction of the distd. impurities from the alc. as later runnings and

removing them from the rectification zone, the highly concd. alc. being withdrawn from the rectification zone and returned to the distn. zone. An arrangement of app. is described.

**Stabilizing aromatic alcohols.** Lucas P. Kyrides (to Monsanto Chemical Co.). U. S. 1,933,064, Oct. 31. An aromatic alc. such as benzyl alc. is mixed and heated with about 3% of a strong org. amine such as triethanolamine which is sol. in the alc. and less volatile than the latter.

**Recovery of alcohol from mixtures with ammonia.** Joseph E. Jewett (to National Aniline and Chemical Co.). U. S. 1,933,556, Nov. 7. A vapor mixt. contg. alc. and NH<sub>3</sub>, such as the mixt. produced in the production of arylglycines by the aldehyde-cyanide process, is contacted with an arylamine such as aniline which serves to absorb the alc. App. is described.

**Triazoles.** Schering-Kahlbaum A.-G. Brit. 396,778, Aug. 11, 1933. 3,4,5-Trisubstituted-1,2,4-triazoles are prepd. by causing 3,5-disubstituted furodiazoles to react with primary aliphatic, aromatic or heterocyclic amines, with or without such solvents as MeOH and EtOH. The furodiazoles are prepd. by treating diacylhydrazines in known manner with POCl<sub>3</sub>. Among examples dimethylfurodiazole is treated with (1) alc. MeNH<sub>2</sub> to give 3,4,5-trimethyltriazole and (2) PhNH<sub>2</sub> to give 3,5-dimethyl-4-phenyltriazole and (3) methylphenylfurodiazole is treated with alc. MeNH<sub>2</sub> to give 3,4-dimethyl-5-phenyltriazole and with PhNH<sub>2</sub> to give 3-methyl-4,5-diphenyltriazole.

**Aminopropanols.** I. G. Farbenind. A.-G. Brit. 396,551, Aug. 10, 1933. Addn. to 365,535 (*C. A.* 27, 1639) and 365,540 (*C. A.* 27, 1640). Racemic 1-hydroxyphenyl-2-amino-1-propanols are prepd. by reducing a 1-hydroxyphenyl-2-keto-1-propanol with H at raised temp. in the presence of NH<sub>3</sub>, or a primary or secondary amine, and a precious metal or metal of the Ni group (Fe, Co, Ni or Cu). When using an alkylamine or arylamine the product is alkylated or arylated in the NH<sub>2</sub> group but in the case of NH<sub>3</sub> or an aralkylamine there is obtained a product unsubstituted in the NH<sub>2</sub> group except when an aralkylamine is used in conjunction with a catalyst of the Ni group (in which case the aralkyl-amino compd. is formed and requires to be further hydrogenated in the presence of a precious metal to split off the aralkyl group). The reaction is preferably effected in an alc. soln. Examples are given of the prepn. of racemic (1) *m*-hydroxyphenylpropanolamine by hydrogenating 1-*m*-hydroxyphenylacetylcarbinol in the presence of benzylamine and Pd; using Ni as the catalyst the racemic *m*-hydroxyphenylbenzylaminopropanol is obtained from which the benzyl group is split off by continuing the hydrogenation in presence of Pd, (2) 3,4-dihydroxyphenylaminopropanol from 1-3,4-dihydroxyphenylacetylcarbinol with Pd and benzylamine, etc.

**Aminopropanols.** I. G. Farbenind. A.-G. Brit. 396,951, Aug. 17, 1933. Racemic 1-phenyl-2-amino-1-propanols that are monohydroxylated in the Ph nucleus are resolved into their optically active components by means of an optically active tartaric acid. Examples are given of the resolution of 1-*m*-hydroxyphenyl-2-methylamino-1-propanol and 1-*m*-hydroxyphenyl-2-amino-1-propanol by *d*-tartaric acid. Cf. *C. A.* 27, 1640.

**Indophenols; sulfur dyes.** Imperial Chemical Industries Ltd. and Max Wyler. Brit. 396,393, Aug. 1, 1933. Indophenols are prepd. by condensing a compd. of formula  $ArNHCHX$ , wherein Ar is an aryl radical having a free *p*-position, X is H, alkyl or aryl and Y is a —CN or CONH<sub>2</sub> group, with a nitrosophenol or a quinonechloroimide or by oxidizing such a compd. with *p*-aminophenol (I) according to known methods. By sulfuring these indophenols or the corresponding leuco compds. S dyes giving level greenish blue to violet-blue shades on cotton are obtained. Among examples (1) anilinoacetamide (II) is condensed with *p*-nitrosophenol and the indophenol obtained sulfurized before or after reduction; the same leucoindophenol is produced by oxidizing II (obtained by boiling the corresponding nitrile in soda soln.) with I by means of acid dichromate followed

by reduction with Zn dust, and (2) the nitrile prep'd. by condensing  $\text{PhNH}_2$ ,  $\text{BzH-bisulfite}$  and alkali cyanide together is treated with quinonechloroimide in  $\text{H}_2\text{SO}_4$ .

• **Acetylated phenols.** Herbert L. J. Haller and Paul S. Schaffer (to the free use of the public). U. S. 1,933,075, Nov. 7. In prep. an acetylated phenol such as *p*-acetamidophenylacetate, an aryldiazonium fluoroborate such as *p*-acetamidophenyldiazonium fluoroborate is heated with a lower aliphatic acid or anhydride such as  $\text{Ac}_2\text{O}$ . Several examples are given.

**Isopropylcresols.** Rheinische Kampfer-Fabrik G. m. b. H. (Karl Schollkopf, inventor). Ger. 586,150, Oct. 18, 1933. Propylene is condensed with *o*-, *m*- or *p*-cresol at a temp. up to  $400^\circ$  in the presence of a catalyst, *e. g.*,  $\text{Al}_2\text{O}_3$ ,  $\text{AlPO}_4$ , Al-Mg hydrosilicate, kieselguhr, or anhyd.  $\text{ZnCl}_2$ . The reaction may be effected in the gaseous or liquid phase and at atm., reduced or raised pressure. The propylene may be replaced by reagents yielding it, *e. g.*,  $\text{Pr}_2\text{O}$ , but the use of  $\text{PrOH}$  is excluded. The products are generally mixts. of *C*-mono or di-isopropylcresols, with or without cresol isopropyl ethers. Similar mixts. may be prep'd. by heating a *C*-isopropylcresol with a catalyst, or by heating a diisopropylcresol with cresol in the presence of a catalyst. The components of the mixed products are sep'd. by extn. with alkali followed by fractional distn. Examples are given describing the prep'n. of thymol and various isomers and homologs, including 4-hydroxy-2-isopropyltoluene, *m.* 37°, *b.* 248°, and 3-hydroxy-2-isopropyltoluene, *m.* 69°, *b.* 228.5°.

**Ketones from secondary alcohols.** Clyde O. Henke (to E. I. du Pont de Nemours & Co.). U. S. 1,933,215, Oct. 31. See Fr. 736,087 (C. A. 27, 1361).

**Cyclic ketones.** Soc. anon. M. Naef & Cie. Brit. 396,576, Aug. 10, 1933. See Fr. 744,343 (C. A. 27, 4031).

**Ketenes.** Peter J. Wiczewich and Per K. Frolich (to Standard Oil Development Co.). Brit. 396,568, Aug. 10, 1933. See Fr. 742,985 (C. A. 27, 3722).

**Esters.** I. G. Farbenind. A.-G. Brit. 395,340, July 4, 1933. Esters, suitable for *plastering* and *softening agents for lacquers, films and plastis contg. cellulose derivs.*, *e. g.*, the nitrate and acetate, urea-aldehyde and other resins or other org. film-forming substances, are made by esterifying all the carbonyl groups of polycarboxylic acids produced by the oxidation of aliphatic hydrocarbons, or their O derivs. of high mol. wt., with  $\text{HNO}_3$  or oxides of N, such oxidation being effected at not over  $110^\circ$ . The esterification is effected with monohydric alcs. or phenols or with 1 OH group of polyhydric alcs. or OH-bearing ethers of polyhydric alcs. Among examples (1) an oxidation product of paraffin wax with  $\text{HNO}_3$  at  $90^\circ$  is esterified with  $\text{BuOH}$ , the ester being distd. off at  $170-230^\circ$  at 1-2 mm. pressure; it may be added to a soln. of low-viscosity cellulose nitrate in a mixt. of equal parts of  $\text{BuOAc}$  or  $\text{iso-BuOAc}$ ,  $\text{BuOH}$  or  $\text{iso-BuOH}$ , and  $\text{PhMe}$  to form an elastic lacquer, (2) an oxidation product of train oil with 45-50%  $\text{HNO}_3$  at  $90^\circ$  while maintaining the acid concn. by adding nitrous gases is esterified with glycol mono-Et ether; the product is a gelatinizing agent for celluloid articles and (3) an oxidation product of "S olive oil" (an oil extd. from olive husks by  $\text{CS}_2$ ) with  $\text{HNO}_3$  as in (2) is esterified with cyclohexanol; the product is stirred with  $\text{Ca(OH)}_2$ , ground in a ball-mill with benzene, the Ca soaps filtered off, the benzene distd. off and the ester distd. off *in vacuo*.

**Alkyl esters of acrylic acid from  $\beta$ -chloropropionic esters.** Bernhard Jacobi and Hans Fikentscher (to I. G. Farbenind. A.-G.). U. S. 1,934,613, Nov. 7. Alkyl esters of  $\beta$ -chloropropionic acid are heated in the presence of a difficultly volatile acid reacting substance such as  $\text{H}_2\text{SO}_4$ ,  $\text{H}_3\text{PO}_4$  or  $\text{ZnCl}_2$ .

**Polymerized vinyl esters and fatty oils.** Alexander Eibner, Willy O. Herrmann, Wolfgang Hachuel and Martin Miller (to Consortium für elektrochemische Industrie G. m. b. H.). U. S. 1,934,297, Nov. 7. Products which are suitable for *lacquers*, etc., are obtained by polymerizing vinyl esters such as vinyl acetate or butyrate with products of the polymerization of fatty oils such as

stand oil or linseed oil or the like. Numerous examples are given.

**Vinyl esters and their polymerization products.** I. G. Farbenind. A.-G. Brit. 395,478, July 20, 1933. Vinyl esters of aliphatic satd. or unsatd., mono- and polycarboxylic acids contg. at least 5 C atoms, of aromatic, cycloaliphatic and heterocyclic mono- and polycarboxylic acids and of mixed aliphatic-aromatic and mixed aliphatic-cycloaliphatic mono- and polycarboxylic acids, the  $\text{COOH}$  groups of which may be attached to the aliphatic or cyclic radical, are manuf'd. by treating such acids with  $\text{C}_2\text{H}_2$  in the presence of Zn or Cd salts of org. carboxylic acids while working in the liquid phase, preferably under increased pressure. Suitable acids are valeric and its isomers, caprylic, lauric, palmitic, margaric, stearic, oleic, adipic, myristic, sebacic,  $\text{BzOH}$ , *o*-, *m*- and *p*-toluic, the different isomers of naphthoic, phenylacetic and cinnamic acids, phenylglycine, phthalic acid and monoalkyl esters thereof, salicylic and hydroxynaphthoic acids, pyridine- and quinoline-carboxylic acids, hydrophthalic and abietic acids, also partially esterified acids, natural resins of high acid value, *e. g.*, colophony, or mixts. of acids, *e. g.*, those obtainable by sapon. of natural fats and oils, *e. g.*, coconut or palm kernel oils, or by oxidation of paraffin or montan waxes. Suitable Zn and Cd salts are  $\text{Zn(OAc)}_2$ , Zn stearate,  $\text{Zn(OBz)}_2$ , and  $\text{Cd(OBz)}_2$ . Absorptive substances, *e. g.*, active C, fuller's earth, silica gel, may be added to the reaction mixt. To prevent explosions the  $\text{C}_2\text{H}_2$  is dild. with inert gases, *e. g.*, N, H, CO,  $\text{CH}_4$  or  $\text{C}_2\text{H}_6$ . Danger of explosions is further precluded by the addn. of inert solvents, *e. g.*,  $\text{C}_6\text{H}_6$ ,  $\text{PhMe}$ , benzene, xylene, cyclohexane or decahydronaphthalene, or esters such as the vinyl esters obtainable by the process or such esters as Me, Et, Bu iso-Bu or Am acetate or butyrate. Polymerization inhibitors, *e. g.*, hydroquinone, naphthols or amines, may be added during distn. or storage of the esters or incorporated in the reaction mixt. during the reaction itself. The prep'n. and polymerization of the esters may be combined, *e. g.*, by using small amts. of catalysts and prolonging the reaction time or by continuing heating to  $150-200^\circ$  after the reaction is completed. The esters may also be polymerized by methods usually used in polymerizing lower vinyl esters. Various other methods of polymerization are described. The polymerization products may be used as varnishes and lacquers, if desired together with cellulose derivs. compatible therewith, with or without inert fillers, org. or inorg. pigments, org. dyes and softening agents. Polymerized vinyl esters of aliphatic open-chain or cycloaliphatic carboxylic acids contg. more than 12 C atoms may be added to polishing preps. Numerous examples are given.

**Ethers of cellulose esters.** Henry Dreyfus. Brit. 396,796, Aug. 11, 1933. A cellulose ester or mixed ester is caused to react with an oxyalkylating agent in the absence of strong inorg. bases such as NaOH under conditions such that no substantial sapon. of the ester occurs. Esters contg. the  $\text{CSS}$  group are excluded. The products may be used in the production of rayon, films, varnishes, plastic masses, molding powders, etc. Among examples (1) cellulose acetate contg. 2-2.5 ester groups is heated in an autoclave with ethylene oxide and (2) cellulose benzoate contg. 1.5-2 ester groups is reacted with propylene oxide in the presence of hydroxypropylmethylamine.

**Alkyl ethers.** Imperial Chemical Industries Ltd. Fr. 749,402, July 24, 1933. Alkyl ethers are prep'd. by causing an alc. contg. more than 10 C atoms to react with an alkyl halide in the presence of finely divided Al and an agent fixing acid. Examples are given of the prep'n. of *octadecyl benzyl ether*, *b<sub>11</sub>*  $250^\circ$ , *cetyl benzyl ether*, *b<sub>18</sub>*  $340-350^\circ$ , *dodecyl benzyl ether*, *b<sub>11</sub>*  $190-202^\circ$ , and *oleyl benzyl ether* which decomposes when heated. The products may be sulfonated to form *wetting agents*.

**Cyclic ethers.** Henry Dreyfus. Brit. 396,761, Aug. 8, 1933. See Fr. 747,423 (C. A. 27, 5082).

**Amino ethers.** Edgar C. Britton (to Dow Chemical Co.). U. S. 1,932,653, Oct. 31. A comp'd. of the general formula  $\text{X}-\text{R}-\text{O}-\text{R}'$  in which X represents a halogen

substituent, R an aryl group and R' alkyl or aryl, is heated with  $\text{NH}_3$ , as in the production of *p*-phenetidine from *p*-chlorophenetole under pressure at  $225^\circ$  in the presence of  $\text{Cu}_2\text{O}$ .

**Unsaturated ethers from acetals.** Karl Haur (to I. G. Farbenind. A.-G.). U. S. 1,931,858, Oct. 24. Acetals are converted into unsatd. ethers, with good yields, by contact of the acetal vapor with finely divided metals such as Au, Ag or the Pt metals, preferably on a carrier such as asbestos, ceramic or metallic substances, kieselguhr, alumina or silica gels or active charcoal, with or without various auxiliary substances such as Cu, Mg, Ca, Al, Ti, Sn, Zn, Cd, Pb, Zr, Th, Cr, Mo, W, U or Mn, their oxides or heat-resisting salts. Various examples with details of procedure are given, and the *vinyl ether of ethylene glycol monoethyl ether* is particularly claimed as a new product. Temps. of  $200$ – $350^\circ$  are suitable for the conversion.

**Cyclic acetals.** Kenneth H. Hoover (to Association of American Soap and Glycerine Producers). U. S. 1,934,309, Nov. 7. A polyhydric alc. and an aldehyde are caused to react to form a cyclic acetal and water in the presence of a water-immiscible org. liquid such as  $\text{C}_6\text{H}_6$  which is not reactive with the alc. and aldehyde and a water mixt. of which will distil from the reaction mixt. at a reaction temp.; distn. of this org. liquid and water is effected and the org. liquid is sep'd. from the water and returned. Various examples are given including the production of butyl glycerol, furfural glycerol and furfural glycol, suitable for plasticizing lacquer compns., etc.

**Organic amines.** Gilbert T. Morgan and David D. Pratt. Brit. 396,760, Aug. 11, 1933. Aliphatic and aromatic amines are obtained by heating to a high temp. and under pressure an aliphatic or aromatic compd., contg. alc. or a single phenolic OH, with an  $\text{NH}_4$  or an aliphatic amine salt. According to examples  $\text{NH}_4\text{Cl}$  reacts under such conditions with EtOH to give mono-, di- and triethylamine, with *m*-cresol to give *m*-toluidine and di-*m*-tolylamine and with *sym*-*m*-xyleneol to give *sym*-*m*-xylylidine and di-3,5-xylylamine and dimethylamine-HCl reacts with *sym*-xyleneol to give a mixt. of primary and secondary bases.

**Halogenated aromatic amines.** Lindley E. Mills (to Dow Chemical Co.). U. S. 1,935,515, Nov. 14. For producing a chloro-aromatic amine such as 3,4-dichloroaniline or the like, a chlorobromo hydrocarbon of the benzene or naphthalene series contg. Cl and Br in the 1,4-position to each other is treated with an aq.  $\text{NH}_3$  base such as  $\text{NH}_3$  itself or monomethylamine in the presence of a Cu-contg. catalyst capable of promoting the aminolysis of a nuclear halogenated aromatic compd., at a temp. of  $80$ – $150^\circ$  and under superatm. pressure, to effect reaction with the Br only. Several examples are given.

**Primary amino compounds.** Wm. J. Hale (to Dow Chemical Co.). U. S. 1,932,518, Oct. 31. Formation of primary amines of the lower aliphatic or benzene series such as aniline is effected by reaction of  $\text{NH}_3$  with a monohalogenated hydrocarbon such as  $\text{PhCl}$  in the presence of added corresponding secondary and tertiary amines, which serve to establish equilibrium reaction conditions.  $\text{Cu}_2\text{O}$  or  $\text{Cu}_2\text{Cl}_2$  may be used as a catalyst.

**Addition compounds of menthols and orthophosphoric acid.** John W. Blagden and Walter E. Huggett (one-third to Howards & Sons, Ltd.). U. S. 1,932,130 1, Oct. 24. See Brit. 374,893 (C. A. 27, 3940).

**$\beta$ -Alkylamino compounds of hydroxyphenylethanols.** Helmut Legerlotz (to Frederick Stearns & Co.). U. S. 1,932,347, Oct. 24. *p*-Hydroxymethylaminoacetophenone-HCl, by reduction in water soln. with H and Pd on carbon as a catalyst, with addn. of  $\text{NH}_3$  after the reduction, forms *p*-hydroxyphenylethanolmethylamine, m.  $184$ – $5^\circ$ , and its hydrochloride m.  $155$ – $6^\circ$ . The *m*-hydroxyphenyl deriv., correspondingly obtained, m.  $142$ – $3^\circ$ . Various details and modifications of procedure are described.

**Tetrazo compounds.** I. G. Farbenind. A.-G. (Erwin Hoffa, Wilhelm Schumacher II, Ernst Tietze and Anton Ossgenbeck, inventors). Ger. 586,353, Oct. 20, 1933.

1 Stable water-sol. tetrazo compds. of *m*- and *p*-diamines of the benzene series are prep'd. by tetrazotizing these in the presence of  $\text{HRF}_4$ . Examples are given.

**Organic persulfo compounds.** Fleisch-Werke A.-G. für Gerbstofffabrikation u. chemische Produkte. Brit. 396,395, July 27, 1933. Divided on and addn. to 394,989 (C. A. 28, 176). The org. persulfo compds. described in 394,989 are prep'd. by treating sulfo compds. other than sulfonyl chlorides with peroxides, the presence of org. solvents and absence of  $\text{H}_2\text{O}$  not being essential. Good cooling and (or) stabilizers must be used. In examples (1) naphthalenesulfonic acid is treated, while cooling and in the presence of Na pyrophosphate (I), with both  $\text{Na}_2\text{O}_2$  and  $\text{H}_2\text{O}_2$ , (2) naphthalenedisulfonic acid is treated with  $\text{H}_2\text{O}_2$  in the presence of I, and (3) diisopropyl- $\beta$ -naphthalenesulfonic acid peroxide is treated with  $\text{Na}_2\text{O}_2$  in the presence of I, with cooling.

**Aromatic vinyl compounds.** I. G. Farbenind. A.-G. Brit. 396,079, July 28, 1933. See Fr. 720,730 (C. A. 27, 307).

**Polyvinyl compounds.** I. G. Farbenind. A.-G. Brit. 396,186, Aug. 3, 1933. Mixed polymerization products are made by causing a product of the polymerization of a mixt. of at least 2 vinyl compds., said product contg. free OH groups, to react with a compd. that reacts with OH groups, e. g., aldehydes, ketones or other compds. such as benzyl chloride, oleic acid chloride,  $\text{ClSO}_2\text{H}$  or phthalic anhydride. Alternatively the product of the polymerization of a mixt. of at least 2 vinyl compds., at least 1 of which is an ester, is sapond. and caused to react with the aldehyde, etc., or is treated simultaneously with a sapon. agent and the aldehyde, etc. When starting from a mixed polymerization product of 2 vinyl esters or a vinyl ester and an acrylic acid ester there may be first obtained a product that still contains 1 acid component while the other has been split off to leave free OH groups. By the action of an aldehyde or ketone on this product a mixed polymerization product is obtained, the OH groups of which are in part esterified and in part combined with the aldehyde or ketone to form an acetal. Among examples (1) the product prep'd. by polymerizing a mixt. of vinyl acetate and oleate in alc. soln. with the aid of Bz peroxide is heated in alc. soln. with butyraldehyde and  $\text{H}_2\text{SO}_4$  to yield a product contg. oleic acid groups and butyraldehyde acetal groups; it is suitable for making lacquers and plastic masses, (2) the mixed polymerization product of acrolein and *p*-hydroxystyrene is heated with chloroacetic acid and aq. NaOH; the product can be used as an assistant in the textile industry and (3) the polyvinyl alc. obtained by sapon. in an acid medium of the mixed polymerization product of vinyl acetate and stearate and still contg. the stearyl residue is heated with  $\text{ClSO}_2\text{H}$  and pyridine, the product dild. with  $\text{H}_2\text{O}$ , the pyridine and excess acid removed by dialysis and the residue neutralized, evapd. under reduced pressure and dild. with  $\text{H}_2\text{O}$  to give a viscous soln. which can be used for sizing and other purposes in the textile industry.

**Compounds of the dibenzopyrenequinone series.** Georg Kranzlein, Arthur Wolfram and Emil Hausdorfer (to General Aniline Works). U. S. 1,932,501, Oct. 31. New compds. of the general formula:

where Z and  $Z_1$  jointly represent the grouping

and Y represents hydroxy, O-alkyl, O-aryl, O-aralkyl or  $\text{SO}_3\text{H}$  occupying positions other than those marked by an x in the formula, and in which the aromatic nuclei may be

further substituted are obtainable by subjecting a dibenzopyrenequinone compd. to the action of a sulfonating agent as, for instance, concd.  $\text{H}_2\text{SO}_4$  or oleum and replacing, if desired, in the sulfonated products thus obtained, the sulfonic acid groups by hydroxy groups as, for instance, by a treatment with caustic alkali. The dihydroxy compds. thus obtained can be converted into the corresponding ethers as, for instance, into the alkoxy or aralkoxy compds. by the usual methods. As etherifying agent preferably *p*-toluenesulfonic acid alkyl ester is used. The compds. thus obtained may be halogenated by the usual methods whereby products are obtainable the shades of which are changed in comparison with the parent material. Numerous examples with details of procedure are given.

**Alkyl derivatives of methyl ethers of cresols.** Alexei F. Chichibabin (to Schering-Kahlbaum A.-G.). U. S. 1,933,775, Nov. 7. For the production of a deriv. such as *tert*-butyl-*p*-cresol Me ether, an olefin such as isobutylene is caused to react on a Me ether of a cresol in the presence of  $\text{H}_3\text{PO}_4$  or  $\text{H}_2\text{SO}_4$ .

**Aminoanthraquinone derivatives.** Compagnie nationale de matières colorantes et manufactures de produits chimiques du nord réunies établissements Kuhlmann. Fr. 750,112, Aug. 5, 1933. Intermediate products are prep'd. by causing  $\text{CH}_2\text{O}$  or substances liberating it, e. g.,  $\text{CH}_3\text{O}-\text{bisulfite}$ , to act on leuco derivs. of aminoanthraquinones and reoxidizing. Me groups are thereby introduced into the anthraquinone ring while the  $\text{NH}_2$  is not methylated. Examples are given of the prep'n. of 2,6-dimethyl-1,5-di-, 2-methyl-1- and 2-methyl-5-chloro-1-aminoanthraquinone.

**Anthracene derivatives.** I. G. Farbenind. A.-G. (Max A. Kunz, Rudolf Stroh and Hermann Dimroth, inventors). Ger. 586,068, Oct. 18, 1933. New compds. are obtained by heating anthraquinone (I) or its derivs. with aliphatic acid amides. Thus, I and  $\text{HCONH}_2$ , boiled gently together for 4 hrs., yield a product, m. 435°, believed to be 9,10-di(formylamino)anthracene. Similar products are obtained from  $\text{HCONH}_2$  and 2 methyl-I and 2-chloro-I. A product believed to be 9-hydroxy-10-acetylaminanthracene is prep'd. by boiling I in  $\text{AcNH}_2$  in the presence of Zn dust. The products yield I or its derivs. on oxidation.

**Guanidine derivatives.** Schering-Kahlbaum A.-G. (Herbert Schotte, inventor). Ger. 576,020, May 12, 1933. Addn. to 565,881 (C. A. 27, 2456). Guanidine compds. are prep'd. by treating basic polyamine salts contg. primary or secondary amino groups with ethers of isothiourea or their salts. Alkali may be present during the reaction. In an example  $\delta$ -aminobutyl- $\gamma$ -aminopropylamine-HBr is treated with *N*-ethylisothiourea-HBr in the presence of water to give  $\delta$ -guanidobutyl- $\gamma$ -guanidopropylamine-(HBr). The trihydrate m. 232°. The prep'n. of guanylthiourea-(HBr) $_2$ , m. 208°, is also described. Cf. C. A. 27, 4245.

**Chlorinated derivatives of indanthrene.** Joyce H. Crowell (to National Aniline & Chemical Co.). U. S. 1,931,046, Oct. 24. An indanthrene substance is subjected to the action of Cl in the presence of  $\text{H}_2\text{SO}_4$  at a temp. not exceeding 50° (suitably about 35°).

**Sulfonating derivatives of aliphatic hydrocarbons.** Soc. pour l'ind. chim. à Bâle. Swiss 161,837, Aug. 1, 1933. A process is described for sulfonating the above derivs. to form soap-like products with alkali hydroxide solns. The process is carried out at low temps. Thus, castor oil is sulfonated with concd.  $\text{H}_2\text{SO}_4$ .

**Acrylic acid derivatives.** Chemische Fabrik Grunau Landshoff & Meyer A.-G. (Fritz Sommer, inventor). Ger. 577,921, June 14, 1933. Derivs. of  $\beta,\beta$ -alkylated or alkylarvylated acrylic acids are prep'd. by converting these, especially those contg. alkyl residues with 2-4 C atoms or a Ph residue, into their amides or ureides. Thus,  $\beta,\beta$ -diethylacrylic acid is heated with  $\text{SOCl}_2$ . The resulting chloride is converted to  $\beta,\beta$ -diethylacrylic acid amide, m. 113°, by treatment with  $\text{NH}_3$ . The prep'n. of  $\beta,\beta$ -diethylacrylic acid ureide, m. 173°, is also described.

**Keto derivatives of cholanolic acid.** Friedrich Boedecker, Gustav Revere and Hans Volk. U. S. 1,933,003, Oct. 31. Keto derivs. of cholanolic acid are formed from cholanolic acid derivs. which contain free OH groups and which except for the OH groups do not contain any substituents which are oxidizable by chromic acid (such as trihydroxy-cholanolic acid), by oxidizing with aq. chromic acid soln., in an inert medium such as xylol. Esters of hydroxy-cholanolic acids such as the methyl ester may be similarly treated.

**Phthalic acid derivatives.** Ernest G. Beckett, Cecil Shaw, William E. Stephen, George C. Semple, Robert F. Thomson and Imperial Chemical Industries Ltd. Brit. 396,735, Aug. 9, 1933. The sepn. and purification of mixts. of chlorinated phthalic acids and (or) anhydrides is effected by treating the mixts. (which may also contain phthalic acid and (or) anhydride) with  $\text{H}_2\text{SO}_4$  of 50-100% concn., so as to convert 1 or more of the acids into anhydrides and (or) *vice versa*, and removing 1 or more of the constituents of the resulting mixt. by the differential action of an org. solvent. Among examples (1) a mixt. of 3,6- and 1,5-dichlorophthalic anhydrides is treated with 98%  $\text{H}_2\text{SO}_4$  at 100° and dild.; the mixt. is then extd. with PhMe which dissolves the 3,6-dichlorophthalic anhydride and leaves 4,5-dichlorophthalic acid and (2) phthalic anhydride is chlorinated in aq. KOH and crystals of impure acid K 4-chlorophthalate filtered off. The mother liquors are treated with  $\text{CaCl}_2$  and the acids (phthalic, 3- and 4-chlorophthalic and dichlorophthalic) obtained from the mixt. of pptd. Ca salts. The dry mixt. of acids is treated with 99.5%  $\text{H}_2\text{SO}_4$ , dild. and extd. with PhMe whereby 3-chlorophthalic and some dichlorophthalic anhydrides pass into soln. The PhMe soln. is concd. and agitated with 56%  $\text{H}_2\text{SO}_4$  whereby 3-chlorophthalic acid ppts. 3,6-Dichlorophthalic anhydride can be crystd. from the filtrate.

**Phthalic acid derivatives.** Imperial Chemical Industries Ltd. Fr. 749,951, Aug. 2, 1933. Mixts. of chlorinated phthalic acids or anhydrides are sepd. and purified by treating the mixt. with  $\text{H}_2\text{SO}_4$  of appropriate concn. whereby one or more of the anhydrides present are converted to acids and may be sepd. from the anhydride or anhydrides not converted.

**Condensation products of the anthraquinone series.** Walter Mieg, Berthold Stein and Willy Trautner (to General Aniline Works). U. S. 1,932,591, Oct. 31. Caustic alkalis in alc. soln. cause condensation of aminoanthraquinones at temps. between about 70° and the b. p. of the reaction mixt. with the formation of new compds. (of undetd. compn.) which do not exhibit pronounced vat dye character but are themselves of yellow to brown color. The condensation is facilitated by the presence of an oxidizing agent, as by leading in a current of air. Several examples with details of procedure are given. Cf. C. A. 28, 177.

**Condensation products from diolefins and hydrocarbons.** Fritz Holmann and Alfred Michael (to I. G. Farbenind. A.-G.). U. S. 1,934,123, Nov. 7. See Ger. 557,514 (C. A. 27, 514).

**Benzyl chloride.** Imperial Chemical Industries Ltd. Ger. 580,115, Oct. 25, 1933. See Brit. 334,260 (C. A. 25, 973).

**Vinyl chloride.** Granville A. Perkins (to Carbide and Carbon Chemicals Corp.). U. S. 1,934,324, Nov. 7. See Can. 329,012 (C. A. 27, 1375).

**Carbamic acid chloride.** I. G. Farbenind. A.-G. Brit. 396,870, Aug. 17, 1933.  $\text{NH}_4\text{Cl}$  is treated with  $\text{COCl}_2$  at 150-310° and carbamic acid chloride sepd. from the reaction products by cooling which may be effected in stages. The  $\text{COCl}_2$  may be dild. with inert gases, e. g., N,  $\text{CO}$ ,  $\text{CO}_2$ , air and (or) HCl.

**Chlorinating naphthalene.** Rudolf Engelhardt (to I. G. Farbenind. A.-G.). U. S. 1,933,122, Oct. 31.  $\text{Cl}_2$  is continuously introduced into a molten reaction mass, maintained at 5-10° above the m. p. of the material in each stage of the chlorination, according to a temp. curve given which follows the same general slope as the

m.-p. curve and gradually increases from 10° above the m.-p. curve at 80° to 80° above the m.-p. curve at -30° when one Cl atom has entered the molecule and which gradually decreases again to about 22° above the m.-p. curve at about 40° when 2.5 Cl atoms have entered the mol. and to at the most 15° above the m. p. curve at a temp. of at least 70° when at least 3 Cl atoms have entered the molecule. The chlorination is continued to obtain a waxy product.

**Salt of acetylsalicylic acid.** Chinoin Gyogyszer és Vegyészeti Termékek Gyára R. T. (V. Kereszty and Wolf) and Emil Wolf. *Swiss* 160,440, May 16, 1933. A basic Al salt of the above acid is obtained by treating an aq. soln. of a salt of the acid with an aq. soln. of an Al salt. The product contains 6.5-6.6% Al and 28-29% AcOH.

**Dialkyl sulfates from olefins.** N. V. de Bataafsche Petroleum Maatschappij. *Ger.* 577,947, June 7, 1933. The dialkyl sulfates with 4 or more C atoms in the alkyl groups are prepd. by treating excess of olefin with 90-100% H<sub>2</sub>SO<sub>4</sub> at least 2 mols. of the former being used to 1 mol. of the latter. The olefins may be used in liquified form under pressure and may be freed from isoolefins by prior treatment with 65-70% H<sub>2</sub>SO<sub>4</sub>. Thus, butylene and H<sub>2</sub>SO<sub>4</sub> give Bu<sub>2</sub>SO<sub>4</sub>.

**Disulfides.** Imperial Chemical Industries Ltd., Hugh M. Bunbury, John S. H. Davies and Alfred Eccles. *Brit.* 395,726, July 21, 1933. Mercaptans in which the SH group is directly attached to a C atom which is itself directly linked to N and S are converted to disulfides by treatment with persulfuric acid or a H<sub>2</sub>O-sol. persulfate. In examples 2-mercaptobenzothiazole, Na dimethyldithiocarbamate and the diethylamine salt of diethyldithiocarbamic acid are converted to corresponding disulfides by aq. NH<sub>3</sub> persulfate. The invention is particularly directed to the manuf. of disulfides for use as *rubber vulcanization accelerators*.

**Diaminodiphenyl disulfides.** Robert Lantz (one-half to Société anon. des matières colorantes et produits chimiques de Saint-Denis). *U. S.* 1,933,217, Oct. 31. Dithioanilines of the general formula NH<sub>2</sub>-R-S-S-R-NH<sub>2</sub> in which R represents a benzene nucleus to which S and NH<sub>2</sub> are attached in any relative positions except the *m* position, are formed by causing a sol. salt of hydroarsulfuric acid such as the Na salt to react with a compd. of the general formula Cl-R-NO<sub>2</sub> in which R represents a benzene nucleus to which Cl and NO<sub>2</sub> are connected in any relative positions except the *m* position, and then oxidizing the resulting product (suitably by air).

**Zinc phthalate.** Lloyd C. Daniels (to Selden Co.). *U. S.* 1,934,171, Nov. 7. A suspension of ZnO or ZnCO<sub>3</sub> in water is treated with a small amt. of an acid weaker than phthalic acid, such as HOAc, and is then agitated with phthalic acid until the Zn is pptd. as Zn phthalate.

**Hydrazine-sulfonates of the diarylamine series.** Arthur Zischer, Wilhelm Seidentaden and Karl Jellinek (to General Aniline Works). *U. S.* 1,932,152, Oct. 24. Hydrazine sulfonates of the diarylamine series corresponding to the probable general formula

where X means a naphthalene nucleus or a radical of the benzene series which may contain in the *p*-position to the NH group a further NH-NH-SO<sub>3</sub> alkali-metal group and R means a radical of the benzene series, with substituents of the benzene radicals such as alkyl, alkoxy, allyloxy, alkylmercapto, aroylamino, halogen, nitro, arylsulfonyl, or arylaminocarbonyl, are produced by treating the corresponding diazo- or bis-diazo-diarylamine sulfonates with a suitable reducing agent or by reducing the corresponding diazo- or bis-diazodiarylaminines in the manner described in *Journal of the Society of Dyers and Colorists* 1921, page 7. They are suitable for the production of *azo dyes*. For this purpose they are advantageously first mixed with combining components contg. a hydroxy or an O-alkali-metal group whereof the adjacent position is capable of attaching an arylazo group. The

comps. thus produced are then brought onto the fibers in the presence of an alkali and the goods thus treated are thereafter subjected to a steaming operation. Several examples with details of procedure are given.

**Organic acids.** I. G. Farbenind. A.-G. (Martin Luther and Hans Franzen, inventors). *Ger.* 576,160, May 8, 1933. Addn. to 492,755 (*C. A.* 24, 2472). In sepg. the carboxylic acids and unsaponifiable constituents from the product obtained by oxidizing paraffin hydrocarbons, the method of 492,755 is improved by carrying out the sapon. with an excess of an aq. suspension of alk. earth hydroxide, or Mg(OH)<sub>2</sub>. This ensures a more complete sapon. Examples are given.

**Organic acids by oxidation of hydrocarbons.** Christoph Beck and Heinrich Diekmann (to I. G. Farbenind. A.-G.). *U. S.* 1,932,613, Oct. 31. For the production of acids by oxidizing normally liquid and solid hydrocarbons such as those of fuel oil or paraffin at temps. of about 60-160° with a stream of gas contg. O, the strength of the oxidation conditions is gradually reduced (as by lowering the temp.) during the oxidation of a batch of the material, to retard the oxidation of the org. acids.

**Organic acids from oxidized nonaromatic hydrocarbons.** Hans Beller and Martin Luther (to I. G. Farbenind. A.-G.). *U. S.* 1,931,859, Oct. 24. An oxidation product of paraffin wax is heated in an open vessel to about 60-95° with a quantity of aq. Na<sub>2</sub>CO<sub>3</sub> soln. of about 20% strength about 5-10% in excess of that theoretically required for saponification, until evolution of CO<sub>2</sub> has ceased, and the material is then heated in a closed pressure-tight vessel to 100-185° in order to obtain org. acid salts. App. is described.

**Producing acids by oxidation of alcohols.** Charles J. Strosacker, Chester C. Kennedy and Earl L. Pelton (to Dow Chemical Co.). *U. S.* 1,934,648, Nov. 7. Alcs. such as PrOH or BuOH are caused to react, at temps. of 250-325°, with a fused mixt. initially contg. NaOH and KOH in specified relative proportions, to produce corresponding acids such as propionic or butyric acids in the form of their salts.

**Producing aliphatic acids, etc., by catalytic reaction between alcohols and carbon monoxide.** Walter Bader (to Celanese Corp. of America). *U. S.* 1,933,696, Nov. 7. For producing oxygenated compds. such as HOAc and MeOAc, an aliphatic alc. such as MeOH is mixed with at least 1 inorg. acidic catalyst contg. at least 1 acidic OH group linked directly to a non-metallic element, such as H<sub>3</sub>PO<sub>4</sub> and the mixt. is subjected to reaction with CO (suitably at a temp. of about 60-400° in successive stages). App. is described.

**Formic acid.** Henry Dreyfus. *Brit.* 396,375, Aug. 1, 1933. See *Fr.* 745,083 (*C. A.* 27, 4248).

**Acetic acid from acetaldehyde.** George Barsky (to American Cyanamid Co.). *U. S.* 1,934,161, Nov. 7. Liquid AcH and an oxidizing gas such as air are caused to flow continuously upwardly through a reaction kettle and the reaction zone is maintained under superatm. pressure and the top of the kettle is maintained at a temp. sufficient to remove AcH from the HOAc produced. The AcH is removed, condensed and returned to the bottom of the kettle, and the HOAc formed is continuously removed. App. is described.

**Lactic acid.** Friedrich A. V. Klopfer. *Brit.* 395,990, July 27, 1933. Solid granular preps. of lactic acid are obtained by absorbing the acid, e. g., an 80% soln. thereof, on dried, powd. vegetable pulps, e. g., peeled, degerminated and powd. carob beans, ext. of acacia berry kernels, carraghene, ext. of seaweed and dried mucilage of linseed.

**Alkylaminosulfobenzenecarboxylic acids.** I. G. Farbenind. A.-G. *Brit.* 396,100, July 31, 1933. 2-Alkylaminobenzene-1-carboxylic acid-4-sulfonic acids are manufd. by reacting an alkylamine with 2-chlorobenzene-1-carboxylic acid-4-sulfonic acid (I) in aq. soln. at above 50°, advantageously with the addn. of Cu or a compd. thereof as catalyst. Examples describe the reaction of (1) I with MeNH<sub>2</sub> with or without Cu, at 130°, (2) the Na salt of I with BuNH<sub>2</sub> at 120° and (3) the Na salt of I with EtNH<sub>2</sub> at 110-120°.

**1,6-Dibromo-2-hydroxynaphthalene-3-carboxylic acid.** Leopold Laska and Johannes Wollemann (to General Aniline Works). U. S. 1,933,987, Nov. 7. 2-Hydroxynaphthalene-3-carboxylic acid is dissolved in  $H_2SO_4$  and 2.0-2.1 at. proportions of Br are added to the soln.

**Acyl benzoic acids.** Bernard H. Jacobson (to Calco Chemical Co.). U. S. 1,933,375, Oct. 31. In the manuf. of an acyl benzoic acid such as *o*-benzoyl or *p*-toluylbenzoic acid by the Friedel & Crafts synthesis, phthalic anhydride, an unsubstituted aromatic hydrocarbon such as  $C_6H_6$  or toluene capable of forming a condensation product, and anhyd.  $AlCl_3$  are commingled at temps. substantially below  $40^\circ$  and reaction heat is withdrawn to maintain the temp. at about such a max. until the reaction is substantially complete.

**Sulfonic acids of organic compounds.** Hans Haussmann (to I. G. Farbenind. A.-G.). U. S. 1,931,491, Oct. 21. Trugsulfonic acids of non-aromatic org. compds. contg. at least 6 C atoms and corresponding to the general

formula  $R'CHSO_3H$  in which R and R' are aliphatic radicals, such as  $C_6H_{17}$  and  $HOOC(C_7H_{14})$ , resp., are produced by acting with an "onium" compd. of a sulfonating agent stronger than concd.  $H_2SO_4$  on an unsatd. aliphatic compd. such as oleic acid, rubber, etc., more than an equimol. proportion of the sulfonating agent being used if the unsatd. compd. contains a hydroxyl group. The products thus formed are water-sol.

**Aminoalkyl sulfonic acids.** Otto Nicodemus and Walter Schmidt (to I. G. Farbenind. A.-G.). U. S. 1,932,907, Oct. 31. For prepg. aminoalkyl sulfonic acids such as the methyltaurine Na salt, a compd. of the general formula  $OH-R-R'-SO_3X$  in which R and R' each stand for a bivalent satd. aliphatic hydrocarbon radical and X stands for H, or an alkali or alk. earth metal atom, such as hydroxyethane Na sulfonate, is heated in an autoclave with a compd. of the general formula  $Y-NH-Y'$  in which Y and Y' stand for H or alkyl, such as methylamine. Cf. C. A. 27, 3949.

**Substituted benzenesulfonic acids.** I. G. Farbenind. A. G. (Richard Strasser, inventor). Ger. 577,632, June 2, 1933. Chloroaminoalkoxybenzenesulfonic acids are prepd. by treating 5-chloro-2-amino-1-alkoxybenzene, or its derivs. obtained by introducing the residue  $COCH_2COR$  (R being a hydrocarbon residue) into the amino group, with a sulfonating agent. Thus, 5-chloro-2-amino-1-methoxybenzene is treated with  $H_2SO_4.H_2O$  at  $40-50^\circ$  to give the sulfonic acid. The deriv. 5-chloro-2-acetoacetyl-amino-1-methoxybenzene can be similarly sulfonated. Other examples are given. The products are used for the prepn. of dyes.

**1-Nitro- and 1-aminocarbazole-3,6-disulfonic acids.** Friedrich Muth and Albert Schmelzer (to General Aniline Works). U. S. 1,931,826, Oct. 24. Compds. of this group, in which the 8-position may be substituted by  $SO_3H$ , H, alkyl, hydroxyalkyl, halogen, CN, the carboxylic acid group, a thioalkyl group or a sulphydryl group, form white to yellow crystals sol. in water in the form of their alkali metal salts and may be employed as dye intermediates, as for prepg. unsulfonated carbazole compds. by splitting off the sulfonic groups in weakly acid soln. by heating under pressure. Several examples with details of procedure are given.

**Sulfamic acids of secondary bases.** Georg Kramlein, Heinrich Gremme, Max Thiele and Fritz Helwert (to General Aniline Works). U. S. 1,933,985, Nov. 7. Sulfamic acids of secondary bases are obtainable in good purity and yields by causing chlorosulfonic acid (or its esters or salts,  $SO_3$  or pyrosulfuric acid or the like) to act upon a prepn. contg. a secondary base such as monomethylaniline or a mixt. of mono- and dimethylanilines, etc. Various examples with details of procedure are given. Cf. C. A. 27, 1010.

**Sulfamic acids of 2-aminoanthrahydroquinone sulfuric acid esters.** Roger Ratti (to Durand & Huguenin S. A.). U. S. 1,934,143, Nov. 7. 2-Aminoanthraquinones having a free amino group are reduced to the corresponding 2-

aminoanthrahydroquinones and the latter are treated in the presence of a tertiary base with an esterifying agent comprising  $SO_3$  so as to introduce, in the same operation,  $H_2SO_4$  residues into the enolic groups of the 2-aminoanthrahydroquinones as well as into their free amino group. Various examples are given, including the production of the Na salt of the sulfamic acid of 2-aminoanthrahydroquinone disulfuric acid ester from 2-aminoanthraquinone and similar reactions.

**Acids, anhydrides and ketones.** Henry Dreyfus. Brit. 396,770, Aug. 9, 1933. See Fr. 749,139 (C. A. 27, 5755).

**Anhydrides.** Henry Dreyfus. Fr. 41,769, Apr. 13, 1933. Addn. to 736,651 (C. A. 27, 1364). Anhydrides, particularly  $Ac_2O$ , are prepd. by the thermal decompn. of salts of the acids with metals of high or relatively high basicity, e. g., Fe, Pb, Mn, Al, Zn or an alk. earth metal, the salts being mixed with more acid salts such as sulfates or chlorides.

**Aliphatic anhydrides.** Henry Dreyfus. Fr. 749,915, Aug. 1, 1933. Aliphatic anhydrides are prepd. by thermally decomposing  $AcOH$  or other aliphatic acids in the presence of a vanadate and/or a molybdate, with the exception of a phosphomolybdate. An example is given using a mixt. of Ba molybdate and pyrovanadate pptd. on kieselguhr.

**Aliphatic acid anhydrides.** C. F. Boehringer & Soehne G. m. b. H. Brit. 396,276, Aug. 3, 1933. See Fr. 746,684 (C. A. 27, 4515).

**Aliphatic anhydrides such as acetic anhydride.** Henry Dreyfus and Clifford I. Haney (to Celanese Corp. of America). U. S. 1,931,887, Oct. 24. Vapor of an aliphatic acid such as  $HOAc$  is subjected to pyrogenetic decompn. and the reaction vapors are condensed by leading them under the surface of an extg. liquid such as a mixt. of ether and gasoline the temp. of which is maintained below the b. p. of water. Cf. C. A. 27, 4250.

**Nitriles of resinous acids.** I. G. Farbenind. A.-G. Fr. 749,970, Aug. 2, 1933. Gaseous  $NH_3$  is caused to react on resinous acids, particularly colophony or their esters, if desired, in the presence of solvents or diluents at a high temp. and in the presence of a dehydrating catalyst, to produce nitriles.

**Acetylene.** Air Reduction Co. Inc. Fr. 749,625, July 27, 1933. See U. S. 1,900,655 (C. A. 27, 2966).

**Diphenylolpropane.** Imperial Chemical Industries Ltd. and Richard Greenhalgh. Brit. 395,732, July 21, 1933. Diphenylolpropane is prepd. by condensing  $PhOH$  with  $Me_2CO$  in equiv. quantities at not exceeding  $65-65-75\%$   $H_2SO_4$  in amt. at least 3 times the wt. of the  $PhOH$ , being used as condensing agent. The condensation may be effected in vessels of Pb.

**Aminophenylhydroxymethylaminopropane.** Firma. E. Merck. Ger. 577,687, June 2, 1933. The substance normal *p*-(*p*-aminophenyl)-1-hydroxy-2-methylaminopropane, m.  $114-116^\circ$ , is obtained by the hydrogenation of the corresponding keto compd. by the aid of noble metal catalysts.

**3-Methylal-3-hydroxymethyl-n-pentane.** Alexander Wacker Gesellschaft für elektrochemische Industrie G. m. b. H. Brit. 396,658, Aug. 10, 1933. 3-Methylal-n-pentane (I) is condensed with  $CH_2O$ , preferably in the presence of a known catalyst for aldol condensations, e. g.,  $NaOH$  or  $Na_2CO_3$ . Advantageously an excess of I is used and a solvent, e. g.,  $MeOH$ , is present.

**Ethyl alcohol.** The Distillers Co. Ltd., Walter P. Joshua, Herbert M. Stanley and John B. Dymock. Brit. 396,724, July 31, 1933. Divided on 392,289 (C. A. 27, 5341); Fr. 749,671, July 27, 1933.  $EtOH$  is produced by passing a mixt. of  $C_2H_4$  and steam over a catalyst comprising  $H_3PO_4$  and  $B_2O_3$ , the amt. of  $H_3PO_4$  being at least 10% more than that corresponding to the orthophosphate but not more than 95% of the catalyst. The process may be effected at  $100-300^\circ$  and up to 250 atm. Examples describe the use of a catalyst made by evapg. a mixt. of 1 mol.  $B_2O_3$  with 2.2 mols.  $H_3PO_4$  and heating at  $200^\circ$ .

**Ethanol and acetone.** Maurice Chaffette. Fr. 750,-

053, Aug. 3, 1933. EtOH and acetone are made by passing a mixt. of steam or water and  $C_2H_4$  or gases contg. it at 150–500° over catalysts composed of a mixt. contg. an oxide of Zn or Cd and other substances such as  $CaCO_3$ ,  $Al_2O_3$ , or Hg phosphate.

**Refining isopropyl alcohol produced from olefins.** Sylvan R. Merley (to Doherty Research Co.). U. S. 1,933,505, Oct. 31. Isopropyl alc. produced from olefins by absorption in  $H_2SO_4$  and subsequent hydrolysis and distn. is refined by passing the vaporous material counter-current and in contact with a  $H_2SO_4$  soln. of about 25% strength, then removing and condensing the treated alc. vapors, sepg. the absorbed impurities from the  $H_2SO_4$  and restoring the strength of the acid to about 25%, re-heating the relatively clean acid, and again using it. App. is described.

**Optically active 1-phenyl-2-(*N*-methyl-*N*-aralkylamino)-1-propanols and 1-phenyl-2-(*N*-methylanilino)-1-propanol.** Friedrich Stolz and Franz Flaecher (to Winthrop Chemical Co.). U. S. 1,934,015, Nov. 7. Synthetically prepd. racemic 1-phenyl-2-(*N*-methyl-*N*-aralkylamino)-1-propanols, where aralkyl is a benzyl radical of the general formula  $CH_2C_6H_4R$ , where R stands for H or methyl can easily be resolved into their optically active components by transforming them into the bitartrates by means of *l*- or *d*-tartaric acid, and these optically active compds. in the form of their salts or as free bases can be transformed into the optically active 1-phenyl-2-(*N*-methylanilino)-1-propanols by hydrogenating them, the aralkyl group being then split off. 1-Phenyl-2-(*N*-methyl-*N*-benzylamino)-1-propanol can be prepd. from methylbenzylaminopropiophenone by reduction by means of reducing agents, such as Na and alc. or by causing benzyl chloride to react with 1-phenyl-2-(*N*-methylanilino)-1-propanol. It forms colorless crystals, m. 72.3°, is sparingly sol. in water and readily sol. in most org. solvents. When racemic 1-phenyl-2-(*N*-methyl-*N*-benzylamino)-1-propanol is resolved by means of *d*-tartaric acid, the *d*-tartrate of *d*-1-phenyl-2-(*N*-methyl-*N*-benzylamino)-1-propanol first crystallizes out almost completely, while the *d*-tartrate of *l*-1-phenyl-2-(*N*-methyl-*N*-benzylamino)-1-propanol remains in soln. The base obtained when the latter compd. has been decompd. easily crystallizes. It is *l*-rotatory and, on catalytic hydrogenation, it yields besides toluene *l*-1-phenyl-2-(*N*-methylanilino)-1-propanol which is identical with the natural ephedrine.

**Acetone.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. (Hans Walter and Hermann Schults, inventors). Ger. 577,705, June 3, 1933. Acetone is produced by leading  $C_2H_2$  and water vapor over porous C impregnated with an Fe-free catalyst. A suitable catalyst is obtained by impregnating active C with aq. solns. of  $(AcO)_2Zn$  and  $(AcO)_2Mn$ , drying, and heating to about 100°. Cf. C. A. 27, 5086.

**Vaporizing formamide.** Paul J. Carlsle (to E. I. du Pont de Nemours & Co.). U. S. 1,934,485, Nov. 7. Liquid formamide is continuously contacted with a metal surface such as Al maintained at a temp. above the b. p. of the formamide at the pressure existing at the metal surface and the vapor formed is removed at such a rate that vaporization takes place substantially instantaneously. App. is described.

**Diphenylformamidines.** Tom Birchall and Ernest H. Rodd (to Imperial Chemical Industries Ltd.). U. S. 1,933,206, Oct. 31. In forming a diphenylformamidine such as diphenyl- or ditolyl-formamidine, a mixt. of formic acid and a primary aromatic amine of the benzene series such as aniline or toluidine is heated (suitably to about the b. p.) in the presence of a catalyst contg. boric acid, a borate or metallic Fe.

**Hexamethylenetetramine.** Henry O. Dering, Margaret D. Kelly and Superfine Chemicals Ltd. Brit. 390,467, Aug. 10, 1933.  $(CH_2)_6N_4$  is prepd. by reacting  $CH_3O$  with  $(NH_4)_2SO_4$  and the oxide, hydroxide or carbonate of an alk. earth metal in aq. medium, the  $(CH_2)_6N_4$  being isolated from the aq. component of the

reaction mixt. To further purify the product  $NH_4H_2PO_4$  may be added to the soln. or the soln. may be treated with  $BaCO_3$  and  $CO_2$ .

***p*-Hydroxyphenylglycine.** Freeman A. Gillett (to Eastman Kodak Co.). U. S. 1,933,799, Nov. 7. In a cyclic process, one mol. proportion of chloroacetic acid in aq. soln. is reacted with a quantity of impure material from the end of a previous cycle which contains one mol. proportion of *p*-aminophenol, the soln. of *p*-aminophenyl chloroacetate thus formed is treated with a decolorizing agent such as decolorizing carbon and after filtering is treated with a mol. proportion of *p*-aminophenol.

**Purifying benzene.** Carl Krauch and Mathias Pier (to I. G. Farbenind. A.-G.). U. S. 1,932,365, Oct. 24. Crude benzene is treated with a gas contg. free H at a temp. of 180–500° and under a pressure of at least 10 atm. in the presence of a catalyst contg. a metal of the 6th group of the periodic system or a difficultly reducible metal oxide immune to poisoning from S, such as MgO (the pressure employed being lower than would effect hydrogenation of the benzene itself under the conditions of the treatment).

**1,2,4,5-Tetrachlorobenzene.** Ludley L. Mills (to Dow Chemical Co.). U. S. 1,934,675, Nov. 7. *o*-Dichlorobenzene is caused to react with approx. 2 mol. equivs. of Cl at a temp. of 20–30°, then cooled and crystd.

**Benzanthrone.** Alphons O. Jager and Lloyd C. Daniels (to Selden Co.). U. S. 1,931,847, Oct. 24. Impure anthraquinone is produced from impure phthalic anhydride and  $CaH_2$  by the Friedel-Craft reaction, and the impure product thus formed is subjected to condensation with an acrolein-forming substance such as glycerol in the presence of a condensing agent, such as  $H_2SO_4$  and Cu or Al. Cf. C. A. 28, 182.

**2-Methylbenzanthrone.** Alexander J. Wuertz (to E. I. du Pont de Nemours & Co.). U. S. 1,934,221, Nov. 7. For the recovery of 2-methylbenzanthrone from a crude mixt. of this compd. with isomers, alkali-reactive impurities are pptd. from a soln. of the crude material in an org. solvent such as  $C_6H_6$  by use of an alkali such as  $Na_2CO_3$  and after sepn. of the pptd. impurities and alkali the 2-methylbenzanthrone is crystd. out.

**Fenchone.** Lee T. Smith (to Hercules Powder Co.). U. S. 1,933,939, Nov. 7. In producing fenchone by the dehydrogenation of fenchyl alc. under the action of heating in the absence of O, a catalyst is used which is capable of effecting the dehydrogenation and which includes at least 2 metals such as Cu and Ni. Mn, Mg, Zn and inert carriers also may be used. Cf. C. A. 27, 187.

**Hydroquinone.** Edgar C. Britton, Shailer L. Bass and Norman Elliott (to Dow Chemical Co.). U. S. 1,934,656, Nov. 7. *p*-Bromophenol is hydrolyzed with an aq. alkali metal hydroxide soln. at a temp. of 75–150°.

**Aminoanthraquinones.** Alexander J. Wuertz (to E. I. du Pont de Nemours & Co.). U. S. 1,933,236, Oct. 31. An anthraquinone deriv. with a sulfonic substituent such as Na  $\beta$ -anthraquinone-sulfonate is heated with aq.  $NH_3$  in the presence of an inorg. oxidizing salt sol. in aq.  $NH_3$  such as  $KClO_3$  and of a nitrate such as  $NH_4NO_3$  in order to form the corresponding aminoanthraquinone.

**Hydroxyselenonaphthenes.** I. G. Farbenind. A.-G. Brit. 390,011, July 27, 1933. 3-Hydroxyselenonaphthenes are prepd. by reacting KCN and Se with a diazotized ester of an anthranilic acid, sapon., treating the product with monochloroacetic acid and converting the product to the hydroxyselenonaphthene by boiling with  $Ac_2O$  followed by sapon. In an example Me anthranilate is converted to 3-hydroxyselenonaphthene.

**1,2,3,4-Tetrahydronaphthalene 1-peroxide.** Soc. pour l'ind. chim. à Bâle. Brit. 390,351, Aug. 3, 1933. Tetrahydronaphthalene (I) is treated with a gas contg. O either in the absence of a catalyst at below 100° or in the presence of a catalyst below 60°. Suitable catalysts are Sn, Pb or  $PbO$ . The product may be crystd. out. In examples I is treated with O or air, followed by sepn. of the product

by distn., pptn. with petr. ether or sepn. of the Na salt with NaOH and addn. of acid to free the peroxide. Cf. *C. A.* 27, 5341.

**Sulfonating  $\beta$ -naphthol.** John M. Tinker and Vernon A. Hansen (to E. I. du Pont de Nemours & Co.). 1,934,216, Nov. 7. For prep. 2-naphthol-1-sulfonic acid,  $\text{SO}_2$  gas is passed into a soln. of  $\beta$ -naphthol in an inert

org. solvent such as  $\text{C}_2\text{H}_2\text{Cl}_4$  (suitably with addn. of a small proportion of  $\text{H}_3\text{BO}_3$ ).

**$p$ -Ketocamphor.** Kenzo Tamura, Gyokujo Kihara, Yasuhiko Asahina and Morizo Ishidate. U. S. 1,933,642, Nov. 7. In producing allo- $p$ -ketocamphor,  $p$ -hydroxycamphor 5 is oxidized with  $\text{Na}_2\text{Cr}_2\text{O}_7$  4 and  $\text{H}_2\text{SO}_4$  3 parts, at a temp. below  $50^\circ$ .

## 11 BIOLOGICAL CHEMISTRY

PAUL F. HOWE

### A GENERAL

ARTHUR W. DOX

**Dilatometric studies in enzyme action. III. Contraction constants of enzyme-substrate reactions. II.** B. Sreenangachari and M. Sreenivasaya. *J. Indian Inst. Sci.* 16A, 69 75(1933).—See *C. A.* 27, 2166

M. L. C. Bernheim

**Crystallization of a compound of hemoglobin and carbon dioxide.** Donald D. Van Slyke, Robert T. Dillon and Alma Hiller. *Proc. Nat. Acad. Sci.* 19, 828 9(1933).—The crystals which sepd. from a soln. of hemoglobin contg.  $\text{CO}_2$  at various pressures contained an amt. of  $\text{CO}_2$  proportional to the amt. of free  $\text{H}_2\text{CO}_3$  in the mother liquor. When the  $\text{CO}_2$  tension reached 670 mm. the hemoglobin crystals contained as much  $\text{CO}_2$  as  $\text{O}_2$ . Crystals forming at physiol.  $\text{CO}_2$  tensions contained only  $1/15$  or  $1/10$  as much  $\text{CO}_2$ .

Rachel Brown

**Sulfur content of hair and of nails in abnormal states. Therapeutic value of hydrolyzed wool. I. Hair.** Herman Brown and Joseph V. Klauder. *Arch. Dermatol. Syphilol.* 27, 584 604(1933).—The av. S content of the hair is 4.86% (4.6–5.1). In 6 cases of alopecia areata, before the oral administration of hydrolyzed wool, the av. amt. of S was 4.38%; after hydrolyzed wool therapy, it rose to 5.5%. In 9 cases suffering from hair loss, the mean S content was 4.28%, regarded as subnormal. Loss of hair is not necessarily assoc. with low S. The metabolism of S (cystine) is not exclusively concerned in the cause of the loss of hair. Hydrolyzed wool therapy may increase the S content of the hair but such increase may or may not be accompanied by increased growth of hair. Dietary deficiency as a cause of loss of hair is more apparent in lab. animals than in man. Local applications of  $p$ -thiocresol were ineffective in stimulating the regrowth of hair.

B. C. Brunstetter

**Taste and chemical constitution.** S. Michael. *Pharm. Monatsh.* 14, 171 2(1933); cf. *C. A.* 27, 742. When the material to be tested is put on the tongue a taste sensation and a temp. sensation occur. The latter is detd. in an app. devised by G. Lämmer. The relation of this temp. change to chem. compn. is discussed.

H. M. Burlage

**An essential difference between protein breakdown by exhaustion of reserves and a temporary breakdown by momentary administration of protein.** G. Sant. *Pharm. Weekblad* 70, 1153 8, 1175 80(1933). The "hydrolysis no." of blood serum, or percentage difference in optical rotation before and after hydrolysis, does not change appreciably from an initial value of 35–43 after ingestion of protein. With higher initial values a lowering of the hydrolysis no. occurs during the 1st 3 hrs. followed by a return to the original value during the next 3–4 hrs. The value 35–43 thus represents a min. protein content because of exhaustion of reserve before or during the assimilation of food.

A. W. Dox

**The barbituric acids. Their toxicology.** Charles Desodt. *Thesis, Lille* 1932, 125 pp.—The properties, uses, toxicology and color reactions of 5 important barbituric acid hypnotics are reviewed. The original work consists in the application of a new method for isolation of barbituric acids from urine. To 250–300 cc. of urine add 0.1 vol. of 15%  $\text{K}_4\text{Fe}(\text{CN})_6$  and shake, then add 0.1 vol. of 11.2%  $\text{Zn}(\text{OAc})_2$  and mix with a stirrer. Filter, and if the filtrate is not acid, add a few drops of  $\text{AcOH}$ . Transfer to

a separatory funnel, add 75 cc. of  $\text{Et}_2\text{O}$ , mix carefully at first, then more vigorously, draw off the aq. layer and repeat the extrn. 4 times. Dry the combined exts. for 20 min. with anhyd.  $\text{Na}_2\text{SO}_4$  and filter through cotton. Evap. the  $\text{Et}_2\text{O}$  on the water bath, ext. the residue with 10–20 cc. of boiling  $\text{EtOH}$ , filter into a tared dish and evap. A white residue is assumed to be pure barbituric acid and the percentage is calcd. from the vols. of urine and of the various filtrates. If the residue is colored it is extd. with 20–30 cc. of boiling  $\text{H}_2\text{O}$  and treated with animal charcoal 15 min. or until the color is removed, then evapd. and weighed. The recovery of barbituric acid (barbital, rutonal, gardenal, dial, soneryl) is 89–96% of the amt. present. Essentially the same procedure is said to be applicable to blood, gastric contents and cerebrospinal fluid. Extrn. from brain and liver is discussed but no expts. are described. Daily excretion by hospital patients during daily doses for the period indicated averaged: barbital 0.25 g., 13 days, 65%; rutonal 0.2 g., 14 days, 49%; dial 0.1 g., 13 days, 30%; gardenal 0.2 g., 14 days, 25%. The barbituric acids are resistant to putrefaction. The findings of Kohn-Abrest (*C. A.* 24, 2506) that putrefaction in the presence of a barbituric acid gives rise to HSCN could not be corroborated.

A. W. Dox

**The system of lipoids.** W. Halden. *Fettechem. Umschau* 40, 189 94(1933).—H. surveys the many attempts to define the term "lipoids"; in a chart he enumerates the compds. related to fats and waxes with their accompanying constituents of sterols, lipochromes, hydrocarbons, carotenoids, and shows isoprene to be the fundamental source of vitamins D and A, of squalene, phytol and xanthophyll. By means of structural formulas the relationship is shown between phytol, squalene, lycopene,  $\beta$ -carotene and vitamin A. The following definitions are suggested. "Lipoids" are biogenetically closely related non-volatile substances of animal or vegetable origin, showing a pronounced fat-wax character, or they occur mixed with fats, waxes or their solvents. "Lipides" is a general term which includes lipoids, fats and waxes.

P. Escher

**Chemical nature of enzymes.** James B. Sumner. *J. Nutrition* 6, 103 12; *Science* 78, 335(1933).—Proof is adduced to show the chem. nature of the enzymes. A comprehensive crit. review with 62 references.

C. R. Fellers

**Comparative biological values of proteins for different species of animals.** Anna Rajzmann. *Compt. rend.* 197, 706 7(1933). In detg. the biol. values of proteins substantially the same values were obtained with rats, rabbits or pigs as exptl. animals.

L. E. Gilson

**Tissue chloropenia and chloropenia.** L. Raffil and I. Ghersevici. *Compt. rend. soc. biol.* 114, 319 22(1933). The results of many post-mortem analyses of tissues are discussed.

L. E. Gilson

**The static biomineral constant of normal human blood serum.** A. Urbeanu. *Compt. rend. soc. biol.* 114, 467 9(1933).—The significance of the surplus of cations in normal serum is discussed.

L. E. Gilson

**Biochemistry of silicic acid. I. Microdetermination of silica.** Earl J. King and Helen Stantial. *Biochem. J.* 27, 990–1001(1933).—The method depends upon the production of a blue color when silicotungstic acid is reduced by 1,2,4-aminonaphtholsulfonic acid. The interfering phosphates are removed by pptn. with  $\text{CaCl}_2$  and  $\text{NH}_4\text{OH}$ . Iron is removed as  $\text{FePO}_4$ . Blood is de-

proteinized by basic ferric acetate. The procedure can be used for the detn. of silica in blood, urine and various tissues. II. The presence of silica in tissues. Earl J. King, Helen Stautial and Margery Dolan. *Ibid.* 1002-6.—Silicate in considerable amt. is excreted through the tissues. The amt. in the urine is influenced by the diet. Among tissues, lung has the largest amt. of silica. Only a small amt. is found in circulating blood. III. The excretion of administered silica. *Ibid.* 1007-14.—Intravenous injection of silicic acid (into rabbits and dogs) caused a moderate concn. of silica in the blood and enormous increases in the urine, but not all of the silica injected could be accounted for. The blood is capable of maintaining a much higher concn. of org. than of inorg. silicate. IV. Relation of silica to the growth of phytoplankton. Earl J. King and Viola Davidson. *Ibid.* 1015-21.—Addn. of silicate to a culture soln. already contg. an abundance of nutrient salts caused increased diatom growth. In high concn. silicic acid appeared to have an unfavorable effect on the growth of diatoms. B. H.

**Removal of sugars from dilute solutions.** Julian L. Baker and Henry F. E. Hulton. *Biochem. J.* 27, 1040-3 (1933).—The capacity of yeast to remove (up to 50%) glucose, sucrose and maltose is approx. equal. Bakers' yeast resembles brewers' yeast in its behavior to glucose, but the former has little action on maltose under the conditions described. Benjamin Harrow

**New views in the field of biologic carbohydrate decomposition.** Ragnar Nilsson. *Angew. Chem.* 46, 647-50 (1933).—A treatise on the formation of glyceric acid-monophosphoric acid and its action in the glucolytic decompn. of carbohydrates. Exptl. results and possible mechanisms of the reactions involved are presented.

Karl Kammermeyer

**Proteins. XIV. Occurrence of phosphorus, copper and iron in various proteins.** Kinsuke Kondo and Shigeki Mori. *J. Chem. Soc. Japan* 54, 966-72 (1933).—Etn. of Cu, Fe and P in 37 purified simple proteins indicates that these elements form the main part of ash; sericin and glutenin contain addnl. ash constituents. The ash of glutenin is mostly Cu and P while that of gliadin is Cu. These elements may exist in combined form with proteins or they may act as a combining link between protein mols. Nutritional investigation of the proteins, therefore, is far more complicated than heretofore realized. Fluctuation of the bio-proteins is also possible when these differ in ash content. K. Katsuta

**Hematoporphyrin, an artificial proteolytic enzyme.** M. J. Boyd. *J. Biol. Chem.* 103, 249-56 (1933).—"Serum albumin undergoes hydrolysis in the presence of light and hematoporphyrin and O<sub>2</sub> is necessary for the hydrolysis. Hematoporphyrin unites with the protein, becomes excited through the absorption of light energy, combines with O<sub>2</sub>, and passes a part of the energy over to the protein mol., thereby activating the latter and causing it to become hydrolyzed. The results obtained support Mathews' theory of enzyme action that enzymes are 'conductors of energy.'" A. P. Lothrop

**The cystine content of deaminized casein.** Abraham White. *J. Biol. Chem.* 103, 295-7 (1933).—The cystine content of casein, 0.27%, which has been deaminized by HNO<sub>3</sub> is identical with that of the untreated protein, within the limits of accuracy of the Vickery and White method of analysis. These results are not in accord with those reported by Steudel and Wohinz (*C. A.* 25, 2743).

A. P. Lothrop

**Glutathione and endocrine glands.** Gaetano Viale. *Rev. sud-americana endocrinol. immunol. quimioterap.* 16, 320-32 (1933).—A review. A. E. Meyer

**The separate enzymes in the enzymic system of lactose yeast.** Stefan Grzycki. *Biochem. Z.* 265, 191-4 (1933).—Lactose yeast affects alc. fermentation of the milk sugar. In the 2 groups studied (*Saccharomyces fragilis* and lactose yeast sp. 102) a' formation of methylglyoxal occurs. Added AcCHO is quantitatively converted to lactic acid, which in one case was the optically pure d-form. Pyruvic acid is converted to the extent of AcH to 69-75%. The

lactose yeast, therefore, contains the usual components (glycolase, mutase and carboxylase) of the fermentation enzyme system. S. Morgulis

**The products of ultra-violet irradiation of ergosterol.** A. V. Trufanov. *Khim. Farm. Prom.* 1933, 198-203.—The app. consists of a quartz vessel, water cooled, with an outlet for recovery of solvent. Soln. of ergosterol is agitated by a flow of O<sub>2</sub>-free, dry CO<sub>2</sub> which is sucked through by a vacuum pump; the flow of CO<sub>2</sub> lags behind the pump creating a vacuum in the app. When taking samples for testing the degree of irradiation the app. is flooded with CO<sub>2</sub>. Carbon arc with 10% MgO is used at 5 cm. distance. The unchanged ergosterol is sepd. by MeOH. The products of irradiation, after recovery of the solvent, are dissolved in oil free from vitamin D and their vitamin efficiency is tested on rats. Photographs of the system and discussion of sources of light are supplied. L. Nasarevich

**Quantum physics of the biologic action of x-rays.** Friedrich Dessauer. *Z. Physik* 84, 218-21 (1933).—Remarks on a paper by Glocker (*C. A.* 26, 5077).

R. Peierls

**Chemistry of the sclera.** Arlington C. Krause. *Am. J. Ophthalmol.* 16, 214-18 (1933).—The distribution of N in the scleral gelatin, elastin and mucoid was detd. by the Van Slyke method (cf. *C. A.* 21, 931). The av. percentage of several more important amino acids in these proteins was calcd. K. W. Scott

**Rate of decomposition of creatine in acid and in alkaline solution.** Alexander T. Cameron and Jean S. Guthrie. *Can. J. Research* 9, 360-72 (1933).—Studies have been made on the decompn. of creatine in acid and alk. solns. at 37.5° and 50°. The rates of transformation to creatinine in acid solns. gave values for the Arrhenius const. varying from 20,700 to 24,000, values in moderate agreement with those of Edgar and Wakefield. There was a definite min. rate of transformation at approx. 0.1 N HCl, and a secondary max. at about 0.01 N HCl. This was probably because of catalysis of creatine-HCl and free creatine at different rates. The slightly differing values found for the Arrhenius const. in strong and in weak acid solns. may be explicable on this basis. The results with alkali support Gachler's views that creatine is initially transformed into urea and sarcosine, which then reunite to form NH<sub>3</sub> and methylhydantonic acid. Alkali catalyzes the change from creatine to creatinine much more rapidly than acid of corresponding strength. J. W. Shipley

**Further investigation of the reaction of certain cells to neutral red solutions.** Hilda Douglas, E. S. Dunthie and J. Bront. *Gatenby. Z. wiss. Zool.* 144, 211-30 (1933).—The result, produced by neutral-red staining of certain cells, is due to aggregation of the dye into globules within the cytoplasm, and is thus to be differentiated from the true neutral-red staining globules, which consist of yolk material. A 30% satd. soln. of neutral red in Ringer soln. is pptd. by some fixatives, but the ppts. are readily sol in alc. and therefore are not the cause of the appearance of the red globules. K. V. Thimann

**Electrometric titration of dl-2-thiolhistidine (Richardson) 2. Naphthenic acids and naphthenesulfonic acids 8 III. Physiology of naphthenic acids (Naphthali) 10.**

## B—METHODS AND APPARATUS

STANLEY R. BENEDICT

**A critical study of histochemical methods for the determination of iodides in tissues.** I. Geish and Edward J. Stieglitz. *Anat. Record* 56, 185-93 (1933).—All histochem. methods for the detn. of iodides in tissues so far suggested are inadequate because of the high diffusibility of the iodide ion or to the failure of the pptg. reagent to penetrate the tissue proteins with sufficient speed. As heavy metals are required for the pptn. of iodide ions, the tendency of these metals to ppt. proteins and thus block their penetration so far has been an insurmountable difficulty. B. C. Brunstetter

**A method for qualitative analysis of protein solutions**

Adolf Schmitz. *Z. physiol. Chem.* **221**, 197-201 (1933).—The concn. of salt soln. required for pptn. of a protein varies with the mol. size of the protein and with the no. and arrangement of ionizable groups present. The qual. method here described for sepn. and classification of proteins is based on photometric detn. of turbidity obtained by adding increasing concns. of  $(\text{NH}_4)_2\text{SO}_4$ . Curves are plotted for blood serum, globulin and albumin, casein, ovalbumin, blood of *Octopus vulgaris*, crust. oxyhemocyanin, chicken embryonal fluid and fibrinogen.

A. W. Dox

**Microscopic detection of saponins by the evaluation of hemolysis in blood gelatin.** R. Fischer and L. Berthold. *Pharm. Presse, Wiss.-prakt. Heft* **1933**, 113-20.—A somewhat modified method, based on recent investigations, for the prepn. of blood gelatin is described. The hemolytic processes taking place in plant sections have been observed and plotted, the curves thereby developed having relationship not only to saponin solns. but to saponin in dry condition. With the saponin solns. in blood gelatin an attempt was made to det. the concn. and therefrom draw conclusions respecting the hemolytic index. On the other hand, slips of filter paper were satd. with saponin solns., dried and examd. These expts. served to det. the degree of hemolysis observed in the plant section, and to furnish comparable data respecting the saponin content of the single plant organs. For this purpose curves were developed which clearly showed the progress of hemolysis in the blood gelatin. In this connection also the advisability of buffering the gelatin was investigated. The action of other hemolyzing substances was studied, notably distd.  $\text{H}_2\text{O}$ , acids, soaps, and org. solvents as  $\text{Et}_2\text{O}$  and xylene, which are involved in the detoxication of plant sections with cholesterol.

W. O. F.

**Estimation of parathyroid hormone.** F. J. Dyer. *Quart. J. Pharm. Pharmacol.* **6**, 426-30 (1933). Expts. are described with groups each of which consists of 5 male rats weighing 140-180 g., for measuring the increase produced in the urinary Ca by 2 different doses of parathyroid ext. The method suggested in an earlier note has been amended. Thus, each rat is placed in a cage by itself, but the urine from the group of 5 is pooled, the diet is given as a paste contg. about 15% butter; the urine is collected at the end of 48 hrs. and not at 24 as previously, the urine is incinerated and the Ca detd. in the ash, by the method of Clark and Collip; injections of parathyroid ext. are given for 3 successive days. To carry out an estn., 2 groups of rats must be used simultaneously, one for the ext. to be tested, the other for the standard of reference. Because of the great variation of rats in their response to parathyroid hormone, and the limited no. of expts. made, it has not so far been possible to construct a curve relating dose and effect. The test sample, must, therefore, be matched against the standard, so that it produces the same rise in urinary Ca as the standard.

W. O. Emery

**Effects of anticoagulants and antiglycolytic agents on the results of determination of blood sugar.** R. Carrasco Pomiguera and E. Bieto. *Compt. rend. soc. biol.* **114**, 116-18 (1933).—Blood samples to which 0.2% of  $\text{Na}_2\text{C}_2\text{O}_4$  was added showed a glucose content 2-22 mg. per 100 cc. lower than untreated samples when analyzed by the Hagedorn-Jensen method. Other samples to which 2% NaF was added gave results 2-14 mg. lower than the controls.

L. E. Gilson

**Method for the photometric measurement of urinary pH.** René Reding. *Compt. rend. soc. biol.* **114**, 187-9 (1933).

L. E. Gilson

**Microdetermination of protein sugar.** H. Bierry and A. Magnan. *Compt. rend. soc. biol.* **114**, 257-8 (1933). A method of detg. glucosamine in 1 cc. of blood plasma is described.

L. E. Gilson

**A micro method for the determination of certain fractions of the nonprotein sulfur of the blood.** R. H. de Meo. *Compt. rend. soc. biol.* **114**, 397-401 (1933).—The method and special app. are described. Two cuvs. I. E. G.

**Some sources of error in the estimation of cysteine and cystine in complex materials when acid hydrolysis is employed.** Joseph W. H. Lugg. *Biochem. J.* **27**, 1022-9

(1933).—In the presence of carbohydrates variable amts. of cysteine and cystine are lost. Addn. of  $\text{SnCl}_2$  before hydrolysis to minimize humin formation fails to prevent a loss of cysteine and also causes the loss of any cystine present by reducing it to cysteine. If sufficient ferric salts are present they destroy some of the cystine and most of the cysteine during hydrolysis. The salts of other heavy metals also interfere. Benjamin Harrow

**The technic of glass electrode measurements.** Benjamin S. Platt and Sylvia Dickinson. *Biochem. J.* **27**, 1069-77 (1933).—Details of the construction of the electrode system are given. Careful temp. control is of considerable importance. Benjamin Harrow

**Determination of iodine in blood.** Harold J. Perkin. *Biochem. J.* **27**, 1078-81 (1933).—A modified von Fellenberg method (cf. *Biochem. Z.* **139**, 371 (1923) and C. A. **17**, 2717.

Benjamin Harrow

**Use of some microorganisms in sugar analysis.** Victor J. Harding and Thomas F. Nicholson. *Biochem. J.* **27**, 1082-94 (1933).—A strain of *Proteus vulgaris* has been developed as an analytical reagent for glucose. *Monilia tropicalis* removes maltose. A system of carbohydrate analysis is suggested.

Benjamin Harrow

**A rapid method for obtaining protein-free ultrafiltrates of blood and plasma.** Clifford Wilson and Ensor Roslyn Holiday. *Biochem. J.* **27**, 1095-98 (1933).—The method is suitable for obtaining rapidly small quantities of ultrafiltrate for inoculation and for filtering large quantities.

Benjamin Harrow

**Determination of alcohol in the blood according to Widmark.** Hans Kaiser and Eugen Wetzel. *Angew. Chem.* **46**, 622-5 (1933).—Considerable exptl. data have shown that the micro method of Widmark is very satisfactory, while it was found that Nicloux's method requires further investigation. The principle of Widmark's method and details of operation are described, and exptl. results are presented. Fourteen references. K. K.

**The quantitative separation of progesterin from estrin in extracts of the corpus luteum.** W. M. Allen and R. K. Meyer. *Am. J. Physiol.* **106**, 55-63 (1933).—Sepn. of progesterin and estrin is made by extg. a soln. of the 2 in 33%  $\text{EtOH}$  3 times with 0.5 times its vol. of petr. ether. The petr. ether fraction contains about 100% of the progesterin and 5% of the estrin.

J. F. Lyman

**The estimation of the free hydrochloric acid in the human gastric juice.** Migiwa Hori. *Japan. J. Gastroenterol.* **5**, 1-12 (1933). The acidity of gastric juice from free HCl and the protein content are not related. Sahlb's iodometric method for free HCl gives a result similar to that from  $\text{C}_1\text{H}$  detn. Titrimetric detns. of free HCl should involve a factor to correct the indicator. These factors are 0.95 for  $\beta$ -dimethoxyphenol, 0.91 for methyl orange and 1.1 for methyl violet. The dimethylaminoazobenzene method may involve an error of 100%.

C. M. McCav

**The error of the titrated total acidity of the human gastric juice.** Migiwa Hori. *Japan. J. Gastroenterol.* **5**, 13-18 (1933).—The values for total acidity in human gastric juice are too high when phenolphthalein is used as the indicator. They can be corrected to bromothymol blue values by multiplication by 0.91. Alizarin red gives values about 1% too low.

C. M. McCav

**A micro method for the quantitative estimation of the proteins of blood plasma.** Grace Medes. *Am. J. Clin. Path.* **3**, 439-42 (1933).—A micro method is described for the estn. of the plasma proteins, requiring 0.7 cc. for complete fractionation and 0.4 cc. for fractionation into fibrinogen, albumin and globulin. The method consists in (1) fractional pptn. with anhyd.  $\text{Na}_2\text{SO}_4$ , (2) pptn. of the protein remaining in the various filtrates with  $\text{CCH}_3\text{COOH}$ , (3) dissolving the ppts. with  $\text{NaOH}$  and (4) detn. of the N in aliquots of the solns. E. R. Main

**The determination of nonprotein nitrogen with special reference to the Koch-McMeekin method.** Cornelius A. Daly. *J. Lab. Clin. Med.* **18**, 1279-85 (1933).—Modifications of the Koch-McMeekin method (C. A. **18**, 3335) are described in which Na citrate and gum ghatti are used to prevent pptn. of the color reagent when solns. turbid from tungstic acid are nesslerized.

E. R. Main

**A simple method with a new apparatus for rapid dialysis.** Preliminary report. I. A. Nelson and I. H. Nelson. *Am. J. Clin. Path.* 3, 447-53(1933).—Two types of app. are described in which dry or wet membranes of Cellophane are used. With the app. it is possible to spread uncoagulated blood in such a thin layer that the proteins approach a monolayer state. Methods are described for obtaining blood dialyzates rapidly and accurately. E. R. Main

**The photometer and its use in the clinical laboratory.** Arthur H. Sanford, Charles Sheard and Arnold E. Osterberg. *Am. J. Clin. Path.* 3, 405-20(1933).—The principles of photoelec. photometry and their applications are reviewed. A new type of app. is described and directions are given for its use in the detn. of the hemoglobin, glucose and creatinine contents of the blood. E. R. Main

**A micro Kjeldahl still.** Thomas P. Nash, Jr. *J. Lab. Clin. Med.* 18, 1285-7(1933). E. R. Main

**A pipet washing device.** Thomas P. Nash, Jr. and Wm. Krauss. *J. Lab. Clin. Med.* 19, 94 5(1933). E. R. Main

**A study of the Otto test for strychnine.** Charles F. Poe and John F. Bailey. *J. Lab. Clin. Med.* 19, 40 6(1933).—Many org. compds., especially alkaloids and aniline derivs., give color reactions characteristic of strychnine when treated with concd.  $H_2SO_4$  and  $K_2Cr_2O_7$ . Lists of compds. which completely mask or interfere with the test are given. E. R. Main

**A study of the dimethylaminobenzaldehyde test for atropine.** Arlie A. O'Kelly and Charles F. Poe. *J. Lab. Clin. Med.* 18, 1235 41(1933). Many org. compds. give color reactions which might be mistaken for a pos. reaction in the dimethylaminobenzaldehyde test for atropine. Lists of compds. which completely mask or interfere with the production of the characteristic color are given. E. R. Main

**The nuclear reaction with yeasts.** Emilia Rochlin. *Zentr. Bakt. Parasitenk.* 11. Abt. 88, 304 6(1933).—An application of the nuclear reaction of Feulgen to yeasts of Feulgen and Rossenback, *C. A.* 18, 2725). Yeast prepns. are hydrolyzed with  $N/1$  HCl and treated with fuchsin decolorized with  $SO_2$  for 3-4 hrs. Any thymonuclear acid present will stain red. John T. Myers

**The detection and estimation of radium in living persons.** IV The retention of soluble radium salts administered intravenously. Herman Schlundt and John T. Nerancy. *Am. J. Roentgenol. Radium Therapy* 30, 515-22(1933); cf. *C. A.* 26, 1315.—In the treatment of certain types of insanity, intravenous injections have been given of  $RaCl_2$ , 10 micro-gr. dissolved in 2 cc. of isotonic  $NaCl$  soln., at intervals of a few days over a period of 2-6 months. Soon after completion of treatment, and again 6 months later, the radioactivity of these patients was measured by both a ray method and a test of the expired air for radon.

Ray measurements were made with a Wulf-Hess quartz lucr. electroscope which had been carefully calibrated against a 10 mg.  $Ra$  standard. The expired air tests were made with Lund electroscopes, calibrated in  $Ra$  units. Precautions necessary in making both types of measurement are described. Complete data were obtained on 12 patients, representing an administration of 2190 micro-gr. of  $Ra$ . At the time of the first tests, averaging 6 months after treatment, 93.6 micro-gr. or 4.3% was retained. Six months later only 1.9% was still retained. Clinical results show no superiority of  $RaCl_2$  therapy over other therapeutic procedures in psychiatric patients. E. H. Quimby

**Verification of the analytical technics in biological media by the method of added quantities.** Henri Grifon. *J. pharm. chim.* 18, 198-206(1933).—For correctness of the technic to be adopted, 2 conditions must be fulfilled: (1) The results of a series of detns. on a given medium must be regular and must agree within exptl. error allowed for pure substances. (2) When a known quantity of the substance to be detd. is added to a known quantity of the same medium, it must be recovered exactly within exptl. error. If this is not the case, a "systematic error" is inherent in method (1), better defined by Vigneron (cf. *C. A.* 26, 902) as the "effects of an accessory phenomenon

superposed on that which is studied." The method of added quantities is discussed mathematically; to avoid error, percentage of substance recovered must not be referred to the sum of substance found in the medium plus that added, but to the former alone. S. Waldbott

**Determination of thyroxine iodine in powdered thyroid glands.** L. Cuny and J. Robert. *J. pharm. chim.* 18, 233-40(1933); cf. Harrington and Randall, *C. A.* 23, 5207; Leland and Foster, *C. A.* 26, 2759.—The Brit. Pharm. 1932 assay of I in the thyroid gland is based on the H. and R. method (A). The recent L. and F. method (B), in which thyroxine-Na is oxid. with  $BuOH$ , gives results about 50% too low. In order to find where the loss of I occurs, both methods were used in parallel on sep. and mixed samples of (1) thyroxine, (2) diiodotyrosine, (3) KI and (4) testicular powder; this I-free protein medium is presumed to give by alk. hydrolysis a soln. analogous to that obtained from the thyroid tissue. The tabulated results show that cold alk. hydrolysis gave good recovery of I in all cases; 4 hrs. heat without (4) lowered recovery with method B to 87.8%; when heated with (4), recovery by this method was lowered to 76.5% in 4 hrs., to 59.6% in 18 hrs. The lowest result with method A was 93.1%. It follows that boiling in alk. medium diminishes the solv. of thyroxine in  $BuOH$ , which is accentuated by the presence of the orchitic medium. Hence method B cannot as yet be adopted; method A should be retained within limitations. Results by Rotter and Miez (*C. A.* 26, 5701) obtained by method A support this conclusion. S. Waldbott

**Enzymic histochemistry. V. A micro method for the estimation of sugars.** K. Linderström-Lang and Heinz Holter. *Compt. rend. trav. lab. Carlsberg* 19, No. 14, 1 12 (1933); cf. *C. A.* 27, 2499, 5826.—The authors have developed the iodometric titration of sugars as a micro method. The buret holds 60 cu. mm., graduated in 0.02. A 0.05 N  $Na_2S_2O_3$  soln. is forced from the buret by a Hg plunger, and the titrating is done in a small vessel with a magnetic stirrer. Glucose and maltose are oxidized stoichiometrically in 30 min. Fructose and sucrose are not oxidized. Sol. starch appears to contain a small amt. of easily oxidized sugar. J. J. Willaman

**Fractionation and purification of org. substance by the principle of chromatographic adsorption analysis** (Winterstein, Stein) 2.

## C - BACTERIOLOGY

CHARLES B. MORREY

**A simply prepared broth for producing hemolytic streptococcal hematoxin (streptolysin).** Homer F. Swift and B. E. Hodge. *Proc. Soc. Exptl. Biol. Med.* 30, 1022-5 (1933).—Filtered sterile salts, buffers and glucose are added to fresh beef heart peptone broth previously sterilized at 100°. The procedure for the manuf. of the broth and the production of streptolysin is given. C. V. B.

**Influence of salt upon diffusion from bacterial cells.** C. R. A. Winslow and H. H. Walker. *Proc. Soc. Exptl. Biol. Med.* 30, 1033 5(1933).—Washed cells from cultures of *Es. coli* were suspended, resp., in distd.  $H_2O$ , and in  $NaCl$  solns. of 0.05-0.08 M, 0.8-1.0 M and 2.0 M concn. and let stand for 30 min. at 37°. The cells were counted and the  $NH_4$  in the centrifuged and clarified menstruum was detd. by direct nesslerization. The low concn. of  $NaCl$  increased cell viability and the diffusion of  $NH_4$  outward through the cell wall; the higher concns. of  $NaCl$  had the opposite and toxic effect. The results may be due to altered permeability or to changes in the physicochem. conditions within or without the cell. C. V. Bailey

**Action at a distance of staphylococcus and *Es. coli* on rabbit bone marrow.** Eugénie Soru and R. Brauner. *Compt. rend. soc. biol.* 114, 231-2(1933); cf. *C. A.* 27, 2706.—By using the cultures in quartz tubes as previously described a mitogenetic effect was observed after 45 min. exposure. L. K. Gilson

**Chemical composition of bacteria. Purine compounds.** André Boivin and Lydia Mesrobian. *Compt. rend. soc.*

*biol.* 114, 302-4(1933); cf. *C. A.* 27, 4555.—Six species were examd. Nucleic acid is not extd. when bacteria are treated with  $\text{CCl}_3\text{CO}_2\text{H}$  soln. Of the total purine N 73-74% is in the form of nucleic acid. Purine N makes up 4-24% of the total acid-sol. N. Acid-sol. purine N increases during autolysis. Chemical composition of bacteria. **Pyrophosphoric acid derivatives.** *Ibid.* 305 7.—The different P acids were detd. in 6 species. All species contained some pyrophosphate. During autolysis the pyrophosphoric acid changes to phosphoric. L. E. Gilson

**Effects of the endocellular substance of the diphtheria bacillus.** H. Goldie. *Compt. rend. soc. biol.* 114, 446-9(1933). L. E. Gilson

**The action of Acanthamoeba castellanii on carbohydrates in peptone culture media.** Relda Caillean. *Compt. rend. soc. biol.* 114, 474 6(1933).—The organism did not utilize glycerol, mannitol, sorbitol or any of the 12 different sugars tried. L. E. Gilson

**Water-soluble proteins of the tubercle bacillus.** George A. C. Gough. *Biochem. J.* 27, 1049 54(1933).—The method of prepn. was based upon one developed by Hardy and Gardner (*J. Physiol., Proc.* lviii(1910)). An ice-cold suspension of the living bacilli, grown on a synthetic medium, was treated with a large excess of abs. alc. at  $-10^\circ$ . This was followed by treating at  $-3^\circ$  with mixts. of alc. and ether contg. increasing proportions of ether until a suspension of the organisms in anhyd. ether was obtained. The suspension was then filtered into Soxhlet thimbles and exhaustively extd. with ether. The bacilli were dried in a vacuum, ground and extd. with water. Fractionation of the mixed proteins with half and fully satd.  $\text{NH}_4$  sulfate solns. yielded 2 proteins, possessing many of the properties of albumins and globulins. These proteins showed different chem. and immunological characteristics. Benjamin Harrow

## D -BOTANY

THOMAS G. PHILLIPS

**Chlorophyll content as an index of the productive capacity of selfed lines of corn and their hybrids.** Howard B. Sprague and Norman Curtis. *J. Am. Soc. Agron.* 25, 709 24(1933).—Both chlorophyll and carotene decreased rather regularly from the uppermost to the lowest leaves of the plants. Xanthophyll values were erratic and no significance was attached to them. Lists of total chlorophyll and carotene contents per plant based on the concn. of the pigments in the middle leaf and on the leaf area were practically as reliable as complete analyses of all leaves. A group of 12 nearly homozygous selfed lines selected on the basis of observed greenness of leaves in 1929 varied in chlorophyll concn. from 5.14 mg. for the lightest strain to 11.30 mg. per 100 sq. cm. of leaf for the darkest green strain when grown in 1930. Total chlorophyll per plant ranged from 106 to 407 mg. The chlorophyll concn. of 18 first generation hybrids involving the 12 selfed lines ranged from 6.23 to 11.61 mg. and the total chlorophyll from 332 to 607 mg. Correlation coeffs. for the 12 selfed lines and 18 hybrids are given to show the relation between total chlorophyll and chlorophyll concn. and leaf area, yields of total dry matter and shelled grain. J. R. Adams

**The effect of soaking in water on the "seeds" of *Dactylis glomerata* L.** H. G. Chippindale. *Ann. Botany* 47, 841 9(1933).—Germination is considerably accelerated if the seeds have at any time previously been soaked in water and subsequently dried. This effect is due to the seeds so treated absorbing water more rapidly than untreated seeds, the pales of which are at first impermeable. R. C. Burrell

**Catalase, peroxidase and respiration in the germination of the light-sensitive seeds of *Nicotiana tabacum*** Ferdinand Schropel. *Botan. Centr. Beihefte* 51, 377-407 (1933).—In the dark, respiration increases with swelling. When swelling ceases, it slowly decreases. In the light, there is at first an increase, then a decrease and finally a slow increase of respiration followed by a more rapid acceleration after 30 hrs. from the beginning of swelling. In the dark, catalase activity slowly increases, reaches a

max. in about 30 hrs. and then decreases. The weakly active peroxidase starts to show decreased activity in about 40 hrs. In the light, after 37 hrs., there was a very marked increase in catalase activity and after 52 hrs. in peroxidase activity. R. C. Burrell

**The presence of citrinin in *Crotalaria crispata*.** A. J. Ewart. *Ann. Botany* 47, 913-15(1933).—The pigment citrinin which has been reported as a metabolic product of the fungus, *Penicillium citrinum*, is also produced by a flowering plant, *Crotalaria crispata*, growing in tropical North Australia. The dried leaves contain 1-1.2%. R. C. Burrell

**Oxidation potential and protein change in the leaf.** Kurt Mothes. *Flora* (Festschrift George Karsten, 1933) 58-98. High  $\text{O}_2$  tension stabilizes the protein, protects it from decompn. and furthers its synthesis. Low  $\text{O}_2$  tension makes the protein subject to the attack of leaf proteinases and leads to its decompn. R. C. B.

**The action of salts in water cultures.** Karl Schmalfuss. *Flora* (Festschrift George Karsten, 1933) 197 210.—A study was made of the effects of various mineral deficiencies (esp. K, Mg, Ca, Fe) on the growth of cuttings of *Callisia repens* in water cultures. Iron chlorosis is favored by the presence of easily sol. phosphates; alk. reaction, and an excess of Ca ions in the culture soln. R. C. B.

**The action of ultra-violet rays on leaves and fruit skins.** Hans Freytag. *Botan. Centr., Beihefte* 51, 408 36 (1933).—F. has investigated necrotic pigmentation of leaves and fruit skins produced by ultra-violet irradiation. With certain leaves, a change in permeability of the cell membrane seems to result. O is necessary for the development of pigmentation in the irradiated area. Enzyme poisons hinder or completely prevent pigmentation. The pigment is perhaps a melanin. R. C. Burrell

**The germination and growth of *Peltandra virginica* in the absence of oxygen.** Thomas I. Edwards. *Bull. Torrey Botan. Club* 60, 573-81(1933).—Seeds of *Peltandra virginica* will germinate in almost complete absence of  $\text{O}_2$  and the seedlings seem to possess unusual tolerance to the products of their own anaerobic respiration. R. C. Burrell

**Potato catalase.** H. H. Bunzell and Marjorie Kenyon. *Bull. Torrey Botan. Club* 60, 469 74(1933).—Catalase activity in different parts of the potato plant (shoots, leaves, stems, tubers) was detd. at different stages of development. It was greater in the foliage than in the tubers of the same plant. In the foliage it was lowest in the early stages of development, increased with growth and diminished when the plant reached full growth. The method of Bunzell (*C. A.* 25, 720) was used to measure the catalase activity. R. C. Burrell

**The vaccination of the tobacco plant against *Thielaviopsis basicola*.** Carlo Ataudi. *Bull. Torrey Botan. Club* 60, 583 97(1933).—Heat, ether and dry vaccine were prepd. from the fungus. The vaccines were poured on the germinating seeds or administered to the soil. Control and vaccinated seedlings were later inoculated with a suspension of *Thielaviopsis*. The treated seedlings showed greater resistance to infection in several series of expts. than did the controls. R. C. Burrell

**Amylases in resting and germinating seeds II.** Rye Erik Ohlsson and Carl E. Uddenberg. *Z. physiol. Chem.* 221, 165 73(1933); cf. *C. A.* 26, 3003.—Seps detns. were made of the  $\alpha$ - or dextrinogenic and the  $\beta$ - or saccharogenic amylases of exts. from rye at different stages of germination. Each enzyme may be obtained free from the other by selective destruction:  $\beta$ -amylase by treating the mixt. with 0.1 N HCl, and  $\alpha$ -amylase by heating 15 min. at  $70^\circ$ . The former has  $pH$  optimum at 4.3 and the latter at 5.5. The saccharogenic power of the original enzyme solution diminishes during the first days of germination, then increases and after 9 days amounts to twice that of the ungerminated rye. The dextrinogenic power is at first almost nil and increases rapidly after the 6th day. These observations are in complete agreement with those previously reported for germinating barley. The combined action of the 2 amylases is not greater than the sum of their

sep. activities. Hydrolysis of starch with dextrinogenic amylase gives products with neg. mutarotation, while those obtained with saccharogenic amylase show pos. mutarotation; hence the amylases are  $\alpha$  and  $\beta$ , resp. III. Oats. Erik Ohlsson and Olle Edfeldt. *Ibid.* 174-9.—The amylases of oats correspond precisely to those of barley and rye, except that the saccharogenic enzyme is present in smaller proportion, and the 2 enzymes have practically the same  $pH$  optimum. The dextrinogenic amylase does not appear until the 9th day of germination, somewhat later than in barley and rye. Simultaneously there is a considerable increase in the saccharogenic enzyme. Mutarotation tests of the hydrolytic products identify the enzymes as  $\alpha$  and  $\beta$ .

**Mandarin pigment.** L. Zechmeister and P. Tuzson. *Z. physiol. Chem.* 221, 278-80 (1933).— $\beta$ -Carotene was isolated in cryst. form from the flesh and from the peel of the mandarin (*Citrus madurensis*).

The presence of a bitter principle in the secretory glands of *Cynara scolymus* and *C. cardunculus* J. Politis. *Praktika (Akad. Athenon)* 7, 31-3 (1932).—The center of formation of the bitter principle in the leaves and other aerial parts of the artichoke (*C. scolymus*), hitherto unobserved, is shown to be located in certain external glands principally on leaves and stalk. Internal parts of stalk and leaves, the root, fleshy flower receptacle and the bloom which lack such glands also lack the bitter principle. The glands comprise 4-5 cell layers, disposed in 2 rows. The uppermost cells grade into smaller ones underneath. The secretion begins beneath the cuticle of the secretory cells at the apex and to it is added that of the connecting cells. The bitter principle of *C. cardunculus* is similar. The presence of an essential oil is mentioned.

Lucien Y. Dyrenforth  
Comparative studies of the metabolism of soluble carbohydrates in male and female plants of *Mercurialis perennis*. R. Bouilleme, M. Bouilleme and L. Ghennu. *Compt. rend. soc. biol.* 114, 189-94 (1933).

The fat and lipid metabolism of yeast. W. Halden, I. Bilger and R. Kunze. *Naturwissenschaften* 21, 660-1 (1933).—The lipid formation in yeast cells is not a sign of degeneration but a special type of metabolism incident to suppression of fermentation and to sprouting. The lowering of the water content of the yeast to a certain optimum value is instrumental in raising the lipid content of cells of a culture: a lowering of 90 to 80%  $H_2O$  in an aq. suspension of beer yeast can raise the ergosterol value of the yeast 5 times (0.2 to 1.1%) without raising the fat content. In order to increase the fat content as well, it is necessary to pass an air- $EtOH$  vapor mixt. over a flat yeast culture contg. 75-80%  $H_2O$  with intermittent evacuation. The ergosterol content will rise to 2-4%, after 10-14 days to 7-8%. The glyceride and sterol formation by respiration process is induced by many narcotic substances like  $EtOH$  (oxidizing to  $AcH$ ); the  $AcH$  itself, however, paralyzes the cells. The  $AcH$  formed is further synthesized to acetoin. A yeast fat formed in this manner and extd. by solvents generally consists of about  $1/4$  to  $1/3$  sterols.

Additional cyanophoric plants of the Maquiling region. IV. Jose B. Juliano. *Philippine Agr.* 22, 254-7 (1933). A list is given of botanical species in the organs of which HCN was found in a systematic testing of plants in the region.

A. L. Mehring  
Inheritance of sugar content and weight in hybrids of sugar and fodder beets. Václav Stehlsk. *Chimie & industrie Special No.*, 1127-40 (June, 1933).—The inheritance of the sugar content is governed by the same laws as that of morphological characteristics. Correlation was established between the sugar content and morphological characteristics and the anatomical constitution of the roots of the hybrids. The partial and intermediate dominance of the sugar-content characteristic of the hybrids was established, and also the physiol. correlation and relation between the wt. of leaves, color, wt. of roots and no. of rings of vein bundles, on the one hand, and the shape of the bulb and sugar content on the other. The

coeffs. of variability of the sugar content were calcd.; the intermediate variation in the first generation of hybrids and an extraordinarily large variation in the second and subsequent generations were observed. By hybridization, various types were obtained that had const. sugar content and morphological characteristics.

A. P.-C.  
Absorption tests with plants. VI. A study of urea and comparison with the ammonia salts. F. Díaz Aguirreche and A. Castillo. *Anales soc. españ. fis. quim.* 31, 609-71 (1933).—The influence of urea on plants was studied, the previous method being investigated (cf. *C. A.* 26, 3005). These results were compared with those obtained by the use of  $NH_4NO_3$  and a mixt. of  $KNO_3$  and other N compds. The results with  $NH_4NO_3$  are explained to be due to the action of opposite ions, while those obtained with urea depend upon its undissocd. state.

R. M. Symmes  
Growth of *Aspergillus niger* at different hydrogen-ion concentrations, with and without the addition of growth-promoting substance B. Niels Nielsen and Vagn Hartzhus. *Compt.-rend. trav. lab. Carlsberg* 19, No. 15, 1-22 (1933); cf. *C. A.* 26, 4358; 27, 1019.—Without the growth-promoting substance the opt.  $pH$  for growth is about 3; with it, the opt.  $pH$  is 6.7. The lowest  $pH$  at which germination will take place is 1.3 with, and 1.5 without, the substance. Cultures over 8 days old show considerable autolysis with the substance, but only a little without it. Conidia formation increases as the  $pH$  increases, there being none below 2.1.

J. J. Willaman  
Fractionation and purification of org. substances by the principle of chromatographic adsorption analysis. II. Chlorophylls (Winterstein, Stein) 2. Ca oxalate rings—periodic precipitate formation [around the epidermal cell of onion skin] (Doring) 2. The tobacco plant (Vickery, Pucher) 17. Prune maturity and storage (Tucker) 12. Influence of light on the formation of chloroplast pigments (Rudolph) 10. Absorption of K by plants (Proebsting) 15.

## F—NUTRITION

PHILIP R. HAWK

A highly satisfactory vitamin B deficient ration. Ba. nett Sure. *Proc. Exptl. Biol. Med.* 30, 779-80 (1933).—Ration (No. 1751), deficient in vitamin B complex, consists of purified casein 20, agar-agar 2, McCollum's salts (No. 185) 4, filtered butter fat 10 and dextrin 64; depletion in the rat is secured in 2-3 weeks. Ration (No. 2345), deficient in vitamin B only, consists of purified casein 10, salts (No. 185) 4, autoclaved dried round steak 15, butter fat 10 and dextrin 61; depletion of vitamin B reserves is secured in 2-3 weeks after all storage of vitamin B complex has been depleted on ration No. 1751. To purify, suspend 3 kg. of casein in 30 l. of tap water contg.  $AcOH$  50 cc.,  $CHCl_3$  5 cc. and toluene 5 cc.; change the fluid daily for 14 days (use distd.  $H_2O$  the last 3 days); dry at  $100^\circ$  and grind; suspend 5 kg. of the powder in 25 l. of 25% by vol.  $EtOH$  for 12 hrs. and stir for 12 hrs. at room temp.; filter, dry at  $100^\circ$  and grind. Round steak to supply vitamin G is cut in small cubes, heated for 6 hrs. at 20 lb. pressure, dried at  $100^\circ$  and ground.

C. V. Bailey  
Some observations on rickets with special reference to its occurrence in pigs. J. P. McGowan. *Brit. Med. J.* 1933, II, 599-602.—Ca deficiency in pigs causes osteoporosis which cannot be prevented by cod-liver oil, vitamin D or sunlight. Balancing of the diet with  $CaCO_3$  also fails to prevent the condition, but actually seems to aggravate it. Rickets is regarded as due to a deficiency of P in the diet in relation to the protein intake. Osteomalacia is essentially a combination of aphosphorosis and acalciosis, because of a deficiency of Ca and P in the diet.

J. B. Brown  
Oil-soluble vitamin A in some pulses and fish of Bengal. N. C. Nag and H. N. Banerjee. *Current Sci.* 2, 95 (1933).—Absorption spectrum analysis of *Cicer arietinum* oil shows bands corresponding to those of cod-liver oil. Hilsha fish-liver oil gives a pronounced band at 500  $\mu$ .

Physiol. expts. with *Cicer arietinum* oil in rats give promising results. Rachel Brown

The role of fat in glycogenesis and the utilization of proteins. P. Maignon. *Nutrition Abstracts & Rev.* 3, 345-53(1933); cf. *C. A.* 27, 2166.—A review. E. H.

The occurrence of vitamin A in the oil of West Indian sharks. C. F. Asenjo. *Science* 78, 479(1933).

E. H.

Recent results in the field of vitamin investigation. Charlotte Riedel. *Pharm. Zentralhalle* 74, 593-9(1933).—A survey is given of recent results obtained in this field, in connection with the graphical formulas of  $\beta$ -carotene and vitamins A and C. W. O. Emery

Vitamin D in the nutrition of the dairy calf. I. W. Rupel, G. Bolstedt and E. R. Hart. *Wis. Agr. Expt. Sta., Research Bull.* 115, 40 pp.(1933).—On rations deficient in vitamin D, calves showed declining rates of growth at the 12th-15th weeks and little growth occurred after 25 weeks. The deficiency is manifested also by a reduction of inorg. P and Ca in the blood serum and by a reduction in the percentage of total ash in the dry fat-free bone. A decline in the level of inorg. P in the blood serum preceded the appearance of stiffness. A level of 10-13 mg. of serum Ca and 7 mg. of inorg. P is considered normal for calves 1-10 months old. The feeding of oxidized cod-liver oil causes increases above these levels at first, but they gradually return to normal. Non-rachitic bones carried 60-63% ash while rachitic bones carried from 45 to over 50%. The breaking strength of the non-rachitic bones was much greater than for the rachitic. Ultra-violet irradiation, sunlight and the feeding of liberal amounts of sun-cured hay protected the calves from vitamin D deficiency. Fifty-two references. C. R. Fellers

Effect of feeding a cod-liver oil concentrate to cows on the vitamin D content of milk. W. E. Krauss, R. M. Bethke and Willard Wilder. *J. Dairy Sci.* 16, 549-55(1933).—See *C. A.* 27, 1919 G. G.

Threshold of activity of pure carotene. Exact value of the biological activity of the international standard of vitamin A. Lucie Randoin and R. Netter. *Bull. soc. chim. biol.* 15, 706-23(1933); cf. *C. A.* 27, 4564. Feeding expts. with young rats are described. By both the preventative and curative methods the minimum daily dose of international standard carotene capable of maintaining health and growth, when used as the sole source of vitamin A, was found to be 4 $\gamma$  or slightly less, although 2 $\gamma$  daily prevented xerophthalmia and prolonged the survival period. Even 10 $\gamma$  per day did not permit as rapid growth as did 1 drop per day of cod-liver oil. The biological activity of the carotene of the adrenals and the presence of carotenoids in the adrenals of various species of animals. *Ibid.* 941-53.—Carotene extd. from beef adrenals had practically the same vitamin A activity as international standard carotene. Carotene was detected in horse and swine adrenals but not in the adrenals of normal rats.

L. E. Gilson

Note on glutathione and vitamin C in tumor tissue. Eric Boyland. *Biochem. J.* 27, 802-5(1933).—The estn. of glutathione in tumor tissue (sarcoma of rat, mouse and fowl, and carcinoma of mouse) by a colorimetric method gives values only  $\frac{1}{3}$  as great as those obtained by I titration. This is due to the presence of ascorbic acid in tumor tissue Benjamin Harrow

Catatorulin. A new method of comparing the oxidative factor in vitamin B<sub>1</sub> concentrates. Reginald Passmore, Rudolf A. Peters and Hugh Mac. Sinclair. *Biochem. J.* 27, 842-50(1933).—The coenzyme effects upon the O uptake of avitaminous birds' brain of 2 vitamin B<sub>1</sub> concentrates are compared. The specific factor responsible is called catatorulin. Cryst. specimens of vitamin B<sub>1</sub> are good sources of catatorulin. There is a wide parallelism between vitamin B<sub>1</sub> and catatorulin activity, suggesting their identity. The method, then, probably ests. vitamin B<sub>1</sub>. Benjamin Harrow

The need for a standard reference in vitamin A testing. Katharine Hope Coward, Kathleen Mary Key and Barbara Gwynneth Emily Morgan. *Biochem. J.* 27, 873-

7(1933).—Thirteen tests of the vitamin A content of a sample of cod-liver oil have been made on groups of rats. A five-fold variation in result was found. B. Harrow

Variations in the quality of butter, particularly in relation to the vitamin A, carotene and xanthophyll contents as influenced by feeding artificially dried grass to stall-fed cattle. Albert E. Gillam, Isidor M. Heilbron, Richard A. Morton, Gerald, Bishop and Jack C. Drummond. *Biochem. J.* 27, 878-88(1933).—The results show that the relatively high proportions of carotene, xanthophyll and vitamin A present in summer butter can be maintained during the winter period of stall feeding by the use of artificially dried grass. Benjamin Harrow

Vitamin A and carotene. X. The relative minimum doses of vitamin A and carotene. Thomas Moore. *Biochem. J.* 27, 898-902(1933); cf. *C. A.* 26, 3545.—Carotene is utilized in the body as efficiently as preformed vitamin A at levels approaching the min. dose. B. H.

The mineral content of the skin of rats suffering from beriberi, with investigations on the formation of vitamin B<sub>1</sub> by molds. Humphrey T. Fawns and Albert Jung. *Biochem. J.* 27, 918-33(1933).—The mold, *Aspergillus niger*, can form vitamin B<sub>1</sub> from a vitamin-B-free diet and cure and prevent beriberi in rats. In beriberi a marked increase in K in the skin is found, and in some cases a rise in Ca. Mg is raised when the Ca is not increased. Phosphates show a tendency to sink and chlorides to rise.

Benjamin Harrow

Further investigations into the fundamental nature of vitamin D action. John P. McCowan. *Biochem. J.* 27, 943-50(1933); cf. *C. A.* 26, 1321.—Vitamin D produces its action by setting free inorg. phosphate endogenously and in all probability from the lipins of the body.

Benjamin Harrow

The ascorbic acid content of the adrenals and livers of different animals. Joseph L. Svirhely. *Biochem. J.* 27, 960-3(1933).—The ascorbic acid content of the adrenals is higher than that of the liver in every animal. Guinea pigs fed first with a liberal amt. of spinach and then placed on a vitamin-C-free diet show a decrease in the ascorbic acid content first in the liver and then in the adrenals; this indicates that the liver serves as a reserve store for the acid. Benjamin Harrow

Essential hematuria—an avitaminosis? N. Aars Nicolaysen. *Med. Rev.* 50, 103-211(1933).—On the west coast of Norway, the food used by certain classes of the population is at times poor in C-vitamin, and a deficit in C-vitamin may manifest itself clinically in unforeseen ways, because the knowledge concerning the latent scurvy is still rather scarce; there is reason to believe that some cases of so-called essential hematurias are of a scorbutic nature, possibly also some cases of melena. H. C. M. Ingeberg

The effect of feeding on the fat content of cow milk. E. J. Sheehy. *J. Dept. Agr. Ireland* 32, 18-29(1933), cf. *C. A.* 27, 755.—No sp. quant. effect on the yield of butter fat was obtained by including olive, linseed, cottonseed, coconut, peanut, palm nut, soy bean or whale oil, or beef fat in the diet of milking cows. Palm nut, cottonseed and linseed meals, when fed up to 6 lb. daily, had no sp. quant. effect on the percentage of fat in milk; cod-liver oil, at the rate of 6 oz. daily, had a depressing effect which persisted for several days after the oil was withheld. The inclusion of sugar-beet pulp, beet roots, treacle, wet grains, rice meal or green fresh pasture herbage in the diet had only a temporary effect on the percentage of fat, neither sepd. nor whole milk powder had a sp. effect. There was no connection between the plane of nutrition and the percentage of fat in the milk. Thirty-one references. K. D. Jacob

Nutrition studies of foodstuffs used in the Puerto Rican dietary. VI. Vitamin A content of pasteurized milk and native cheese. D. H. Cook and Joseph H. Axtmayer. *Puerto Rico J. Pub. Health Trop. Med.* 9, 90-2(1933); cf. *C. A.* 27, 5381.—The vitamin A content of pasteurized milk was found to be 2 units per cc. and whole milk cheese 20 units per g. J. A. Kennedy

Some aspects of carbohydrate metabolism. John R.

Murlin. *Ohio J. Sci.* 33, 385-58(1933)—Carbohydrate metabolism is reviewed. The following subjects are covered: hydrolysis to glucose, conversion of amino acids and proteins to this substance, its oxidation and conversion to glycogen and fats, the opposing actions of insulin and adrenaline on its metabolism, sugar tolerance. Expts. are conducted to prove that fats are converted to carbohydrates. This contention appears to be true in the germinating bean and practically so in human beings chosen because of their high fat tolerance. I. M. L.

**Vegetable feeding in the young infant. Influence on gastro-intestinal motility and mineral retention.** Frederic W. Schlutz, Minerva Morse and Helen Oldham. *Am. J. Diseases Children* 46, 757-74(1933).—The use of raw or puréed spinach as supplements to the milk feedings of very young infants does not appreciably affect the mineral balance. When dried spinach is used the retention is slightly lower than that which prevails when the minerals are derived solely from milk. The beneficial effect of the addn. of vegetable matter to the dietary of young infants does not appear to be due to improvement in mineral retention or to increased gastro-intestinal motility.

E. R. Main  
**The vitamin D potency of sun-irradiated dried yeast.** Katharine H. Coward. *Lancet* 1933, II, 920.—Yeast may be activated antirachitically by exposure to strong sunlight. Different samples vary greatly in the extent to which they may be activated. E. R. Main

**Vitamin D milk in the treatment of active rickets. A clinical assay.** Benjamin Cramer and Isaac F. Gittleman. *New Engl. J. Med.* 209, 906-16(1933).—Vitamin D milk produced either by direct irradiation of milk or by feeding yeast to lactating cattle appears to be an effective therapeutic agent in active rickets. E. R. Main

**Vitamin D milk.** Edwin T. Wyman. *New Engl. J. Med.* 209, 889-93(1933).—Vitamin D milk appears to be an effective antirachitic agent, producing marked increases in the serum Ca and P contents and healing of active rickets in children. E. R. Main

**The action of large doses of irradiated ergosterol in rats fed with a normal diet. I. The behavior of calcium in the lungs and skin.** I. Marcialis. *Boll. soc. ital. biol. sper.* 8, 627-30(1933).—Excessive doses of irradiated ergosterol (50 drops Vigantol daily 75 to 165 days) caused no injurious effects on the growth. There was an increase of Ca in the lungs but the amt. in the skin was about normal. II. **The behavior of potassium in the lungs and skin.** *Ibid.* 631-4.—Large doses of irradiated ergosterol produced no noticeable changes in the K content of the lungs during the first 2 months but toward the 3rd month it produced a noticeable diminution compared with the controls. The amt. of K in the skin fell within the normal limits. III. **The action of large doses of irradiated ergosterol in rats kept on a deficient diet. The behavior of calcium in the lungs and skin.** *Ibid.* 634-6.—The amt. of Ca in the lungs of the rats receiving the irradiated ergosterol increased very markedly compared with the normals. The amt. in the skin was within the normal limits. Peter Masucci

**Magnesium in the bones of animals treated with irradiated ergosterol.** Luigi Robuschi. *Boll. soc. ital. biol. sper.* 8, 675-9(1933).—The administration of irradiated ergosterol and Mg lactate to rabbits favors growth, increases the total solids of the bones, but does not change the ash content nor the percentage of Mg in the ash. Peter Masucci

**Determination of the antiscorbutic potency of vegetable products.** Gustaf F. Göthlin. *Acta med. scand., Suppl.* 53, 120 pp., 52 charts(1933).—In Upper Norrland, at least in the early spring, even among the apparently healthy children 1 in every 5 may be suffering from vitamin C undernourishment. Raw mash or juice of black currants, raw cloudberry mash or beverage, raspberry mash and "water cloudberry" (14 to 90 g.) can give complete protection. The raw juices may be stirred into a little gelatin soln. at 35-40° and thickened by rapid cooling. The "water cloudberry" is a preserve made without boiling and has a

50% higher vitamin C content. Its use on a larger scale is strongly recommended. S. Morgulis

**Determination of potency of vitamin D preparations.** III. Martin Schieblisch. *Biochem. Z.* 265, 1-4(1933); cf. C. A. 23, 4971.—The rachitogenic effect of McCollum's diet 3143 has been greatly increased by substituting buckwheat for the ordinary wheat, so that the need of rat units for prevention is more than doubled (0.07γ instead of 0.03γ). S. Morgulis

**Knowledge of the antiscorbutic vitamin (vitamin C).** P. Karrer, H. Salomon, K. Schöpp and R. Morf. *Vierteljahrsschrift naturforsch. Ges. Zurich* 78, No. 1/2, 8-14(1933).—The authors purified hexuronic acid by recrystn. from MeOH. Both the first and fifth fractions showed the same potency when fed to guinea pigs. The fifth fraction had the empirical formula,  $C_6H_8O_6$ . From the properties of the Na salt, the detn. of active H, the behavior toward *p*-nitrophenylhydrazine, nitromethane, activated H, diazomethane, and Cu acetate in the cold, and the properties of the acetate and dimethyl derivs., the authors conclude that the most likely formula for the compd. is  $CH_2(OH)CH(OH)COCH_2COCOOH$ , although  $OHCH_2COCH(OH)CH(OH)COOH$  is also possible. Further investigation is in progress. C. R. Moulton

**Directions regarding the practical evaluation, according to vitamin requirements, of foods and medicines rich in vitamins. II. The vitamin B complex.** A. Jung. *Z. Vitaminforsch.* 1, 192(1932); *Bull. soc. sci. hyg. aliment.* 21, 292.—From a comparison of various methods of investigation, J. concludes: (1) For pigeons, the av. total curative dose of vitamin B<sub>1</sub> is 6 rat units, the daily curative dose 1.5, the prophylactic dose 6-8 units for 35 days and 20 units for 60 days. (2) For a working man the prophylactic dose is 15-45 prophylactic pigeon doses or 200-300 daily rat doses. These doses are contained in 15-20 g. of dried yeast, 400-600 g. fresh meat, 12 egg yolks, 240 g. whole wheat, 400 g. whole-wheat bread, 1 kg. potatoes, 1 l. milk, 500 g. spinach, etc. As regards vitamin B<sub>2</sub>, 4 units per kg. body wt. is sufficient for a child and 2 units for an adult. III. **Vitamin C.** *Z. Vitaminforsch.* 1, 294; *Bull. soc. sci. hyg. aliment.* 21, 289-90.—The min. dose of vitamin C for nurslings is 5 guinea-pig units, and for adults 15-25; corresponding to 150-250 international units, or 100 or 500 g. methyl-nornarcotine. The juice of 2 oranges per day is sufficient. Apples constitute a very irregular source, while potatoes are a good source, furnishing 100 units per 400 g. The doses of vitamin D required for prophylaxis are 1 or 2 clinical units, and for therapeutic treatment 5 units. Strongly activated medicines should be controlled as to vitamin D content and should be administered only on prescription. A. Papineau-Couture

**Synthesis of *d*- and *l*-ascorbic acid (vitamin C).** T. Reichstein, A. Grüssner and R. Oppenauer. *Helv. Chim. Acta* 16, 1019-33(1933); cf. C. A. 27, 3977, 5789.—*d*-Xylose was converted to the osone (I) by prep. the osazone (66.5% yield) and treating this with BzH (22.3% yield). Small samples of I were converted to the cyanohydrin with HCN under various conditions, the max. yield being 26%. Hydrolysis of this product with HCl gave crude *d*-ascorbic acid (II). II was purified through the Me<sub>2</sub>CO compd. m. 185-9° corr.,  $[\alpha]_D^{25} = -24.5^\circ$ , or the brucine salt (decompn. 209°)  $[\alpha]_D^{25} = -80^\circ$ . *l*-Ascorbic acid (III) was prep. from *l*-xylose (20 g.) in a similar way (yield, 0.880 g.). III m. 187-9°,  $[\alpha]_D^{25} = +48^\circ$ . It showed no depression of m. p. when mixed with natural ascorbic acid. A mixt. of equal pts. of II and III after crystn. together m. 168-9° and was optically inactive. Preliminary reports state that III is as active as natural ascorbic acid in preventing scurvy. II is ineffective when used in amts. 4 times as great. Proof was cited for the belief that Haworth's formula for ascorbic acid  $CH_2OHCHOH-CH(OH)-COH = COHCO$  was correct. E. W. Scott

**Phosphorus and rickets. II. The role of phosphate ion in antirachitic activity of inorganic compounds of phosphorus.** Raoul Lecoq and Henri Vilette. *J. pharm.*

*chim.* 18, 192-7(1933); cf. *C. A.* 26, 3012.—Summary: (1) The  $\text{PO}_4$  ion as in  $\text{Na}_2\text{HPO}_4$  has practically no curative action on rickets of the white rat after a diet devoid of vitamin C, and contg. a large excess of Ca compared with P. (2) The  $\text{PO}_4$  ion seems definitely endowed with antirachitic properties; they vary, however, with the no. of mols. of  $\text{H}_2\text{O}$  combined with  $\text{P}_2\text{O}_5$ . Thus in order to produce identical results, 100 parts of rickets-producing diet (Rando-L.) must receive 0.100 part of P in the form of  $\text{Na}_2\text{HPO}_4$ , 0.200 part of P as  $\text{Na}_4\text{P}_2\text{O}_7$  and 0.300 part as  $\text{NaPO}_3$ . (3) The antirachitic activity of  $\text{NaH}_2\text{PO}_4$  and  $\text{Na}_2\text{HPO}_4$  is comparable to that of  $\text{KH}_2\text{PO}_4$  and  $\text{K}_2\text{HPO}_4$ , their contents in P being taken into account; the activity of the analogous  $\text{NH}_4$  salts under like conditions seems slightly inferior. (4) The calcifying properties of  $\alpha$ -phosphates diminish from the Na to the  $\text{Na}_2$  salt, from K to  $\text{K}_2$  and from  $\text{NH}_4$  to  $(\text{NH}_4)_2$ ; hence the no. of free acid functions of these salts seem to det. their efficacy. (5) In order to confer upon the ration, under the usual conditions of the expt., a curative, satisfactory antirachitic action, about 20 international units (*i. u.*) of vitamin D must be added to 100 g. of the rickets-producing diet (R.-L.). The efficacy of a phosphoric deriv. may be expressed in antirachitic *i. u.* and referred either to 1 g. of substance, or to a definite wt. of P. S. Waldbott

**Ergosterol products.** I. G. Farbenind. A.-G. (Otto Linsert, inventor). Ger. 576,021, May 6, 1933. Addn. to 565,900 (*C. A.* 27, 2476). See U. S. 1,902,785 (*C. A.* 27, 3294).

## F—PHYSIOLOGY

HOMER W. SMITH

**Total and thyroxine iodine content of thyroid gland after injection of saline anterior pituitary extracts.** G. L. Foster, A. B. Gutman and E. B. Gutman. *Proc. Soc. Exptl. Biol. Med.* 30, 1028-32(1933). In the sheep, 10 daily intraperitoneal injections of a saline anterior pituitary ext. caused a 50% decrease in the total I content of the thyroid gland and a proportionate decrease in the thyroxine content. C. V. Bailey

**Relationship between chloride content and blood cerebrospinal fluid bromide ratio.** Wm. Malamud, B. M. Mullins and J. R. Brown. *Proc. Soc. Exptl. Biol. Med.* 30, 1084-7(1933). By the Walter method, Br added to water, blood serum or spinal fluid from which the Cl had been removed was recovered with the usual error of colorimetry. When 100 mg. of bromides per 100 cc. was added to these fluids, and NaCl in concns. of 0.2, 0.3 and 0.6%, the recoveries were, resp., 86.5 mg., 78.0 mg. and 73.7 mg. per 100 cc. In applying this method to the detn. of Br in body fluids, correction should be made for the definite loss due to the particular concn. of Cl in the fluid. C. V. Bailey

**The hormonal determination of pregnancy in domestic animals.** Küst. *Zuchtungskunde* 7, 245-56(1932).—The Aschheim-Zondek pregnancy test is not applicable for the detn. of pregnancy in domestic animals. By the detection of ovarian hormone (O. H.) in urine pregnancy in mares may be established with certainty beginning with the 7th or 8th week. The O. H. and the hormone from the anterior pituitary (H. AP.) are present in strikingly large amts. in the blood of pregnant mares. The irregular sepn. of O. H. in the urine of pregnant oxen, goats and hogs makes the detection of pregnancy so uncertain as to be impractical. The blood, milk and saliva of pregnant cows contain neither O. H. nor H. AP. in amts. sufficient for the detn. of pregnancy. The presence of O. H. or H. AP. could not be demonstrated in the urine of pregnant dogs. B. C. Brunstetter

**Physiology of the bone marrow.** K. Felix, A. Grassmück, K. Huck and K. Matzen. *Z. physiol. Chem.* 221, 137-44(1933).—Respiration expts. with bone marrow suspended in physiol. NaCl soln show a max.  $\text{O}_2$  consumption at  $p_{\text{H}}$  8.3. Red marrow is more active than fat marrow. The  $\text{O}_2$  consumption is proportional to the content of purine bases which in turn is an index of the abundance of cells. It is increased by addn. of alanine

but not by aspartic or glutamic acid nor by glycine or glycerylglycine. Proline and tryptophan have a somewhat favorable influence. By far the greatest effect is obtained with prepn. from liver and gastric mucosa, not only those contg. the anti-anemic substance but other fractions as well. A. W. Dux

**Ethyl sulfide formation in the animal organism.** J. Wohlgenuth. *Z. physiol. Chem.* 221, 207-8(1933).—W. takes issue with Christomanos (*C. A.* 27, 3978) regarding the endogenous origin of  $\text{Et}_2\text{S}$ . Although dogs excrete more  $\text{Et}_2\text{S}$  on a low-protein diet of potatoes and bread, the explanation is the incomplete utilization of such a diet and the resulting intestinal putrefaction. A. W. Dux

**Uric acid synthesis in the avian organism. I. Uric acid synthesis in the organism of the pigeon.** Werner Schuler and Wilhelm Reindel. *Z. physiol. Chem.* 221, 209-31(1933). In the presence of surviving tissue sections of pigeon organ<sup>4</sup> the synthesis of uric acid has been performed *in vitro*. The site of the biol. synthesis is the kidney. Both kidney and liver contain a precursory substance which is not a purine. The formation of this precursor is an enzymic reaction with  $p_{\text{H}}$  optimum at 7.6-7.7 and temp. optimum at 40°. The same substance is present in the musculature although not formed there by enzyme reaction. The actual synthesis of uric acid shows a  $p_{\text{H}}$  optimum at 7.1 and requires the intervention of living kidney tissue. Amino acids are the source of N and this is utilized by way of  $\text{NH}_3$ . Urea is not a precursor of uric acid, and the 3-C compds., glycerol, lactic acid, malonic acid and tartaric acid, do not serve as sources of C, as generally stated in the literature. II. **Uric acid synthesis in the organism of the hen and goose.** *Ibid.* 232-40.—Similar observations were made with liver and kidney sections from the hen and goose. Uric acid synthesis was performed *in vitro* in 2 stages, *vis.*, the enzymic formation of precursory substance without the intervention of living tissue, and the final synthesis in the presence of surviving resping tissue. The 2nd step occurs here in the kidney, as with the pigeon, and also in the liver. A. W. Dux

**The parallel determination of the respiratory quotient and alveolar air of man in the post-absorptive condition.** T. M. Carpenter and R. C. Lee. *J. Nutrition* 6, 37-53(1933); cf. *C. A.* 27, 761. Respiratory exchange of 2 human subjects was measured for numerous 15-min intervals by means of an open-circuit respiration app. with mouthpiece as a breathing appliance. With 1 trained subject the av. respiratory quotient and the alveolar  $\text{CO}_2$  did not change significantly in 3½ hrs. With the untrained subject both respiratory quotient and alveolar  $\text{CO}_2$  varied, usually in opposite directions. In both subjects the respiratory quotients tended to run parallel with the respiratory quotients of total expired air. There was a marked neg. correlation between the alveolar respiratory quotient and the percentage of alveolar  $\text{O}_2$  deficit. Effect of glucose and fructose on the human respiratory quotient and alveolar air. *Ibid.* 55-82. There was no change in the alveolar  $\text{CO}_2$  with the trained subject accompanying the rises in the respiratory quotient after the ingestion of the sugars, but with an untrained subject there was a marked fall in the alveolar  $\text{CO}_2$  during the periods of max. rise in the respiratory quotient. With the trained subject there was not a definite relationship between the alveolar  $\text{CO}_2$  and the alveolar respiratory quotient in the expts. with fructose, but in the expt. with glucose and in the 2 groups of expts. with the untrained subject, there was a tendency to a neg. correlation between the alveolar  $\text{CO}_2$  and the alveolar respiratory quotient. The rise in respiratory quotients resulting from the fructose is regarded as a result of the metabolism of fructose without the formation of org. acids in its transformation in sufficient quantities to affect the  $\text{CO}_2$  tension of the alveolar air. C. R. Feller

**Results from feeding spray chemicals to albino rats.** T. J. Talbert and W. L. Tayloe. *Mo. Agr. Expt. Sta. Research Bull.* 183, 3-19(1933).—Arsenic fed to rats did not retard growth unless fed in quantities larger than the

equiv. of 0.04 grain  $As_2O_3$  per lb. of fruit. Pb as Pb(OAc)<sub>2</sub> and As in its various forms as an insecticide appear to have injurious effects on rats only after prolonged feeding. Arsenic or Pb or both, when fed in quantities larger than the equiv. to 0.04 grain for about 175 days, had an injurious effect on the offspring by decreasing the wt. and ability of the females to produce and rear young. When spray chemicals are fed in quantities 4 times the "world" tolerance, they have very marked injurious effects on rats, and when the feeding is extended for 400 or more days, the mortality rate greatly increases and reaches 35.5%. Conclusion: Human beings are unlikely to consume enough As as residue on fruit sprayed and handled in the usual manner to be injurious to health.

C. R. Fellers

**Growth and development with special reference to domestic animals. XXVII. Endogenous urinary nitrogen and total creatinine excretion in rats as functions of dietary protein level, time on nitrogen-free diets, age, body weight and basal metabolism.** Ural S. Ashworth and Samuel Brody. Mo. Agr. Expt. Sta., *Research Bull.* 189, 5-68(1933); cf. C. A. 27, 1924.—Comparisons are made of rats paired to diets of low- and high-protein levels. To secure min. urinary N excretion, the animals were kept on practically N-free diets for approx. 100 days. The av. total creatinine N coeff. for all the rats was 15.1 and this value is practically independent of age and dietary protein level. The min. N coeff. is not reached until about the 15th day on the N-free diet. The av. value at this time is about 140 mg. of urinary N per kg. of body wt. The limiting max. value of the ratio of total creatinine N to total endogenous N is about 15%, reached at the same time that the N coeff. becomes a min. The av. value of this ratio is 11%. The ratio of Cal. (basal metabolism) to mg. total creatinine N declines with increasing wt. at approx. the same rate as the ratio of Cal. to body wt. The av. numerical values of this ratio range from 13 at 80 g. body wt. to 6 at 300 g. body wt. The Cal. per mg. of urinary endogenous N ratio approach 1.5 as a limit for young rats with high basal metabolism. For heavier animals the limit is about 0.8 Cal. A greater amt. of fatty tissue in high protein rats is indicated by their lower endogenous N coeffs. **XXVIII. Decline of endogenous nitrogen excretion per unit weight with increasing weight in growing rats, and its relation to the decline in basal metabolism. Decline in live weight, nitrogen and energy metabolism with the advance of the period of nitrogen starvation and the influence of live weight and of the preceding level of protein intake on these declines and on survival periods.** *Ibid.* 190, 5-19.—Basal, endogenous N and basal energy metabolism in rats follow the same course with increasing live wt., age or conditions of starvation. There is a very intimate functional relation between basal energy and endogenous N metabolism. This relation is "caused by the same mechanism, i. e., the "active protoplasmic mass" in the body. It is unreasonable to assume that surface area is a limiting factor under conditions of thermal neutrality. Creatinine N is a decreasing function of the total endogenous N with decreasing live wt. of the animal. A prolonged period on a N-free diet reduces the energy metabolism to the same min. level, 400 Cal. per sq m. per day, as during prolonged abs. starvation. The fecal N on a N-free diet constitutes close to 20% of the total N excretion. Rats may survive for 6 months on N-free but otherwise complete diets. The time curve for live wt. of such rats shows stair-case phenomena, suggesting the successive use of tissues of successive stability. These stair-case phenomena are also exhibited in the time curves of N excretion. **XXIX. Age curves of creatinine and urinary nitrogen coefficients in dairy cattle and their relations to energy metabolism.** *Ibid.* 191, 5-18.—The preformed creatinine N coeff., 9.5, of growing dairy cattle is the same as in human beings. This figure is a const. during the age interval of 7-40 months. The creatine N coeff. of dairy females is 7.6 which is parallel to the preformed creatinine N coeff. The high creatine coeff. may be of dietary origin. The ratio of basal energy metabolism

to creatinine excretion declines with the increasing live wt. in the same manner as the decline of the ratio of basal metabolism to live wt. **XXX. The partition of digestible nitrogen intake between growth, milk secretion and urinary excretion in growing dairy cattle.** Samuel Brody and Arthur C. Ragsdale. *Ibid.* 192, 5-28.—After the age of 10 months in growing dairy heifers 45-92% of the digestible dietary N is excreted in the urine. The higher value obtains between the age of 10 and 20 months, and the lower value during the last months of gestation and during the flush of lactation. The digestible crude protein intake of dairy heifers on good feed ranged from 0.14 to 0.47 lb. per 100 lb. live wt. The total digestible nutrient intake ranged from 1 to 2 lb. total digestible N per 100 lb. of live wt. The apparent efficiency of growth when expressed in the form of ratios of unit live wt. gained to unit wt. of food consumed ranged, with respect to digestible N, from 23 during the 1st month to 4 during the 25th month; with respect to total digestible nutrients during the same period, it ranged from 0.8 to 0.1. In general, young calves from 3 to 9 months old are overfed with respect to N and relatively underfed with respect to energy. It is desirable to reduce the protein content of the grain mix, and possibly add an inexpensive oil to the skimmed milk fed to calves to compensate for the removal of the butter fat. **XXXI. Influence of the plane of nutrition on the utilizability of feeding stuffs. Review of literature and graphic analysis of published data on the net-energy and specific dynamic action problems.** Samuel Brody and Robert C. Procter. *Ibid.* 193, 5-48.—This paper is devoted largely to a graphical and math. analysis of data concerning the influence of plane of nutrition on the net energy values of feeding stuffs fed to steers and rabbits.

C. R. Fellers

**Function, assay and preparation of galactin, a lactation-stimulating hormone of the anterior pituitary, and an investigation of the factors responsible for the control of normal lactation.** W. U. Gardner and C. W. Turner. Mo. Agr. Expt. Sta., *Research Bull.* 196, 5-61(1933).—Galactin is effective in stimulating or initiating lactation in the rabbit, guinea pig, dog and sow. The rat, mouse and monkey have not thus far responded to galactin administration. The response of the mammary glands of the rabbit to galactin depends on the degree to which the glands are developed and to some other factor, presumably of ovarian origin, which conditions them for response. Galactin was ineffective in stimulating the growth of mammary glands of young ovariectomized female rabbits, young male rabbits, or of restoring involuted mammary glands of ovariectomized female rabbits. Galactin was obtained from both sheep and bovine pituitaries. Galactin content of the exts. was independent of the gonad-stimulating hormone content. Methods of extn. and assay are detailed. Eighty-one references. C. R. F.

**Histological differences in the muscles of full-, half- and rough-fed steers.** Don D. Robertson and Dan D. Baker. Mo. Agr. Expt. Sta., *Research Bull.* 200, 3-11(1933).—The muscle fibers of the full-fed animals were greatest in diam.; those of the rough-fed steers smallest. Glycogen was present in small amts. in fresh muscle fibers of all animals studied. Glycogen was not found in refrigerated meat. True fats were abundant in connective tissue of the muscles of full-fed cattle, but only traces in the rough-fed steer. True fats were not demonstrated within the muscle fibers. Short-period cold storage produced no significant changes in the fats. C. R. Fellers

**The theory of blood coagulation. II. Syneresis of blood in the presence of acids and alkalis.** Satya Prakash. *Kolloid-Z.* 65, 88-92(1933); cf. C. A. 25, 738, 1580; 26, 4643.—Syneresis of goat blood at 25° increases at low concn. of AcOH, HCl and glycochol but decreases at higher concns. Urea speeds the syneresis but the final values diminish with increased concn. Glycerol and glucose diminish syneresis. Arthur Fleischer  
**The synthetic formation of creatine at the expense of tissue proteins.** Gertrude Pariset. *Compt. rend.* 197, 704-6(1933).—The sum of the creatine and creatinine

N excreted during a period of inanition plus that present in their tissues at the end of the period was considerably greater than the quantity calcd. to be present in their tissues at the beginning; hence creatine must have been formed from tissue proteins. L. E. Gilson

The phosphorus, potassium, calcium and potassium-calcium ratio of the blood after partial ablation of the liver. C. I. Parhon, Hélène Derevici and Michel Derevici. *Compt. rend. soc. biol.* 114, 67-8(1933).—Partial ablation of the liver in guinea pigs caused a small decrease in blood Ca and a large decrease in blood K, resulting in an av. K/Ca ratio of 1.41 (1.92 is normal). Blood P was slightly decreased. L. E. Gilson

Comparative values for the urobilin contents of human urine and duodenal contents. M. Royer, R. Dassen and F. Martinez. *Compt. rend. soc. biol.* 114, 75-7(1933).—Detns. were made on numerous normal and pathol. cases. The values obtained varied greatly. In hepatic insufficiency there is much bilirubin in the urine and little in the bile. L. E. Gilson

Action of hypophysis and thyroid on basal metabolism. B. A. Houssay and Argentina Artundo. *Compt. rend. soc. biol.* 114, 79-80(1933).—In dogs hypophysectomy decreases basal metabolism about 15% by causing epithelial atrophy and hypofunction of the thyroid. Removal of the thyroid after hypophysectomy caused an addnl. decrease in basal metabolism, but removal of the hypophysis from a thyroidectomized animal had no effect on basal metabolism. L. E. Gilson

Action of follicular hormone on the tetany and blood calcium of female dogs with chronic parathyroid insufficiency. Franz Mathieu. *Compt. rend. soc. biol.* 114, 104-6(1933); cf. *C. A.* 27, 5107.—In thyroidparathyroidectomized female dogs subcutaneous injections of theelin or menformon caused a decrease in blood Ca and a slight tetany. Theelin had a similar and stronger action. None of the hormones had any hypocalcemic effect in normal animals. L. E. Gilson

A conception of the structure and the oxidizing-reducing function of hemoglobin. G. Litareczek and G. T. Dinischiotu. *Compt. rend. soc. biol.* 114, 287-90(1933). Hypothetical. L. E. Gilson

Calcium of the milk and blood serum of thyroparathyroidectomized lactating bitches. C. I. Parhon, R. Ceruatesco and I. Ornstein. *Compt. rend. soc. biol.* 114, 323(1933); cf. *C. A.* 26, 5135.—Milk Ca and serum Ca showed large decreases 21 hrs. after the operation. Milk secretion usually ceased in less than 96 hrs. L. E. Gilson

Metabolism of growth. Its variations with age and with the seasons. G. Popoviciu, G. Benetato, N. Munteanu and M. Sorescu. *Compt. rend. soc. biol.* 114, 332-4(1933).—Analyses of blood samples taken from infants 1-15 months old and adolescents 18-21 yrs. old at different months of the year are given. L. E. Gilson

Form in which iodine is eliminated in human urine after administration of thyroxine by mouth. A. W. Elmer and M. Scheps. *Compt. rend. soc. biol.* 114, 350-1(1933).—The I is eliminated as degradation products of thyroxine. Decomposition by the liver of thyroxine injected intravenously. A. W. Elmer and Z. Luczynski. *Ibid.* 351-2.—In the rabbit part of the thyroxine traverses the liver unchanged and part is broken up and the I compds. formed excreted in the bile. L. E. Gilson

Effect of extirpation of the spleen on the cholesterol of the blood after irradiation by infra-red rays. S. Malczynski and J. Lankosz. *Compt. rend. soc. biol.* 114, 352-4(1933); cf. *C. A.* 27, 5345.—In the dog the spleen seems to have no influence on the oscillations of blood cholesterol. L. E. Gilson

[Changes in] the hypophysis of the rabbit treated with the hormones from the urine of pregnant women. I. Karp. *Compt. rend. soc. biol.* 114, 357-9(1933). L. E. Gilson

Action of extract of the anterior hypophysis on basal metabolism. Argentina Artundo and L. A. Solari. *Compt. rend. soc. biol.* 114, 385-6(1933).—Hypophyseal

implantations do not modify the metabolism of the toad. In the dog, ext. of the anterior hypophysis causes a marked increase in basal metabolism and all the other symptoms characteristic of hyperfunction of the thyroid. L. E. Gilson

Effect of alkalosis on the secretion of acid by the stomach. G. Delrue and A. Lacquet. *Compt. rend. soc. biol.* 114, 570 2(1933).—In dogs extreme alkalosis produced by feeding  $\text{NaHCO}_3$  (max.  $p_{\text{H}}$  of blood reached was 7.76) had no effect on the acidity of the gastric juice. L. E. Gilson

Morphological metabolism of neutral fats in the central nervous system during development of the embryo. A. Hadjiloff and G. Ouzounoff. *Compt. rend. soc. biol.* 114, 578 80(1933).—In the chick embryo neutral fats were detected in the central nervous system from the 5th to about the 15th day, then they disappeared. L. E. Gilson

Blood glutathione of Sebright cocks and hens. J. R. Chanton and P. Caridroit. *Compt. rend. soc. biol.* 114, 893-4(1933).—The plumage of Schright cocks is similar to that of the hens and the glutathione content of the blood of both sexes is practically the same, whereas in breeds where there is a marked difference in the plumage of the sexes the blood glutathione of the cocks is much greater than that of the hens. L. E. Gilson

Acid-base equilibrium in old age. G. C. Dogliotti and M. Santi. *Minerva med.* 1933, 11, 378-84.—Fifty persons 70 yrs. of age or older were studied for blood  $p_{\text{H}}$  (electrometric method) and alk. reserve (Van Slyke). Normal  $p_{\text{H}}$  was considered between 7.35 and 7.40, normal alk. reserve 50-70. There were 17 cases of acidosis, 10 with normal and 7 with low alk. reserve; 20 cases of alkalosis, 14 with normal and 6 with low alk. reserve; 13 with normal  $p_{\text{H}}$ , 7 with normal and 6 with low alk. reserve. Helen Lee Gruehl

Chloride and water in the constitution of tissues. Harold G. Close. *Biochem. J.* 27, 967-70(1933). The chief characteristics of body fluids (B), nuclear tissues (N) and anuclear tissues (A) are: no. of cells: B nil, N many, A few; metabolic rate: B nil, N high, A low, reaction: B alk., N acid, A alk.; water: B high, N moderate, A low; Cl: B high, N low, A high, Na: B high, N low, A high; K: B low, N high, A low; Na/K: B high, N low, A high; protein: B low, N moderate, A high. Benjamin Harrow

The volume variations of the muscle as related to the chemical processes of the contraction. O. Meyerhof and H. Hartmann. *Naturwissenschaften* 21, 661(1933).—Dilatometric measurements in enzyme exts. of the muscle indicate that the vol. variation (cf. *C. A.* 27, 1665, 3513, 4291) during contraction is due to changes in mol. vol. by decompn. and synthesis of the participating substances. Decompn. of creatinephosphoric acid is accompanied by a contraction of 10-12 cc. per mole, that of adenyphosphoric acid 42 cc. per mole, lactic acid formation from glycogen by an increase of 24 cc. per mole. The balance, however, did not entirely check with live muscle. The explanation is in addnl. swelling of the muscle. If liquid paraffin is used in the expts. instead of Ringer soln. the results agree. After a series of tetanus conditions a dilatation of  $4.7 \times 10^{-4}$  of the muscle vol. remains, equal to the calcd. value for 2.5 mg. lactic acid and 1.6 mg.  $\text{H}_2\text{PO}_4$  formation per g. muscle. Good agreement is also obtained for muscle poisoned with iodoacetic acid in which lactic acid formation is inhibited. B. J. C. van der Hoeven

The fluorine content of bones and teeth. R. Klement. *Naturwissenschaften* 21, 662-3(1933).—The F contents of bones and teeth substances, consisting largely of hydroxyl apatite (*C. A.* 24, 405; 27, 1037), were detd. anew. The analysis method of Armstrong (*C. A.* 27, 2397) and that of Willard-Winter (*C. A.* 27, 681) were used. Land mammals have a F content below 0.1%: human skull 0.059, tooth 0.030, bovine hollow bone 0.047, tooth 0.049, deer bone 0.065, monkey-tail vertebrae 0.038. Sea animals have higher F contents:

"dugong" phalanx 0.57, narwhal rib 1.62, dolphin tooth 0.71, dolphin cheekbone 0.80, shark (*Lamna*) cartilage 0.59, shark tooth 0.74, man-eating shark tooth 0.69. Fossil bones are exceptionally high in F: *Halitherium* rib 2.73, shark tooth 2.84, *Triceratops* rib 2.36%. F and OH can interchange isomorphically in the apatite; the F is derived from the sea water and accumulated.

B. J. C. van der Hoeven

The availability of iron from different sources for hemoglobin formation. C. A. Elvehjem, E. B. Hart and W. C. Sherman. *J. Biol. Chem.* 103, 61-70(1933).—The dipyriddy method of Hill (*C. A.* 25, 2387) is apparently a valuable means of detg. available Fe in food stuffs. Feeding expts. showed an availability of the Fe in wheat, yeast and oats approx. equal to the amt. of the total Fe which reacted with dipyriddy (47, 47 and 57%, resp.). The Fe in glutamic acid parahematin does not react with the reagent and showed very slight utilization. FeCl<sub>3</sub>, pyrophosphate, glutamate and hypophosphite supply readily available Fe for hemoglobin formation.

A. P. Lothrop

The renal threshold for bilirubin. II. E. H. Bensley. *J. Biol. Chem.* 103, 71-9(1933); cf. *C. A.* 26, 4637.—No evidence has been obtained that direct bilirubin is a threshold substance. The kidneys offer no barrier to its excretion regardless of its concn. in the blood. The kidneys are, however, impermeable to indirect bilirubin and no bilirubin is found in the urine (with a few explainable exceptions) when the blood contains indirect bilirubin only. Hunter's diazo test was used for the detection of bilirubin in the urine. The results confirm the findings of Rabinowitch (*loc. cit.*).

A. P. Lothrop

The synthesis of hippuric acid in the animal organism. VII. Hydrazine intoxication and hippuric acid synthesis in the rabbit. Victor J. Tulane, A. A. Christman and Howard B. Lewis. *J. Biol. Chem.* 103, 141-50(1933).—In hydrazine intoxication the excretion of hippuric acid during the 1st 6 hrs. after administration of BzONa is much less than in normal rabbits but the total excretion after 24 hrs. is only slightly less than in normal animals. Three equivs. of glycine were always fed with the BzONa so there was no failure in the supply of glycine. There is no corresponding increased excretion of either free BzOH or BzOH conjugated with some substance other than glycine. Similar results are obtained after feeding Na hippurate and glycine. The delayed synthesis of hippuric acid by the liver is best explained by the hepatic injury induced by the hydrazine. IX. A comparative study of the rate of synthesis and excretion of hippuric acid and phenacetic acids by the rabbit. Victor J. Tulane and Howard B. Lewis. *Ibid.* 151-60.—Even in the same species the 2 homologous acids, BzOH and PhCH<sub>2</sub>CO<sub>2</sub>H, differ in their behavior in the living organism. The excretion of phenacetic acid is slow, the av. excretions after feeding equiv. amts. of BzOH and PhCH<sub>2</sub>CO<sub>2</sub>H being equiv. to 37 and 6% of the intake, resp., during the 1st 6 hrs. The rate is increased by feeding glycine along with PhCH<sub>2</sub>CO<sub>2</sub>H but only up to an av. total excretion of 21%. The slow excretion is not assoc. with slow absorption from the intestine since the rate is not increased after intravenous injection. The slow excretion is believed to be due to a limitation in the capacity to synthesize phenacetic acid even though an exogenous supply of glycine is available. The excretion of "extra" hippuric acid after BzONa ingestion with or without exogenous glycine is usually complete after 24 hrs. but under similar conditions the excretion of "extra" phenacetic acid is frequently prolonged for a period of several days. Twenty-two references. A. P. L.

The effect of  $p_{H_2}$  on carbohydrate changes in isolated anaerobic frog muscle. Margaret Kerly and Ethel Ronzoni. *J. Biol. Chem.* 103, 161-73(1933).—"At an alk. reaction lactic acid increase approx. balances carbohydrate decrease and there is only a small increase in hexosemonophosphate. As the reaction is made progressively more acid, lactic acid formation becomes less while hexosemonophosphate formation increases, the sum

of the 2 about balancing the loss in total carbohydrate. During anaerobiosis at an alk. or neutral reaction the formation of lower carbohydrates is very small. At  $p_{H_2}$  6 considerable quantities both of glucose and of intermediary carbohydrate are formed. The latter is alc.-sol., has an alc.-insol. Ba salt, is reducing but non-fermentable and on hydrolysis forms fermentable sugar." A method is described for the estn. of total carbohydrate, sol. carbohydrate, hexosephosphate and lactic acid on a single muscle sample. The disappearance of hexosephosphate from intact frog muscle. Ethel Ronzoni and Margaret Kerly. *Ibid.* 175-81.—"Muscles kept anaerobically at  $p_{H_2}$  6 form in 2 1/2 hrs. 70-80 mg. % of hexosephosphate (as hexose), the phosphocreatine is almost completely hydrolyzed and approx. 1/2 of the adenosinetriphosphate is dephosphorylized but no lactic acid is formed. During the subsequent treatment with O<sub>2</sub> all of these substances are restored to their normal level accompanied by an acceleration in the rate of O<sub>2</sub> consumption above that of normal muscles. This bears no direct relationship to the loss of hexosephosphate. The time at which the rate of oxidation approaches the normal rate approx. coincides with the complete restitution of creatinephosphate. On the other hand when placed in N<sub>2</sub> at  $p_{H_2}$  9, while lactic acid production is resumed, it proceeds at the normal rate for anaerobic muscles. Hexosephosphate shows but little decrease; the breakdown of phosphocreatine is slowed but there is no restitution; neither is there a restitution of adenosinetriphosphate."

A. P. Lothrop

The calorogenic action of glycine. Helen G. Lewis and James M. Luck. *J. Biol. Chem.* 103, 227-33(1933).—The increase in metabolism induced by low concns. of subcutaneously administered glycine to fasting rats is equal to that induced by oral ingestion but in higher concns. it is considerably less and it exerts no calorogenic action at 2 g. per kg. of body wt. and above. Glycine is markedly toxic to rats in doses of 2 g. per kg. or more. For amts. not exceeding 0.55 g. per kg. (1.5 millimols.) the increase in metabolism after oral ingestion of glycine is directly proportional to the quantity given, is quickly produced and of short duration. It is clear that various factors are involved which do not permit a simple hypothesis to explain the specific dynamic action of glycine (or any other amino acid).

A. P. Lothrop

Is *d*-glucose absorbed from the stomach of the dog? Stephen J. Maddock, Harry C. Trimble and Benjamin W. Carey, Jr. *J. Biol. Chem.* 103, 285-94(1933); cf. *C. A.* 27, 2480.—Absorption of *d*-glucose in significant quantities from the stomach of the dog does not take place. In expts. in which the pylorus was blocked from the outside thus avoiding the complications of fistulas or of general anesthesia 99.3 ± 1.2% of ingested glucose (5-47 g.) was recovered, the concn. of the solns. varying between 2.8 and 38%. Changes in the sugar content of the small veins of the dog stomach before and for several hrs. after the introduction of glucose into the stomach with ligated pylorus were slight and irregular and not definitely in excess of the probable exptl. error. The activity of the pylorus in preventing or promoting outflow of liquid may be responsible for the irregularities in measurement of absorption rates and has an important bearing in tolerance tests, particularly in the production of variations in the shape of the early portions of blood-sugar curves. Twenty-five references.

A. P. Lothrop

The influence of nervous stimulation on absorption from the intestine, the humoral theory of nervous action. Ernst Gellhorn and David Northup. *Am. J. Physiol.* 106, 283-90(1933).—In a frog prepn. in which the intestine is perfused with isotonic glucose and the blood vessels supplying the intestine with Ringer soln. and in which the perfusion rate is kept const., the absorption of glucose is regularly altered by stimulation of the autonomic nerves. Similarly glucose absorption is altered by the administration of acetylcholine and adrenaline.

J. F. Lyman

Metabolic studies in partially hypophysectomized dogs. R. G. Dagg and A. G. Eaton. *Am. J. Physiol.* 106,

299 308(1933).—Two dogs, portions of whose pituitaries had been removed, showed decreases of 5.4 and 22.0%, resp., in basal metabolism. The specific dynamic action of beef heart was slightly above normal in the operated animals; their tolerance to insulin was increased and their glucose tolerance decreased. J. F. Lyman

The potassium-calcium antagonism in regard to absorption from the intestine. Ernst Gellhorn and Arthur Skupa. *Am. J. Physiol.* 106, 318 22(1933).—In the absence of both K and Ca the permeability of the intestine to glucose increases reversibly. Slight changes in the concn. of KCl and CaCl<sub>2</sub> in Ringer soln. with which the intestinal blood vessels are perfused lead to changes in the permeability of the intestine wall to glucose. The absorption of glucose is increased by K and decreased by Ca. J. F. L.

Choline esters in tissue extracts. H. C. Chang and J. H. Gaddum. *J. Physiol.* 79, 255 85(1933).—An unidentified substance occurs in some tissues which produces an effect on the isolated frog heart superficially similar to that of acetylcholine. Acetylcholine is undoubtedly present in most of the tissues but the amounts are less than 4  $\gamma$  per g. of tissue except in human placenta where 28  $\gamma$  per g. was found. J. F. Lyman

The control of the insulin output of the pancreas. T. Kosaka. *J. Physiol.* 79, 416 22(1933).—Infusion of a 5% glucose soln. into the pancreatic blood stream of a decapitated cat is followed by a more rapid decline in arterial blood sugar than occurs when similar injections are made into the general circulation. The pancreas responds promptly to a high sugar content of its arterial blood by a liberation of insulin. J. F. Lyman

The influence of the gall bladder, Oddi's muscle and the duodenum upon the outflow of bile. I. Injection of visceral nerve poisons and pituitrin. Konan Shi. *Japan. J. Gastroenterol.* 5, 19 25(1933). Intravenous injection of pilocarpine increases the internal pressure of the gall bladder and the excretion of bile. Atropine gives the opposite effects. Adrenaline gives a temporary reaction like atropine, and pituitrin acts slightly like pilocarpine. II. Observations made after the injection of some substances into the duodenum. *Ibid.* 26-30.—The injection of milk or peptone into the duodenum of a dog increases the outflow of bile as a result of increasing the pressure of the bile and decreasing the tension of Oddi's muscle. Under the same conditions a MgSO<sub>4</sub> soln. increases the bile flow as a result of a depression of tension of Oddi's muscle and of the duodenum. C. M. McCay

Factors causing variation in the hemoglobin level with age in the first year of life. Helen M. M. Mackay. *Arch. Disease Childhood* 8, 251-44(1933).—The rapid decrease in the hemoglobin content of the blood during the 1st week of life is assocd. with a decrease in the no. of erythrocytes, which continues until the 3rd month. The Fe derived from the destruction of the erythrocytes is stored in the liver and spleen and is utilized during the period of rising hemoglobin level, from the 3rd to the 6th month. As the store becomes depleted, the hemoglobin content drops slowly until the end of the 1st yr. when the ingestion of mixed diets augments the Fe intake. E. R. Main

A study of the total and ultrafilterable calcium and the acid-soluble phosphate content of the blood serum of four hundred and twenty-two healthy children. Marion S. Needels and Carl M. Marberg. *J. Lab. Clin. Med.* 18, 1227 34(1933). There appears to be no correlation between the incidence of dental caries and the total Ca, ultrafilterable Ca or total acid-sol. phosphate contents of the serum of children 10 17 yrs. of age. The total Ca content of the serum is lower in the spring than in the fall. When 1 pint of orange juice and the juice of 1 lemon are included in the daily diet, the total Ca content of the serum of the boys shows no seasonal variations while that of the girls shows indefinite variations. The acid-sol. phosphate content is not subject to seasonal variations but tends to decrease as the age increases. Modifications are described for the methods of Moritz

(C. A. 20, 1099) and Greenberg (C. A. 24, 1403) for the detn. of ultrafilterable Ca. E. R. Main

A study of the red blood cell count and hemoglobin in the adolescent male. S. Milton Goldhamer and Agnes I. Fritzell. *J. Lab. Clin. Med.* 19, 172-7(1933).—The no. of erythrocytes present in the blood of boys 12-17 yrs. of age ranges from 3.28 to 5.87 millions per cu. mm. with an av. of 4.718 million. The hemoglobin content is 9.80-13.58 g. per 100 cc. with an av. of 11.55 g. The av. hemoglobin coeff. is 12.35 g. per 100 cc. and the av. color index is 0.87. E. R. Main

The physiology of insulin. Geo. H. Tuttle. *Lancet* 1933, II, 687-90.—A review of the evidence for the existence of cellular insulins and a theoretical discussion of their physiol. functions and relation to pancreatic insulin. E. R. Main

Chemical organization in the living cell. Gowland Hopkins. *Lancet* 1933, II, 573-5.—An address. E. R. Main

Spinach and gastric secretion. J. Oviedo Bustos. *Arch. Argent. enfermedades ap. digest. nutrición* 8, No. 4 (1933); *Rev. sudamericana endocrinol. inmunol. quimioterapia* 16, 743-4.—Spinach and a decoction from fresh leaves produce an abundant secretion of gastric juice. A. E. Meyer

Extracts from muscles and organs in medicine. C. Mallardo. *Il Morgagni* 75, No. 6(1933); *Rev. sudamericana endocrinol. inmunol. quimioterapia* 16, 760.—Muscle and organ exts. have a different method of hypotensor action and different applications. It is supposed that the former contain adenyolphosphoric acid, the latter choline or a related compd. A. E. Meyer

The hypotensor action of muscle extracts. G. Lanza. *Il Morgagni* 75, No. 18(1933); *Rev. sudamericana endocrinol. inmunol. quimioterapia* 16, 750-60.—Muscle exts. have a pronounced hypotensor action, which is especially conspicuous in hypertension. A. E. Meyer

Pigments in bile obtained by duodenal tube. M. Royer. *Presse méd.* 41, 74-6(1933).—The bilirubin and urobilin contents in bile A and B have been studied in patients with and without cholecystitis. As H<sub>2</sub>O is absorbed from the bile B through the mucosa, an increase of both pigments is observed. The ratio of the relative increase of bilirubin: relative increase of urobilin varies from 1.14 to 5.0 in persons free from cholecystitis. In cholecystitis, urobilin can be formed from bilirubin by the action of microorganisms; the ratio may vary from 0.85 to 0.37. A. E. Meyer

Hypercrinemia (increase of hormones in the blood) and renal retention. M. Loeper, P. Soulié and F. P. Merklen. *Presse méd.* 41, 153-5(1933) A. E. M.

## G—PATHOLOGY

### IF. GIDEON WRLES

Active immunization of human beings with tetanus toxoid. Edith M. Lincoln and Charles K. Greenwald. *Proc. Soc. Exptl. Biol. Med.* 30, 1241 3(1933).—At weekly intervals 3 intramuscular injections of tetanus toxoid, made by treating toxin with 0.4% formalin and incubating at 38° for 10 days, were given to 5 adults and 13 children; tetanus antitoxin appeared in the blood and remained for at least 3 years. C. Y. Bailey

The relation of amino acid nitrogen to the Wassermann reaction. George Brewer. *Am. J. Syphilis* 17, 221-7 (1933).—In 41 controls, the mean ratio of amino acid N in the blood to amino acid N in the cerebrospinal fluid was 0.260 (0.163-0.431); in 14 neurosyphilitics, this ratio was 0.261 (0.171-0.335). No evidence was found to relate amino acid N to the Wassermann reaction. B. C. Brunstetter

The spinal-fluid sugar and chlorides in neurosyphilis. Geo. Brewer. *Am. J. Syphilis* 17, 382-6(1933).—In 86 controls, the mean ratio of cerebrospinal fluid (C. S. F.) sugar to blood sugar was 0.647, while the ratio of C. S. F. chlorides to blood chlorides was 1.48. The chloride ratio is significantly decreased in neurosyphilis only

when severe meningeal irritation or damage occurs; in 5 cases of general paresis the av. ratio was 1.36. The sugar ratio which showed considerable individual variation tended to decrease with increasing meningeal damage; for the above paresis cases the av. ratio was 0.519.

B. C. Brunstetter

**The relation of lipoids in inflamed skin.** Wilhelm Milbradt. *Arch. Dermatol. Syphilis* 168, 429-37 (1933).—Rabbit skin was inflamed by 3 methods: (1) chemically, by the application of croton oil or mustard oil for 24 hrs.; (2) by ultra-violet radiation; and (3) by infra-red radiation. After 1, there was a rise in cholesterol (C), phosphatides (P) and in the ratio of phosphatides to cholesterol (lipocytic index, or L. I.). After 2, there was a decrease in C, with increase in P and L. I. After 3, there were decreases in C, P and L. I. The water content of the skin increases in all forms of skin irritation.

B. C. Brunstetter

**Urinary proteose. Allergic dermatoses and the eczema-asthma-hay fever complex.** Frank E. Cormia. *Arch. Dermatol. Syphilol.* 27, 745-50 (1933).—Proteose, present in normal urine to the extent of 25 mg. per 100 cc., increases in various allergic conditions to 100 mg. per 100 cc.

B. C. Brunstetter

**The morbid anatomy and histology of asbestosis.** S. Roodhouse Gloyne. *Tubercle* 14, 445-51, 493-7 (1933).—The asbestosis lung shows particles of 5 different kinds: (a) C pigment common to all town dwellers; (b) amorphous brown pigment, presumably blood; (c) sharp jagged particles, probably carbonaceous; (d) the asbestos fiber; (e) the asbestosis body. The asbestos fibers can also be readily found in the upper respiratory tract of the workers. *Ibid.* 550-8.—The asbestosis body is a regular concomitant of the disease, but structures closely resembling it are found in other pneumoconioses. In case of doubt the strong yellow pigment should be dissolved with strong  $H_2SO_4$ . The central asbestos fiber thus displayed is usually different from the particles seen in the pseudo-asbestosis bodies.

H. J. Corper

**The galactose test for liver cirrhosis.** Eugen Hermann. *Wiener klin. Wochschr.* 41, 1230-1 (1933).—The test (*Wiener med. Wochschr.* 1906) consists in giving 40 g. of galactose at 6 A. M. Galactose excretion by the kidneys in the next 4 hrs. is detd. Although cases of liver cirrhosis are supposed to excrete less than 3 g. H. found much larger amts. excreted by many such cases and he concludes the method is without value in diagnosis.

D. B. Dill

**Aptitude of various species of animals to ketonuria and ammoniuria.** H. Trimbach. *Compt. rend.* 197, 708-9 (1933). The relative amts. of the different ketone bodies and the  $NH_3$  in the urine of the common exptl. animals on the same diet vary greatly with the species. Exptl. data are given.

L. E. Gilson

**Histological and chemical modifications in argyria.** L. Langeron, A. Delattre and M. Paget. *Compt. rend. soc. biol.* 114, 132-3 (1933).—Ag deposits in the tissues of a person who had taken collargol daily for a long period are described.

L. E. Gilson

**Presence of hemolysins in extracts of intestinal parasites of the dog (*Ancylostoma caninum* and *Toxocara canis*).** Walter O. Cruz. *Compt. rend. soc. biol.* 114, 139-41 (1933).—The parasites contain a heat-resistant substance having a weak hemolytic action.

L. E. G.

**The thermal amplitude of anti-typhus serums and the standardization of Widal's reaction.** L. Hirsfeld and R. Amzel. *Compt. rend. soc. biol.* 114, 201-2 (1933).

L. E. Gilson

**Urea content of the blood serum in experimental deuteropathic amyotrophy.** C. I. Parhon, I. Ornstein and I. Lucinescu. *Compt. rend. soc. biol.* 114, 325-7 (1933).

In dogs resection of the nerves of the brachial plexus caused little change in blood urea the first week following, but during the next 2-4 weeks, as wasting of the affected muscles progressed, the blood urea was in most cases considerably above normal.

L. E. Gilson

**Pancreatic diabetes and the adrenal glands.** J. T.

Lewis and E. S. Turcatti. *Compt. rend. soc. biol.* 114, 403-6 (1933).—Removal of the adrenals has little effect on the diabetes and glucemia produced in dogs by pancreatectomy.

L. E. Gilson

**Glucemia after clyma.** Enrico Tagliaferro. *Minerva med.* 1933, 11, 424-8.—Fasting patients (18 non-diabetics, 2 diabetics, 2 hepatic cases) were studied for normal glucemia (colorimetric method of Crecelius Seifert) and then received 40 cc. cold water by clyma; 2 hrs. later the blood was tested for glucemia again. On the 2 subsequent days the test was repeated first with 40 cc. physiol. saline and then with 40 cc. 40% glucose soln. All non-diabetics showed hypoglucemia (min. 5 mg./100 cc., max. 40 mg./100 cc.) after rectal introduction of liquid, even of the sugar soln. The diabetics showed a more marked hypoglucemia while in the hepatic cases there was hardly any change over the normal. A physiol. explanation is offered for these changes.

H. L. G.

**Nature of the bactericidal substance in the urine of patients receiving a ketogenic diet.** Albert T. Fuller. *Biochem. J.* 27, 976-82 (1933).—In the treatment of pyelitis, providing a sufficiently intense ketosis can be obtained, the bacteria and pus often disappear from the urine within a few days. The principal factor inhibiting the growth of bacteria is  $L$ - $\beta$ -hydroxybutyric acid.

Benjamin Harrow

**Calcium, potassium and inorganic phosphate contents of the serum in cancer patients. Effect of Röntgen-ray radiation on the level of these substances in the blood serum of cancer patients.** Henry Jackson, Jr. and F. H. L. Taylor. *Am. J. Cancer* 19, 379-88 (1933).—Normal values for the Ca content of the blood were found in 52% of the cases of cancer exant. and values lower than normal in 48%. The lowered concn. of Ca appeared to be a result of the disturbed nutrition assocd. with advanced carcinoma. The K and inorg. phosphate concns. were normal. After x-ray therapy the K, Ca and P contents and the ratios, Ca:P and K:P, were unaltered.

E. R. Main

**Tar cancer in mice maintained on diets supplemented with fresh liver.** A. F. Watson. *Am. J. Cancer* 19, 380-95 (1933).—An increased carcinogenic response is observed in tar-treated mice when fresh liver is included in the diet. Benign warts and epitheliomata appear earlier and in greater nos. and the period of induction of malignancy is not reduced.

E. R. Main

**The immunologic properties of casein.** Marie Lucie Demanez. *Arch. intern. méd. exptl.* 8, 233-54 (1933); cf. C. A. 27, 3726.—The caseins derived from cow, goat and sheep milks appear to be biologically identical, but distinct from those of human and horse milk. The precipitin serums obtained by injections of beef, sheep and horse serums into rabbits do not react with the corresponding caseins, although human antiserum shows a definite reaction with casein from human milk. Anticasein serums show only a slight reaction with the serums of the corresponding species. The fraction of casein sol. in 70% EtOH and the alc.-insol. residue cannot be distinguished by biol. methods. The antigenic properties of casein are not modified by exposure to temps. of 50° or 100°, and are only slightly modified by iodation.

E. R. Main

**Studies concerning the specificity of fibrinogen.** Marie Lucie Demanez. *Arch. intern. méd. exptl.* 8, 255-67 (1933).—Immune serums produced by injections of fibrinogens into rabbits react definitely with the corresponding antigens, but only to a slight extent with fibrinogens from other species. The lack of species specificity is possibly explained by the fact that fibrinogen has the same physiol. function in all species.

E. R. Main

**Investigations on the anemia of experimental rat cancer.** Istvan Sümegi. *Beitr. path. Anat.* 92, 210-21 (1933).—The lipoidal material obtained by extn. of rat tumor tissue with  $Et_2O$ , injected subcutaneously into rats, produces an anemia characterized by a high color index and marked lymphocytosis. The higher fatty acids obtained by sapon. of the  $Et_2O$ -sol. ext. cause similar symptoms but no lymphocytosis. The

lower fatty acids cause severe or fatal cachexia but do not affect the blood picture. The glycerol fraction causes an anemia with no increase in the color index. Other fractions of tumor tissue, protein, carbohydrate, lecithins and esters of higher alcs. produce no symptoms of anemia. Goose fat and the fatty acids obtained from it do not cause anemia, although the glycerol fraction produces effects similar to those produced by the glycerol fraction of tumor fat. The injection of com. glycerol causes an anemia resembling the hemolytic type. Anemia is produced by the injection of fat from human carcinomas, but the effect is less marked.

E. R. Main

Glucose tolerance curves in pulmonary tuberculosis. Observations upon 100 cases. David W. Kramer. *J. Lab. Clin. Med.* 18, 1212-20(1933).—Patients with pulmonary tuberculosis appear to have an increased tolerance for glucose. High or diabetic types of glucose tolerance curves were found in 17% of the patients examined, low curves in 24% and normal curves in 59%.

E. R. Main

The possibility of a pressor principle in the blood of persons with hypertension. An experimental study. Albert H. Elliot and Franklin R. Nuzum. *J. Lab. Clin. Med.* 18, 1255-60(1933).—Intravenous injections of large amts. of fresh citrated blood from normal persons into rabbits produce in most instances a marked transitory rise in blood pressure followed by a prolonged fall. The injection of blood from patients with hypertension produces a higher initial rise. Injections of EtOH, Et<sub>2</sub>O and H<sub>2</sub>O-sol. fractions of blood cause a transitory fall.

E. R. Main

Blood catalase in heart disease. I. Preliminary report. James C. Healy and Henry Baker. *J. Lab. Clin. Med.* 19, 133-41(1933).—The blood catalase content appears to be markedly increased in rheumatic heart disease and scarlatinal endocarditis and normal in cases of scarlet fever and diphtheria which show no heart damage. The technic for the detn. of catalase by the action of an alk. soln. of H<sub>2</sub>O<sub>2</sub> upon laked blood is described.

E. R. Main

The relationship between the antianemia principles in stomach and liver. John F. Wilkinson and Louis Klein. *Lancet* 1933, II, 629-33.—Further evidence is presented for the enzymic nature of hemopoietin, the antianemic principle isolated from hog stomach (*C. A.* 27, 3980). Upon incubation of thermolabile, active concentrates of hemopoietin with beef muscle, a heat-resistant hemopoietically active substance is synthesized, which is similar to or identical with the active principle of liver. The active substance appears to be synthesized *in vivo* by the action of hemopoietin on the proteins of food and stored in the liver. Hemopoietin is present in the normal stomach of man and carnivorous and omnivorous animals, but has not been found in herbivorous animals. The gastric secretions of patients with true pernicious anemia appear to be deficient in this enzyme.

E. R. Main

Carbohydrate metabolism in pruritus and chronic urticarias. J. Gay Prieto and M. González Rey. *Arch. med. cirurg. especialidades* 35, No. 52(1932); *Rev. sudamericana endocrinol. inmunol. quimioterap.* 16, 846.—Hypoglycemia was found in 10 cases out of 16; the dermatosis is caused by a hepatic dysfunction. It may be relieved by increasing the glycogen reserve in the liver with carbohydrate and insulin.

A. E. Meyer

Glucemia in scarlet fever, measles and varicella. L. Manzoni. *Riv. clin. pediatr.* No. 12(1932); *Rev. sudamericana endocrinol. inmunol. quimioterap.* 16, 846-7.—The blood sugar is increased during the febrile stage of scarlet fever and measles. No change was found in varicella.

A. E. Meyer

Glucemia in pulmonary tuberculosis. Antonio Dalto. *Semana méd.* (Buenos Aires) 1933, II, 1004-26.

A. E. Meyer

A reducing substance found in chromophilic adenomas, and in the normal anterior pituitary. T. J. Putnam and H. B. Wilcox. *Am. J. Path.* 9, 649-50(1933).

1 A substance reducing methylene blue was demonstrated in the normal anterior pituitary and its ext.; and in larger amts. in a chromophile adenoma. None was found in a chromophobe adenoma. It does not reduce Benedict's soln. or give the other common tests for sugar.

F. B. Seibert

Contributions of chemistry to the knowledge of immune processes. M. Heideberger. *Medicine* 12, 279-95 (1933).—A discussion of the meaning of antigen and antibody is followed by a chem. analysis of the interaction between them. Strong evidence is given for the chem. union of antigen or hapten with antibody in multiple proportions which can be expressed in terms of the laws of phys. chemistry. Methods are given for measuring quantitatively the amt. of antibody pptd. by antigen.

F. B. Seibert

Application of optical spectroscopy to analysis of tumor tissue. Winifred R. Mankin. *J. Proc. Roy. Soc. N. S. Wales* 66, 509-15(1932); cf. *C. A.* 26, 2478.—Dried tumor tissue showed the presence of Al, Cr, Cu, Li, Mn, Sr and Zn.

Cornelia T. Snell

Fibrinogen formation in the animal body. Eiichi Hori. *Sei-i-kwai Med. J.* 51, No. 8, 97-111(English Abstract 8-9(1932)).—The fibrinogen (I) content of rabbit blood under various exptl. conditions is detd. by a refractometer. The venous blood contains more I than the arterial. I in the blood, reduced by means of plasmaphoresis or by the injection of the placenta infusion, reaches the normal value in 3-4 hrs. But in a rabbit the liver of which is previously blocked by pelikan, the recovery of I in the blood does not occur even after 4 hrs. By perfusing the livers of normal rabbits with their own defibrinated blood, I is gradually increased in the blood, and reaches the normal value after 3-4 hrs., but by a similar perfusion through the liver previously blocked with pelikan, the formation of I occurs to a slight extent. When defibrinated blood is free from leucocytes, the recovery of fibrinogen by perfusion through the normal liver is slower than when the blood contains leucocytes. The perfusion of the liver with suspension of red blood corpuscles, with or without the serum, causes a delay in fibrinogen formation; at the end of 4 hrs., the amt. is still about 1/2 of the normal value. H. concludes that I must be formed chiefly from the leucocytes by the liver—at least in the rabbit.

S. Tashiro

## H—PHARMACOLOGY

A. N. RICHARDS

Enhanced action of morphine in experimental nephrosis after oral ingestion of magnesium sulfate. Arthur D. Hirschfelder. *Proc. Soc. Exptl. Biol. Med.* 30, 1057-8 (1933). In 8 rabbits, rendered nephrotic by the injection of 10 mg. of HgCl<sub>2</sub>, the plasma Mg was 1.89-2.17 mg. per 100 cc. Two hrs. after the oral administration of 2 g. MgSO<sub>4</sub> per kg. of body wt., the plasma Mg was 6.9-8.98 mg. per 100 cc. and at that time the subcutaneous injection of 30 mg. of morphine sulfate per kg. caused deep narcosis and death of 5 of the exptl. animals. In 4 controls the narcosis was less intense and recovery was complete in 3-4 hrs. Morphine should be administered only with the greatest caution to nephritic patients who have received MgSO<sub>4</sub> as a purgative.

C. V. Bailey

Configuration and anesthetic activity of aromatic alcohols. P. K. Knoefel and G. A. Alles. *Proc. Soc. Exptl. Biol. Med.* 30, 1070-7(1933).—Aq. solns. of aromatic alcs. applied locally were tested by the duration of anesthesia of the rabbit cornea and by the time required for the production of sensory block of the frog sciatic nerve. Increase in the length of the straight C chain and (or) the transformation to secondary and tertiary alc. increased the anesthetic activity.

C. V. Bailey

A comparative pharmacologic study of adsorption, distribution and excretion of injectable bismuth preparations. Marvin R. Thompson, C. I. Ichniowski and Bertrau S. Roberts. *Am. J. Syphilis* 17, 205-20(1933).—Five com. BI preps. were studied. It was found that

the greater the rate of absorption of Bi, the greater the toxicity. After toxic doses, the greatest tissue destruction appeared to occur in the liver and kidneys. B. C. B.

The toxic effect of arsenobenzene preparations on the liver. E. M. Lewin. *Arch. Dermatol. Syphilis* 168, 7-12(1933).—Liver cells respond to the toxic action of arsenophenamine by the increased production and secretion of bile; the cells absorb more bilirubin from the blood.

B. C. Brunstetter

Sensitivity to erythema and mineral economy. Gustav Papcke. *Arch. Dermatol. Syphilis* 168, 476-9(1933).—Peroral administration of an isoionic mixt. of Ca, K and Mg salts decreased the erythemic response of the skin to ultra-violet light radiation.

B. C. B.

The hydrogen-ion concentration of the topical preparations commonly employed in dermatology. Oscar L. Levin and Seymour H. Silvers. *Arch. Dermatol. Syphilis* 28, 149-52(1933).—With the quinhydrone electrode most local remedies were found to be acid or neutral in reaction. The reaction of solns. of Al acetate N. F. and solns. of boric acid is about that of the skin surface; their excellent buffer action makes them valuable in the treatment for acute and subacute inflammatory skin conditions and particularly for the exudative and vesicular dermatoses.

B. C. Brunstetter

Chemotherapeutic investigation. D. Binz. *Pharm. Monatsh.* 14, 173-4(1933).—A historical review.

H. M. Burlage

The active principle of onions (*Allium sativum*) which lowers blood sugar per os. I. Per Laland and Odd Wåge Havrevold. *Z. physiol. Chem.* 221, 180-96(1933).—Oral administration of various exts. of onions to rabbits and pancreatized dogs causes a lowering of blood sugar. The active principle is volatile with steam and sol. in  $H_2O$ . In addn. to the hypoglucemic substance there is present also a substance which raises blood sugar. This substance has been isolated but not examd. chemically. The lowest blood-sugar values are obtained after 1-5 hrs. With prolonged control expts. an after-effect has been observed in numerous instances. The various active fractions lose their activity when kept 1-10 days in the ice box, despite addn. of antiseptics. Even with large doses no symptoms of intoxication have been observed. By fractionation in high vacuum and subsequent recryst. a white cryst. substance m. 174° was obtained. The substance is S-free and gives characteristic pptn. and color reactions with most of the alkaloid reagents. S is present in the active fractions. It seems that the simultaneous presence of S and alkaloid is absolutely necessary for physiol. activity, since either one separately is inert. A pericard fraction from potatoes obtained by a modification of Sippola's method causes a lowering of blood sugar both orally and intravenously. The hypoglucemic principle is believed to be widely distributed in the plant kingdom.

A. W. Dox

The pharmacologic importance of furfuryl alcohol and furfural of coffee infusions. G. Joachimoglu and N. Khasuni. *Praktika (Akad. Athenon)* 7, 39-43(1933) (in German).—Furfuryl alc. in amts. of 40-150 mg. and furfural in amts. of 30-60 mg. given per os to human beings are without effect. Daily doses of 1 g. of furfuryl alc. or of furfural are without effect on dogs. Furfural acts 21 times and furfuryl alc. 11 times more powerfully than ethanol upon isolated rabbit intestine. Furfuryl alc. has a narcotic effect on goldfish 21 times that of ethanol. The corresponding figure for furfural is 63. With the limited amts. of these constituents present in coffee infusions no pharmacol. effect should mar enjoyment of this beverage.

Lucien Y. Dyrenforth

Poisoning by *Taxus* leaves. Aufrecht. *Pharm. Ztg.* 78, 1149(1933).—An unusual case of intoxication is cited involving the death of a horse from feeding on leaves of the yew, although it had been originally assumed that the animal succumbed from a dose of strychnine.

W. O. E.

Effect of calcium administration on the toxicity of carbon tetrachloride in mice. Frank Wokes. *Quart. J. Pharm. Pharmacol.* 6, 413-17(1933).—The oral toxicity of  $CCl_4$

for mice has been detd. A mortality of 50% is produced by a dose of approx. 8.75 ml. per kg. in mice on a normal diet contg. 0.4 to 0.5% of Ca. Variation in the Ca content of the diet from 0.2 to 2.0% of Ca produced no significant difference in the susceptibility of the mice to  $CCl_4$ . Oral administration of Ca lactate (0.15 or 0.3 g. of Ca per kg.) caused a decrease in the susceptibility, but failed to secure complete protection, although the dose was considerably higher than that recommended by Lamson, Minot and Robbins from expts. on dogs.

W. O. E.

Variation in the susceptibility of mice to certain anesthetics. J. C. Gage. *Quart. J. Pharm. Pharmacol.* 6, 418-25(1933).—Mice have been injected with a series of doses of 4 drugs used as basal narcotics: paraldehyde, avertin, nembutal and pemocton. Paraldehyde and avertin were given by rectum, nembutal and pemocton intravenously. Curves have been constructed for each drug showing the percentages of mice narcotized and killed when a series of doses is injected; the ratio of the 50% narcotic dose to the 50% toxic dose has also been calcd. for each. It is concluded from a consideration of the curves and the narcotic-toxic ratios that, for use as basal narcotics on mice, nembutal, pemocton and avertin are as safe as paraldehyde.

W. O. E.

Action of metallic salts on tissue cultures in vitro. J. Verne and C. Sannic. *Bull. soc. chim. biol.* 15, 1022-43(1933).—See C. A. 27, 3754.

L. E. Gilson

The lipoids of the parathyroid cells in certain experimental conditions, with particular reference to variations in the endocrine equilibrium. C. I. Parhon and Eugénie Trofimov. *Compt. rend. soc. biol.* 114, 65-7(1933).—The effects of thyroxine, pituitary hormones, insulin, Vigantol and KCl on the quantity and appearance of the lipid deposits in the parathyroid cells of rabbits are described.

L. E. Gilson

Extract of anterior hypophysis and adrenaline and morphine hyperglucemia. B. A. Housay and Elena Di Benedetto. *Compt. rend. soc. biol.* 114, 82-3(1933).—The hyperglucemic action of adrenaline or morphine is greater in dogs already made hyperglucemic by repeated large daily doses of ext. of anterior hypophysis than in untreated controls.

L. E. Gilson

The fixation of hydrocyanic acid by erythrocytes containing methemoglobin. E. Hug and A. D. Marenzi. *Compt. rend. soc. biol.* 114, 84-6(1933); cf. C. A. 27, 2216.—Dog corpuscles were treated with  $NaNO_2$ , phenylhydrazine or other reagents to convert the hemoglobin to methemoglobin, washed with physiol. NaCl soln., and treated with HCN soln. The methemoglobin prep. by  $NaNO_2$  fixed more than 1 but less than 2 eqvs. of HCN, that formed by the other reagents less than 1 equiv.

Mechanism of the antidotal action of sodium nitrite in hydrocyanic acid intoxication. *Ibid.* 86-7.—Dogs were used. The  $NaNO_2$  forms methemoglobin which fixes the HCN. There is some evidence that the HCN is then slowly converted to a thiocyanate and excreted in the urine. Combined action of sodium nitrite and sodium thiosulfate in the treatment of hydrocyanic intoxication in rabbits. E. Hug. *Ibid.* 87-9; cf. C. A. 27, 135.—Rabbits survived several times the lethal dose of HCN when it was followed by 0.02 g./kg.  $NaNO_2$ , then 1 g./kg.  $Na_2S_2O_3$ , given intravenously.

L. E. Gilson

Insulin and the protein sugar of the blood. G. Carrière and P. Martin. *Compt. rend. soc. biol.* 114, 135-6(1933).—Insulin has no effect on the total protein sugar of the blood. Protein sugar and serum proteins during insulin hypoglycemia in normal and diabetic cases. G. Carrière, P. Martin and Carbonnel. *Ibid.* 205-6.—Insulin does not affect the protein sugar of the plasma or the proteins of the serum.

L. E. Gilson

Changes in the blood of dogs caused by the venom of *Naja tripudians*. J. Vellard and M. Miguelote-Vianna. *Compt. rend. soc. biol.* 114, 143-4(1933).—The venom has no action on the blood proteins. It acts on the phosphatides, causing a decrease in the ability of the blood to coagulate. It causes a transient decrease in the natural hemolytic power of the serum.

L. E. G.

**Phlorhizin concentration of the plasma during phlorhizin diabetes in dogs with or without kidneys.** Albert Lambrechts. *Compt. rend. soc. biol.* 114, 146-7(1933); cf. C. A. 27, 5358.—When phlorhizin is injected intravenously in the dog 80% of it disappears from the blood in 15 min. A trace can be detected after 4 hrs. Ligating the renal pedicles to exclude the kidneys from the circulation does not change the above results. L. E. Gilson

**Chemotherapy of spontaneous and induced leptospirosis in white mice.** U. Thiry. *Compt. rend. soc. biol.* 114, 172-4(1933).—The effects of some compds. of Bi, As, Sb and Au were detd. L. E. Gilson

**Caryokinetic action of arsenic compounds on grafted tumors.** A. P. Dustin and C. Grégoire. *Compt. rend. soc. biol.* 114, 195-6(1933).—In mice the subcutaneous injection of 30 mg. Na cacodylate enormously increased the no. of cell mitoses in grafted Crocker type sarcoma. L. E. Gilson

**Choleretic action of marrubic acid.** Fernand Mercier and C. Rizzo. *Compt. rend. soc. biol.* 114, 263-4(1933).—Marrubic acid and Na marrubinate were prepd. from marrubium. Na marrubinate, given parenterally, had a marked cholagog effect on dogs. L. E. Gilson

**Effect of urethan anesthesia on the sensitivity of the respiratory center to direct chemical excitants.** André Le Grand and Norbet Herbaux. *Compt. rend. soc. biol.* 114, 271-2(1933).—In dogs, cats, rats and rabbits urethan anesthesia renders the respiratory center much less responsive to the direct application of NaCl. L. E. Gilson

**Ability of glutathione to penetrate the interior of the erythrocyte.** G. Litareczek and G. T. Dinischiotu. *Compt. rend. soc. biol.* 114, 285-7(1933); cf. C. A. 27, 2995. When 0.1% glutathione was added to whole blood *in vitro* at 37° most of it was fixed within the corpuscles at the end of 2 hrs. None of it could be recovered from the corpuscles by washing with physiol. salt soln. L. E. Gilson

**Influence of injections of potassium chloride and calcium chloride on the potassium-calcium ratio of dog blood.** L. Balilif and I. Ghercovici. *Compt. rend. soc. biol.* 114, 324-5(1933). L. E. Gilson

**Action of diiodotyrosine and inorganic iodine on the thyroids of guinea pigs given injections of the hormone thyreostimulin of the anterior hypophysis.** A. Wladyslaw Elmer. *Compt. rend. soc. biol.* 114, 348-50(1933).—Histological. L. E. G.

**Manometric study of cerebral circulation. Analysis of the vasoconstrictor action of adrenaline.** G. Ungur and M. Eek. *Compt. rend. soc. biol.* 114, 459-60(1933); cf. C. A. 27, 3524.—Action of adrenaline on the cerebral arteries of animals after enervation of the carotid sinus. G. Ungur. *Ibid.* 460-1. L. E. Gilson

**Hypotensive and vasodilator action of hordenine.** Raymond-Hamet. *Compt. rend. soc. biol.* 114, 476-8(1933). L. E. Gilson

**Hyperthermia-producing action of sodium picramate.** H. Casier. *Compt. rend. soc. biol.* 114, 551-5(1933). In pigeons and dogs picramic acid, 40-90 mg./kg. given intravenously, caused a marked hyperthermia. Its action is similar to that of dinitrophenol or dinitronaphthol but it is less toxic. L. E. Gilson

**Influence of the autonomic nervous system on the toxicity of lanadigloside.** Edgard Zunz and Gabriel Sanchez de la Cuesta. *Compt. rend. soc. biol.* 114, 558-60(1933). The effect of lanadigloside (lanadigin of Mannich, Mohs and Mauss, C. A. 25, 377) on cats under various conditions was studied. L. E. Gilson

**Anticoagulant action of germanin and moranyl *in vivo*.** Edgard Zunz, Gabriel Sanchez de la Cuesta and Olga Vesselsky. *Compt. rend. soc. biol.* 114, 560-2(1933).—In rabbits 75-200 mg. of germanin or moranyl given intravenously renders the blood non-coagulable for at least 45 min. after the injection by inhibiting the formation or action, or both, of thrombin. The larger doses cause some decrease in blood fibrinogen, platelets and alkali reserve. L. E. Gilson

**Pharmacodynamic properties of a new derivative of sparteine, sparteine ethylphenylbarbiturate.** Fernand

<sup>1</sup> Mercier. *Compt. rend. soc. biol.* 114, 615-17(1933).—The compd. has a marked neurodepressive effect, each constituent complementing the effect of the other. It acts on both the central and the vegetative nervous systems. L. E. Gilson

**Comparative action of strychnine and brucine on the fatigue of [frog] muscle.** M. Chambon and C. Salussola. *Compt. rend. soc. biol.* 114, 633-5(1933); cf. C. A. 27, 1048. L. E. Gilson

<sup>2</sup> **Toxicity of rivanol injected intravenously in the dog or rabbit.** M. Levrat, F. Morelon and Ollier. *Compt. rend. soc. biol.* 114, 643-5(1933). Rivanol is diethoxy-6,9-diaminoacridine. It acts like tryptaflavine but it is less toxic. L. E. Gilson

**Mechanism of the action of calcium and potassium salts injected into the cerebral ventricles.** L. Stern, J. A. Rossine and G. J. Chvoles. *Compt. rend. soc. biol.* 114, 674-7(1933); cf. C. A. 27, 2216.—The direct action of Ca on the vegetative nervous centers of the brain consists of an excitation of the parasympathetic centers (vasodilator and cardiac inhibitor) but a possible inhibitor effect on the sympathetic centers is not excluded. K excites the vasoconstrictor and cardiac centers and probably indirectly weakens the tonus of the parasympathetic centers. Expts. on dogs are described. L. E. G.

<sup>4</sup> **Action of diethylaminomethyl-3-benzodioxan (Fournéau 883) and coryanthine on the fever provoked by chemical agents.** J. Sivadjan. *Compt. rend. soc. biol.* 114, 848-70(1933). Both compds. antagonize the hyperthermia-producing action of  $\beta$ -tetrahydronaphthylamine or 2,4-dinitrophenol in rabbits or guinea pigs. L. E. Gilson

<sup>5</sup> **Vascular effects of the Peruvian drug called "chuchua." Raymond-Hamet and Colas.** *Compt. rend. soc. biol.* 114, 914-16(1933).—The drug has a powerful vasodilator action. Its botanical source is uncertain. An alkaloid is present. L. E. Gilson

**Action of methyl violet, uranium nitrate and sodium citrate on the formation of cerebrospinal fluid.** C. Massaut. *Compt. rend. soc. biol.* 114, 921-2(1933).—When injected intravenously in dogs none of the above compds. altered the compn. of the spinal fluid. L. E. Gilson

<sup>6</sup> **Acute response of guinea pigs to vapors of some new commercial organic compounds. VII. Dichloroethyl ether.** H. H. Schrenk, F. A. Patty and W. P. Yant. *U. S. Pub Health Repts.* 48, 1389-98(1933); cf. C. A. 24, 5071. The physiol. action, symptoms and pathol. findings are given. It was not possible at room temp. to attain a concn. that would kill in a short time. Exposure to 0.10% for 30-60 min. was dangerous to the life of guinea pigs; 0.01-0.02% is the max. amt. for 60 min. without serious disturbance; and 0.0035 is the max. amt. for several hrs. exposure without serious disturbance. This substance possesses definite warning properties of odor, as well as eye, nose and throat irritation in concns. that are dangerous in an exposure of 1 hr. or less. Concns. below 0.01%, dangerous for exposure periods of several hrs., possess an easily noticeable, though not especially objectionable, odor and little or no irritation. J. A. K.

<sup>8</sup> **Treatment of bis( $\beta$ -dichlorodiethyl)sulfide (mustard gas) burns with paraffin preparations.** Muntsch. *Gasschutz u. Luftschutz* 3, 269(1933).—M. comments on an article by Drugow (*Wojennomedizinski Zhur.* 2, 12-25(1931)) describing successful expts. on treating mustard gas burns with paraffin packing. M. states that the method is not new and was described by Taylor, *Military Surgeon* 46, 83(1920). A. L. Kibler

<sup>9</sup> **The influence of sinomenin and parasinomenin on the excretion of phosphoric acid in the urine of rabbits, together with a comparison of their influence with that of quinine.** Yoshizo Arakawa. *Folia Pharmacol. Japon.* 16, No. 3, 257-64(Breviaria 21-2)(1933).—The excretion of  $P_2O_5$  in the urine of rabbits after administration of the above drugs was measured by the titration method with uranyl acetate. In doses of 0.05-0.15 g. per kg. no change was noted in quantity or sp. gr., but  $P_2O_5$  excretion increased with the small dose and decreased with the

large one. The influence of sinomenin and parasinomenin on the excretion of sodium chloride in the urine of rabbits, together with a comparison of their influence with that of quinine. *Ibid.* 265-71 (Breviaria 22).—The excretion of NaCl was almost unchanged by the administration of the hydrochloride of the above drugs when given to rabbits in doses of 0.05-0.15 g. per kg. In the largest dose, a slight diminution was observed, quinine giving the greatest effect and sinomenin the least.

G. H. W. Lucas

**Experimental studies on mercury poisoning. III.** The influence of dextrose, calcium chloride and urea on mercury poisoning. Makoto Kuse. *Folia Pharmacol. Japon.* 16, No. 3, 278-91 (Breviaria 23-4) (1933); cf. *C. A.* 27, 3527.—Dextrose injected with novasurol produced a marked diuretic action and appeared to prolong the life of the animals. This protecting effect was exhibited also by CaCl<sub>2</sub> and urea. **IV.** The influence of some organ extracts and hypnotics on mercury poisoning. *Ibid.* 292-308 (Breviaria 24-5).—After novasurol injections in male rabbits, in about 4 hrs. urine flow was suppressed and the water and salt excretion was decreased. When pituitrin was given with novasurol a similar effect was noted. Administration of thyroxine caused a marked diuresis which was present even if it were given with pituitrin and novasurol; the NaCl excretion was much greater. Liver powder, "Leber Riken," caused a marked diuresis with increased NaCl output when given alone or with novasurol. Paraldehyde produced a similar effect. Na phenobarbital caused a fall in water and NaCl excretion, but when given with novasurol a marked diuresis followed with a great increase in NaCl. Pituitrin exerted a protective action in novasurol poisoning even up to 7 days after the administration of the novasurol. This protective action was shown also by paraldehyde, Na barbital and Na phenobarbital.

G. H. W. Lucas

The narcotic reinforcing action of yohimbine, quinine, cinchonine and ergotamine. Shigeo Yamachi. *Folia Pharmacol. Japon.* 16, No. 3, 309-24 (Breviaria 25) (1933).—While yohimbine, quinine, cinchonine and ergotamine in rabbits alone show no hypnotic action, small doses combined with narcotics so increase the narcotic action of such drugs as morphine and chloral that non-effective doses now become effective. This may be due to a sympathetic effect.

G. H. W. L.

The action of opium alkaloids on the blood sugar of rabbits. Holm Gyoku. *Folia Pharmacol. Japon.* 16, No. 3, 337-50 (Breviaria 26-7) (1933). Opium alkaloids 0.02 to 0.05 g. per kg. injected in the ear vein of rabbits increased blood sugar. This increase was more marked with heroin, codeine, morphine and apomorphine than with thebaine, papaverine, narceine and narcotine. Pantopon produced a marked increase. One perhaps must assume that the alkaloids with the phenanthrene nucleus produced a more noticeable effect than those with the isoquinoline nucleus. Thebaine is an exception to this rule; it produced violent convulsions. Its action on blood sugar may be attributed to its peculiar C linkage. The action of pantopon is especially interesting.

G. H. W. Lucas

Some atypical responses of rabbits to insulin. I. T. Zeebwer. *Am. J. Physiol.* 106, 273-82 (1933).—Six out of 40 unselected rabbits showed marked resistance to insulin. After removal of the thyroids 2 very resistant rabbits showed increased sensitiveness to insulin varying from 10 to 20 times, while 4 normal control rabbits showed an increased sensitiveness to insulin of 2.5 to 4.6 fold after thyroidectomy.

J. F. Lyman

The effect of atropine on adrenaline hyperglucemia in rabbits, decerebrated anterior to the pons. M. G. Forster assisted by A. K. Chalmers. *J. Physiol.* 79, 239-48 (1933).—Atropine affects the hyperglucemia which results from injections of adrenaline much in the same way as it does that which follows pontine decerebration or the feeding of sugar.

J. F. Lyman

Insulin and adrenaline. M. W. Goldblatt. *J. Physiol.* 79, 286-300 (1933).—Insulin and adrenaline produce an

increase in liver glycogen in the starving young rabbit. With insulin this increase may or may not be associated with a fall of muscle glycogen. Most frequently there is an increase in total glycogen. With adrenaline, in non-glucosuric doses, the increase in liver glycogen is always associated with a fall in muscle glycogen. The action of insulin is not accompanied by such an increase in blood lactate as would justify the belief that adrenal secretion is the cause of the increase in liver glycogen which always follows such action.

J. F. Lyman

**Studies of the pharmacology of local anesthetics. VI.** Comparison of metycaine with cocaine and procaine on experimental animals. Edward L. Swanson. *J. Lab. Clin. Med.* 19, 120-5 (1933); cf. *C. A.* 24, 5370.—Metycaine,  $\gamma$ -(2-methylpiperidino)-propylbenzoate-HCl, produces less depressing symptoms on the perfused frog heart than cocaine but is more depressant than procaine. The comparative effects on the general circulation and on the peripheral vessels are more like those of procaine than cocaine. The effect on the sensory nerve trunk is  $\frac{2}{3}$  as great as that of procaine and more than 3 times greater than that of cocaine. Its action on smooth muscle is more effective than either.

E. R. Main

**Phytopharmacology of stomach washings in various digestive disorders and pernicious anemia.** David I. Macht and Moses Paulson. *J. Lab. Clin. Med.* 19, 155-65 (1933).—A phytotoxic substance appears to be present in the stomach washings as well as in the serum and spinal fluids of patients with pernicious anemia (cf. *C. A.* 24, 2799). The degree of toxicity is indicated by the phytotoxic index, the ratio of increment in the length of seedlings of *Lupinus albus* grown in media containing the stomach washings to that of normal seedlings. The stomach washings obtained from normal persons and patients with gastric carcinoma and various gastrointestinal disorders (exclusive of pernicious anemia) have a phytotoxic index of 0.86. The washings from cases of true or essential achylia have an index of 0.85, while those from cases of pernicious anemia have an index of 0.50.

E. R. Main

**Methylene blue as an antidote for aniline dye poisoning.** Case report with confirmatory experimental study. John R. Williams and Frank E. Challis. *J. Lab. Clin. Med.* 19, 166-71 (1933).

E. R. Main

**Morphine pentobarbital anesthesia for dog surgery.** M. H. Seevers. *J. Lab. Clin. Med.* 19, 202 (1933).

E. R. Main

**Discussion of the so-called "acidosis-therapy" of malignant tumors.** Anna Goldfeder. *Z. Krebsforsch.* 39, 417-20 (1933).

E. R. Main

**The influence of acidosis-producing chemical preparations upon the growth or disappearance of transplantable tumors.** Anna Goldfeder. *Z. Krebsforsch.* 39, 421-35 (1933).—The injection of CH<sub>3</sub>COOH in combination with NH<sub>4</sub>Cl and CaCl<sub>2</sub> into tumor-bearing rats and mice caused the tumors to become smaller or disappear in 38% of the mice and in 51% of the rats. The injections were most effective if made during the early stages of tumor development. Injections of CH<sub>3</sub>COOH or of I alone were ineffective.

E. R. Main

**The pharmacodynamic action of mineral waters.** Gaston Dastugue. *Bull. sci. pharmacol.* 40, 532-45 (1933).—A review of the experiences by other authors, proving the necessity of the pharmacodynamic study in addition to the phys. and chem. analysis.

A. E. M.

**Ergotamine and quinine in glucemia.** G. De Boins. *L'ospedale maggiore* Dec., 1932; *Rev. sudamericana endocrinol. inmunol. quimioterap.* 16, 748.—Both alkaloids caused a decrease of blood sugar and inhibit artificial hyperglucemia to a certain degree. However, they do not increase the sugar tolerance and are useless in diabetes.

A. E. Meyer

**Diabetes treatment with insulin in oil.** Marcel Labbé, R. Boulin and Daunois. *Presse méd.* 41, 113-15 (1933).—Two preps. had no effect; one was moderately successful. The method shows many disadvantages.

A. E. M.

**The effect of vagotonin in arterial hypertension.**

Abrami, Santenose and Bernal. *Presse méd.* 41, 329-31 (1933).—Doses of 20-40 mg. vagotonin produce a slowly progressing reduction of the arterial pressure of long duration. It is especially effective in sympatheticotonic hypertension. It is ineffective in normal pressure.

A. E. Meyer  
Insulin in oil. II. Chabanier, C. Lobo-Onell and E. Lelu. *Presse méd.* 41, 377-8 (1933).—The oil soln. of insulin is of advantage only in very grave cases, where a continuous intake of insulin is required. Local reactions are present, but they are not prohibitive. A. E. M.

Magnesium sulfate in skin diseases. J. Azpuru España. *Rev. méd. Hondureña* 1, No. 3 (1930); *Rev. sudamericana endocrinol. inmunol. quimioterap.* 16, 763-4. The local application is described. A. E. M.

Spectroscopic method for the investigation of the action of poisons in the blood. Carlos L. Carbousschi. *Semana méd.* (Buenos Aires) 1933, 11, 1187-96. The general technique is described and the absorption spectra of blood treated with the following substances are given: CO, N<sub>2</sub>O, C<sub>2</sub>H<sub>2</sub>, H<sub>2</sub>S, PhNO<sub>2</sub>, and F salts; the spectroscopic characteristics of methemoglobin, hematin, hemochromogen and hematoporphyrin are discussed and also the intoxications, which may lead to the formation of these substances. A. E. Meyer

Gastro-duodenal ulcer treatment with pepsin injections. M. Royer. *Soc. medicina interna* Nov. 17, 1932; *Rev. sudamericana endocrinol. inmunol. quimioterap.* 16, 767. The results were not satisfactory. A. E. Meyer

The pharmacology of *Marrubium vulgare* L. Rizzo Cath. *Thesis Univ. Aix-Marseille* (1933); *Rev. sudamericana endocrinol. inmunol. quimioterap.* 16, 743. The crystal. bitter substance, *Marrubium*, does not exist in the fresh drug; it is probably formed from an essential oil. The plant contains a neutral saponin and 0.2% of choline. The ext. has a hypotensor action on intravenous application. It is effective as an expectorant and as a diuretic. A. E. Meyer

Pharmacology of anabesine. K. D. Sargin. *Khim. Farm. Prom.* 1933, 136-8. The expts. on the animals indicate that this alkaloid is very similar to nicotine in its action. It changes the blood pressure and affects the intestines and uterus the same way as nicotine and its general effects show that it can hardly be used in therapy. L. Nasarevich

Racemic lactic acid as a food. I. Its assimilation and toxicity in rabbits. J. A. Collazo, J. Puyal and Isabel Torres. *Anales soc. espn. fis. quim.* 31, 672-84 (1933). Lactic acid and glucose in the blood were detd. after giving lactic acid to rabbits by mouth. Per kg. of body weight 5-6 g. of the acid or of its salts produced no severe toxic effects. Symptoms (excitement, dyspnea, tachycardia) occurred when the lactic acid content of the blood exceeded 200-250 mg.%. E. M. Symmes

The influence of panax ginseng on serum calcium and potassium ions. II. The effects of convulsants on serum calcium and potassium ions of normal rabbits, and rabbits fed with ginseng. Kinci In. *J. Chosen Med. Assocn.* 23, 725-32 (German Abstract 61) (1933); cf. C. A. 26, 214; 27, 4590. The injection of camphor, picrotoxin and caffeine in doses producing a stimulation in normal rabbits increases the serum Ca ion, but the effect on the K ion is not decisive. Strychnine in stimulant or convulsant dosage also increases serum Ca. When a similar injection is made into rabbits fed with ginseng, these effects on serum Ca are more pronounced, showing that ginseng acts pharmacologically additive with convulsants. S. Tashiro

Sugar tolerance in experimental acidosis and the effect of insulin and vitamin B. Susumu Tatsuzawa. *Sei-i-kwai Med. J.* 51, No. 8, 1-16 (English Abstract 1-2) (1932).—The normal sugar-tolerance curve of the rabbit shows the max. at 10 min. after the glucose injection (4 cc. 25% soln. per kg.), and reaches the normal 2 1/2-3 hrs. The rabbits fed 2.438 g. of NaH<sub>2</sub>PO<sub>4</sub> in 35 cc. H<sub>2</sub>O (pH 4.3) twice daily for 3 days showed a marked disturbance in sugar tolerance, which can be corrected

by an injection of insulin, but not that of vitamin B (oryzanin soln.). Normal rabbits starved for 3 days show a slight sign of acidosis, having also more or less hyperglucemia, but their curve is normal. S. T.

Studies in phlorhizin. II. The relation between phlorhizin diuresis and glucosuria in normal rabbits and in rabbits with disturbance of the liver function. Toranoshin Onodera. *Sei-i-kwai Med. J.* 51, No. 8, 17-29 (English Abstract 2-3) (1932); cf. C. A. 27, 5825. When phlorhizin is injected into rabbits subcutaneously, the period of the max. glucosuria is preceded by that of the max. vol. of the urine; but with intravenous injection, the 2 periods coincide. In the latter case, however, the return to normality is quicker in urinary vol. than in that of urinary sugar. The disappearance of glucosuria in repeated phlorhizin injection requires a longer time than in a single injection. When phlorhizin is injected into rabbits, the liver of which is previously damaged by P or pelikan, the disappearance of glucosuria takes a longer time than when a similar injection is made to normal rabbits. III. Glutathione content of the tissues of phlorhizinized rabbits. *Ibid.* 30-7 (English Abstract 3).—The av. reduced glutathione contents of the normal rabbits are: liver 0.2424, kidney 0.0823, suprarenals 0.0193, muscle 0.0424, spleen 0.1249, testicles 0.0696, lungs 0.058 and heart 0.0320%. The av. reduced glutathione contents of tissues taken at the max. period of phlorhizin glucosuria are as compared to that of the normal: liver 11, kidney -1.0, muscle -2.4, heart -4.0, spleen +21, testicle +60.8, lung +22.0 and suprarenal +495.4%. The av. glutathione contents of tissues taken from the animal recovered from phlorhizin intoxication show some increase over normal in all the tissues. S. Tashiro

The role of diiodotyrosine in hyperthyroidism. Alexander B. Gutman, Lawrence W. Sloan, Ethel R. Gutman and Walter W. Palmer. *J. Am. Med. Assoc.* 101, 256-9 (1933).—Thirty cases of hyperthyroidism were treated with diiodotyrosine before subtotal thyroidectomy. The glands were analyzed for total I and thyroxine contents. The effects on basal metabolic rate and clinical symptoms in this series were compared with those of a series of 185 cases treated with inorg. iodides. The results are interpreted as emphasizing the similarities in these 2 types of iodide medication. R. P. Walton

Synthesis of pharmacologically important amines (Kindler, Hesse) 10. Synthesis of pharmacologically important carboxylic acids (Kindler, Peschke) 10.

## I. ZOÖLOGY

R. A. GORTNER

The effect of increasing the partial pressure of carbon dioxide in the environment on the gas exchange of *Chironomus laryae*. Otto Marnisch. *Z. vergl. Physiol.* 16, 76-88 (1932).—The R. Q. of larvae of *Chironomus thummi* (obtained in the summer) was independent of the partial pressure of CO<sub>2</sub>. The ant. of respiration was const. in the presence of 10-30% CO<sub>2</sub> and then decreased in proportion to the further increase of CO<sub>2</sub>; at 85% CO<sub>2</sub> it was about 1/2 that found in air. There is a discussion of the concept "ecological efficiency" which is measured by the range of CO<sub>2</sub> in which the organism can hold its ant. of respiration const. H. C. Brunstetter

Phosphatides. VIII. Fatty acids of the liver phosphatides and of the liver oil from *Rana temporaria*. E. Klenk. *Z. physiol. Chem.* 221, 259-64 (1933); cf. C. A. 28, 184. The characteristic feature of the fatty acids from the phosphatides and oil of frog liver, in comparison with that of higher vertebrates, is the low content of stearic acid and the relatively high content of highly unsatd. acids of the C<sub>20</sub> and C<sub>22</sub> groups. External factors such as nutrition and body temp. seem to det. the nature of the glycerides stored in the fat deposit. A. W. Dox

The fat of the fatty deposit of *Rana temporaria*. F. Klenk. *Z. physiol. Chem.* 221, 264-70 (1933).—By fractionation of the Me esters of the fatty acids, detn. of

their I nos., prepn. of the Br derivs. of the unsatd. acids, and crystn. of the hydrogenated acids, the presence of palmitoleic, linoleic, linolenic, arachidonic and clupanodonic acids was established. The palmitoleic acid probably originates by  $\beta$ -oxidation of higher unsatd. acids rather than by dehydrogenation of palmitic acid. Frog fat resembles the fat of fresh-water fishes and, like the latter, occupies a position intermediate between the fat of land mammals and that of marine fishes. A. W. D.

The hypophysis and the nitrogen excretion of toads. B. Braier. *Compt. rend. soc. biol.* 114, 80-2(1933).—In the toad, as in dogs, hypophysectomy causes a 80% decrease in N excretion. L. E. Gilson

The phosphocreatine and glutathione of the muscles of toads after hypophysectomy. A. D. Marenzi. *Compt. rend. soc. biol.* 114, 394-6(1933).—In toads ablation of the glandular lobe of the hypophysis produces an asthenic syndrome, a 30% decrease in the phosphocreatine and total P of the muscles, and a decrease in muscle and liver glutathione. Implantation of toad hypophysis or injection of ext. of bovine anterior hypophysis ameliorates all these effects. L. E. Gilson

Action of butylethylmalonylurea (Soneryl) on the excitability of the nervous centers of selachians. Albert (Hrc). *Compt. rend. soc. biol.* 114, 453-5(1933); cf. C. A. 27, 1938, 3580.—Action of butylethylmalonylurea on neuromuscular excitability [of frogs]. *Ibid.* 667-9.

Mineral excretion of leeches. Mme Braconnier-Favreudeny. *Compt. rend. soc. biol.* 114, 705-6(1933). L. E. Gilson

Toxicity to trout of potassium cyanide and *p*-cresol in water containing different concentrations of dissolved oxygen. Bernard A. Southgate, Frederick T. K. Pentelow and Ronald Hassindale. *Biochem. J.* 27, 983-5(1933).—At low O concns. the toxicity of the cyanide solns. increases rapidly with decrease in O concn. The same is true for *p*-cresol. Benjamin Harrow

The production biology of the Baltic Sea. Fritz Gessner. *Naturwissenschaften* 21, 649-54(1933).—A review of work on the plankton production in the Baltic related to the phosphate, nitrate and  $\text{NH}_4$  contents at different elevations and the presence of convection currents. B. J. C. van der Hoeven

Phytoplankton in the English lakes. II. The composition of the phytoplankton in relation to dissolved substances. W. H. Pearsall. *J. Ecology* 20, 241-62(1932); cf. *Ibid.* 18, 306. Diatoms occur when the waters are richest in nitrate, phosphate and  $\text{SiO}_2$  (in winter and spring). The appearance of *Asterionella* is correlated with higher concns. of phosphate, nitrate and

Ca than that of *Tabellaria fenestrata*. *Melosira granulata* shows a very definite correlation with waters rich in org. matter and in Myxophyceae, and forms maxima in waters of low Ca content. The green algae and desmids occur in summer when nitrates and phosphates are low. Desmids occur particularly when Ca and the nitrate phosphate ratio is low. *Dinobryon* appears to be favored by somewhat higher ratios of nitrate to phosphate; it may replace diatoms when the  $\text{SiO}_2$  or Ca content is low in spring.

Myxophyceae show a general correlation with high org. matter, and have the ability to grow rapidly in minimal quantities of nitrate and phosphate. *Oscillatoria tenuis* seems to have a higher Ca requirement than *Coccolophaerium kuetzingianum*. K. D. Jacob

Biology of the American cockroach (*Periplaneta americana* L.). H. Z. Klein. *Z. wiss. Zool.* 144, 102-22(1933).—The duration of the pre-oviposition period of *Periplaneta* has a very high temp. coeff., lasting 10 days at 26-8°, 15 days at 24-5°, and more than 6 months at temps. below 20°. Other stages in development are also markedly dependent on temp., some being completely suspended below 20°. K. V. Thimann

Local irradiation of the Triton embryo with ultra-violet light. Bernhard Durken. *Z. wiss. Zool.* 144, 123-62(1933).—The effects of local ultra-violet irradiation on developing embryos of *Triton taeniatum* are largely limited to the surface cells, probably on account of high light absorption by the yolk granules. The result is a pigmentation of the irradiated area followed by a contraction of the surface of the cell which forces out the contents. In the later stages of development irradiation kills the entire cell on which it falls, and the dead cell is either thrown out, or, in still older embryos, remains within the organism without undergoing further development. K. V. Thimann

Ecology of sand-dune beetles. H. Z. Klein. *Z. wiss. Zool.* 144, 240-61(1933).—The surface temp. of the soil largely det. the activities of Scarabaeidae and Tenebrionidae. Temps. below 11-12° at a depth of 10 cm. inhibit all activity. Activity begins at various temps. above 14°. A further increase of 7° above the min. leads in each case to the beginning of flight. K. V. T.

Castration studies in cladocerans. I. Development of secondary sexual characters in radium-irradiated males of *Daphnia magna*. Yasumasa Mori. *Z. wiss. Zool.* 144, 289-316(1933).—Exposure of young males of *Daphnia magna* to 15 mg. of  $\text{RaBr}_2$  through a film of 7 mm. of water causes degeneration of the sexual cells equiv. to castration, together with a decrease in metabolic rate and some general inhibition of growth. The influence of sex organs on growth can thus be conveniently studied. K. V. Thimann

## 12—FOODS

F. C. BLANCK AND H. A. LEPPER

Proteins of Indian foodstuffs. V. Alcohol-soluble protein of fenugreek (*Trigonella foenum graecum*). V. V. Sreenivasa Rao, B. N. Sastri and N. Narayana. *J. Indian Inst. Sci.* 16A, 85-7(1933).—Two prepn. of the prolamin from fenugreek obtained by different methods had nearly the same compn. The prolamin is characterized by a low basic N content and high percentages of cystine and tryptophan, thus resembling the alc.-sol. protein of leg. F. L. Dunlap

Food adulteration today. C. H. Manley. *J. Roy. Sanit. Inst.* 54, 214-18(1933).—Sulfites (600 pts. per million) in boiled sweets, cheeses colored by Sn and As, As in baking powders, starch fillers in potted meats, baking powders of only 1.5% available  $\text{CO}_2$ , are among the many violations reported. A. L. Elder

Concentrating liquids by freezing in a continuous process. Karl L. Ford. *Food Ind.* 5, 129(1933).—Equipment is described. C. R. Fellers

How to prevent caking in powdered foods. H. V. Moss. *Food Ind.* 5, 133(1933).— $\text{Ca}_3(\text{PO}_4)_2$  and basic  $\text{MgCO}_3$  gave

best results as anticakers in table salt and in powd. sugar when used at a concn. of 1 1/2%. Starch and  $\text{CaSO}_4$  were of little value. The point is made that the  $\text{Ca}_3(\text{PO}_4)_2$  is a valuable addn. to the av. human diet as a source of both Ca and P. C. R. Fellers

Making up color solutions. J. H. Toulouse. *Natl. Bottlers' Gas.* 51, No. 610, 55(1933).—Stock solns. of certified colors for food use will support the growth of yeast and bacteria. Four methods for maintaining sterility are: steam sterilization, Na benzoate with or without added citric acid,  $\text{EtOH}$  and citric acid. The latter is particularly adaptable to carbonated beverages. J. H. T.

Report of the Committee on Definition of Moisture Bases for Laboratory Reports. R. K. Durham. *Cereal Chem.* 10, 465-7(1933). L. H. Bailey

Report of the Committee on Definitions of Technical Terms. Washington Platt. *Cereal Chem.* 10, 463-4(1933). L. H. Bailey

Report of Committee on Methods of Analysis. C. E. Mangels. *Cereal Chem.* 10, 470-1(1933). L. H. B.

**Report of the Subcommittee on the Development of a Volumetric Copper Reduction Method for Sugar Determinations.** J. T. Flohil. *Cereal Chem.* 10, 471-6(1933).

L. H. Bailey

**Report of Committee on Testing Rye Flours.** L. H. Bailey. *Cereal Chem.* 10, 468 9(1933).

**Non-survival of red mold of the *Monilia sitophila* group at baking temperature.** C. B. Morison. *Cereal Chem.* 10, 462(1933).—The conidia and ascospores of this species of *Monilia* were killed at 70° exposure of 10 min. and at 60° exposure of 20 min. At 50° survival was noted after 30 min. exposure.

L. H. Bailey

**Eight years' work by the Montana Grain Inspection Laboratory.** Clyde McKee, W. O. Whitcomb, W. D. Hay and D. M. Peese. *Mont. Agr. Expt. Sta., Bull.* 270, 4 52(1933).—The protein test is considered the most important single, simple test in detg. the strength of wheat from a baking viewpoint. There is a definite increase in loaf vol. as the protein increases to 15%; above this percentage, there is no further increase in vol. Protein percentage should be reported at a standard moisture content of wheat. The protein content of wheat from adjoining fields varied by as much as 2%.

C. R. Fellers

**Effect of winter exposure in the stook on quality of wheat.** R. K. Larmour, J. G. Malloch and W. F. Geddes. *Can. J. Research* 9, 252-60(1933).—Samples of wheat were exposed in the stook over winter and threshed in the spring in 2 seasons. These spring-threshed samples were compared with check samples from the same lots that had been threshed in the fall. The exposed samples lost grade in 50% of the cases, and decreased in weight per bushel in practically all cases. The flour yield was generally increased slightly as a result of the winter exposure. In respect to baking quality 22% showed improvement and 40% showed damage. The change in grade and bushel weight do not correspond very closely with changes in baking behavior.

J. W. Shipley

**A comparison of various harvesting methods in respect to moisture and grade of the grain.** R. K. Larmour, W. F. Geddes and D. Cameron. *Can. J. Research* 9, 486-501(1933). In a moisture and grade survey of grain harvested by various methods in western Canada during the 1932-1933 season it was found that straight-combined wheat showed a greater percentage of tough and damp samples than either stook-threshed or swath-combined samples. Of 401 stook-threshed samples 3% was tough or damp; of 416 straight-combined samples 22% was tough and 3% damp; and of 211 swath-combined samples 8% was tough and 1% damp. With respect to grade, it was found that as a result of exposure to rains the av. grade lowering was least for stooked grain and greatest for swath-combined grain.

J. W. Shipley

**Wheat milling tests; awards and comments on R. A. S. show wheats, 1933.** G. W. Norris. *Agr. Gaz. N. S. Wales* 44, 502 6(1933).—Analytical data are given.

K. D. Jacob

**Identification of sitosterol palmitate in the ether extract of wheat flour.** A. Dangoumau. *Bull. soc. chim. biol.* 15, 1083-93(1933). Sitosterol palmitate crystd. spontaneously from concd. Et<sub>2</sub>O exts. of wheat flour. After repeated crystn. from AcOEt it formed irregular hexagonal plates m. 96.5°. Thirty-five references.

L. E. G.

**Effect of storage upon the bread-making qualities of Wyoming hard wheat flours.** Emma J. Thiessen. *Wyo. Agr. Expt. Sta., Bull.* 198, 3 27(1933).—An aging period of 1-3 months improved flour; little further change occurred for about 2 yrs. but after that deterioration set in and increased rapidly to the 4-yr. period. The water-absorbing power of the flour increased with age, and was most rapid when stored in sacks. A modification of the gluten probably occurs during storage.

C. R. Fellers

**Harvesting and drying rough rice in California.** Roy Bainer. *Calif. Agr. Expt. Sta., Bull.* 541, 3 29(1932). Rice having a high moisture content does not give high yields of head rice since it lacks resilience to withstand the milling process. Such rice is best artificially dried at temps. below 100°F. Paddy rice may be safely handled

in bulk or sacks if the moisture is below 15%. Too rapid drying of rice at high temps. in the sun produces sun-checks. Sun-checking in brown rice is a fair, though not pos., indication as to what milling yields may be expected.

C. R. Fellers

**Chemical compositions of New Mexico pinto and bayo beans.** Mary L. Greenwood. *N. M. Agr. Expt. Sta., Bull.* 213, 3-11(1933).—Twenty-four samples of pinto beans gave the following av. percentage compn.: protein 23.9, fat 1.1, total carbohydrates 63.2, ash 3.9 and moisture 7.9. Sixteen samples of bayo beans gave: protein 22.3, fat 1.3, total carbohydrates 65.6, ash 3.7 and moisture 7.1. Limited data indicate that the percentage of protein varies inversely with the yield of beans. Significant differences in compn. among samples grown in different sections of the state and at varying altitudes were not found.

C. R. Fellers

**Baking powder.** E. M. Bailey. *Conn. Agr. Expt. Sta., Bull.* 354, 762(1933).—Seven samples of baking powd. varied from 13.8 to 15.2% total CO<sub>2</sub>, and from 12.6 to 15% of available CO<sub>2</sub>.

C. R. Fellers

**Baking powder.** Simon Mendelsohn. *Food Manuf.* 8, 415-19(1933). Recent developments in the org. chemistry of baking-powder materials are described.

E. H.

**Action of milk and cleansing chemicals on the metals used in dairy equipment.** G. Keymeulen. *Bull. inst. agron. sta. recherches Gembloux* 2, 215-42(1933).—Test pieces of different metals and alloys used in the manuf. of dairy equipment have been put in contact with sour milk and sterilized milk either sep. or joined together by a rivet. Preference, in the following order, should be given to the use of glass-enameled equipment; stainless steels and Ni-Cr alloy no. 60; Al and its alloys; and Cu alloys nos. 58, 64 and 65. The riveted pieces proving highly resistant were: stainless steel-Ni with Ni rivets; stainless steel-tinned Cu with Fe rivets; tinned Cu-Ni with Cu rivets and tinned Cu-tinned steel with Cu rivets. A no. of cleansing agents were tested and it was found that the cleansings should be done with the following chemicals: a 1-2% soln. of either a liquid or solid product contg. Na<sub>2</sub>CO<sub>3</sub>, Na<sub>2</sub>SiO<sub>3</sub> and NaOCl for stainless steel, Cu and its alloys, Al alloy no. 46, Ni and its alloy no. 60, glass-enameled equipment; a 1 to 4% soln. of a solid product with a soda base and Na<sub>2</sub>SiO<sub>3</sub> for stainless steel, Cu, Al alloy no. 46, tinned equipment, glass-enameled equipment; a 1-4% soln. of a special solid product which does not attack Sn for tinned and glass-enameled equipment; a 1-4% soln. of a solid product probably composed of Na<sub>2</sub>CO<sub>3</sub>, Na<sub>2</sub>SiO<sub>3</sub> and NaOCl for tinned equipment, Ni and its alloy no. 60, Al and its alloys, glass-enameled equipment.

J. R. Adams

**Standard procedure for the bacterial analysis of milk.** A. H. Robertson. *N. Y. State Dept. Agr. & Markets, Ann. Rept.* 1931, 127 33(1932).—The directions have been made more detailed and sp. than the Standard Methods of the American Public Health Asscn.

C. R. Fellers

**Testing cow milk for pasteurization.** A. Tapernoux. *Compt. rend. soc. biol.* 114, 649-52(1933).—Discussion.

L. E. Gilson

**Thermophilic bacteria in milk pasteurized by the high-temperature short-time process.** M. W. Yale and C. D. Kelly. *N. Y. Agr. Expt. Sta., Bull.* 630, 3 23(1933).—Counts on 125 samples of market milk showed 10 4500 thermophiles per cc., with an av. of less than 100. The role of these organisms in pasteurization is discussed.

C. R. Fellers

**Certain biological factors related to tallowness in milk and cream.** P. H. Tracy, R. J. Ramsey and H. A. Ruehe. *Ill. Agr. Expt. Sta., Bull.* 389, 579 95(1933).—Incubation of milk contaminated with Cu at 68 90°F. retards the development of tallowness which normally occurs in such milk stored at 40°F. The incubation of milk at the above temps. previous to contamination with Cu retards the development of tallowness. Both yeasts and bacteria growing in milk retard tallowness. When milk contg. Cu is homogenized, the tallowy flavor is less apparent.

Incubation of cream contg. Cu greatly improves the quality of the resulting butter. Oxidation-reduction potential measurements on milk show (1) aseptically drawn milk develops a lower *Eh* reading upon storage at either 40°F. or room temp.; (2) the addn. of Cu salts causes the potential to rise rapidly toward the oxidation phase; and (3) bacteria or yeast cells cause a rapid reduction to take place in the milk. Similar results were obtained with cream. The metabolism of bacteria and yeasts plays an important role in control of tallowiness in dairy products and probably accounts for the general absence of tallowy flavors in pasteurized milks produced during the summer months. Lack of bacterial metabolism in raw milk probably accounts for the tendency for some pasteurized milk to become tallowy during winter.

**Controlling ropy milk outbreaks.** C. D. Kelly. N. Y. Agr. Expt. Sta., *Bull.* 631, 3-18(1933).—The outbreaks were caused by types of bacteria closely resembling *Aerobacter aerogenes*. Milk plant equipment may be sterilized by the use of steam, hot water and Cl so that the ropy milk organisms can be controlled. C. R. Fellers

**Detecting milk powder in frankfurters and sausages.** M. A. Meskil. N. Y. State Dept. Agr. & Markets, *Ann. Rept.* 1931, 120-3(1932).—Milk powder is best detected by detg. lactose by the A. O. A. C. method and confirming the presence of lactose by the osazone test. A simple test for mucic acid also is given. C. R. F.

**Some of the factors affecting the body and texture of ice cream.** B. E. Horrall. Ind. (Purdue) Agr. Expt. Sta., *Bull.* 375, 3-12(1933).—Processing the mix at 165° and 180°F. gave the best body and texture, while the 150°F. processing gave the poorest texture. The fat clumping, basic viscosity and time to obtain the desired overrun decreased as the processing temp. decreased. There was very little difference in the body and texture in ice cream when the mix was aged 4 and 24 hrs. Ice cream stored at -10°F. had the best body and texture during a 30-day holding period, while that stored at 10°F. had the coarsest body and texture and developed a stronger storage flavor. When ice cream is drawn from the freezer at the hard stage, the body is smoother and the texture closer, than if drawn at a soft stage. The smoothness of ice cream increased with increased content of gelatin.

**Bacteriology of butter. V. Studies on microorganisms in churns.** H. C. Olson and B. W. Hamner. Ia. Agr. Expt. Sta., *Research Bull.* 159, 59-120(1933); cf. C. A. 26, 1355.—The agar disk method showed great variations in the bacterial content of churns in different milk plants. The use of NaOCl or other Cl derivs. in the rinsing water greatly reduced the nos. of bacteria in churns. Nearly all of the 61 cultures of bacteria isolated from churns produced objectionable changes in butter when stored at a temp. of 59°F. The micrococci and non-sporulating bacilli caused more serious flavor changes than the aerobic sporulating bacteria. Rancidity was the most common defect noted as a result of bacterial changes in butter. C. R. Fellers

**The  $p_H$  of fresh and storage eggs.** S. E. Erikson, R. E. Boyden, J. Holmes Martin and W. M. Insko, Jr. Ky. Agr. Expt. Sta., *Research Bull.* 335, 359-94(1932); cf. C. A. 27, 2918.—Pen averages gave little variation in  $p_H$ , the greatest differences being 7.95 and 6.31. The pens were given different feeds but cod-liver oil, sunshine or blue grass range showed no significant effect on the  $p_H$  of the eggs. Storage eggs showed greater variation, i. e., 6.9-8.8. The av.  $p_H$  of yolk and white of fresh eggs was 6.32 and 7.92, resp. The av.  $p_H$  of yolk and white of storage eggs was 6.98 and 8.9, resp. C. R. Fellers

**Beating properties of egg white.** W. C. Henry and A. D. Barbour. Ind. Eng. Chem. 25, 1054-8(1933).—A mech. power beater with speed control was used to beat eggs to obtain vol. increase at 20° at a speed of 1080 r. p. m. Thin egg white has better initial beating properties than the thick fraction, but loses vol. on continued beating. The addn. of water to egg white greatly increases the

resulting vol. after beating. Oil reduces vol. under similar conditions. The increase in vol. after beating increases with decreasing H-ion concn. of the mixt., this effect becoming more pronounced above  $p_H$  10.

**Copper, iron and manganese content of fish.** T. B. Parks and E. R. Rose. *J. Nutrition* 6, 95-8(1933).—The content of Cu in both the fresh and salt water fish averaged about 2.5 mg. per kg. of moist fish. Salt water fish contain about 12% more Fe than the fresh water species. Species of fish with dark tissues contain approx. 75% more Fe than species with light colored tissues. Fish muscle contains small amts. of Mn, the content varying from 0.10 to 0.31. The Fe varied from 3.4 to 9.6; and the Cu from 1.4 to 4.1 mg. per kg. Twenty species of fish were exand. C. R. Fellers

**Free hydrogen-ion concentration of oyster liquor and the ratio of total solids to free liquor of oysters.** Kathryn Breen. N. Y. State Dept. Agr. & Markets, *Ann. Rept.* 1931, 124-7(1932).—Data obtained on 237 samples of oysters show that generally a high  $p_H$  value is accompanied by a low free-liquor content, and a low  $p_H$  with a high free-liquor content. The  $p_H$  value is more indicative of how long and at what temps. the oysters have been stored. If the  $p_H$  is 5.8 or above, water has probably been added. If the  $p_H$  is less than 5.8, the detection of small amts. of water becomes more questionable. C. R. Fellers

**Changes occurring during freezing and thawing of fruits and vegetables.** M. A. Joslyn and G. L. Marsh. Calif. Agr. Expt. Sta., *Bull.* 551, 3-40(1933); cf. C. A. 27, 4319. C. R. Fellers

**Canning fruit and vegetables.** Geo. Cadbury. *Chemistry & Industry* 1933, 885-91.—A paper discussing briefly the tech. aspects of the canning industry. F. L. D.

**Pectin from dried grape marc.** A. Mehlitz. *Konserven-Ind.* 19, 320-1, 325-7(1932).—From the material contg. 0.5-1.5% pectin, calcd. as Ca pectate, only an impure powder contg. 14% ash and 31.3% of Ca pectate could be obtained by triple extn. and pptn. with EtOH. Fermentation may have diminished its gelatinizing power. B. C. A.

**Citrus fruit juice.** J. F. Cooper. *Canning Age* 13, 468-90(1932).—The bitter taste developing in stored citrus juice is due to the presence of naringin in grapefruit juice and to hesperidin in the orange. The content of these glucosides in the fruit decreases with maturity. Changes in color in these juices are due to the presence of peel oil, a certain amt. of which, however, causes the solid particles to remain in suspension in the juice. B. C. A.

**Tomato juice.** E. M. Bailey. Conn. Agr. Expt. Sta., *Bull.* 354, 791-3(1933).—Ten samples of canned or bottled tomato juice showed the presence of no added color or preservatives; the NaCl content varied from 0.29 to 0.87, and solids from 5.4 to 8.3%. C. R. Fellers

**Orange extracts.** E. M. Bailey. Conn. Agr. Expt. Sta., *Bull.* 354, 769-71(1933).—Thirty-one samples of com. orange exts. showed variations in orange oil by vol. of 4.1-16.2. Orange ext. should not contain less than 5% of orange oil. Terpeneless orange ext. is prepd. by shaking oil of orange in dil. alc. or by dissolving terpeneless oil of orange in dil. alc. It corresponds in flavoring strength to orange ext. C. R. Fellers

**Sugar content of fruit sirup.** P. Berg. *Konserven-Ind.* 19, 313-15(1932).—The ext. content of the com. samples of com. fruit sirup was 64.6-72.9%. B. C. A.

**Methods of sirup preparation.** J. H. Buchanan. *Natl. Bottlers' Gaz.* 51, No. 610, 48(1933).—A review of sirup making for carbonated beverages. A nomograph is given for calg. amts. of sucrose and water for sirups of varying densities and time table for sterilizing effect of citric acid in stored sirups. J. H. Toulouse

**Variations in arsenical spray residue caused by sampling.** Alice Waterhouse. N. Y. State Dept. Agr. & Markets, *Ann. Rept.* 1931, 97-9(1932).—A sample of apples contg. spray residue was divided into 2 parts, the first consisting of the apples showing the greatest amt. of visible residue, and the second, the remainder of the apples.

The 20 individual analyses made on fruit from the first sample showed variations in grains of  $As_2O_3$  per lb. of 0.005-0.05; and the second sample variations of 0.004-0.047. Variations in results on the same sample greater than 20-25% are excessive. Visual examn. cannot be relied on to give apples contg. the most As residues.

C. R. Fellers

**Prune maturity and storage.** Lowell R. Tucker and Lief Verner. Idaho Agr. Expt. Sta., *Bull.* 196, 3-20 (1932).—Maturity changes in the Italian prune are characterized by softening of the flesh, development of color pigments in the skin, increase in sugar content, and decrease in acid content. Firmness is an accurate measure for judging the keeping qualities of prunes in storage. Firm prunes with a high sugar content when picked keep as well as prunes of the same firmness with a low sugar content, and also have a better flavor. Prunes keep better if placed in storage immediately after picking. In general, prunes keep approx. as well in storage as they do if left on the tree.

C. R. Fellers

**Prune maturity and storage.** L. R. Tucker. Idaho State Hort. Assoc., *Proc. 36th Ann. Conv.* 1931, 110-15.—Data are given on the sugar content of prunes at different stages of maturity. The ratio sugar:pressure (required to rupture the fruit) gives a more dependable measure of ripeness than does either test alone. The russeted areas on damaged prunes are higher in sugar than the normal areas, whereas the sunburned areas are low in sugar.

K. D. Jacob

**Maple products.** L. J. Cross. N. Y. State Dept. Agr. Markets, *Ann. Rept.* 1931, 93 4(1932); cf. C. A. 26, 868.—The Cowles malic acid method for the examn. of maple products gave the best results for routine work. Darker colored maple products, in general, contained more malic acid and ash than the lighter colored products. The chem. compn. of the various maple products examd. showed great variations.

C. R. Fellers

**Estimation of vegetable oil in mayonnaise.** J. L. Perlman. N. Y. State Dept. Agr. & Markets, *Ann. Rept.* 1931, 118-20(1932).—In fresh mixed eggs the lipoids are present to the extent of 37.5 times the av. lipid  $P_2O_5$  content. Hence, the percentage of lipid  $P_2O_5$ , times the factor 37.5 subtracted from the total fat-and-lipoids value, will yield a reasonably accurate approximation of the vegetable oil present in a mayonnaise.

C. R. Fellers

**Mayonnaise analysis; special reference to its egg constituents.** J. L. Perlman. N. Y. State Dept. Agr. & Markets, *Ann. Rept.* 1931, 101-12(1932); cf. C. A. 26, 5353.—A study of several methods for the detn. of total fat and lecithin-phosphoric acid in mayonnaise revealed a condition of lecithin decompn. present in most of the samples sold on the retail market, which renders a true estn. of the egg-yolk content somewhat uncertain. The alc.- $CHCl_3$  extn. method yields the highest fat and the highest lecithin-phosphoric acid values in the fresh samples. A new species of bacteria, *B. lekitosis*, was isolated from decomp. egg yolk, and this organism forms an enzyme capable of decomp. lecithin. The diagnostic value of the lecithin-phosphoric acid detn. for ascertaining the percentage of egg yolk in mayonnaise is questionable in samples over 30 days old and stored at ordinary temps.

C. R. Fellers

**Activated carbon for water treatment (carbonated beverages).** F. S. Lammers. *Natl. Bottlers' Gaz.* 51, No. 614, 58(1933).—A review, with applications to carbonated beverages.

J. H. Toulouse

**Using anhydrous dextrose in carbonated beverages.** J. H. Buchanan. *Natl. Bottlers' Gaz.* 51, No. 613, 58(1933).—A table is given for replacement of sucrose with dextrose. Advantages are: Greater freedom from micro-organisms, better body and flavor transfer, no change in taste because of inversion.

J. H. Toulouse

**Sulfites in horseradish.** M. A. Meskil. N. Y. State Dept. Agr. & Markets, *Ann. Rept.* 1931, 100-1(1932).—The A. O. A. C. method for detg.  $SO_2$  is sufficiently accurate for the detection and estn. of  $SO_2$  in com. samples of

ground horseradish. The mercaptans present in horseradish are apparently active only in the very fresh roots and even then not in amts. sufficient to be misleading.

C. R. Fellers

**The influence of time of cutting on the yield of highmoor meadows and nutrient content of highmoor hay.** F. Brune. *Landw. Jahrb.* 76, 767-82(1932).—The nutrient value decreases with age after flowering. Data on the nutrient value and results of feeding trials of hay cut at various times are given.

George R. Greenbank

**The effect of a varying percentage of clover in pasture field grass upon its chemical composition and feed value.** Nils Hansson. *Nordisk Jordbrugsforskning* 1932, 262-7.—Results of chem. analyses and digestibility tests of pasture field grass contg. 0.7-100% of clover show that the optimum percentage of clover lies between 15-20 and 40-50% referred to dry samples. The upper limit results from the fact that higher percentages have an unfavorable effect upon the digestion of the animals, and upon the consistency of the butter, while at lower percentages the feed does not contain the necessary min. of digestible albumin.

H. C. M. Ingeberg

**Ensilage competition—Hills District.** R. Hill. *J. Dept. Agr. S. Australia* 37, 54-9(1933).—Chem. analyses are given of 12 ensilage samples prepd. from different plants and treated under different conditions. The  $H_2O$  content varies from 69 to 82% but is standardized at 75% for purposes of comparison of the products.

M. S. A.

**Edible fish meal. Its composition and value with instructions for its use in feeding cattle, swine, sheep and poultry.** Rodney DeLisle. *Brit. Columbia Fisheries Dept. Victoria* 80 pp.(1930).—A comprehensive review. In general, fish meal is a good source of protein and minerals.

C. R. Fellers

**Waste-disposal systems in food plants (Fielder) 14. Detn. of sulfurous acid [in dried fruits] (Nichols, Reed) 7. Removal of spray residue from canning peaches (Plank) 15. Starch and bread making (Katz, van Italic) 28. Recovering protein from press cake (Kozanov, Smirnova) 27. Inhibiting effect of certain substances on the oxidation of sulfurous acid [in dried fruits] (Mitchell, et al.) 7. Colloid chemistry of boiled rice (Sakurada, Futino) 2. Detn. of F [in foods] (Wichmann, Dahle) 7. Detg. moisture [in flour, corn, etc.] (Brit. pat. 396,098) 13. Fats and oils (lard, beef fat) (Brit. pat. 395,971) 27. Centrifugal sepn. of starch and gluten (U. S. pat. 1,933,119) 1. Drier for milk (U. S. pat. 1,933,819) 1.**

**Food product.** Camille Groll and Édouard Stirnimann. *Fr.* 749,742, July 28, 1933. A food contg. vitamin C, suitable for children, is made by introducing into freshly condensed and sugared milk plants such as cress grown under perfectly sterilized conditions. The seeds are freed from bacteria and grown on a sterilized absorbent material such as felt or sawdust and sprinkled with sterilized water in a sterilized atm.

**Food preparations.** "Tres" Gyógyszer-Végyészeti Ipari és Kereskedelmi R. T. *Brit.* 396,150, Aug. 3, 1933. Gluten or glutinous products are made from the seed kernels of the carob bean tree or of related plants of the groups Mimosaceae and Caealpineaceae, or the sepd. germinal substance thereof, by methods similar to those used in making such products from wheat, e. g., kneading with  $H_2O$ . Bleaching may be effected by treating the raw material or glutinous products with dil. acids, e. g., citric, tartaric or oxidizing agents, e. g., hypochlorites, Na *p*-toluenesulfonchloroamide, peroxides and per salts. The wet gluten ext. may be intermittently sterilized or dried at room temp. or *in vacuo* at 40-50° and subsequently ground. Food preps. may be made by baking a paste of the gluten to which flour, albuminous food, cellulose, starch or gluten denatured by heating may be added. Cf. C. A. 27, 4320.

**"Molasses-cake" flour.** John D. Duff and Louis E. Dietrich (to P. Duff & Sons, Inc.). U. S. 1,931,892, Oct. 24. Molasses and a shortening are first mixed and

heated together to produce an emulsion in which the shortening is melted and thoroughly incorporated with the molasses, flour is then added while heating, and the resulting dough is reduced to a dry powd. condition and a dry gasifying agent such as  $\text{NaHCO}_3$  is added.

**Preserving bread, etc.** Établissements J. J. Carnaud & Forges de Basse-Indre. Brit. 396,634, Aug. 10, 1933. In preserving bread, etc., the dough is mixed with a hygroscopic substance, e. g., glycerol, glucose,  $\text{MgCl}_2$ , and baked in a container onto which a cover is clinched. The cover is completely sealed by soldering while the container is hot and the container is again heated and allowed to cool slowly.

**Food product\* from milk solids, etc.** Frederick S. Beverley (to Kraft-Phenix Cheese Corp.). U. S. 1,931,813, Oct. 24. A product of sufficiently solid consistency to be served with a knife without crumbling or shattering comprises milk solids (contg. the albumen in substantially its natural chemical condition) about 65, water about 15 and sugar about 20%.

**Device for estimating the fat in milk, etc.** Firina Carl Zeiss. Ger. 577,577, June 1, 1933.

**Antirachitic milk.** Gustav Kersten and Otto K. Schultz. Ger. 577,531, June 1, 1933. This prepd. by sepp. the cream, subjecting this to an ultra-violet irradiation, and finally mixing the irradiated cream with the skim milk.

**Rotary drum apparatus suitable for drying milk, etc.** Jorgen Braback. U. S. 1,933,960, Nov. 7. Various structural and operative details are described.

**Emulsifying appliance for the production of artificial cream, etc.** Leonard W. Taylor and Thomas N. Osborne (trading as Taylor & Osborne). Brit. 396,985, Aug. 17, 1933.

**Homogenizing apparatus, especially for making cream-like compositions from milk and butter or butter substitutes.** Frederick J. Clarke and Samuel G. Clarke. Brit. 396,014, July 25, 1933.

**Coloring butter, etc.** Carl von Kanel. Swiss 162,130, Aug. 16, 1933. Butter, margarine and other fats or oils are colored by an ext. of *bixa orellana* tinted with turmeric.

**Oleomargarine or butter substitute.** Arthur E. Seymour. U. S. 1,934,564, Nov. 7. Melted edible oils are mixed with milk at a temp. slightly below the solidifying temp. of the oils to produce an emulsion in which a slight rise in temp. due to release of the latent heat of fusion of the oil mixt. is then permitted; the emulsion thus formed is solidified or crystd. while the temp. is so raised by combining it with cold ripened skimmed milk; the liquid is drained off; warm ripened milk is added to the crystals,

followed by churning, drawing off liquid, salting and working. App. is described.

**Apparatus for preparing fresh fruits such as apples or pears for the market by spraying with solutions such as those of cleansing agents to remove toxic spray residues.** Douglas C. Morris and Leonard O. Cockrill (to Brodex Co.). U. S. 1,932,827, Oct. 31. Various structural and operative details are described.

**Retarding damage by mold growth of fruits and vegetables.** Hugh F. Rippey (to Laucks Laboratories, Inc.). U. S. 1,935,509, Nov. 14. After harvesting, fruits or vegetables such as apples, etc. (substantially free from poisonous spray residue), are treated with an aq. soln. contg. at least 2% of  $\text{Na}_2\text{PO}_4$ .

**Clarifying grape juice by use of pectic enzymes.** John J. Willaman and Zoltan I. Kertesz (to Rohm & Haas Co.). U. S. 1,932,833, Oct. 31. The juice may be treated with enzymes from *Aspergillus niger* or the like.

**Jelly preparations.** California Fruit Growers Exchange. Brit. 396,749, Aug. 8, 1933. A confectionery jelly prepd. from sugar, pectin and sufficient citric, tartaric or other acid to make it tart is rendered slow-setting by adding a small quantity of a sol. salt of a strong base and weak acid, e. g.,  $\text{NaOAc}$ ,  $\text{Na}_2\text{CO}_3$ ,  $\text{NaHCO}_3$ ,  $\text{Na citrate}$ .

**"Soluble coffee."** Louis G. Copes, Carl H. Haurand and Emily Kellogg (to The Best Foods, Inc.). U. S. 1,932,769, Oct. 31. Green coffee beans are preheated at a temp. above about 95° and below the roasting temp. for a sufficient time to render insol. in water those substances which would be made insol. by the subsequent evapn. and roasting of the water ext. The preheated coffee is then extd. with water, the ext. is filtered and dehydrated, and the residue is roasted.

**Coffee extract.** Louis G. Copes (to The Best Foods, Inc.). U. S. 1,933,040, Oct. 31. Crushed raw coffee beans are extd. first with cold water and then for a short time with hot water; the extracts thus obtained are combined, evapd. to dryness, and the residue is roasted.

**Metallic high-pressure container suitable for use in carbonating beverages.** Kurt W. H. Barthelmes (to K. Barthelmes Mfg. Co.). U. S. 1,933,135, Oct. 31. Structural features.

**Animal food.** Commanditaire Vennootschap Onder de Firma P. H. Kaars Sijpesteijn. Fr. 749,595, July 26, 1933. Colloidal Fe oxide (contg. about 66%  $\text{Fe}_2\text{O}_3$ ) is added to animal foods.

**Poultry feed.** Ernst Häberli. Swiss 161,303, July 1, 1933. A nutritive food especially for poultry, is prepd. by treating casein with a Ca compd. and mixing the product with foods such as bone meal, fish meal, grain, etc.

### 13 - GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

**Cross section through the inorganic heavy-chemical industry, 1932-3.** Bruno Waeser. *Chem.-Ztg.* 57, 833-6, 854-5 (1933). E. H.

**Determination of the hardness of technical adsorbents.** Franz Krezil. *Z. ges. Schiess-Sprengstoffw.* 28, 382-4 (1933). Methods are described for testing adsorbents, such as charcoal, for resistance to abrasion or crumbling by pressure, impact, friction and heat. A. L. Kibler

**Flow of fluids in conduits.** L. D. Williams. *Ind. Eng. Chem.* 25, 1316-19 (1933). The methods of calcg. pressure drops accompanying the flow of fluids in conduits are summarized and reduced to simplest form for engineering use. L. W. T. Cummings

**Investigation on evaporation and the application of the test results to evaporator construction.** Heinrich Vorkauf. *Chem. App.* 20, 13-15, 33-5 (1933). Investigations of various operating and design factors showed that the evapn. of liquors is affected by the vapor space height, the height of the liquid level above the steam inlet and the pressure. For a fixed vapor space the expression for the allowable load is:  $R_v = R_{v1} + 1/(1 + 1.1H_w)^4$ , where  $R_v$  has the dimensions cu. m./cu. m. hr.;  $R_{v1} = 500 +$

$40/(0.01 + H_D \sqrt{H_D})$  (cu. m./cu. m. hr.), where  $H_D$  = height of vapor space and  $H_w$  = height of liquid level above the vapor inlet. These formulas are valid for atm. pressure only. For other pressures  $R_v$  must be multiplied by the pressure coeff.  $f$ . Charts are presented which relate  $R_v$  and  $(f \times R_v)$  directly. When the vapor is introduced above the liquid level these formulas cannot be used; an empirical value of 7500 (cu. m./cu. m. hr.) has to be used for  $R_v$ , which is corrected for other pressures in the usual manner. Exptl. results in graphic form are presented for the relations between load and vapor space, moisture content of vapor and load, load and pressure, and load and concn. of liquor. The liquids tested were pure  $\text{H}_2\text{O}$ , and solns. of various concns. of  $\text{NaOH}$ ,  $\text{Na}_2\text{SO}_4$ ,  $\text{Na}_2\text{CO}_3$ , and  $\text{NaCl}$ . Sample calcs. are made and diagrams of various types of construction are presented. Karl Kammermeyer

**The load capacity of the surface of boiling liquid in the evaporation process.** Martin Strübin. *Chem. App.* 19, 148-7, 157-61 (1932). A math. treatment of the deviations from the ideal evapn. process and of the equl. of suspension for the entrained water particles in the vapor

stream. The detn. of the position of the limit plane of suspended particles is an indication of the required height of free vapor space over the liquid and shows that the free-vapor-space requirement increases rapidly with increasing load and increasing sp. vol. of the vapor. Neither the wt. % moisture content of the vapor nor the height vapor space is affected by the sp. gr. of the vaporizing liquid. The following equations are derived (1) for the velocity of rising vapor  $Cv = (G \times v) / (3600 \times F)$ , where  $G$  = wt. evapd.,  $v$  = sp. vol.,  $F$  = cross-sectional area, (2) for the limit diam. of the suspended particles (spheres),  $\delta = 6/4(v^2(2g \times v \times \delta_1))$ , where  $\delta_1$  = sp. gr. of liquid, (3) for the position of the limit plane of the suspended particles  $h = (v^2/2g)$ ; (4) for the moisture content of the vapor which can be expected  $x = 0.0031 \sqrt{G} \sqrt{v}$ , where  $G$  =  $G/F$  and (5) for the vapor space for vertical evaporators  $V' = (G^2 v^2 / 3600^2 2g)$ . Exptl. results for water and MeOH at various pressures are presented. Seven references.

K. Kammerneyer

**Surface extension of liquids in gas washing** L. Piatti. *Kolloid-Z.* 65, 122 (1933). Patent review, subdivided on the basis of (a) uninterrupted production of new surface, (b) small liquid drops, (c) change of surface tension and viscosity of absorbent.

Arthur Flischer

**A study of entrainment in a forced-circulation evaporator.** Oren C. Cesna and Walter L. Badger. *Am. Inst. Chem. Eng.*, Roanoke Meeting, Dec., 1933 (preprint) 23 pp. —The entrainment of liquor by the vapor in an evaporator of the forced-circulation type was studied and the relation between the quantity of liquor carried by the vapor and the conditions maintained within the evaporator was detd. The amt. of entrainment in a forced-circulation evaporator when using a non-foaming liquid is given by the equation  $E = (\rho/\rho') \lambda' (\rho \mu v^2 / \rho' \mu' \lambda')^{1/2}$ . The  $\lambda'$  function in general follows the form of the plot shown in the paper. The actual values given for the function, however, apply only for a liquid with a surface tension and viscosity essentially the same as those of water and for an evaporator whose dimensions in the vicinity of the deflector have the same relation as those of the evaporator used in this study and shown in graphs.

C. L. Mantell

**The isothermal flow of liquid layers.** C. M. Cooper, T. B. Drew and W. H. McAdams. *Am. Inst. Chem. Eng.*, Roanoke Meeting, Dec., 1933 (preprint) 12 pp. The use of wetted-wall towers in connection with such processes as absorption, rectification and humidification lends importance to the relationships that describe the motion of thin layers of liquid flowing under the action of gravity over wetted surfaces. The radii of curvature of these surfaces are usually so great relative to the thickness of the fluid layer that the problem is essentially that of a broad, shallow, open stream on a flat plate. The paper is an exptl. study over the velocity ranges below those usually met by customary hydraulic equations. The exptl. method is outlined and the data are compared with theoretical formulas.

C. L. Mantell

**The development of air conditioning in industrial, residential and public buildings; its effect on human beings, the factors which enter into its design.** P. I. Davidson. *Am. Inst. Chem. Eng.*, Roanoke Meeting, Dec., 1933 (preprint) 69 pp. —The paper discusses the history of air conditioning, its application to the textile industries and rayon, the tobacco industries, the manuf. of asbestos, ceramics, food products, fruit ripening, the packaging of effervescent salts and the manuf. of rope. Investigations on the effect on health, comfort and efficiency are reviewed. The major share of the paper treats of design problems of air conditioning, the source and nature of the heat load, and typical air-conditioning equipment, with a prediction of the future of air conditioning. An extensive bibliography is included.

C. L. Mantell

**Dust deposits from commercial operations.** A. Quintana y Mari. *Quim. e ind.* 10, 241-4 (1933). —Sources, compns., and routine phys., microscopic and chem. tests are described briefly.

E. M. Symmes

**Azeotropism in technic.** L. Piatti. *Nitrocellulose* 4, 154-61 (1933). —A review.

E. M. Symmes

**Hydrogen as a transmitter of energy.** Gerhard Voss. *Arch. Warmewirt.* 14, 301-2 (1933); cf. *C. A.* 22, 2114. —V. gives a brief description of a compact plant for generating 3.2 cu. m. per hr. of  $H_2$  electrolytically at 200 atm. The voltage is less than at ordinary pressure and the energy efficiency is 73%. Engines using  $H_2$  have high compression, efficiency and capacity. With  $H_2$  and  $O_2$  (with water in the cylinder to keep the temp. down) an engine without exhaust can be made, suitable for enclosed places. Hydrogen may also be used to help out in gasoline motors.

Ernest W. Thiele

**Heat transfer in jacketed vessels.** Basil Heastie. *Ind. Chemist* 9, 371-2, 380 (1933).

E. H.

**Heat transfer by condensing vapor on vertical tubes.** C. G. Kirkbride. *Am. Inst. Chem. Eng.*, Roanoke Meeting, Dec., 1933 (preprint) 17 pp. —Since the literature contains so little information on condensation on vertical tubes and on liquid films flowing down vertical surfaces, it was decided to investigate this subject and attempt to develop a reliable method for predicting heat-transfer coeffs. for vapors condensing on vertical tubes. Data were taken on film thicknesses and were correlated by means of an equation developed by dimensional analysis. By using the information on film thicknesses and data on heat-transfer rates available in the literature, a method was developed which apparently has considerable merit.

C. L. Mantell

**Heat transmission by condensing pure and mixed substances on horizontal tubes.** C. G. Kirkbride. *Ind. Eng. Chem.* 25, 1324-31 (1933). —Data are reported on heat transmission by condensing benzene and complex hydrocarbon vapors outside a single horizontal tube. Condensation was effected from satd. and superheated conditions in the absence of noncondensable gas, in the presence of steam, and in the presence of a noncondensable gas,  $N_2$ . Methods of predicting the heat-transfer coeffs. under these conditions are presented. Data are also given for heat transmission to fluids flowing inside tubes in turbulent and viscous motion.

L. W. T. Cummings

**Steam film heat-transfer coefficients for vertical tubes.** G. M. Hebbard and W. L. Badger. *Am. Inst. Chem. Eng.*, Roanoke Meeting, Dec. 1933 (preprint) 21 pp. —

The larger part of the available data on heat transfer through films of condensed steam has been observed with horizontal tubes. Only a few workers have investigated the films on vertical tubes. Some empirical relations have been established, but generally, the effort has been made to compare the data with some one of the theoretical equations that have been derived by W. Nusselt. For vertical tubes, observed values of the steam film coeffs., ranging from 2000 to 3000 B. t. u., were from one-half to twice as large as corresponding values calcd. by the theoretical equations. Steam film coeffs. of heat transfer, detd. for a 1-in. O. D. vertical tube over a wide range of operating conditions (84 runs) with practically air-free steam, do not check the Nusselt equation. If a const. factor of 0.2515 is applied to this equation, all runs are within the limit of accuracy of the work for the greatest individual deviation (approx.  $\pm 5\%$ ), and within  $\pm 0.33\%$  for the av. of all runs. A similar relation is shown to be possible with the data of a parallel investigation. The cause of the deviation of the present coeffs. from other results is probably due partly to a layer of Fe oxide on the evaporator tube, partly to the use of a longer tube than was heretofore employed, and partly to less accurate methods for wall-temp. measurement used in all previous work.

C. L. Mantell

**Chemical warstuffs and their future development.** Beck. *Sudder. Apoth.-Ztg.* 73, 581-8 (1933). —An address descriptive of the various devices and materials (app. and chemicals) employed during the World War.

W. O. E.

**Protection from gas attacks by air.** H. Gnam. *Sudder. Apoth.-Ztg.* 73, 588-91 (1933). —An address suggestive of certain precautions indicated during war gas attacks.

W. O. E.

**Prescriptions for war gas intoxications.** Hans Kaiser. *Sudderl. Apoth.-Ztg.* 73, 592-4 (1933). W. O. E.

**First provisional gas masks during the World War.** Eugen Hohnsaenger. *Sudderl. Apoth.-Ztg.* 73, 595 (1933).—A brief account of the 1st Ger. attempts to prep. a suitable gas mask during the early campaign in France. W. O. E.

**Water-vapor refrigeration.** Paul Bancel. *Am. Inst. Chem. Eng.*, Roanoke Meeting, Dec., 1933 (preprint) 20 pp.—The development of water-vapor refrigeration depended on the development of compressing units capable of sweeping very large vols. of low-density vapor. These have taken 2 forms: the steam jet booster and the centrifugal compressor. The paper describes these units, gives their characteristics and applications, with illustrations and charts. C. L. Mantell

**The drop-wise condensation of steam.** W. M. Nagle and T. B. Drew. *Am. Inst. Chem. Eng.*, Roanoke Meeting, Dec., 1933 (preprint) 38 pp.—The investigation was undertaken to explain observations made during a study of the water-side coeff. of heat transfer in a falling-film condenser. During 12 hrs. of continuous operation the capacity of the condenser was repeatedly found to increase about 60% from an initial value of approx. 90 lb. of steam/(hr.)(sq. ft.) to 145 lb. of steam/(hr.)(sq. ft.), although there was no corresponding change in the operating conditions imposed upon the app. The cause of this behavior was proved to be an increase of the steam-side coeff. of heat transmission. Results of others indicated that the change might be assocd. with a shift from film to drop-wise condensation. Exptl. work with various app. and metallic surfaces was made. The heat-transfer coeff. of drop-wise condensation is many times larger than film-wise condensation. App. is described in detail. Methods are given by which drop-wise condensation was made to take place. C. L. Mantell

Heat dissipation of heated wires and pipes in a current of air (Hilpert) 2.

**Chemical reactions.** Henry Dreyfus. *Fr.* 749,791, July 29, 1933. Exothermic chem. reactions, particularly in the gaseous or vapor phase, are carried out in narrow spaces, e. g., annular spaces formed between concentric tubes. The spaces have a thickness below 2.5 cm., and preferably 12-2.5 mm. An app. is described. (C. A. 27, 4323).

**Gaseous reactions.** Le Carbone. *Fr.* 750,094, Aug. 3, 1933. Gases or vapors are caused to react by passing them, mixed or not with moist air, through a battery, the pos. electrode of which is composed of very porous active C and which works in a continuous or intermittent manner on an exterior circuit of low resistance, or the gases or vapors traverse an electrolyzer, the cathode of which is composed of porous active C.

**Liquefying gases.** I. G. Farbenind. A.-G. (Fritz Markau, inventor). *Ger.* 577,834, June 6, 1933. Condensable gases in gas mixts. are liquefied by compressing in several stages, removing the heat developed by compression, and subjecting to a cooling agent.

**Liquefying gases such as sulfur dioxide.** Ralph H. McKee. *U. S.* 1,932,903, Oct. 31. The gas is dissolved in a strong soln. of a salt such as KCNS in which soln. the gas is more sol. than in water; the salt soln. is heated to expel the dissolved gas, the latter is dried by contacting it with liquefied gas, and the dried gas is cooled. App. is described.

**Purifying liquids.** Jacques R. Anger. *Fr.* 41,708, Mar. 29, 1933. Addn. to 711,654 (C. A. 26, 2001). Flocculation of the impurities is caused by the presence in the liquid of conducting elements acting on the charge of the colloidal particles, which become agglomerated and are deposited by their wt. Various forms are described.

**Distilling liquids.** Maschinenbau-A.-G. Goltzern-Grumma. *Fr.* 749,496, July 25, 1933. In distg. liquids contg. gases, such as worts for the manuf. of BuOH, acetone and EtOH, the mixt. of vapors and gases are con-

densed in more than one step, e. g., in one or more condensers kept at a relatively high temp., and then in a "gas separator" at a much lower temp. The condensate from the gas separator is preferably returned to the distn. column.

**Concentrating, distilling or heating liquids such as acids, alkalies, hydrocarbons, etc.** Joseph W. Harris *U. S.* 1,932,406, Oct. 31. Falling, exposed streams of the liquid are subjected to the heating action of an elec. current passed through them. *U. S.* 1,932,406 relates to app. for elec. heating of liquids flowing as a thin sheet over foraminous material such as wire cloth screen and exposed on both sides.

**Dispersing organic materials.** James F. Moseley. *Fr.* 749,446, July 24, 1933. An insol. hydrated oxide having colloidal properties, particularly SiO<sub>2</sub>, is used for dispersing org. substances such as those used for treating leather, textiles or paper, or for impregnating, finishing or delustering rayon. The degree of dispersion of the SiO<sub>2</sub> may be modified by peptizing agents.

**Determining moisture.** Charles H. W. Long. *Brit.* 396,098, July 31, 1933. To det. the moisture content of flour, corn, beet pulp, tobacco, etc., a measured quantity of the substance is arranged in an elec. circuit (a selected elec. characteristic of which is predetd.) in such manner as to produce a variation in said characteristic, which is ascertained from indicating means operatively connected with the circuit and which is substantially proportional to the moisture content of the substance. App. is described.

**Vacuum distillation.** Cecil R. Burch, Frederick H. Preece and Associated Electrical Industries Ltd. *Brit.* 396,205, Aug. 3, 1933. In the vacuum distn. of org. liquids that contain substances which condense under pressure or when the vacuum is lowered in the rotary pump producing the vacuum a tube or chamber is interposed between the distn. system and the pump, the surface thereof being heated to such temp. that the condensable substances are decompd. into solids and incondensable gases. App. is described.

**Recovering volatile substances by use of solid absorbent material.** Albert Godel (to Société de recherches & d'exploitations pétrolières). *U. S.* 1,934,301, Nov. 7. Loss of volatile substances contained in an absorption material during the step of drying and simultaneously cooling the hot absorption material after distn. is obviated by effecting the drying and cooling by a gas circulated in a closed circuit (the gas being cooled at a point in the circuit in the interior of the absorber and then conveyed back to the absorbent material). App. is described.

**Resolving oil-water suspensions and loose emulsions.** Harmon F. Fisher (to Petroleum Rectifying Co. of Calif.). *U. S.* 1,932,093, Oct. 24. The emulsion is passed between two relatively moving bodies such as intermeshed gears one of which is preferentially wetted by one phase of the emulsion and the other by the other phase. App. is described.

**Removing acid constituents from gases.** Metallgesellschaft A.-G. *Brit.* 396,969, Aug. 17, 1933. Gaseous contg. small amts. of acid constituents in a gaseous or finely divided liquid or solid form, e. g., HCl, HF, SO<sub>2</sub>, SO<sub>3</sub>, HNO<sub>3</sub>, SiF<sub>4</sub>, are caused to act on aq. suspensions of residues of fossil fuels whereby the acid constituents are extd. and converted to salts, principally of Al, Fe and Ca. Grate residues or fine dust from the combustion of brown coal or pit coal may be used. In examples (1) a furnace gas contg. SO<sub>2</sub> is washed at 50° with an aq. suspension of a flue dust, (2) a gas contg. HF or SiF<sub>4</sub> is washed with an aq. suspension of coke ash and (3) a gas contg. HCl is washed with an aq. suspension of brown coal ash.

**Crystallization.** Appareils et évaporateurs Kestner. *Fr.* 41,587, Feb. 7, 1933. Addn. to 731,065 (C. A. 27, 355). The process of *Fr.* 731,065 may be applied to a soln. of several salts of exothermic crystn. or to a mixt. of a soln. of one or more salts of exothermic crystn. with a finely divided solid product, e. g., a mixt. of NH<sub>4</sub>Cl and KNO<sub>3</sub>, or NH<sub>4</sub>NO<sub>3</sub> and CaSO<sub>4</sub>.

**Classifying diatomaceous earth into different sizes by**

air currents. Arthur B. Cummins (to Celite Corp.). U. S. 1,934,410, Nov. 7. Various details of app. and operation are described.

**Drying in molds.** J. D. & A. B. Spreckles Investment Co. Brit. 395,903, July 27, 1933. In molding solid bodies from granular material, particularly sugar, a cementing liquid (sirup) is poured on the granular material in the mold and a gas, *e. g.*, dried, heated air, is passed through the mass to distribute the liquid throughout the material, remove excess liquid and dry the mass. App. is described.

**Drying air.** Bernard H. Wilsdon and Leonard W. Burrige. Brit. 396,439, Aug. 4, 1933. The air in an enclosed space, *e. g.*, a showcase, shop window or picture frame, is prevented from becoming too moist by contact with a mixt. of solid compds. which contain  $H_2O$  of crystn. and exhibit aq. vapor dissocn. pressures below those at which molds and fungoid growths vegetate, *e. g.*,  $MgSO_4 \cdot 6H_2O$  and  $MgSO_4 \cdot 7H_2O$ ,  $ZnSO_4 \cdot 6H_2O$  and  $ZnSO_4 \cdot 7H_2O$ ,  $CuSO_4 \cdot 3H_2O$  and  $CuSO_4 \cdot 5H_2O$ ,  $FeSO_4 \cdot 6H_2O$  and  $FeSO_4 \cdot 7H_2O$ .

**Filtering air.** Società italiana Pirelli. Brit. 395,918, July 27, 1933. Air is rendered respirable by removal of aerosols in filters employing a loose mass of mingled fibers, other than the fine "vegetable wool" of reeds, etc., intimately mixed with inert powd. substance. Wool, cotton waste, hemp waste, wood pulp, rayon waste and (or) asbestos may be used mixed with talc, cork and (or) elonite dust.

**Conditioning air by heat exchange with a cooling medium such as water.** Jesse H. Davis and Samuel M. Anderson (to H. F. Sturtevant Co.). U. S. 1,932,513, Oct. 31. Various details of app. and operation are described.

**Use of exhaust steam from a steam engine for heating water, etc.** Maynard D. Church (to Moore Steam Turbine Corp.). U. S. 1,932,574, Oct. 31. The steam is condensed by 2 independent streams of water or other fluid and the effective action of one of the streams is controlled to regulate the outgoing temp. of the other. App. is described.

**Heat-transfer medium.** Herbert W. Daudt and John E. Cole (to E. I. du Pont de Nemours & Co.). U. S. 1,933,166, Oct. 31. A product suitable for use in refrigerating systems comprises a compd. of S, O and F, such as  $SO_2F_2$  or  $SOF_2$ .

**Use of mercury vapor for heat transfer in operations such as chemical reactions or distillation.** Crosby Field (to Chemical Machinery Corp.). U. S. reissue 18,993, Nov. 14. A reissue of original pat. No. 1,810,912 (C. A. 25, 4950).

**Manipulating drums containing material such as carbon dioxide under pressure.** Franklin B. Hunt (to Liquid Carbonic Corp.). U. S. 1,933,060, Oct. 31. Various details are given relating to transfer of the material under pressure from one receptacle or chamber to another, as in gasifying solid  $CO_2$ .

**Use of solid and liquid carbon dioxide in cooling, freezing and carbonating liquids, etc.** Justus C. Goosmann (to American Dryice Corp.). U. S. 1,933,256-7, 8, Oct. 31. Various features of app. and operation are described.

**Antimony trifluorodichloride.** Robert R. McNary (to Frigidaire Corp.). U. S. 1,934,943, Nov. 14. A compd. of the formula  $SbF_2Cl_2$  is formed by the action of Cl on  $SbF_3$  and is a viscous liquid suitable for use as a catalyst in fluorination of halogen derivs. of aliphatic hydrocarbons.

**Gas masks.** Rudolf Weichert. Brit. 396,904, Aug. 17, 1933.

**Filter boxes for respirators.** Bernhard Dräger. Brit. 396,323, Aug. 3, 1933.

**Respiratory filters.** Erwin Thaler and Clara-Fabrikate Cloetta & Co. m. b. H. Brit. 396,804, Aug. 17, 1933. A filter element for use in respirators comprises sponge rubber, the pores of which are lined with a gas-absorbing substance, preferably by kneading into the sponge an aq. chem. paste which may also contain moistening agents, powd. adsorbent, *e. g.*, active C or silica gel, or binding,

stiffening or setting agents, *e. g.*, cement, dextrin, starch, powd. asbestos, waterglass. The rubber may subsequently be vulcanized. Suitable pastes are (1) for absorbing acid gases, K metasilicate, or a mixt. thereof with  $K_2CO_3$ , 12, active C 4, powd. cement 5 parts;  $(CH_3)_4N_4$  or complex Zn salts, *e. g.*, zincates or zincamines may be added, and (2) for absorbing  $NH_3$ ,  $CuCl$  and active C in equal parts.

**Impermeable suit for use in chemical warfare.** Beriah M. Thompson. U. S. 1,931,562, Oct. 24. Structural details of a ventilating device, etc.

**Dielectric materials.** Compagnie française pour l'exploitation des procédés Thomson-Houston. Fr. 41,743, Mar. 29, 1933. Addn. to 711,858. Dielectrics are composed wholly or in part of polychloro derivs. of aromatic hydrocarbons, particularly biphenyl and its derivs. The no. of Cl atoms is preferably equal to or greater than the no. of H atoms.

**Insulators.** Ernest A. Hallwood. Brit. 396,151, Aug. 3, 1933. Insulators are made from a compn. of powd. resin and powd. glass molded under heat and pressure without the use of solvents. Coloring matter may be added.

**Insulators, condensers, etc.** Alexander F. Fekete. Brit. 396,453, Aug. 10, 1933. An elec. insulator, condenser, etc., comprises a metallic armature, *e. g.*, of Al or an Al-coated base, an insulating film comprising an electrochemically formed compd. of the metal of such armature, *e. g.*, the oxide, and a metallic layer providing a second armature or conductor closely adhering to the insulating film. Further layers of film and metal may be applied. The oxide layer, prior to coating, may be treated with superheated steam and may be coated with the metallic layer by spraying.

**Insulating materials.** Allgemeine Elektrizitäts-Ges. Fr. 749,575, July 26, 1933. Unsapond. cellulose acetates contg. a small amt. of radicals of other org. or inorg. acids are used for making insulating materials.  $CHCl_3$  may be used as solvent.

**Heat and sound insulating materials.** Soc. des établissements Wanner. Fr. 749,686, July 27, 1933. The material is obtained by mixing  $MgCO_3$ , asbestos fibers, slag wool and kieselguhr.

**Heat-insulating material suitable for use at high temperatures.** Russell H. Heilman (to Philip Carey Mfg. Co.). U. S. 1,931,795, Oct. 24. Natural bauxite is processed to form monohydrated bauxite and a mass of particles of the monohydrated bauxite in its initial moist condition is mixed with asbestos fiber and bentonite clay, surplus liquid is removed and the mass is dried.

**Light-weight heat-insulating blocks.** Erik Hüttemann and Wolfgang Czernin (to Frederick O. Anderegg). U. S. 1,932,971, Oct. 31. A mixt. of finely pulverized siliceous material and a calcareous binder is formed into a fluid consistency with water, prehardened (as by steam under pressure) and formed into desired shapes, completely hardened and dried to remove all water.

**Heat-insulating cement suitable for use on brickwork or metal work of ovens, etc.** Adolph V. Leun and Leo H. Roffe (to Bethlehem Steel Co.). U. S. 1,933,271, Oct. 31. Slag wool 73, asbestos fiber 13, bentonite 6, a modifying clay such as "medium fat" clay 7 and  $Na_2CO_3$  1% are used together.

**Machine for continuously extruding a plastic covering, *e. g.*, vulcanized rubber, upon a series of wires.** Bell Telephone Laboratories, Inc. Brit. 396,062, July 26, 1933.

**Oil compositions suitable for cooling and insulating in electrical apparatus.** Frank M. Clark (to General Elec. Co.). U. S. 1,935,595, Nov. 14. Trichlorobenzene (suitably in a proportion of about 40% or less) is added to mineral or vegetable oils to lower the congealing point.

**Electrical insulation.** Willoughby S. Smith, Henry J. Garnett and John N. Dean. U. S. 1,934,335, Nov. 7. An insulating material suitable for use on submarine cables comprises gutta-percha of low resin content mixed with 50% or less of a semi-solid refined petroleum product such

as a petroleum jelly. Rubber also may be added. Cf. C. A. 27, 448.

**Submarine cable insulation.** Siemens & Halske A.-G. Brit. 395,908, July 27, 1933. The cables are provided with an insulation contg. a rubber mixt. consisting of rubber and cellulose derivs. in the preferred proportions of 60:40. The cellulose derivs. may be ethers or esters of high mol fatty acids, e. g., cellulose laurate, sol. in the rubber or, especially where vulcanization is contemplated, act as fillers, e. g., benzylcellulose. Softening agents, e. g., mineral wax, may be added. The compn. is highly resistant to H<sub>2</sub>O and has low dielec. losses.

**Lacquer-covered electric cables.** Winters S. Johnstone (to Packard Elec. Corp.). U. S. 1,931,610, Oct. 24. After applying successive lacquer coatings to a cable and while some of the outer coatings are still in a soft and partially dried condition, pigmented material of contrast-

ing color such as a pigmented pyroxylin ink contg. a solvent such as toluene to assist penetration of the lacquer is applied.

**Lead covered electric cable.** Archie R. Kemp (to Bell Telephone Laboratories, Inc.). U. S. 1,935,322, Nov. 14. Structural features are described, involving an insulated cable sheathed with Pb and having an outer covering of braided asbestos covered wire impregnated with a fire- and water-proofing material such as a stearin pitch compn.

**Sheathed underground cables.** Archie R. Kemp and John H. Ingman (to Bell Telephone Laboratories, Inc.). U. S. 1,935,323, Nov. 14. Metal-sheathed cables are provided with an outer covering of a mixt. comprising "vegetable pitch" 10-40, blown asphalt 10-15, ground vulcanized rubber 30-45, ground silica about 10 and gil-onite or asbestos fibers 10-30%. Various details of manuf. are described.

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

**Water supplies.** G. M. Fyfe. *Surveyor* 84, 295-6 (1933).—Av. temporary and permanent hardness for different types of waters are: rainwater 0, 0.3; upland surface 1.4, 3.6; spring 11, 7.0; deep well 12, 8; shallow 18, 22, resp. From a health point of view there is little to choose between soft and hard water. Claims have been made that where soft water is consumed children have a tendency to suffer from rickets. Hard water is considered to be assocd. with rheumatic and gouty complaints.

A. L. Elder

**Steps in the purification of the Bridgeport water supply.** Frank C. Barrows. *J. New Engl. Water Works Assoc.* 47, 219-22 (1933).—In 1911 hypochlorite of lime was used; in 1916 Cl<sub>2</sub> gas replaced this; in 1932 NH<sub>3</sub> was used in conjunction with Cl<sub>2</sub>. Improvement was marked. Flushing of dead ends was less frequent. CuSO<sub>4</sub> used for algae has been greatly decreased. The approx. Cl<sub>2</sub> dosage has been 3.5 lb. per million gal. water.

D. K. F.

**Wakefield water supply.** Robert S. Weston. *J. New Engl. Water Works Assoc.* 47, 239-47 (1933).—The main supply, from a spring- and brook-fed lake, is supplemented by excellent well water. The surface is subject to contamination with bacteria and microorganisms. Cl<sub>2</sub> aeration and slow sand filtration produce a satisfactory supply.

D. K. French

**Relation of forests to the evaporating power of the air.** Paul W. Stickel. *J. New Engl. Water Works Assoc.* 47, 229-38 (1933).—In openings, even small ones, nearly twice as much water will be evapd. than beneath forest cover. Many interrelated factors are involved. Shade and temp. are the principal ones.

D. K. French

**Catalytic action of mineral waters.** A. Rezek and T. Pinter. *Pharm. Monatsh.* 14, 197-202 (1933).—The work of previous investigators is reviewed. Several waters are studied and the following detns. made: (1) For the detn. of catalysis the reaction with H<sub>2</sub>O<sub>2</sub>, as suggested by Fresenius is used. (2) The peroxidases are detected by benzidine in acid soln. (conc'd. soln. of benzidine in dil. AcOH and 3% H<sub>2</sub>O<sub>2</sub>) and in alk. soln. (0.5% benzidine in EtOH and 0.1% H<sub>2</sub>O<sub>2</sub>). The appearance of the green and blue color in about 5 min. was taken as a pos. reaction. (3) Fe<sup>3+</sup> ion was detected with thiocyanate or ferrocyanide soln. after oxidation with HNO<sub>3</sub> or by means of isonitrosoacetophenone according to Kröhnke and the Mn ion with NH<sub>4</sub> peroxide and AgNO<sub>3</sub> according to Feigl. (4)  $p_H$  was detd. by the methods of Sorenson and of Michaelis.

H. M. Burlage

**Manganese in drinking and industrial water.** E. Naumann. *Z. Gesundheitsch. Städtehyg.* 25, 163-70 (1933).—A review.

B. C. Brunstetter

**Active carbon in water purification.** H. Haupt and W. Steffens. *Z. Gesundheitsch. Städtehyg.* 25, 97-111 (1933).—A review.

B. C. Brunstetter

**The determination of odors and tastes in water.** Gordon M. Fair. *J. New Engl. Water Works Assoc.* 47, 248-72

(1933).—An unusually complete consideration of the problem including physiol. factors. Classification of odors, threshold values, the Weber Fechner law, the odor scale of Allison and Katz, followed by a discussion of the existing methods of determining odors and tastes in water. Refinements in equipment and technic are suggested, as well as the use of odor potential for recording the results.

D. K. French

**Pipe linings and friction coefficients.** Elson T. Killam. *J. New Engl. Water Works Assoc.* 47, 283-95 (1933); cf. C. A. 27, 153.—Smooth linings make possible pipe of smaller diam., elimination of variations in residual pressure, and of troubles and problems due to tuberculation. Rate of flow is directly proportional to the value of its friction coeff. Relative values for various surfaces are given. A slight roughening will cause a great loss in carrying capacity.

D. K. French

**Advances in iron coagulation and coagulants.** E. L. Bean. *J. New Engl. Water Works Assoc.* 47, 273-9 (1933).—With the appearance of iron coagulants at reasonable prices their efficiency has been emphasized. Reaction time is shorter. Effective  $p_H$  range is shown from 3.8 to 10 or higher. Mn removal is easily accomplished. Color removal is more effective than where Al compds are used. Pure ferric sulfate in granular or powd. form is now available.

D. K. French

**Aldershot sewage-disposal experiments.** J. W. Edwards. *Surveyor* 84, 204 (1933).—Primary purification with beds of 2-in. gage gravel, clinker and coke beds were 58, 70 and 70%, resp. The percentage purification at 4, 9, 12, 15, 27, 43 and 59 in. levels was 28, 16, 7, 5, 5, 9 and 5, resp. Expts. are being made with a steam-heated sludge bed.

A. L. Elder

**Development and status of ventilation technic.** L. Worp. *Ingenieur* 48, W53-9 (1933).—A lecture reviewing modern air-conditioning equipment.

B. J. C. van der Hoeven

**Ship fumigation at the Port of Durban.** G. A. Park Ross. *J. Roy. Sanit. Inst.* 54, 35-40 (1933).—Ca(CN)<sub>2</sub> dusting is used in concn. of slightly over 1 to 11,000 or 60-80 g. dosage per 1000 cu. ft. are used. Compressed air and steam have been used to drive the gas from ill-ventilated spaces.

A. L. Elder

**Installing waste-disposal systems in food plants.** Fred A. Fielder. *Food Ind.* 5, 440-1 (1933).—Suitable systems are described with figures and drawings.

C. R. Fellers

**Typhoid formerly and at present.** O. Solbrig. *Gesundh.-Ing.* 56, 461-4, 474-8 (1933).—The decrease in typhoid in various cities of Germany with improvement of sanitary conditions and water supplies is discussed, together with the means of spread of the disease and methods of combating it. Tables and graphs present statistics from various localities of Germany and some other countries over about the last 60 years.

M. G. Moore

Determination of Fe [in drinking water] (Alten, et al.) 7. 1

**Purifying water.** Hugh Rodman (to Rodman Chemical Co.). U. S. 1,933,567, Nov. 7. Water such as may contain substances of objectionable smell or taste is rendered potable by agitating it with finely divided and readily suspensible coal or coke and then sepg. the suspended solids.

**Purifying water.** Max Penschuck. Ger. 577,830, June 6, 1933. App. in which sewage or surface water is purified by treatment with  $Al_2(SO_4)_3$  as a precipitant is described.

**Apparatus for purifying water by active carbon.** Bau et assainissement. Fr. 749,759, July 29, 1933.

**Apparatus for purifying water by injection of chemical reagents into a water conduit.** Harry B. Hartman. U. S. 1,931,818, Oct. 24. A water meter controls a pump for injecting the treating agent.

**Water filter suitable for use with spigots.** Joseph F. Auberscheck. U. S. 1,934,159, Nov. 7. Structural details.

**Apparatus for treating water with softening agents, etc.** Laurentz Hunkemoller and Anton Hunkemoller. Swiss 161,850, Aug. 1, 1933.

**Apparatus for softening water.** Wm. L. O'Brien and Arthur C. Zimmerman (to Duro Co.). U. S. 1,932,117, Oct. 24. Structural details.

**Apparatus for softening water.** Aktiebolaget Filtrum. Fr. 749,696, July 27, 1933.

**Base-exchange water-softening apparatus.** Aktiebolaget Filtrum. Brit. 396,104, Aug. 3, 1933.

**Apparatus for softening water by use of base-exchange material.** Andrew J. Dotterweich (to Automatic Water Softener Co.). U. S. 1,933,309, Oct. 31. Various structural and mech. details are described. U. S. 1,933,370 also relates to app. for softening water with zeolitic material.

**Control system (with a photoelectric cell) for base-exchange water-softening apparatus.** Orland R. Sweeney and Thomas B. Clark (to Permutit Co.). U. S. 1,931,968, Oct. 24. Various structural and operative details of an elec. control system are described.

**Fixed diffusers for blowing air or other gas into sewage or other liquid.** Joseph A. Hartley, Cyril J. Hartley and John W. Hartley. Brit. 396,732, Aug. 4, 1933.

**Apparatus for separating solids from sewage, etc.** Wilhelm Wurl. Ger. 586,429, Oct. 21, 1933.

**Purifying waste waters.** Adrien Chabal. Fr. 749,455 July 25, 1933. Waste waters and sewage are aerated not only at the purifying station, but also in the drainage system, whereby the liberation of odors and formation of colloidal matter is avoided.

**Conditioning air with ozone.** Earle W. Ballentine (to Solar Industries, Inc.). U. S. 1,932,379, Oct. 24. Air is first treated with an amt. of ozone in excess of that required to produce the desired effect and is then heated to remove the objectionable excess of ozone. App. is described adapted for conditioning air for rooms.

## 15- SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND E. D. JACOB

Some soils of the North Cape district [New Zealand]. R. F. R. Grimmer and F. J. A. Brogan. *New Zealand J. Agr.* 47, 229-36(1933).—Chem. analyses of 13 samples are given. The soils are deficient in available Ca, Mg, K and P, and the  $pH$  values are usually less than 5.5.

K. D. Jacob

**Notes on the soils of the Trans Nzoia.** G. H. Gethin Jones. Kenya Colony Dept. Agr., *Bull.* 8, 11 pp.(1932).—The light reddish soils are derived from volcanic lava and metamorphic Archean schists. In 51 samples of surface soil the  $pH$  ranged from 5.6 to 6.4, the av. being approx. 6.0. The  $pH$  of the subsoils ranged from 5.2 to 7.2 and averaged 5.85. In general, the soils are low in available P.

K. D. Jacob

**Classification and evaluation of the soils of Western San Diego County.** R. Earl Storie. Calif. Agr. Expt. Sta., *Bull.* 552, 3-41(1933).—A reconnaissance survey.

C. R. Fellers

**The story of Field A of the Massachusetts Agricultural Experiment Station. A review of experiments with nitrogen fertilizers.** Fred W. Morse. Mass. Agr. Expt. Sta., *Bull.* 290, 3-23(1932).—Fifty years' results are presented and interpreted.

C. R. Fellers

**Soil conditions associated with crop failures in Devon and Cornwall.** A. Blenkinsop. *J. Ministry Agr. (Engl.)* 40, 595-604(1933).—An accurate valuation of a soil can be made by a careful estn. of the balance of its Ca,  $P_2O_5$  and  $K_2O$  and nitrate N content. Extreme variations in these soils are:  $pH$  3.9-8.9; total  $P_2O_5$  310-10,410 pts. per million; available  $P_2O_5$  12-5200 pts. per million and exchangeable  $K_2O$  36-1190 pts. per million. The failure of a no. of crops is discussed with relation to soil balance. The CaO status of the soil is the greatest single limiting factor detg. the distribution of crops. Excess soil acidity is a cause of crop failures and with this is often assocd. a  $P_2O_5$  deficiency. These soils are also marked by their high rate of nitrification.

J. R. Adams

**Mechanical analysis of soils.** J. Gollan, L. Hervot and V. Nicollier. *Rev. facultad quim. ind. agr., Univ. nacl.itoral 2*, 64-87(1932).—A general outline of principles and methods.

O. W. Wilcox

**A new reversible agitation apparatus with horizontal rotary movement suitable for analyses on a large scale.**

C. Krugel and C. Dreyspring. *Superphosphate* 6, 197-205(1933).—See C. A. 27, 5865.

K. D. Jacob

**Determination of the liquid limit of soils.** Josue Gollan. *Rev. facultad quim. ind. agr., Univ. nacl.itoral 2*, 106-9(1932).—Description, with figures and drawings, of an improved app. L. Hervot. *Ibid.* 110-11. H made an exptl. comparison of the capsule method used in the U. S. with the method and app. originated by Gollan. The results obtained by the American method show deviations up to 3.304 (about 11%); with the Gollan method, which largely eliminates the personal equation of the operator, the agreement was within 0.4.

O. W. Wilcox

**Moisture relationships of soils in situ.** J. H. Neal. *Agr. Eng.* 13, 128-32(1932).—Data are given on mineral, muck and peat soils of varying textures. The moisture content of satd. mineral soils and their pore space show a fairly definite relationship to the moisture equiv. The moisture content of moderately fine-textured soils *in situ* lying below the water table varies between 1.0 and 1.4 times the moisture equiv., while that for the coarsest textured soils may exceed 5 times the moisture equiv. A more or less direct relation exists between the org. matter content, moisture equiv., linear shrinkage and cubical shrinkage of soils. Methods for the study of moisture conditions in soils *in situ* are outlined.

K. D. Jacob

**Combined water in the clay of the soils of Santa Fe.** Josue Gollan and Carlos Christen. *Rev. facultad quim. ind. agr., Univ. nacl.itoral 2*, 128-9(1932).—Analyses give an av. value of 5.2% for the combined water in the clay fraction of Santa Fe soils.

O. W. Wilcox

**"Overo" soils with infertile spots.** J. Gollan and J. Cruellas. *Rev. facultad quim. ind. agr., Univ. nacl.itoral 2*, 96-105(1932).—Certain fertile soils ("tierras overas") are dotted with spots of varying areas which are practically sterile. This sterility was found to be due to a low ratio  $CaO/MgO < 2$ , whereas on the fertile areas this ratio was found to be  $> 4$ .

O. W. Wilcox

**The relation between reaction and particle size in soils.** H. Niklas and A. Frey. *Landw. Jahrb.* 76, 819-43(1932).—Soils having particles of different sizes but of the same compn. are studied to det. if particle size is related to

acidity. A formula is given for detg. the "rest" acidity curve of soils.

**Determination of nitrogen in soils. II. Protective action of silica as a factor in the estimation of nitrogen by the Kjeldahl method.** A. Srinivasan and V. Subrahmanyam. *Indian J. Agr. Sci.* 3, 646-57(1933); cf. *C. A.* 27, 1696.—A study was made of the effect of various substances on the detn. of N in soil, by the Gunning-Hibbard modification of the Kjeldahl method (I) and by digestion after allowing the sample to stand overnight in contact with 1:1  $H_2SO_4$  (II). The results obtained by I were lower than those obtained by II and the residue left after digestion by I consisted of undigested soil particles enclosed in thick coatings of  $SiO_2$ , the protective action of  $SiO_2$  being more marked with heavy than with light soils. A study of the mechanism of the formation of the protective layer showed that  $SiO_2$  was the immediate product of the reaction between hot concd.  $H_2SO_4$  and the aluminosilicates present in the soil, the protective coat usually being formed before the acid had wetted all the soil particles. When soil was heated with dil. acid, as in II,  $SiO_2$  was not formed until all the  $H_2O$  had been driven out, thus allowing sufficient time for the acid to react with all the soil particles. The layer of  $SiO_2$  formed by concd. acid was readily penetrated by dil. acid. Titaniferous minerals and org. compds. had no appreciable effect on the decompn. of soil by concd.  $H_2SO_4$ , but the digestion was rendered somewhat difficult by the presence of increasing amts. of Fe and Al oxides and laterite; digestion was greatly hastened by addn. of  $H_2O_2$  and fine grinding of the soil had a favorable effect. K. D. Jacob

**Determination of carbonates and organic matter in soils.** Josue Gollan and Carlos Christen. *Rev. facultad quim. ind. agr., Univ. nat.itoral* 2, 112-19(1932).—A sample of the soil is decompd. with HCl or  $H_2SO_4$  in a flask and the evolved  $CO_2$  is absorbed in standard NaOH soln., free from  $CO_2$ ; the absorbed  $CO_2$  is pptd. with  $BaCl_2$  and the change in titer of the NaOH soln. detd. for detn. of org. matter in soils the sample is first freed from  $CO_2$  by treatment with acids; the residue is oxidized in a flask with dichromate and  $H_2SO_4$ ; the  $CO_2$  formed is absorbed in NaOH soln. and detd. as described above.

O. W. Wilcox

**Soil conditions affecting coffee in Kenya.** David S. Gracie and A. D. Le Poer Trench. Kenya Colony Dept. Agr., *Bull.* 7, 45 pp.(1931).—Data are given on the coloration with Comber's soln., exchangeable Ca,  $pH$  value (0.2 M KCl ext.) and sp. acidity of numerous profiles of coffee soils. The  $pH$  values of the samples from the 1st 9-in. layers of soils ranged approx. from 4.5 to 5.5, the subsoil samples usually having slightly lower values. Although there was no direct relation between soil acidity and the growth of coffee, excessive subsoil acidity favored development of chlorosis of the trees and was assocd. with a low content of available K. High acidity and low exchangeable Ca in the soil seemed to favor mealy bug attack on the trees. In the red soils of the Kikuyu Province the exchangeable C and total N decreased and the  $pH$  value increased with increase in the richness of the soil. In certain soils, high in exchangeable Ca and having low acidities, the trees exhibited the typical symptoms of Mn deficiency and the leaves were somewhat low in Mn as compared with those from normal trees. Data are given on the percentages of dry matter, total N, Ca, P, K, Fe and Mn in the leaves, cherries and pulp of coffee. Chlorotic wheat plants, grown on a grayish black soil, that had been fertilized with double superphosphate, contained 51.9 mg. Fe and 2.9 mg. Mn per 100 g. dry matter, whereas normal plants contained 8.0 and 12.9 mg., resp.

K. D. Jacob

**The climatic and soil requirements of tea.** Harold H. Mann. *Empire J. Exptl. Agr.* 1, 245-52(1933).—The chem. characteristics of tea soils are discussed. They should not contain more than a trace of lime (less than about 0.15% CaO sol. in HCl) and the  $pH$  should be approx. 5.2-5.6. A large excess of N, either org. or inorg., in the soil is disastrous to the quality of the tea. Seventeen references.

K. D. Jacob

**The acidity of tea soils of northeast India. II. The treatment of soils of low acidity.** C. J. Harrison. Sci. Dept. Indian Tea Assoc., *Quart. J.* 1932, 70-7.—Tea grows well on soils having  $pH$  values of about 4.3-5.8, and having neutral salt ext.  $pH$  values of approx. 3.5-5.0; the  $pH$  values of the less acid soils can be brought into this range by applications of S, the amt. of S required being detd. from the amt. of  $H_2SO_4$  necessary to reduce the  $pH$  of a small sample of the soil to the desired value. For a given change in  $pH$  a much larger amt. of S is required for heavy clay soils than for sand, silt and loam soils. Data are given on the Hopkins acidities,  $pH$  values of soil water exts. and  $pH$  values of neutral salt exts. of tea soils from various localities in northeast India. K. D. Jacob

**Effect of soil acidity on the yield of sugar cane.** H. H. Croucher. *J. Jamaica Agr. Soc.* 37, 508(1933).—The yield of cane on soil having a  $pH$  value of 7.0 in the top soil and 7.2 in the subsoil was 33.0 tons/acre, as compared with 18.50-18.75 tons on soils of  $pH$  4.95-5.50 in the top soil and 4.6-4.8 in the subsoil.

K. D. Jacob

**Principles of fruit production and soil fertility maintenance.** Clayton L. Long. Idaho State Hort. Assoc., *Proc. 37th Ann. Conv.* 1932, 58-70.—Over a 9-yr. period, an apple orchard soil planted to a cover crop of alfalfa showed an av. annual gain of 245 lb. N and a loss of 81 lb.  $P_2O_5$  and 206 lb.  $K_2O$  per acre as compared with the virgin soil.

K. D. Jacob

**Test on plant material for diagnosing phosphorus deficiencies.** S. F. Thornton. Ind. (Purdue) Agr. Expt. Sta., *Bull.* 355, 20 pp.(1932); cf. *C. A.* 26, 2267.—Samples of stems or leaf petioles are taken from or near actively growing points of plants. From 1 to 1.5 g. of the crushed material is treated with 10 cc. of a reagent contg. 4 g. of  $(NH_4)_2MoO_4$  dissolved in 500 cc. of  $H_2O$ , to which are added 63 cc. of concd. HCl and 437 cc. of  $H_2O$ . After vigorous shaking with the reagent a small crystal of  $SnCl_2$  is added. The blue coloration indicates the morg. P in the stems.

B. C. A.

**Recent investigations and experiments on different phosphate fertilizer questions.** O. Engels. *Das Superphosphat* 9, 97-101(1933).—A brief review of work on soil P and the effects of phosphate fertilizers on the yield and quality of crops. Thirteen references.

K. D. J.

**Is there danger of loss of phosphate by leaching when phosphate fertilizers are applied to the soil in the autumn?** Ludwig Schmitt. *Das Superphosphat* 9, 103-8(1933).—Lysimeter expts. were carried out with a strongly acid pervious sand soil (I), an alk. slightly loamy loess soil (II), an alk. strongly loamy, sandy loess soil (III) and an alk. river mud (IV). Superphosphate and basic slag were applied in amts. equiv. to 60 kg.  $P_2O_5$  per hectare annually and the lysimeters were planted to wheat, potatoes and oats in successive years. With superphosphate the total loss of  $P_2O_5$  by leaching during 3 years from I, II, III and IV was 1.41, 1.19, 0.91 and 0.98 kg./hectare, resp., and with basic slag the loss was 1.40, 0.71, 0.74 and 0.99 kg.; with superphosphate the total amt. of  $P_2O_5$  removed by the crops was 100.2, 171.1 and 115.6, and with basic slag 114.2, 166.2 and 115.8 kg./hectare from I, II and IV, resp. No increase in the P content of a soil at depths below 20 cm. was obtained in 30 years when superphosphate and basic slag were applied at the rate of 64 kg.  $P_2O_5$ /hectare annually; with double this amt. of P a slight increase was obtained in the 2nd 20 cm.

K. D. J.

**Movement of added phosphate in soil.** I. B. W. Doak. *New Zealand J. Sci. Tech.* 15, 155-62(1933).—It appears that the penetration of added  $P_2O_5$  is much more rapid when the applications of  $P_2O_5$  are heavy and made at infrequent intervals than when smaller applications are made more frequently. Analyses support the contention that the P in the soil occurs as (a) natural stable P compds. which are subject to negligible wastage by leaching, and (b) the unstable P compds. of added dressings which are removed fairly rapidly from the surface layers by percolating waters. A brief review is given of the available literature on the subject.

J. R. Adams

**The laying of cereal crops.** P. Hildebrand. *Das Superphosphat* 9, 102-3(1933).—A brief discussion of the

factors contributing to the laying of cereal crops and the value of phosphate fertilizers in preventing this condition.

K. D. Jacob

Soil maps, reaction maps and phosphoric acid maps as a basis for the setting up of fertilizing and tillage plans for fields. E. Pfuhl. *Das Superphosphat* 9, 110-14 (1933).—The prepn. of maps showing the soil types and the reaction and P requirements of fields is described.

K. D. Jacob

Can the amount of phosphoric acid necessary for maximum plant growth be determined in advance? Hoffmann. *Das Superphosphat* 9, 114-16 (1933).—Contrary to Remy (cf. C. A. 27, 3770), H. concludes that the fertilizer requirements of soils usually can be detd. in advance of planting the crop with sufficient accuracy for practical purposes.

K. D. Jacob

Is a top-dressing of superphosphate equal to a dressing applied to the arable soil? C. Krugel and C. Hevspaning. *Das Superphosphat* 6, 157-65, 177-85 (1933).—The results of pot expts. with oats, barley, corn, red clover and summer wheat indicated that superphosphate is used as efficiently by the plant when it is applied to the surface of the soil as when it is worked into the soil. This seems to be due to the strong development of the root system near the surface of the soil rather than to the leaching of the P into the soil.

K. D. Jacob

Investigations in pasture production. V. Effect of applying superphosphate at different times of year and of heavy dressings of sulfate of ammonia on yield of herbage. A. W. Hudson and G. K. McPherson. *New Zealand J. Agr.* 47, 234-42 (1933); cf. C. A. 27, 4616.—The lowest total yields were obtained from winter applications of superphosphate; the differences between the yields from applications at other times of the year were small, spring applications giving the best results. Application of  $(\text{NH}_4)_2\text{SO}_4$  with the superphosphate resulted in smaller yields than were obtained with superphosphate alone.

K. D. Jacob

The efficiency of Schleswig-Holstein permanent pastures. W. Dix. *Landw. Jahrb.* 76, 525-74 (1932).—1. shows the relation between the chem. compn. and phys. properties of the soil to chem. compn. and nutritional value of the herbage.

George R. Greenbank

Influence of season and of ammonium sulfate on the chemical composition of perennial rye grass and of white clover. H. O. Askew. *New Zealand J. Sci. Tech.* 15, 143-54 (1933).—Samples were taken from 2 series of plots, one receiving a base fertilizer of superphosphate and  $\text{K}_2\text{SO}_4$  (control plot) and the other the same base fertilizer mixt. with top dressings of  $(\text{NH}_4)_2\text{SO}_4$ . Dry matter in the rye grass and in white clover show little variation. With both species drought decreases the  $\text{P}_2\text{O}_5$ , N,  $\text{K}_2\text{O}$  and sol. ash contents; the CaO and  $\text{SiO}_2$  contents increase as the season advances, and are not decreased during dry weather. Seasonal variations in the different constituents are much smaller for white clover than for perennial rye grass. Application of  $(\text{NH}_4)_2\text{SO}_4$  increases the N content most markedly in the first sample collected after top-dressing; later, there is little difference between the N contents of treated and untreated rye grass or white clover. Rye grass is much more sensitive to drought than is white clover.  $(\text{NH}_4)_2\text{SO}_4$  increases the K<sub>2</sub>O, sol. ash and total and morg. S contents of rye grass, particularly in the periods immediately following the application of the fertilizer. CaO,  $\text{P}_2\text{O}_5$  and  $\text{SiO}_2$  tend to be lower on the N plots than on the control. With white clover the CaO,  $\text{P}_2\text{O}_5$ , N, and sol. ash contents are increased after each application of  $(\text{NH}_4)_2\text{SO}_4$ ; later, they all fall to lower values than those for the control plots.  $\text{K}_2\text{O}$  tends to be lower on the N-treated clover than on the controls. The depression in the CaO content of the rye grass and of white clover due to fertilizing with  $(\text{NH}_4)_2\text{SO}_4$  is insufficient to account for the large decreases in the CaO content of mixed pastures following the use of nitrogenous fertilizer. The N: $\text{P}_2\text{O}_5$  ratio tends to fall during the summer periods in the perennial rye grass but tends to increase in the white clover. This ratio for white clover is almost double that of rye grass.

J. R. Adams

Causes of the action of Thomas meal. V. The significance of magnesia and manganese in Thomas meal. A. Wilhelmj and S. Gericke. *Phosphorsäure* 3, 513-47 (1933); cf. C. A. 27, 5860.—Samples of synthetic Thomas meal were prepd. in which the Ca was replaced by equiv. quantities of Mg in amts. ranging from 0.0 to 47.21%  $\text{MgO}$ . The results of numerous expts. showed that the Mg in Thomas meal has the same effect as the Ca in reducing soil acidity. In amts. to about 2% of the Thomas meal, Mg has a favorable effect on the absorption of P by seedling plants; higher percentages depress the absorption of P, the effects being similar to those obtained with equiv. amts. of Mg as  $\text{MgCO}_3$ . Under comparable conditions, Mg as  $\text{MgSO}_4$  increases the absorption of P. The normal content of Mg (about 1-4.5%  $\text{MgO}$ ) in Thomas meal has a direct beneficial effect on the growth of plants in Mg-deficient soils; higher percentages of Mg may have a detrimental effect. Expts. with synthetic Thomas meals contg. 0.0-10.24% Mn showed that the Mn had no effect either on the root soly. of the  $\text{P}_2\text{O}_5$  in Thomas meal or on the yield of oats grown in sand and loamy sand soils, but increased the kernel wt. and the germinating power of the grain; it had no effect on the absorption and utilization of the  $\text{P}_2\text{O}_5$ . Seventeen references.

K. D. Jacob

Recent developments in nitrogen fertilizers. C. L. Burdick. *Am. Inst. Chem. Eng., Rome Meeting*, Dec. 1933 (preprint), 147pp.—The synthetic  $\text{NH}_3$  industry is approaching the 20th anniversary of its large-scale com. development. In the early years of this century fears were regularly expressed regarding prospective shortage of N. For the last 15 years the pressure has been steadily for cheaper N. The emphasis of the paper is on the history and economics of recent developments.

C. L. Mantell

Assortment and technology of nitrogen fertilizers in relation to the coke chemical industry. L. S. Assinovsky. *Coke and Chem. (U. S. S. R.)* 1932, No. 3, 14-24, No. 7, 20-7. — A discussion of the resp. values of  $(\text{NH}_4)_2\text{SO}_4$ ,  $\text{NH}_4\text{NO}_3$ ,  $\text{Ca}(\text{NO}_3)_2$ ,  $\text{CO}(\text{NH}_2)_2$ ,  $(\text{NH}_4)_2\text{CO}_3$ ,  $\text{NH}_4\text{Cl}$ ,  $(\text{NH}_4)_2\text{HPO}_4$  and  $\text{NH}_4\text{H}_2\text{PO}_4$  as fertilizers. An outline of plant technology for the production of each of these fertilizers is given.

James Sorrel

The effect of nitrogenous fertilizers on the growth and yield of wheat and barley in South Australia. I. Wheat grown after fallow and after stubble. A. E. V. Richardson and H. C. Gurney. *Empire J. Exptl. Agr.* 1, 193-205 (1933).—When equiv. amts. of N were applied to wheat over a 5-yr. period the largest increases in yields were obtained with  $\text{NaNO}_3$ ; no significant differences occurred between the increases given by  $(\text{NH}_4)_2\text{SO}_4$ , Nitro-chalk and urea, but the increases given by  $(\text{NH}_4)_2\text{HPO}_4$  were definitely smaller. Drilling superphosphate or  $(\text{NH}_4)_2\text{HPO}_4$  with the seed increased the yield 3.2 and 3.9 bu./acre, resp., as compared with broadcasting the fertilizer on the surface of the soil; with  $(\text{NH}_4)_2\text{SO}_4$  there was no significant difference between the drilled and the broadcast applications.  $(\text{NH}_4)_2\text{SO}_4$  slightly depressed the plant-establishment, caused a vigorous burst of tillering resulting in a greater no. of ear-bearing tillers at harvest, increased slightly the length of ear, caused a weaker and sapper growth, decreased the percentage of grain to total produce, and increased the growth of weeds. Naturally occurring N on fallow caused a more prolonged and steadier tillering, resulting in sturdier tillers, the percentage survival of which was better than with  $(\text{NH}_4)_2\text{SO}_4$  on stubble.

K. D. Jacob

A simple and rapid chemical test on plant material as an aid in determining potassium needs. S. F. Thornton. *Ind. (Purdue) Agr. Expt. Sta. Bull.* 384, 3-20 (1933); cf. C. A. 27, 4336. The previously described technique gave reliable indications of the needs of farm crops for K fertilizers. Interpretation of results of the test in terms of K supply is based on work with plants from a large no. of soils whose fertilizer and yield histories are definitely known. For corn, potatoes and soy beans a good correlation existed between results of the test fertilizer treat-

ments, and yield responses. Thirty-two references.

C. R. Fellers  
Absorption of potassium by plants as affected by decrease exchangeable potassium in the soil. E. L. Proebsting. *J. Pomology and Hort. Sci.* 11, 190-204 (1933).—Exptl. data show that different plants vary widely in their ability to withdraw supplies of K from a given soil. Neither exchangeable nor  $H_2O$ -sol. K is an accurate index of the ability of the soil to supply K. The non-exchangeable K may be an important source of supply to some plants in certain soils. J. O. H.

The effect of fertilizers and rainfall on the length of cotton fiber. E. B. Keynolds and D. T. Killough. *J. Am. Soc. Agron.* 25, 756-64 (1933); cf. C. A. 27, 3280.—On Lufkin fine sandy loam there appeared to be no significant correlation between the percentage of N,  $P_2O_5$  or  $K_2O$  and the length of cotton fiber. N and  $K_2O$  had no appreciable effect on the length of fiber on Kirwin fine sandy loam but applications of  $P_2O_5$  increased the length of lint to some extent, which approached significance. In some instances the length of fiber was positively correlated with the amt. of rainfall during the time the bolls were developing. J. R. Adams

Cotton fertilizer tests at the Georgia Coastal Plain Experiment Station. S. A. Parham. Ga. Coastal Plain Expt. Sta., *Bull.* 19, 12-21 (1932).—Long-continued tests with various formulas show the ideal cotton fertilizer applied at the rate of 500 lb. per acre should contain  $P_2O_5$  9,  $NH_4$  3 and  $K_2O$  5% applied at the time of planting, and a top dressing of 100-150 lb. of  $NaNO_3$  or its equiv., applied as soon as the cotton is chopped. On thin land this formula may be changed to a 9-4-5 combination.  $CaO$  or  $CaCO_3$  gave no increases in yield of cotton. High-analysis fertilizers gave equally good results as the less concentrated, provided they are thoroughly mixed with the soil. Approx. 20-25% of the  $NH_4$  in cotton fertilizers should be derived from an org. source such as cottonseed meal and the remainder from such inorg. sources as  $NaNO_3$  or  $(NH_4)_2SO_4$ . As sources of K, kainite, over a 9-yr. period gave the highest yields with  $K_2SO_4$  next, and KCl third. C. R. Fellers

Study of rice fertilization. L. C. Kapp. Ark. Agr. Expt. Sta., *Bull.* 291, 3-37 (1933).—A lack of N is responsible for most of the abnormal growth and low yields of rice. In greenhouse expts.  $NaNO_3$  proved superior to a source of N to  $(NH_4)_2SO_4$ . Rice straw applications decreased the growth and yield of rice. Small frequent applications of  $NaNO_3$  greatly increased yields of rice. Nitrites are not accumulated in submerged soils in sufficient quantities to prove toxic to rice seedlings. The increased yields of rice from dried and sterilized soil over moist soil are not correlated with the P content of the soil soln. The P content of the plants decreased as the age of the plant increased. P fertilizers did not increase yields because it appears that the rice obtains sufficient P for its needs from the soil. This holds good in spite of the fact that the soil soln. contains very little P.

C. R. Fellers  
Tobacco fertilizer tests at the Georgia Coastal Plain Experiment Station. J. M. Carr. Ga. Coastal Plain Agr. Expt. Sta., *Bull.* 19, 89-93 (1932).—Field expts. on Lufkin sandy loam covering 8 yrs. showed that fertilizers analyzing 3-4%  $NH_4$  gave the greatest net returns per acre. Less than 3%  $NH_4$  gave good quality but decreased yields. The fertilizer for tobacco should contain 8-12%  $P_2O_5$ . Because of premature ripening less than 10%  $P_2O_5$  is suggested. Potash increased yields of tobacco in proportion to the amt. added (max. 8%). Marked signs of K deficiency occurred when the  $K_2O$  % was less than 1%. Org. and inorg. sources of N should be used in approx. equal proportions. Dried blood, cottonseed meal and fish scrap are satisfactory organics, while  $NaNO_3$ , urea,  $NH_4NO_3$  and  $Ca(NO_3)_2$  are good inorg. sources of N. C. R. Fellers

Effects of inoculation and liming on soybeans grown on the Grundy silt loam. R. H. Walker and P. R. Brown. Ia. Agr. Expt. Sta., *Bull.* 298, 279-406 (1933).—From 2 to 3 tons of  $CaCO_3$  per acre are required to neutralize most

of these soils. Inoculation produced much healthier plants and greater yields of hay and beans. By the use of both lime and inoculated seed, the yield of hay was doubled and the yield of seed tripled, as compared to the controls. Lime alone also resulted in marked crop increases.

C. R. Fellers  
Effects of inoculation and liming on alfalfa grown on the Grundy silt loam. R. H. Walker and P. R. Brown. Ia. Agr. Expt. Sta., *Bull.* 305, 43-60 (1933).—Inoculation of alfalfa seed planted on Grundy loam not only insured a far better stand and yield of hay, but the hay contained more N. Lime, especially when finely ground, likewise increased the stand and yield of alfalfa on these soils. The use of lime increased the protein and Ca content of the alfalfa, thus greatly adding to the nutritive value of the hay.

C. R. Fellers  
Reaction between urea and gypsum. Colin W. Whitaker, Frank O. Lundstrom and Sterling B. Hendricks. *Ind. Eng. Chem.* 25, 1280-2 (1933).—Urea reacts with gypsum in the presence of moisture to form the complex  $CaSO_4 \cdot 4CO(NH_2)_2$ . The phys., optical and chem. properties of this compd. are described. It is less hygroscopic than urea and, if formed in a fertilizer mixt., would not impair the mech. condition of that mixt. J. O. H.

Some factors affecting the premature dropping of pecans. H. L. Crane. National Pecan Assoc., *Rept. Proc. 30th Ann. Conv.* 1931, 92-7.—Increasing the N content of complete fertilizers applied to pecan trees caused an approx. proportionate increase in tree growth, total no. of blossoms, total no. of nuts set, percentage of pistillate blossoms that set nuts and percentage of shoots that blossomed which set nuts. N-deficient trees set but few nuts although the trees blossomed heavily. Under extreme conditions of N starvation the trees formed but few blossoms and these failed to mature into nuts.

K. D. Jacob  
The base exchange in coal ashes. H. Mönig. *Angew. Chem.* 46, 631-4 (1933).—Exptl. results, which are reported, show that the exchangeable mineral constituents contained in coal are identical with the Al silicates of the soil and could possibly be used for artificial fertilizing purposes. The exchange reactions follow the mass-action law and consequently the phenomena are not absorption processes but equil. reactions. K. K.

Chlorophyll defects of lucern as indicators of different physiological disturbances. M. Kliukowski. *Phytopath. Z.* 6, 531-7 (1933).—When lucern was grown in quartz sand and supplied with a nutrient medium deficient in K the leaves developed a white mottling in 10 weeks and the plants exhibited the typical symptoms of K deficiency. In the presence of an excess of K growth of the plants was strongly depressed and comparatively few blooms were formed. The best growth and development were obtained when K was supplied in the proper amt.

K. D. Jacob  
Composition of commercial insecticides, fungicides, bactericides, rodenticides and weed killers. A compilation supplementary to Bulletin 300. H. J. Fisher and E. M. Bailey. Conn. Agr. Expt. Sta., *Bull.* 346, 211-68 (1933); cf. C. A. 23, 4010.—Addnl. analyses are listed.

C. R. Fellers  
Comparative toxicities of anabasine sulfate and nicotine sulfate for aphids and leafhoppers. Philip Garman. Conn. Agr. Expt. Sta., *Bull.* 349, 433-4 (1933).—Preliminary field tests showed the anabasine sulfate obtained from the North African weed, *Anabasis aphylla* L., to be about 5 times as toxic as the nicotine sulfate. These promising results indicate a need for further work on this new insecticide.

C. R. Fellers  
Control of the grape leafhopper in California. J. F. Lamiman. Calif. Agr. Expt. Sta., *Circ.* 72, 3-20 (1933).—The grape leafhopper, *Erythroneura comes*, may be effectively controlled by nicotine, pyrethrum-oil sprays or by nicotine or  $Ca(CN)_2$  dusts. For the nicotine spray, 1 pint of 40% nicotine sulfate and  $\frac{1}{2}$  lb. of casein spreader is used for 100 gal. of spray.  $Ca(CN)_2$  dust should be used at the rate of approx. 20 lb. per acre.

C. R. Fellers

**Walnut aphid control.** W. H. Wright. Calif. State Dept. Agr., *Monthly Bull.* 22, 166-9(1933).—Light infestations are readily controlled by dusting the trees with 4% nicotine sulfate. For heavier infestations 2 or 3 applications of 3.5-4% should be used and timed 1-2 weeks apart.

**Review of codling-moth-control measures.** Stewart Lockwood. Calif. State Dept. Agr., *Monthly Bull.* 22, 170-8(1933).—A crit. review.

**Control of the codling moth of Idaho.** Claude Wakeland and R. W. Haegele. Idaho State Hort. Assoc., *Proc. 36th Ann. Conv.* 1931, 74-82.—Addn. of 1 gal. of com. oil emulsion (80%) to 100 gal. Pb arsenate spray materially increased the degree of control of the codling moth on apples, but rendered the removal of As from the fruit more difficult. The oil used in emulsions for summer spraying should have a viscosity of 65-75 and the sulfonation no. should not be less than 85. Oil-Pb arsenate sprays applied after July 25th rendered As residue removal extremely difficult. Arsenic is very much more easily removed from fruit washed immediately after picking than after it has been allowed to set a few days at normal temp.

**Codling-moth control: experiments at Harcourt.** R. T. M. Pescott. *J. Dept. Agr. Victoria* 31, 484-9(1933).—Alternating sprays of white oil emulsion (1.60) and Pb arsenate, following the 2 calyx sprays of Pb arsenate, gave more efficient control of the codling moth than was obtained with Pb arsenate sprays alone and resulted in smaller amts. of As (0.006-0.008 grams per lb. of fruit) adhering to the apples. Dutox, a proprietary product consisting principally of BaSiF<sub>6</sub>, was not satisfactory as a follow-up spray for the calyx sprays of Pb arsenate. A 10% vinegar soln. was more effective than fermented apple juice as a codling-moth lure; addn. of geraniol reduced the efficiency of the lures. Banding the trees with corrugated cardboard soaked in an engine oil soln. of  $\beta$ -naphthol resulted in the capture and killing of large nos. of larvae.

**Fluorine compounds as substitutes for lead arsenate in the control of the codling moth.** E. J. Newcomer and R. H. Carter. Idaho State Hort. Soc., *Proc. 36th Ann. Conv.* 1931, 161-5.—BaSiF<sub>6</sub>, K<sub>2</sub>SiF<sub>6</sub> and cerolite gave results comparable with those obtained with Pb arsenate for control of the codling moth on apples in the Pacific Northwest. Sprays contg. 1 lb. of the F compd. and 1 pint of fish oil or mineral oil emulsion per 100 gal. water are recommended.

**The danger of the cabbage moth and its economical and efficient control.** Enrique F. Schultz. *Rev. ind. agr. Tucuman* 22, 313-16(1932).—Control of the cabbage moth in the larval stage is effected by use of a 1% soln. of Pb arsenate in an aq. soln. prepd. by trituration of cabbage leaves, also use of a powder composed of 75-100 g. Pb arsenate per kg. flour. The poison is applied to the plant leaves.

**Banding for mealy-bug control.** H. C. James. Kenya Colony Dept. Agr., *Bull.* 24, 6 pp.(1932).—Cellophane is more effective than grease-proof paper as a base for castor-oil bands on coffee trees. The best results are obtained with crude castor oil but refined oil is satisfactory if it is mixed with 30% of resin. The duration of effectiveness of the band is not increased by addn. of HgCl<sub>2</sub>. The life of treated Cellophane bands is approx. 1 yr.

**Biology and control of citrus insects and mites.** H. J. Quayle. Calif. Agr. Expt. Sta., *Bull.* 542, 3-87(1932).—A complete survey of insects with recommended sprays and treatments to control those of economic importance.

**San Jose scale control by lime-sulfur and oil emulsion sprays.** Claude Wakeland. Idaho State Hort. Assoc., *Proc. 37th Ann. Conv.* 1932, 43-7, 49-54.—Oil emulsion (3%) and liquid lime-S (4-5° Baume) sprays gave good control of San Jose scale on fruit trees; dry lime-S gave poorer results. The effect of oil sprays was immediate and of short duration, whereas the max. efficiency of lime-S sprays was attained only after approx. 60 days.

The oil used in the sprays should have a sulfonation value of 50-70 and a viscosity of not less than 100. The chemistry of lime-S sprays is reviewed.

**Influence of sprays on residue removal.** R. S. Snyder. Idaho State Hort. Assoc., *Proc. 37th Ann. Conv.* 1932, 71-3, 75-7.—When apple trees were sprayed with combination mineral oil-Pb arsenate sprays removal of arsenical residue from the fruit was much more difficult when the oil had a viscosity of 70-75 and sulfonation test of 90 than when it had the same sulfonation value and a viscosity of 50. Because of the formation of wax, removal of As was much more difficult when the fruit was stored for 10 weeks at ordinary temp. before washing than when it was washed immediately after picking. When the fruit was placed in cold storage for 10 weeks formation of wax was hindered and removal of As was nearly as easy as when the apples were washed immediately.

**Removal of spray residue from canning peaches sprayed for peach twig borer control.** H. K. Plank. Calif. State Dept. Agr., *Monthly Bull.* 22, 113-30(1933).—Hanss, Cling and Phillips variety of canning peach trees were sprayed 1-4 times with a spray contg. per 300 gal., 9 lb. dry basic Pb arsenate and 2 lb. of colloidal spreader. The ripe peaches showed 0.011-0.072 grains per lb. of As<sub>2</sub>O<sub>3</sub>; peeled fruit from the canning tables showed only traces of As, and the canned peaches, none.

**Report of the imperial mycologist.** W. McRae. Imp. Inst. Agr. Research Fusa, *Sci. Repts.* 1931-32, 122-40 (1933); cf. C. A. 26, 5374.—A fungus resembling *Sclerotinia sclerotiorum* Lib. was isolated from *Hibiscus sabdariffa* affected with stem rot. The fungus prefers an acid medium, produces appreciable amts. of oxalic acid and requires good aeration for abundant sclerotial formation. Disinfection of the seed with Uspulun Universal (0.25% soln. for 1 hr.) was more effective than treatment with formalin in controlling *Helminthosporium salivum* and *H. teres* on barley. The wilt disease of chickpeas, caused by *Fusarium* sp., was favored by fertilizing the plants with (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> and superphosphate.

**New methods for the control of loose smut of wheat by steeping.** G. Gassner. *Phytopath. Z.* 5, 407-33(1933). *Rev. Applied Mycol.* 12, 499-500.—Immersion up to 24 hrs. of wheat in hot water (35°, 40° or 45°) gives good control of loose smut (*Ustilago tritici*) apparently because when O is excluded under these conditions intramolecular respiration takes place to form alc. and other cleavage products. Moistening the grain with 5, 6, 7 1/2 or 10 l. of water per cwt. in closed containers for 14 hrs. at these temps. was equally effective. G. believes that the disinfection is partially or wholly due to these cleavage products. On this assumption 2-5% of EtOH was added to the water used and it was found that the time necessary for the treatment was much less and the EtOH soln. could be used repeatedly without decrease in its efficacy. Methylated spirits and MeCHOHMe similarly gave good results and promising results were also given by acetone, cyclohexanone, dioxane, MeOH, glycol, glycol monoethyl ether, and glycol monobutyl ether.

**Combating the flying smut of wheat by means of wet disinfectants.** G. Gassner and H. Kirchhoff. *Phytopath. Z.* 6, 453-68(1933); cf. Gassner, C. A. 27, 4016.—Promising results in the control of flying smut of wheat were obtained by treating the seed for 3-5 hrs. at 50° with 5-6 l. water per quintal. The time of treatment and the amt. of liquid can be reduced somewhat by increasing the temp. to 52.5°. Addn. of 0.5-4.0% of either distd. spirits or isopropyl alc. improved the efficiency of the treatment but slightly reduced the germinating power of the grain.

**Root rot, foot rot and head blight of wheat in Kenya.** H. J. Taylor and Colin Maher. Kenya Colony Dept. Agr., *Bull.* 4, 15 pp.(1931).—Good control of the diseases, which are caused by *Fusarium* sp., was obtained by treating the soil with 200 lb. CaCN<sub>2</sub> per acre.

**Photoperiodism. Value of supplementary illumination and reduction of light on flowering plants in the green-**

house. Alex Laurie and G. H. Poesth. Ohio Agr. Expt. Sta., *Bull.* 512, 3-42(1932).—Copious nitrate formation occurred in greenhouse soils in spite of greatly reduced daylight. Heavy N fertilization with  $(\text{NH}_4)_2\text{SO}_4$  did not retard flower formation in chrysanthemums. C. R. F.

**Diseases of narcissus.** Frank P. McWhorter and Freeman Weiss. Ore. Agr. Expt. Sta., *Bull.* 304, 5-41(1932).—In order to control common bulb diseases, it is recommended that the bulbs be dipped before planting for at least 15 min. in either  $\text{CH}_2\text{O}$  or  $\text{HgCl}_2$  solns. The  $\text{CH}_2\text{O}$  dip contains 1 pint of 40%  $\text{CH}_2\text{O}$  to  $12\frac{1}{2}$  gal. of water. The  $\text{HgCl}_2$  dip contains 1 oz. of  $\text{HgCl}_2$  to 6 gal. of water. C. R. Fellers

**The control of Antestia in wetter districts.** F. B. Notley. Kenya Colony Dept. Agr., *Bull.* 4, 12 pp. (1933).—Good control of *Antestia jaceta* Germ. on coffee trees was obtained by spraying with a 1:50 aq. diln. of kerosene-pyrethrum-soap emulsion; the emulsion contains 1 lb. pyrethrum powder, 1 gal. kerosene and 0.5 lb. neutral soap per 6 gal. Because of its low stability, the emulsion must be used immediately and it is incompatible with Bordeaux mixt. and Pb arsenate. Arsenite-molasses baits are ineffective against the insect in wet districts. K. D. Jacob

**Melampsora amygdalinae, the rust of basket willows (Salix triandra).** I. Observations and experiments in 1932. L. Ogilvie and H. P. Hutchinson. Univ. Bristol Agr. Hort. Research Sta., *Ann. Rept.* 1932, 125-30.—Treatment of willow stumps with 2 applications of tar oil winter washes (10-15%), the 1st on Apr. 20th and the 2nd on May 4th, killed the 1st willow shoots but caused a marked diminution of rust on the subsequent shoots. II. Spore germination experiments. L. Ogilvie. *Ibid.* 131-8.—Germination of spores of *M. amygdalinae* was entirely prevented by exposure to 0.2% Bordeaux mixt., 1.0% Burgundy mixt., 0.25% "Shirlan" (salicylanilide), or 0.00058%  $\text{CuSO}_4$ ;  $\text{NH}_4$  polysulfide (1:200) and flowers of S had little effect. The dry spores are not resistant to a temp. of  $24^\circ$  and germination of the spores in water is checked at this temp.; air is essential to germination. K. D. Jacob

**The "yellowing of coffee."** V. A. Beckley. Kenya Colony Dept. Agr., *Bull.* 3, 6 pp. (1931).—Chlorosis of coffee trees was prevented and cured by the application of 0.5 lb.  $(\text{NH}_4)_2\text{SO}_4$  per tree. Other N fertilizers also were effective in treating the condition. K. D. Jacob

**Control of Alternaria blight of ginseng with Bordeaux mixture and injuries accompanying its use.** H. A. Rannels and J. D. Wilson. Ohio Agr. Expt. Sta., *Bull.* 522, 4-16 (1933). The use of a 3-4-1/2-50 Bordeaux mixt. to which 1 lb. each of potash fish-oil soap and Ca arsenate have been added for each 50 gal. of spray material is recommended for the control of blight, *Alternaria panax* Whetzel. This treatment is normally effective if 3-4 applications are made. Leaf burning and drought injury occasionally occur. C. R. Fellers

**Puncture vine in California.** B. Johnson. Calif. Agr. Expt. Sta., *Bull.* 528, 42 pp. (1932).—Among chem. methods of killing plants and seeds, Diesel-oil spraying was most successful. Oils contg. 2.5% of asphalt emulsify readily with water and water-oil emulsions penetrate the seed-burns. C. R. Fellers

**Cotton wilt. IV. Effect of fertilizers.** V. H. Young, G. Janssen, and J. O. Ware. Ark. Agr. Expt. Sta., *Bull.* 272, 27 pp. (1932).—Heavy applications of K fertilizers either alone or in combination with N and P markedly decreased cotton wilt and rust, and stimulated vegetative growth and seed production. B. C. A.

**Collar rot of tomatoes.** W. A. Kreutzer and L. W. Durrell. Colo. Agr. Expt. Sta., *Bull.* 402, 3-12(1933).—Seed treatments with  $\text{CuCO}_3$ , Ceresan and Semesan dusts were ineffective in controlling this infection. The seed bed may be sterilized by steam or by  $\text{CH}_2\text{O}$ . One part of  $\text{CH}_2\text{O}$  to 50 parts of water and applied at the rate of 1 gal. per sq. ft. of soil is recommended. C. R. Fellers

**The absorption and movement of sodium chlorate when used as an herbicide.** W. E. Loomis, E. V. Smith, Russell Bissey and L. E. Arnold. *J. Am. Soc. Agron.*

25, 724-30(1933).— $\text{NaClO}_3$  apparently penetrates readily all the external surfaces of the plant with the exception of unusually heavy cuticle or corky layers. It appears that the movement of  $\text{NaClO}_3$  within the plant is principally in the xylem and is most rapid in the direction of the transpiration stream.  $\text{NaClO}_3$ , whether applied to the soil directly or reaching it in the drip and leachings from sprayed plants, has persisted in the soil in an apparently unchanged form for  $2\frac{1}{2}$  yrs. It may be absorbed from the soil soln. by the roots and rhizomes of plants and translocated to the tops so that both tops and roots are killed by the toxin. Its removal from the soil by leaching is possible but large vols. of  $\text{H}_2\text{O}$  are required and it appears that its disappearance is due primarily to the decompos. of the salt. Decompos. is fairly rapid in moist soil at temps. above  $20^\circ$ , but may be very slow in cool dry soil. J. R. Adams

**Use of arsenical compounds in the control of deep-rooted perennial weeds.** A. S. Crafts. *Hilgardia* 7, 361-72(1933).—The most dil. As soln. giving effective control in field plots contained 0.5%  $\text{As}_2\text{O}_3$  by wt. Higher concns. up to 4% were not more effective. Sprays of acid reaction were most effective; the lowest effective concn. of the acid was approx. 1 N. The stock arsenical is prepd. by mixing dry 4 parts by wt. of  $\text{As}_2\text{O}_3$  and 1 part by wt. of NaOH, adding 3 parts of water and stirring until dissolved. The spray soln. is made by dilg. 1 part of the stock As soln. with 100 parts of water, mixing thoroughly, and adding with const. stirring 5 parts by wt. of concd.  $\text{H}_2\text{SO}_4$ . C. R. Fellers

**Weed control.** Walter S. Ball. Calif. State Dept. Agr., *Monthly Bull.* 22, 252-7(1933).—The limitations of oil and chem. sprays are discussed. C. R. Fellers

**Progress in weed control.** A. S. Crafts. Calif. State Dept. Agr., *Monthly Bull.* 22, 264-8(1933).—General. C. R. Fellers

**Weed control by means of soil sterilization.** Paul M. Goodwin. Calif. State Dept. Agr., *Monthly Bull.* 22, 299-301(1933).—The use of  $\text{Na}_2\text{HAsO}_4$  as a weed spray along irrigation ditches proved feasible and effective. C. R. Fellers

**Camel thorn, Alhagi camelorum Fisch.** Walter S. Ball and Wilfred W. Robbins. Calif. State Dept. Agr., *Monthly Bull.* 22, 258-63(1933).—This very obnoxious weed which has recently spread greatly in Calif. can be eradicated only by thorough treatment of the soil with  $\text{CS}_2$  to a depth of 10 in. C. R. Fellers

**Disinfectants and parasiticides in relation to poultry.** H. A. Hoffman. Calif. Agr. Expt. Sta., *Monthly Bull.* 22, 232-9(1933).—A summary of properties and uses of phenol, cresols, emulsified coal-tar disinfectants, chlorinated lime, NaOCl preps., 1, CaO,  $\text{HgCl}_2$ ,  $\text{CH}_2\text{O}$ , lye, Cu salts,  $\text{KMnO}_4$  and kerosene. C. R. Fellers

**Effect of mercurial ointment on hatchability.** Alan Deakin and Geo. Robertson. *Poultry Sci.* 12, 378-81 (1933).—When eggs were set under hens treated with mercurial ointment (for control of body lice) for 48, 36, 24, 12 and 2 hrs., resp., then transferred to the incubator, there was a gradation of mortality of the embryo that was complete for eggs set under treated hens for 48 hrs., but not apparently affecting those set under treated hens only 2 hrs. In a few cases embryos survived when the eggs were treated directly with mercurial ointment and then incubated. Mercurial ointment should not be used on breeding chickens during, and probably 2-3 months previous to, the breeding season. K. D. J.

**Variations in arsenical spray residue (Waterhouse) 12.**  $\text{P}_2\text{O}_5$  and double superphosphates (Tiedemann, Gundelach) 18. [Product contg.] alkali chlorates [as weed killer] (Brit. pat. 306,701) 18. Fungicides (Brit. pat. 306,737) 17.

**Fertilizer.** Harry C. Moore (to Armour Fertilizer Works). U. S. 1,931,768, Oct. 24. Superphosphate is treated with an ammoniacal soln. of  $\text{NH}_4\text{NO}_3$ .

**Fertilizer.** Leopold Hecht (to I. G. Farbenind. A.-G.).

U. S. 1,931,819, Oct. 24.  $\text{NH}_4\text{NO}_3$  and di- $\text{NH}_4$  phosphate are used together in a fertilizer which may also contain other ingredients.

**Fertilizers.** Ruhrchemie A.-G. Brit. 396,092, July 27, 1933. Fertilizers are prepd. by decomp. raw phosphates with the  $\text{HNO}_3$  necessary to render the  $\text{P}_2\text{O}_5$  present sol., treating the mixt. with  $\text{NH}_4$  salts of acids that form difficultly sol. salts with Ca, preferably with  $(\text{NH}_4)_2\text{SO}_4$ , filtering off the pptd.  $\text{CaSO}_4$  and undecomposed, evap. the soln. almost to dryness to form a mixt. of  $\text{NH}_4\text{NO}_3$ ,  $\text{NH}_4\text{H}_2\text{PO}_4$  and residual  $\text{CaSO}_4$  and treating the mass with liquid or gaseous  $\text{NH}_3$  in a practically pure state until the  $\text{NH}_4\text{NO}_3$  is dissolved out. The  $\text{NH}_4\text{NO}_3$ , after the removal of the  $\text{NH}_3$  and the  $\text{NH}_4$  phosphate, preferably after removal of the residual  $\text{NH}_3$ , are then mixed in desired proportions or 1 or the other may be mixed with the dried reaction mass that has not been treated with  $\text{NH}_3$ . Any residual  $\text{NH}_4\text{NO}_3$  or  $\text{NH}_4$  phosphate may be mixed with other fertilizers. The  $\text{NH}_3$  used for the soln. of the  $\text{NH}_4\text{NO}_3$ , if necessary after sepn. from the  $\text{NH}_4\text{NO}_3$ , may be combined with acids to form fertilizers. In 396,729, July 31, 1933, addn. to 396,092, the soln. is evapd. to dryness, the N content adjusted by dissolving out any desired amt. of  $\text{NH}_4\text{NO}_3$  with the  $\text{NH}_3$  and the  $(\text{NH}_4)_2\text{HPO}_4$  formed in the residue reconverted into  $\text{NH}_4\text{H}_2\text{PO}_4$  by adding free acid, e. g.,  $\text{HNO}_3$ ,  $\text{HCl}$ ,  $\text{H}_2\text{SO}_4$ , either with or without the simultaneous addn. of other fertilizing salts. The  $\text{NH}_4\text{NO}_3$  may be completely removed.

**Fertilizer production by alkaline digestion of cellulosic materials such as wood chips.** Harold R. Murdock (to Champion Fibre Co.). U. S. 1,933,445, Oct. 31.  $\text{HNO}_3$  or  $\text{H}_3\text{PO}_4$  or an acid nitrate or phosphate is used for neutralizing an alk. waste liquor produced by the pulping of cellulosic material such as wood chips with alk. liquor (such as KOH soln.) contg. a suitable proportion of an alk. K compd.

**Solidification of reaction products obtained by the reaction of nitric acid on phosphate of lime.** Gottfried Trumpler (to Lonza Elektricitätswerke und Chemische Fabriken A.-G.). U. S. 1,935,528, Nov. 14. For producing a fertilizer, the plastic reaction product, while still warm and during the course of its solidification, is subjected to mech. subdivision while mixing with it the cold, dry, pulverized final product from a previous operation.

**Superphosphates.** Soc. anon. pour le traitement des minerais aluminopolassiques. Swiss 162,159, Aug. 16, 1933. Superphosphates sol. in water are prepd. by treating  $\text{Ca}_3(\text{PO}_4)_2$  with  $\text{H}_2\text{SO}_4$  contg. 850-900 gr.  $\text{P}_2\text{O}_5$  per l.

**Insecticide, etc.** Schering-Kahlbaum A.-G. (Karl Gornitz and Herbert Schotte, inventors). Ger. 577,739, June 3, 1933. A prepn. for killing insects or fungi on plants contains white complex Fe arsenates. Other substances, such as wetting, sticking or suspending agents, filling material or other fungicides or insecticides may be added.

**Insecticide and insectifuge.** Dudley H. Grant (to

Standard Oil Development Co.). U. S. 1,934,057, Nov. 7. See Can. 333,642 (C. A. 27, 4622).

**Insecticides and disinfectants.** E. I. du Pont de Nemours & Co. Brit. 396,064, July 17, 1933. Divided on 391,141 (C. A. 27, 4818). **Insecticidal, wood-preserving and disinfectant compds.** comprise a fluosilicate of an aliphatic or heterocyclic amine as defined in 391,141 and an inert liquid diluent, with or without other active materials. According to examples horticultural insecticides consist of dil. aq. sols. of the fluosilicates of di-*n*-butylamine, pyridine, piperidine or 6-ethoxy-2-amino-benzothiazole together with a small quantity of fish-oil soap or sulfonated oxidized petroleum oil as spreading agent. Wool, fur, hair, hide, etc., may be rendered mothproof with aq. solns. of di-*n*-butylamine fluosilicate or quinoline fluosilicate.

**Fungicides, etc.** Maison A. Baud. Fr. 749,521, July 25, 1933. Sulfonated compds., particularly sulfonaphthalenes, with or without antiflocculating agents such as powd. alum are added to insecticide or fungicide pastes, etc., for vegetables.

**Fungicide and insecticide.** Soc. anon. des mines d'Orbagnoux. Ger. 577,977, June 8, 1933. A prepn. for plant preservation is prepd. by treating the Cu or Pb salts of ichthoysulfonic acid with an alkali salt of an oxyacid and alkali or  $\text{NH}_4\text{OH}$  to render them sol. in water. Thus,  $\text{CuSO}_4$ , Rochelle salt,  $\text{NH}_4\text{OH}$  and  $\text{NOH}$  are mixed into ichthoysulfonic acid.

**Parasiticidal sulfur preparation.** Alonzo S. McDaniel (to Loomis, Stump and Banks). U. S. 1,934,989, Nov. 14. A compn. suitable for spraying or use on animal or on human beings comprises bentonite, the particle size of which is mainly 0.01-0.02 in. in diam. assocd. with S solidified from a fluid state in the bentonite and on its particles.

**Extract from pyrethrum flowers.** Nicholas A. Sankowsky (to Standard Oil Development Co.). U. S. 1,933,077, Oct. 31. Pyrethrum flowers are placed in an extr. column in the form of a mass contg. interstices; a solvent such as kerosene is distributed over the flowers at a rate less than sufficient to flood the interstices of the material with solvent, so that the solvent is caused to flow substantially only over the exterior surfaces and through the intercellular surfaces of the flowers, and the resulting comparatively concd. ext. is withdrawn from the bottom of the extraction column. App. is described.

**Barium polysulfide.** Ignaz Kreidl. Ger. 577,812, June 6, 1933. Solid  $\text{BaS}_2$  for use in the protection of plants is prepd. by treating  $\text{BaS}$  with S in water in the presence of morg. sulfides, sulfites or thiosulfates to act as carriers. The water is heated to nearly boiling.

**Weed killers.** I. G. Farbenind. A.-G. Fr. 719,973, Aug. 2, 1933. The possibility of recultivating soil in which weeds have been killed is accelerated by using as weed killers chlorates, such as those of Fe or Sn, which undergo a spontaneous decompn. Catalysts such as  $\text{MgCl}_2$  which accelerate the decompn. may be added to the soil after the destruction of the weeds.

## 16 THE FERMENTATION INDUSTRIES

C. N. FREY

**Experiences in hydrolysis and fermentation of sawdust.** M. Schön and P. Béraud. *Ann. combustibles liquides* 8, 619-29 (1933). Hydrolysis expts. with dil.  $\text{H}_2\text{SO}_4$  solns. and fermentation tests were carried out on pine, oak and poplar sawdusts and the resulting juices, resp. Exptl. procedure and results are reported, and time-concn. fermentation curves are presented. Karl Kammermeyer

**Recirculation process lowers cost of vinegar production.** A. L. Nugry. *Food Ind.* 5, 174-6 (1933).—By cooling the vinegar stock as it passes through the surge tank, 100-grain vinegar can be produced in a single but a larger-capacity generator. C. R. Fellers

**The very frequent presence of coproporphyrin in preparations of nucleic acid extracted from beer yeast.** C.

Dheré and Andree Roche. *Compt. rend. soc. biol.* 114, 449-52 (1933).—Coproporphyrin was detected by its fluorescence spectrum in nearly all the com. preps. of nucleic acid examd. L. E. Gilson

**Fat and lipid metabolism of yeast (Halden, et al.)** 11D Distg. liquids (Jr. pat. 749,496) 13. Filters [for beer] (Brit. pat. 396,255) 1.

**Rectifying alcohol.** Usines de Melle and Henri M. Guinot. Brit. 396,005, Aug. 10, 1933. Addn. to 387,589 (C. A. 27, 4624). See Fr. 42,028 (C. A. 27, 4873).

**Denaturing alcohols.** A. Riebeck'sche Montanwerke

A.-G. (Theodor Hellthaler and Erich Peter, inventors). Ger. 586,224, Oct. 19, 1933. See Fr. 743,498 (C. A. 27, 3774).

**Butyl and isopropyl alcohols by fermentation.** Samuel C. Prescott and Kisaku Morikawa (Morikawa to Prescott). U. S. 1,933,683, Nov. 7. A substantially pure culture of *Bacillus technicus* which may be derived from molded rice or "koji" is used for fermenting a mash contg. fermentable sugars.

**Propionic acid.** Hugh R. Stiles and Perry W. Wilson (to Commercial Solvents Corp.). U. S. 1,932,755, Oct. 31. For the production of propionic acid and HIOAc, a mash contg. hydrolyzed starchy material and which may be prepd. from corn, barley or potatoes, etc., is subjected to fermentation by a culture contg. propionic acid bacteria. Cf. C. A. 27, 4874.

**Fermentation processes.** H. Th. Bohme A.-G. Nr. 41,537, Jan. 28, 1933. Addn. to 708,285 (C. A. 26, 1062). The pyloric attachments of fish are used in the process of fermentation. Nr. 708,285.

**Fermentation process.** Industrikemiska Aktiebolaget. Nr. 749,848, July 29, 1933. Finely divided air is passed through a relatively thin layer of the fermenting liquid.

**Filter press, particularly for worts.** Edmond Bredon-Weustenraad. Fr. 749,628, July 27, 1933.

**Yeast.** The International Yeast Co. Ltd. and Wm. G. Bennett. Brit. 396,206, Aug. 3, 1933. Yeast and similar organisms of high ergosterol content for use as food and for medicinal purposes are produced by cultivation under conditions in which they are subjected to deficiency in nitrogenous nutrient while in the presence of an oxidizing agent or O-carrier, e. g., salts of peracids, methylene blue, in an aerated medium, other nutrient substances being supplied in normal amt. Examples are given. Cf. C. A. 27, 5471.

**Dried yeast.** Kyutaro Mizobata. U. S. 1,934,941, Nov. 14. Whole rice is steamed and sterilized by heating, then cooled and used as an absorbent for previously cultivated pure yeast to form a compn. which may be stored for a time in a suitable vessel (such as a described bottle).

**Electrolytic bleaching of molasses for yeast production.** Joseph W. Thompson and John W. Hinchley. U. S. 1,933,830, Nov. 7. Molasses is dild. until it contains about 15% of sugars; 0.5–1.0% of a non-poisonous inorg. acid such as  $H_2SO_4$  is added; the mixt. is subjected to the action of an electric d. c. until bleaching to a degree of about 60% is effected; impurities are removed by filtration, the acid present is neutralized (suitably by adding  $NH_3$  or  $CaCO_3$ ) and the soln. is decanted from any ppt. which may be formed.

## 17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

**Aseptic filtration in the apothecary.** H. Eschenbrenner. Pharm. Monatsh. 14, 169–70 (1933). Methods of sterilization and titration under sterile conditions are reviewed. The disadvantages of the Seitz filter are discussed. The use of the Zigmundy membrane filter and the Buwa app. is recommended and the latter described. H. M. B.

**Observations concerning the healing properties of Leonurus cardiac.** L. B. Pater. Pharm. Monatsh. 14, 171 (1933).—Cases are cited in which the drug was used in the treatment of epilepsy. H. M. Burlage

**Pharmaceuticals and medicinals from the Bible and Talmud.** E. Berg. Pharm. Monatsh. 14, 177 (1933).—Historical review. H. M. Burlage

**The brooms (Genista).** A. M. Burger. Reichstoff Ind. u. Kosmetik 8, 159–61 (1933).—The brooms—*Genista coparia* and *G. monosperma* (*G. tinctoria*)—and their constituents are discussed. They have been found of value in the prepn. of *Wisteria*, *Ixia* and *Freesia* bouquets and formulas for the same are given. H. M. Burlage

**The use of iodoform gauze in surgery.** H. Feriz. Pharm. Weekblad 70, 1154–60 (1933).—Numerous advantages of CHI<sub>3</sub> dressings are pointed out. A. W. D.

**The phytosterol of Phyllanthus acidus Skeels.** A. J. Ultee. Pharm. Weekblad 70, 1173–5 (1933).—The phytosterol obtained by  $C_6H_6$  extn. of the bark of *Phyllanthus acidus* and repeated crystn. from EtOH m. 228–9° and  $[\alpha]_D^{25}$  40.7° in  $CHCl_3$ . Its acetate m. 206°. It is not identical with lycopel as shown by m.-p. depression when the 2 sterols or their acetate are mixed. A. W. Dox

**Methods for the examination of homeopathic drugs.** H. Neugebauer. Pharm. Weekblad 70, 1221–7 (1933).—A review of methods for detecting certain drugs in high diln., e. g., Fe, Cu, Sb, Bi and some alkaloids, by means of color reactions, biochem., spectroscopic, luminescence and capillary reactions. A. W. Dox

**Mucilage of fenugreek (Trigonella foenum graecum).** C. R. Hariharan Iyer and B. N. Sastri. J. Indian Inst. Sci. 16A, 88–90 (1933).—The purified mucilage is a mannogalactan. F. L. Dunlap

**Difference in alcohol values of pharmacopoeial tinctures.** Walter Mayer. Apoth. Ztg. 48, 1089–91 (1933).—Reference is made and exception taken to certain statements made by Schlemmer and Siegert (cf. C. A. 27, 4875). A series of tinctures is listed showing both their alc. and dry residue content, noting the striking relationship of these values.

W. O. E.

**Essential oil content of the 1933 camomile harvest.** H. Will. Apoth. Ztg. 48, 1134 (1933).—A tabular presentation of some 37 different samples of camomile from provinces in Germany, Hungary and Jugoslavia affords a comparative est. of differences in the color, smell and essential oil content of the 1933 product. W. O. E.

**Investigation of emplastrum lithargyri.** S. Babich. Arch. Pharm. 271, 446–8 (1933).—To the pharmacopoeial directions under "Emplastrum lithargyri" should be added: the method for estg. PbO and moisture; the method given in detail by B. is equally applicable to Emplastrum plumbi compositum; the estn. of fatty acid is desirable. W. O. E.

**Emulsions and salve bases.** W. Kern. Deut. Apotheke 2, 140–3 (Apoth. Ztg., 1933).—An address. W. O. E.

**Petrolatum salves in the treatment of poison gas (dichlorodiethyl sulfide) burns.** Otto Muntsch. Deut. Apotheke 2, 143–4 (Apoth. Ztg., 1933).—An exptl. study of the relative merits apparent in the treatment of burns from dichlorodiethyl sulfide with various petrolatum salves and with bleaching powder. The results obtained do not justify a preference of the former over the latter treatment. W. O. E.

**Natural and synthetic drugs.** K. Bodendorf. Deut. Pharm. Ges. 1, 1–5 (Apoth. Ztg., 1933).—An address. W. O. E.

**Preparation of mixtures, as liq. kalii arsenicosi with tinct. chinac composita, or tinct. amara or tinct. ferri pomati.** S. Babich. Pharm. Zentralhalle 74, 563–6 (1933).—On mixing tinct. chinac composita with (a) liq. kalii arsenicosi (via the Pharm. U. S. S. R.), (b) liq. Kalii arsenicosi acidulus via Winkler and (c)  $H_2O_2$  ppts. result in all cases. The formation of these ppts. is influenced by the presence of  $H_2O$ ,  $As_2O_3$  in acid and alk. soln., and by alkali. The wt. of ppts. is least with  $H_2O$ , the greatest with liq. kalii arsenicosi. Avoidance of pptn. under the conditions stated appears impossible. The amt. of ppt. in g. and in percentage is in proportion to the total amt. of dry residue of the mixts. very small. The ppt. absorbs none of the  $As_2O_3$ . Since the amt. of ppt. formed is not large, and since the content of  $As_2O_3$  is not thereby materially changed, mixts. of tinct. chinac composita and liq. kalii arsenicosi may be regarded as practically compatible. The same also may be said in the case of mixts. of tinct. amara and liq. kalii arsenicosi acid or with liq. kalii arsenicosi. The mixt. of tinct. ferri pomati

and liq. kalii arsenicosi forms no ppt. on standing.

W. O. E.

**Estimation of arbutin in folia uvae ursi, and its preparations.** Clemens Grimme. *Pharm. Zentralhalle* 74, 669-70 (1933).—Zechner's method is so modified and given in detail that it now becomes possible to effect the estn. of arbutin in one day.

W. O. E.

**Microvolumetric estimation of bismuth in pharmaceutical preparations.** Johann Straub and Eugen Mihalovits. *Pharm. Zentralhalle* 74, 685-9 (1933). The microvol. method previously developed by S. is equally applicable to pharmaceutical preps.

W. O. E.

**Estimation of phenol in 1% solutions of sodium arsenate in ampoules.** A. M. Kleshnya. *Pharm. Zentralhalle* 74, 689-91 (1933). The method followed is essentially a modified form of Koppeschaar's procedure.

W. O. E.

**Turbidity in solutions of aluminum acetate D. A.-B. VI.** E. Mohlau. *Apoth. Ztg.* 48, 1337 (1933).—The practice of adding boric acid to the official prepn. to counteract turbidity is discouraged, since it is believed that as yet no substance is known which is capable of permanently inhibiting the formation of turbidity and ppt. in solns. of Al acetate.

W. O. E.

**New drugs and pharmaceutical specialties in the second and third quarters of 1933.** F. Zernik. *Sueddeut. Apoth.-Ztg.* 73, 690-1, 700-1 (1933).

W. O. E.

**Tinctura anticholeric D. Apoth. Ver. 5.** Walter Meyer. *Pharm. Ztg.* 78, 968-9 (1933).—Several suggestions for the improvement of this prepn. are given, notably the substitution of tinct. gallarum for opium where the latter is not readily available, or for economic reasons.

W. O. E.

**Natural and synthetic menthol.** A. Serini. *Pharm. Ztg.* 78, 979 (1933).—A commentary on this year's report of Schimmel & Co. (*C. A.* 27, 5472) in regard to certain quality differences in menthols. *dl*-Menthol m. 35° and on standing quietly begins to solidify at about 25°. The solidification pt. is found by the usual method at 28°. The product is not, however, really hard, but pappy. Only after 1/2 to 3 min. does the cryst. mixt. change into a hard and stiff mass, whereby the temp. rises to 31-2°. This phenomenon of double solidification permits recognition of isomer-free *dl*-menthol from all other types of menthol and its mixts.

W. O. E.

**Stability of insulin in solution.** Gyula Mikó. *Pharm. Zentralhalle* 74, 561-3 (1933). Comparison of a 10-yr. old sample of insulin, "Iletin," with a standard insulin developed the surprising fact that the older product "Iletin" was very nearly as strong (96.58%) as the standard of 100 units.

W. O. E.

**Ultramicroscopic observations on salve bases and medicated salves.** W. Brandrup. *Pharm. Ztg.* 78, 1121 (1933).—An ultramicroscopic study of ichthyl salves shows that uniform distribution of the medicament, and hence uniform distribution of the salve over the skin, is effected only when the salve is rich in lanolin.

W. O. E.

**Extr. chamomillae fluid, and extr. salviae fluid.** Hans Kuiser and Eugen Wetzel. *Sueddeut. Apoth.-Ztg.* 73, 683-4 (1933).—Improved procedures for prepg. these extrs. are outlined.

W. O. E.

**Stability of aqueous solutions of gallotannic acid.** W. A. Woodard and A. N. Cowland. *Quart. J. Pharm. Pharmacol.* 6, 363-74 (1933).—The rate of deterioration in aq. solus. of gallotannic acid preserved at a temp. of 60-65°F. is negligible over a period of 6 months. The rate of deterioration is not influenced by the concn. of solns. A small quantity of suitable antiseptic and preservative is needed in solns. HgCl<sub>2</sub> has been shown unsuitable for this purpose, and on the evidence herein quoted purified cresol 1 part in 250 might conveniently replace the Hg compd.

W. O. E.

**Keeping properties of liquor arsenicalis.** E. M. Smelt. *Quart. J. Pharm. Pharmacol.* 6, 375-88 (1933).—The occurrence of molds and deposits contg. As<sub>2</sub>O<sub>3</sub> in some specimens of liquor arsenicalis Brit. Pharm. 1932 is confirmed. No objectionable odors were detected. The use of NaOH instead of KOH was found to encourage rather than pre-

vent mold growth. No increase in the tendency to grow molds was observed when liquor arsenicalis was contaminated with traces of nitrate. Storage under dispensary conditions did not prove more favorable to the development of molds than storage in closed, filled containers. The growth of molds was inhibited by addn. of preservatives and by adjustment of the soln. to *p*<sub>H</sub> 2 or to *p*<sub>H</sub> 8.0. The limits of *p*<sub>H</sub> beyond which the formation of As<sub>2</sub>O<sub>3</sub> crystals would be prevented were considered to be 3.0 and 9.0. On account of the incompatibility of an alk. soln. with soln. of strychnine-HCl, an acid soln. is to be preferred.

W. O. E.

**Determination of acriflavine and related medicinal dyes.** A. D. Powell and G. F. Hall. *Quart. J. Pharm. Pharmacol.* 6, 389-94 (1933).—The method recommended consists in the pptn. of flavine dyes as ferrieyanide, and titration of the excess ferrieyanide by reduction with HI under suitable conditions. It may be applied to acriflavine and proflavine, and is more satisfactory and readily carried out than are N detns. It also may be applied in the detn. of dressings medicated with flavine dyes, where the N detn. is inapplicable.

W. O. E.

**Relative activities of ergotoxine and ergotamine with special reference to the assay of ergot preparations.** E. Lozinski, G. W. Holden and G. R. Diver. *Quart. J. Pharm. Pharmacol.* 6, 395-8 (1933).—A correction for the presence of ergotamine should be introduced in the colorimetric assay of ergot. When assayed biologically, with ergotamine as a standard, a correction for the lower activity of this salt, as compared with ergotoxine, should be introduced. In both instances, for all practical purposes, 60% of the observed readings would give a sufficiently close approximation of the ergotoxine content.

W. O. E.

**Keeping properties of liquid extract of ergot.** E. M. Smelt. *Quart. J. Pharm. Pharmacol.* 6, 399-405 (1933).—The Brit. Pharm. method of assay for liquid ext. of ergot requires bright sunlight or a Hg vapor lamp and cannot always be used. Allport and Cocking's modification of this assay gives identical results and may be conveniently carried out at any time. The rate of deterioration of liquid ext. of ergot Brit. Pharm. 1932 under different conditions of storage has been investigated. At room temp. in partially filled bottles rapid loss of alkaloid takes place. If kept for more than 6 weeks under ordinary dispensary conditions the alkaloidal strength is liable to fall below the min. permitted by the Brit. Pharm. When kept at room temp. in filled bottles in the dark, the keeping properties are much improved. The rate of change in liquid ext. kept in completely filled bottles in an ice chest is very slow.

W. O. E.

**Determination of moisture in mercuric oxide.** G. J. W. Ferrey. *Quart. J. Pharm. Pharmacol.* 6, 406-10 (1933). Moisture in yellow HgO Brit. Pharm. may be detd. with negligible error by drying for 1 hr. at 70°. The error involved in drying at 150° is considerable. The behavior of Hg<sub>2</sub>O on heating has been investigated. The influence of the non-volatile impurities in yellow HgO on the detn. of moisture is discussed.

W. O. E.

**Note on the British Pharmacopeia limit test for more soluble sugars in lactose.** G. J. W. Ferrey. *Quart. J. Pharm. Pharmacol.* 6, 411-12 (1933).—In examg. samples of lactose it was found that specimens passing the Brit. Pharm. tests in other respects and possessing no odor often gave residues in the limit test for more sol. sugars than the stipulated Brit. Pharm. limit of 0.005 g. It is suggested that the Brit. Pharm. limit might well be trebled without detracting in any way from its usefulness in detecting adulteration by cane sugar or dextrose.

W. O. E.

**Precipitation of alkaloids by tannins and the use of antipyrine in the detection of tannins.** Alan H. Ware and Victor Smith. *Quart. J. Pharm. Pharmacol.* 6, 454-63 (1933).—The statements recently published implying that it is the exception rather than the rule for alkaloids to be pptd. by tannins are erroneous. Fifty-two alkaloids, related org. N bases and their salts representing 31 distinct alkaloids and org. bases; of which 22, representing 14

distinct alkaloids and bases, are pptd. by tannin alone from aq. soln., while 14 others, representing also 14 distinct alkaloids and bases, are pptd. by tannin in the presence of 0.04%  $\text{NaHCO}_3$  (in the final admixt.), that is, insufficient  $\text{NaHCO}_3$  to ppt. the alkaloid without the tannin, with rare exceptions. Furthermore, it is shown that 49 substances, including the 36 above referred to, and representing 29 individual bases, are pptd. by tannins in the presence of an acid admixt. of Na phosphates (most other Na salts of weak acids will give more or less pptn., but there are several advantages in the use of the particular admixt. adopted). A method is referred to and suggested for use as a routine test for alkaloids to confirm results obtained via Dragendorff. While parallel results are obtainable by the 2 methods in testing isolated alkaloids and their salts, Dragendorff's reagent is well known to give ppts. with many org. substances which are not bases. A method is outlined for testing vegetable powders and extractives. The behavior of antipyrine with aq. vegetable extractives has been examd. This substance yields a bulky ppt. with all extractives contg. tannin over a wide range of  $\text{pH}$ , but most completely in the presence of an acid admixt. of phosphates; no other aq. vegetable extractives tested behave similarly, with a partial exception named. The method is recommended as affording an apparently specific test for tannins useful in confirming the result given to the test with an Fe complex devised by one of the writers, more especially when the color of the ppt. given in the last case is not typical. W. O. E.

**Chemical tests for *Strophanthus*.** E. M. Smelt. *Quart. J. Pharm. Pharmacol.* 6, 467-74 (1933).—Fourteen color tests were investigated with a view to finding some which would distinguish between the seeds and preps. of *S. bomby* and *S. emini*. Four tests are recommended for this purpose, namely, the  $\text{H}_2\text{SO}_4$  test, the  $\text{PhOH}$  and  $\text{HCl}$  test, the fufural and  $\text{H}_2\text{SO}_4$  test, and the resorcinol and  $\text{HCl}$  test, all of which are suitable for the identification of the seeds of other species of *Strophanthus*. More definite colors were obtained when an alc. ext. of the seeds was used than when the tests were applied directly to sections of the seeds. W. O. E.

**Spectrographic investigation of gum acacia.** S. Judd Lewis and J. Wombwell. *Quart. J. Pharm. Pharmacol.* 6, 475-82 (1933). Eight samples of gum from various sources ("Soudan," "Bleached," "Kordofan," "cleaned," "Italian," "Talha," etc.), have been examd., notably with respect to their ash. From the data obtained it appears that Al was absent in the Kordofans; Ba and Ca are both variable, in general occurring in fairly constant amounts to one another; Sr is practically uniform throughout; Fe is much higher in the Talhas, while K is low; Li is remarkably high in one sample and is almost universally present; Mg is much higher in the Talhas than elsewhere; Mn also following Fe with which it is constantly associated; with one exception B occurs in the Talhas only; Si is high in the Talhas; Pb and Sn occur in the majority; the Italian was exceptional in that it contained slight traces of Ag, As, Br and W; 2 other samples contained min. traces of Bi, and another a heavy trace of Zn. W. O. E.

**Comparison of the action of various solvents on defatted cochineal.** John Rae. *Quart. J. Pharm. Pharmacol.* 6, 18, 5 (1933).—An ash limit of 6% is suggested which would include all genuine samples of coccus cacti, and the figure given in the Brit. Pharm. Codex 1923 requires amending. Ethylene glycol is an excellent solvent of defatted cochineal, producing a soln. approx. 50% stronger in tintorial value than one made with 26% alc., and 20% stronger than Liq. cocci Brit. Pharm. Codex. W. O. E.

**Compound tincture of cardamom: loss of color in certain mixtures.** Charles M. Caines and Norman Evers. *Quart. J. Pharm. Pharmacol.* 6, 486-91 (1933).—Decolorization occurring in mixts. contg. compound tincture of cardamom Brit. Pharm. is due to the alkyl of the mixts. from  $\text{pH}$  7.0 to 9.5 mixts. are fairly stable in the dark and are not sensitive to oxidation, but are decolorized by exposure to light. At  $\text{pH}$  values above 9.5 fading occurs in the dark as well as in the light and is hastened by oxidation.

1 There is little difference observable in the rate of fading of mixts. prepd. with tinct. cardam. compo Brit. Pharm. 1932 and Brit. Pharm. 1914. Ca salts cause pptn. of Ca carminate in the form of a black deposit at  $\text{pH}$  values of 4 and upward. Mg salts do not ppt. the coloring matter in the same way as Ca salts. W. O. E.

**Decomposition of acetylsalicylic acid in aqueous solution.** C. Morton. *Quart. J. Pharm. Pharmacol.* 6, 492-5 (1933).—The velocity of decompn. of acetylsalicylic acid in aq. soln. in the presence of alkali-metal citrates and acetates has been detd., and a composite graph given from which the percentage of hydrolysis at any period during storage can be read. The rate of decompn. is independent of the absolute and relative concns. of the acetylsalicylic acid and alkali metal salt, but increases very rapidly with rise of temp. The use of stock mixts. or of heat in effecting soln. is inadmissible. The velocity const. for the unimol. reaction at air temp. is 0.0043. W. O. E.

**Mistura bismuthi hydroxidi.** H. Treves Brown. *Quart. J. Pharm. Pharmacol.* 6, 502-5 (1933).—The following procedure was devised for making this product: Mix Bi subnitrate (125 g.) with 75 ml. of distd.  $\text{H}_2\text{O}$ , add 90 ml.  $\text{HNO}_3$ , and warm gently until soln. is effected. Dissolve 90 g.  $\text{NaOH}$  in 5000 ml. of  $\text{H}_2\text{O}$  and add the Bi soln. quickly, in one quantity, stirring rapidly. Allow the ppt. to subside and pour off the clear liquid; collect the ppt. on a calico strainer and wash with  $\text{H}_2\text{O}$ , maintaining a layer of liquid above the ppt., until the washings are neutral to phenolphthalein; allow the residue to drain and mix it with sufficient distd.  $\text{H}_2\text{O}$  to produce the required vol. (1000 ml.). W. O. E.

**Some proposed new formulas for the British Pharmaceutical Codex.** II. H. Treves Brown. *Quart. J. Pharm. Pharmacol.* 6, 506-16 (1933); cf. C. A. 27, 563. The preps. considered are: Exst. ergoti, Liq. azorubri, Liq. tartrazinae compositus, Mist. magnesi hydroxidi et parafini liq., Nebula adrenalinae et ephedrinae oleosa, Nebula adrenalinae aromatz., Pasta magnesi sulph., Pasta tragacanthae compos. and Syrup. glycerophosphatum cum pepsino compos. W. O. E.

**Solution of arsenious and mercuric iodides.** F. R. C. Bateson. *Quart. J. Pharm. Pharmacol.* 6, 517-21 (1933).— $\text{HgI}_2$  when dissolved in a soln. of arsenious iodide forms a compd. with the HI and not with the As. In solns. of III contg. 0.1 mols. per l., when satd. with  $\text{HgI}_2$ , a compd. is formed, approximating the formula  $\text{HgI}_2 \cdot 2\text{III}$ . Donovan's soln., when prepd. with pure arsenious iodide, is much more stable than has been generally assumed. In dispensing solns. of  $\text{HgI}_2$  and KI, a wt. of KI at least equal to that of  $\text{HgI}_2$  should be used. W. O. E.

**Variation in solubility of calcium lactate.** Norman Glass. *Quart. J. Pharm. Pharmacol.* 6, 522-30 (1933).—The differences observed are not due to any change taking place within a specimen of Ca lactate after production, but such differences are inherent in the original formation of the salt. No method was discovered of sepg. a more sol. salt from a less sol. sample. For practical purposes it must be accepted that specimens of Ca lactate differ from one another in soly. with different processes of manuf.; the true explanation of the difference has not been found; it is useless to set a single const. as a standard of soly. for Ca lactate, because it would exclude the product of a no. of manufacturers which in all other respects is of official quality. W. O. E.

**Yield of extractive in unstandardized official extracts.** B. R. Veness. *Quart. J. Pharm. Pharmacol.* 6, 531-2 (1933).—The drugs examd. were cascara sagrada, gentian, liquorice and krameria, from which the av. yields of exts. were 24, 40, 30 and 11%, resp. W. O. E.

**Preparation and storage of solutions of tribromoethyl alcohol.** W. H. Butchers, K. Bullock and G. R. Priddey. *Quart. J. Pharm. Pharmacol.* 6, 533-9 (1933).—Exptl. results clearly indicate among other things that tribromoethyl alc. in soln. undergoes progressive decompn., the rate of which is increased by a rise in temp. Initial decompn. was shown by means of a Universal Indicator

(B. D. H.), whereas this was not disclosed by Congo red soln. The following test has been devised: Transfer 3 mls of the prep. soln. to a clean test tube and cool. In a similar test tube place a like vol. of distd.  $H_2O$  used in the prep. of the tribromoethyl alc. soln., and to each tube add 2 drops of Universal Indicator; the color of the 1st tube should be greenish yellow and it should not be possible to detect any difference in color of the 2 tubes. The new test indicates decompn. when the acidity of the soln. is too low to be indicated by titration with 0.02 N NaOH soln. Congo red requires the liberation of a titratable amt. of acid (over 0.5 mil per 100 mls) before indicating decompn. There is progressive decompn. of tribromoethyl alc. in soln. when stored at body temp. Appreciable decompn. occurs when the soln. is stored overnight in a vacuum flask and this practice is open to serious objection. Overheating the  $H_2O$  with which the tribromoethyl alc. is used to a temp. of 65° will cause decompn. immediately detected by the new test. W. O. E.

**Antisepsis and disinfection of the mouth and throat.** Durcsm. *Suddeut. Apoth.-Ztg.* 73, 574-6(1933). An illustrated article suggesting the use of certain ring-form tablets (Ringlein) contg. higher esters of *p*-hydroxybenzoic acid, for gradual soln. in the mouth. Expts. show the efficiency of such treatment. W. O. E.

**Brazilian "coto barks" and their plant sources.** Fred. W. Preise. *Pharm. Zentralhalle* 74, 577-8(1933).—The following species are mentioned as constituting the various sources of com. coto bark: *Ocotea pretiosa* Muessn., *Oreodaphne hookeriana* Nees, *Palcurea densiflora* Mart., *Rudgea viburnoides* Benth., *Pseudochimarrhis turbinata* Ducke, *Ladenbergia paraensis* n. sp. Ducke, *Calyophyllum spruceanum* Benth., *Spicramnia* species, *Simaruba amara* Aubl., *Simaruba ferruginea* St. Hil., *Ocotea argyrophylla* Ducke, *Nectandra elaeophora* Barb., *Bracteanthus glycyrrhizifolius* Ducke, *Piper* species, *Stenocalyx* species, *Pourouma cecropifolia* Mart., *Couepia rufa* Ducke, *Couepia subcordata* Benth., *Eugenia grisea* Mart., *Arrabidaea chia* Bur., *Warszewiczia coccinea* Klotzsch, *Picrolemma pseudo-coffee* Ducke, listed in the order of importance. W. O. E.

**Pharmacopeia Helvetica 5th edition.** L. Rosenthaler. *Pharm. Zentralhalle* 74, 579-84(1933).—A digest. W. O. E.

**Chemical investigations of the tobacco plant. IV. Effect of the curing process on the organic acids of tobacco leaves.** Hubert B. Vickery and Geo. W. Pucher. *Conn. Agr. Expt. Sta., Bull.* 352, 649-84(1933); cf. *C. A.* 25, 2458; 27, 4274.—With new improvements in methods and technic, previous conclusions have been rechecked. Methods are described. For the general method, a faintly acid hot- $H_2O$  ext. of the tissue was prep. and the substances that form Ba salts insol. in 60% EtOH were removed. The org. acids in this ppt. were recovered by Et<sub>2</sub>O extn., and were esterified and the esters distd. Different acids were identified by the prep. of suitable derivs. Analyses for citric and malic acids were also carried out by indirect methods, and it is shown that the ester method closely confirms the results of the indirect method. Very extensive losses of oxalic acid occur during ordinary procedures for the prep. of aq. exts. from tobacco leaf tissue inasmuch as this acid is moderately volatile with water or alc. vapor. No reliance can be placed on analytical figures secured after such exts. have been concd. unless precautions are taken to recover the oxalic acid from the distillate. A new method for oxalic acid detn. was developed in which the oxalic acid in dried leaf tissue is removed from the acidified tissue by Et<sub>2</sub>O and is detd. as  $CaC_2O_4$ . The efficiency of the Ba salts pptn. method for the isolation of the org. acids was confirmed. From 85 to 90% of the titratable acidity of an aq. ext. of dried tobacco leaves was found in the Ba salts fraction. Both nitrogenous and non-nitrogenous org. solids of unknown compn. were present in the Ba salts fraction. Malic acid decreased during the curing process, about 16% of the original amt. of this acid being utilized in the catabolic processes. On the other hand, citric acid increased nearly 6-fold in the

same time. The origin of this citric acid is as yet unknown. Oxalic acid changed very little during the curing process. It was present largely as insol. salts. The total acidity, the acidity in the form presumably of monobasic acids, and the acidity in the form of acids precipitable as Ba salts by 60% alc. all changed very little, if at all, during curing. On the other hand, the acids of unknown compn. diminished greatly, their place being taken by citric acid. The curing process thus results in a very extensive simplification of the org. acid picture. Only 64% of the acidity of the fresh leaves can be accounted for in terms of known acids, chiefly malic, citric and oxalic. More than 81% of the acidity consists of these 3 acids after only 12 days of curing and a similar high proportion was identified in the fully cured leaf. Small amts. of succinic and fumaric acids were found, also possibly maleic acid. Both citric and malic acids were present in the residue from the distn. of the esters even after the temp. was carried far above the b. p. of triethyl citrate. Small but appreciable quantities of malic and citric acids were also found in the so-called unesterifiable fraction. C. R. Fellers.

**Aspirin.** E. M. Bailey. *Conn. Agr. Expt. Sta., Bull.* 354, 796-9(1933).—Fifty-four com. samples were examd. for acetyl-salicylic acid and free salicylic acid content. The 5-grain tablets showed variations of 4.65-5.27 grains of acetyl-salicylic acid, and none—0.05 grain free salicylic acid per tablet. C. R. Fellers.

**Essential oils: the methods of production and their possibilities in Kenya Colony.** V. A. Beckley. *Kenya Colony Dept. Agr., Bull.* 19, 25 pp.(1931).—*Micromeria microphylla* yields a clear white oil practically identical with that from scented verbena. *Mentha sylvestris* produces an oil resembling peppermint with a suggestion of pennyroyal. Camphor is present in the oil from *Ocimum canum*. When it is distd. with low-pressure steam the East African cedar (*Juniperus procera*) yields 1.5-3.0% of a pale yellow to dark brown oil which deposits a large amt. of long needle-shaped crystals on standing; the yield of crystals is higher from well-seasoned wood than from green or partially seasoned wood and is increased by exposing the sawdust to the sun. Geranium oil produced from plants grown in Kenya is low in esters and has a peculiar odor; the yield is about 0.15% from the leafy shoots and 0.27% from the leaves. Lemon-grass oil produced from plants grown in Kenya is very insol. in alc. The leaves of *Eucalyptus globulus* yielded 1.5% oil; *E. citriodora* gave a smaller yield. The fresh leaves of *Pogostemon patchouli* yielded 0.06-0.20% oil; fermentation of the leaves increased the yield to 0.5%. K. D. Jacob.

**Stillts for the production of essential oils.** V. A. Beckley and T. L. McClelland. *Kenya Colony Dept. Agr., Bull.* 25, 9 pp.(1932). K. D. J.

**Sodium evipan: a preliminary report on a new intravenous anesthesia.** G. Miller. *Can. Med. Assoc. J.* 29, 596-8(1933).—Sodium evipan is administered intravenously. The patient falls into a deep sleep in about 30 sec and operations may be commenced immediately. Anesthesia persists for about 20-30 min. For properly chosen cases it appears to be a valuable anesthetic. G. H. W. Lucas.

**The combination action of Solanaceae alkaloids.** Hajime Yamada. *Folia Pharmacol. Japon.* 16, No. 3, 351-60(Breviaria 27)(1933). The combined action of 1-hyoscyamine, 1-scopolamine and 1-homatropine on the parasympathetic fibers of the rabbit intestine and isolated frog heart show much greater efficiency in removing the effect of acetylcholine than any one alone. Apparently one alkaloid potentiates the action of the others. G. H. W. Lucas.

**The cultivation of *Lobelia inflata*.** M. Mascré and H. Genot. *Bull. sci. pharmacol.* 40, 453-9(1933).—The harvest can be increased by the use of fertilizers to above 3 times the usual value, but the relative content of alkaloids decreases. The factor for the alkaloid increase is about 2.5. A. E. Meyer.

**Chemical and physiological assays of some *Lobelias*.** M. Mascré and M. Caron. *Bull. sci. pharmacol.* 40, 519-

20(1933).—The chem. assay was performed by the pptn. of the alkaloids as silicotungstates. For the physiol. assay, the silicotungstates were decompd. with  $\text{NH}_3$ , extd. with  $\text{Et}_2\text{O}$  and the residue of evapn. was dissolved in dil.  $\text{H}_2\text{SO}_4$ . The physiol. effect of *L. inflata* in the anesthetized dog is a sharp increase of the blood pressure and a decrease of the amplitude and rate of respiration. The alkaloid content was found as follows: *L. inflata* leaves 0.585%, seeds 0.21 and 0.235%; *L. cardinalis* 0.445%; *L. syphilitica* 0.535%; *L. urens* 0.752%; *L. erinus* traces. The physiol. action in all species was like that of *L. inflata*. A. E. Meyer

The chemical composition of *Retama sphaerocarpa* Boiss. P. Valier. *Bull. sci. pharmacol.* 40, 520-3(1933). The upper parts of the plant give 3.1% of ashes, the compn. of which is given. The  $\text{EtOH}$  ext. contains an appreciable quantity of an alkaloid. A. E. Meyer

A new method of extraction and separation of the alkaloids of *Pseudocinchona africana* A. Chev. Raymond-Hamet. *Bull. sci. pharmacol.* 40, 523-7(1933).—Moisten the powd. bark with a 10% soln. of  $\text{Na}_2\text{CO}_3$  and ext. with benzine. Shake out with 2% formic acid, add  $\text{NaHCO}_3$  and ext. with  $\text{CHCl}_3$ . Evap. to dryness. The yield from 900 g. bark was 52.5 g. alkaloids. Dissolve the latter in  $\text{EtOH}$  and  $\text{Me}_2\text{CO}$  and change into the  $\text{HCl}$  salts. When the aqueous soln. of the  $\text{HCl}$  salt is extd. with  $\text{CHCl}_3$ , an amorphous alkaloid is obtained on evapn. (yield 1.325% of the bark). Make the extd. soln. alk. with  $\text{NaHCO}_3$  and ext. with  $\text{Et}_2\text{O}$ . The alkaloid corynanthine crystallizes from the concd.  $\text{Et}_2\text{O}$  soln. (1.0925%). When the mother liquid is mixed with a soln. of  $\text{HCl}$  in  $\text{Et}_2\text{O}$ , a small quantity of a ppt. is obtained. A. E. M.

*Digitalis lanata*. G. Spagnol. *Rev. sudamericana cardiol. inmunol. quimioterap.* 16, 783-94(1933).—*Digitalis lanata*, cultivated in Argentina, contained 49.6 international cat units per g., which is 4.4 times the potency of a standard of *Digitalis purpurea*. Hanvlik's methods on pigeons give the same toxicity as *purpurea*. This proves that the difference between toxic limit and therapeutic dose is more favorable in *D. lanata*. A. E. Meyer

Determination of phenacetin, antifebrin or aspirin. G. Vaisman. *Farm. Zhur.* 3, 109-12(1933).—The method is based on acid ( $\text{NHCl}$ ) hydrolysis of the sample for 1 hr. and subsequent titration of the excess  $\text{HCl}$  with standard  $\text{NaOH}$  and phenolphthalein. L. Nasarevich

Extract of ergot; its biological evaluation. A. D. Porenfeld and H. V. Tutayev. *Farm. Zhur.* 4, 156-9(1933).—The state pharm. method bases the evaluation of the ext. on its histamine content, instead of the alkaloids. Broom-Clark's method is much more specific and better adapted for biol. standardization. L. N.

Chemical evaluation of extract of ergot. A. D. Rozenfeld and H. Ya. Troppe. *Farm. Zhur.* 4, 159-64(1933).—Extensive expts. with about 37 detns. listed shows that Keller-Bromme's method as used in the German Pharm. V for alkaloids is sufficiently accurate and reliable to replace biological methods. Smith's colorimetric method has the advantages of speed. L. Nasarevich

Determination of volatile oils in plants. M. I. Perlova. *Farm. Zhur.* 4, 165-6(1933).—The app. comprises steam supply, a flask in which the sample is steamed, a condenser and a U-shaped buret, with one column graduated, and wide neck into which the distillate is fed. Water rises through the second column and is discarded and the oil floated in the graduated neck. L. Nasarevich

Preparation of bismoverol. G. A. Kirkhgof, M. O. Spektor and E. A. Akon'yantz. *Khim. Farm. Prom.* 1933, 122-3. —The method used in Russ. patent 14,468 is much simplified by dissolving 1.2 moles of  $\text{Bi}_2\text{O}_3$  in a mixt. of 1.67 moles of lactic acid and 7 moles of  $\text{AcOH}$  and dild. with  $\text{H}_2\text{O}$ . This soln. is heated to 50-60° and while stirring 1 mole of tartaric acid is added. The temp. is kept at 80° for 3 hrs., the ppt. washed by decantation, filtered and dried *in vacuo* at 80-90°. L. Nasarevich

Bismuth citrate and lactate. G. A. Kirkhgof and M. O. Spektor. *Khim. Farm. Prom.* 1933, 123. —One mole of 10% lactic acid is heated to 45° and treated with excess of

$\text{Bi}_2\text{O}_3$ , filtered and the crystals are washed and dried. The contents of  $\text{Bi}_2\text{O}_3$  = 59.23%. A. compd.  $(\text{C}_6\text{H}_5\text{O}_2)_3\text{Bi}(\text{OH})_3$  is prepd. analogous to bismoverol, with 1 mole each of citric acid and  $\text{Bi}_2\text{O}_3$ . The product contains 87%  $\text{Bi}_2\text{O}_3$ . L. Nasarevich

Anhydrous quinine. S. Elgazin. *Khim. Farm. Prom.* 1933, 124-5. —Stir wuter (90 l.), 2.5 kg. of  $\text{H}_2\text{SO}_4$  and 25 kg. of wet quinine at 60° and filter through charcoal. Neutralize the filtrate with  $\text{NaOH}$  (5%), filter the anhyd. quinine and dry at 50°. L. Nasarevich

Determination of santonin. N. G. Buntzelman. *Khim. Farm. Prom.* 1933, 130-5. —Treat the ground plant with 10%  $\text{HCl}$  until completely wet and shake with 10%  $\text{CHCl}_3$  90%  $\text{C}_6\text{H}_6$ . After 12 hrs. filter, evap. to 5-7 cc., add 5 g. of  $\text{Ba}(\text{OH})_2$  + 100 cc. of  $\text{H}_2\text{O}$  and heat with grinding. Reext. the pptd. resins. Acidify the filtrates with  $\text{HCl}$  and ext. 3 times with  $\text{CHCl}_3$ . Wash the  $\text{CHCl}_3$  with 1.5%  $\text{NaOH}$  and  $\text{H}_2\text{O}$ , evap., dissolve the residue in 7.5 cc. of abs. alc. and 42.5 cc. of hot  $\text{H}_2\text{O}$  and crystallize for 20-40 hrs. Filter the pptd. santonin, wash with 15% alc. and dry at 105-110°. L. Nasarevich

Determination of nicotine. M. G. Ruitkov. *Khim. Farm. Prom.* 1933, 140-2. —The sample dissolved in 50 cc. is dild. with steam and 2 g. of fresh  $\text{MgO}$  into dil.  $\text{HCl}$ . An aliquot of the distillate is treated with 1.5 cc. of  $\text{HCl}$  and 3 cc. of 12%  $\text{H}_2\text{Si}(\text{W}_2\text{O}_7)_8 \cdot 22\text{H}_2\text{O}$ . In 3 min. at 85° the ppt. is formed and after 2 hrs. crystn. is ready to filter. The ignited residue multiplied by 0.114 = the weight of nicotine. This method requires  $\frac{1}{3}$  of the time necessary for Bertran and Javillier's method. L. N.

Powdered extract of uva-ursi. I. Oberhard and E. Katz. *Khim. Farm. Prom.* 1933, 143-6. —The highest percentage of arbutin is obtained by double extn. of leaves; the leaves are boiled each time for 15 min. with 5 pts. of  $\text{H}_2\text{O}$ . The hot ext. is filtered on cloth, evapd. to  $\frac{1}{2}$  vol., mixed with dextrin or lactose, dried at 50° and powd. Arbutin is detd. iodometrically according to Zeichner. L. Nasarevich

Determination of alkaloids. Ya. Fialkov and S. Babich. *Khim. Farm. Prom.* 1933, 148-9. —Very rapid detn. is made by shaking a small vol. of the sample (2 cc.) with 70 cc. of  $\text{CHCl}_3$  and 5 g. of anhyd.  $\text{Na}_2\text{SO}_4$  in a flask until dispersed. Then  $\text{NH}_4\text{OH}$  is added, the flask shaken, the clear  $\text{CHCl}_3$  filtered, evapd., the residue dissolved in 0.02 N acid and the excess titrated with 0.02 N  $\text{NaOH}$ . L. Nasarevich

Quinine hydrochloride and sulfate. E. M. Tareev. *Khim. Farm. Prom.* 1933, 157-8. —A comparative discussion of quinine hydrochloride and sulfate uses in treatment of malaria, with preference given to hydrochloride as more sol., stable and efficient salt. L. Nasarevich

Analysis of tablets. D. Popov. *Khim. Farm. Prom.* 1933, 164-7. —A discussion of analysis of tablets contg. diethylallylacetanilide, aspirin, amatin, diplosal, antipyrine, pyrimidone, nitroglycerin, veramon, phenobarbital, and its derivs. Br is detd. either by boiling with  $\text{NaOH}$  and titration with  $\text{AgNO}_3$  and  $\text{NH}_4\text{CNS}$  or by boiling with  $\text{Na}$  and  $\text{C}_2\text{H}_5\text{OH}$ . I is detd. by oxidation to  $-\text{IO}_2$  and titration with  $\text{KI}$  and  $\text{Na}_2\text{S}_2\text{O}_3$ , or it is liberated with  $\text{HNO}_3$ , extd. with  $\text{CHCl}_3$  and titrated. The double bond is detd. bromometrically. Antipyrine is either titrated according to Kolthof or treated with the excess of picric acid (standard) and titrated. Nitroglycerin is detd. by reduction with  $\text{Al}$  and alkali, distg. and titrating with  $\text{NH}_3$ . Pyrimidone and barbituric acids are sepd. by extn. with solvents; the soln. is first made alk. (for pyrimidone) and then acidified and the acids are extd. L. N.

Hydration of anabasine. A. P. Orckhov and D. A. Brodskii. *Khim. Farm. Prom.* 1933, 188-90. —Anabasine (8 g.) in 120 cc. N  $\text{HCl}$  with Adams' catalyst is shaken with  $\text{H}_2$  for 18 hrs. 3.7 l. of hydrogen is consumed (3.3 l. theoretical). The filtered soln. evapd. *in vacuo* and treated with abs. alc. ppt.  $\alpha,\beta$ -dipiperidyl- $\text{HCl}$ , m. 300°. The base is sepd. with alkali, extd. with ether and crystd. in needles.  $\alpha,\beta$ -Dipiperidyl m. 68-9° and b. 113-14°. Picrate, chloroaurate, chloroplatinate, dinitroso- $\alpha,\beta$ -dipiperidyl and dibenzoyl- $\alpha,\beta$ -dipiperidyl are

sepd. and described. Another way to hydrate anabasine is to boil it in abs. alc. with Na. L. Nasarevich

**Xanthone.** M. Spektor. *Khim. Farm. Prom.* 1933, 195 6.—Aspirin (2 mols) is distd. at 120–70° until all the AcOH is over, then the temp. is raised so that in 4 hrs. it reaches 350–5° at 40 mm. and xanthone crystallizes out. Recrystd. from alc. xanthone yields 70%; m. p. 168–70°. L. Nasarevich

**Analysis of opium.** B. A. Klyachkina. *Khim. Farm. Prom.* 1933, 203 13.—After detn. of H<sub>2</sub>O 10 g. of opium is extd. with 100 cc. of 0.5% HCl for 24 hrs. and filtered. One part of the filtrate is dried for solids and the other 50 cc. is extd. with CHCl<sub>3</sub> and NaOH, concd., mixed with ether, filtered, shaken with 6 cc. of 30% NaOH, the aq. part combined with the original NaOH soln. contg. morphine and the solvent evapd. leaving narcotine, papaverine, thebaine and codeine. For morphine the combined NaOH soln. is acidified with HCl, treated with 6 g. of slaked lime, made up to known weight and set aside for 2 hrs. with shaking. A known part of the filtrate is mixed with 22 cc. of ether, 3 cc. of alc., 2 g. of NH<sub>4</sub>Cl, crystd. for 24 hrs., filtered on Schott's glass filter, washed with H<sub>2</sub>O satd. with ether and dried as anhyd. morphine at 70–105°. A correction of 0.08 is added. For narcotine the filtrates from morphine are neutralized, concd., strongly acidified with HCl, extd. with CHCl<sub>3</sub>, the CHCl<sub>3</sub> is concd. to 2 cc. and poured slowly into petr. ether. Narcotine-HCl is pptd., gently dried and weighed. Narcotine and papaverine are sepd. from other alkaloids by dissolving the mixt. in 5% CH<sub>3</sub>COOH, addn. of 2 g. of CH<sub>3</sub>COONa and crystn. The narcotine-papaverine ppt. is washed, sapond. with 6% alc. KOH, transferred to a separatory funnel with 5% NaOH and CHCl<sub>3</sub>, the CHCl<sub>3</sub> ext. is dried and dissolved in 10 cc. of alc., 5 cc. of this alc. mixed with 5 cc. of satd. alc. picrolonic acid, crystd. for 24 hrs., filtered and weighed. Picrolonate  $\times 0.561$  = papaverine. The alk. soln. contg. narcotine is acidified with HCl, heated to 90°, cooled, made alk., extd. with C<sub>6</sub>H<sub>6</sub>, dried and weighed. Codeine and thebaine in the filtrate from the above are extd. with CHCl<sub>3</sub> (alk.), concd. with H<sub>2</sub>O, crystd. in the cold, filtered and washed with *N* NH<sub>3</sub>. The filtrate is made more alk., extd. with CHCl<sub>3</sub>, of which an aliquot is dried and titrated for codeine. The thebaine left in the CHCl<sub>3</sub> is detd. colorimetrically (red ring with H<sub>2</sub>SO<sub>4</sub>; the min. amt. shown = 0.00025 g.). The ppt. (main part of thebaine) is dried at 70°, dissolved in 6 cc. of alc. mixed with 3 cc. of 7.5% alc. tartaric acid and crystd. for 24 hrs. The filtered thebaine tartrate may be either weighed or titrated. L. Nasarevich

**Thermopsis lanceolata K. Br.** M. Varlakov. *Khim. Farm. Prom.* 1933, 226–8.—*Thermopsis* found along the northern Chinese border contains 0.37% of alkaloids, sol. in H<sub>2</sub>O, CHCl<sub>3</sub> and alc., insol. in ether and benzene. The plant is poisonous and its action on frogs, rats, rabbits, cats and dogs is described. L. Nasarevich

**Estimation of the primary alcohols content of essential oils by phthalization.** L. S. Glichitch and Y. R. Naves. *Chimie & Industrie Special No.*, 1024 8 (June, 1933).—A study of the detn. of primary alcs. by phthalization in C<sub>6</sub>H<sub>6</sub> soln. on the water bath as recommended by Schimmel (*Ber. Schimmel* 1899, 24; 1912, 39–42; cf. C. A. 26, 2285) showed that phthalization is more or less complete and that the results obtained require a correction that varies with the nature of the alcs. present, the amt. found present and the time of alk. neutralization. It may be of some use for the comparative analysis of oils of citronella, as the influence of the 3 above-mentioned factors is fairly const. for this oil. Moreover, a considerable proportion of the secondary alcs. present are counted as primary. The following technique overcomes these sources of errors and gives accurate results for the sum of the primary and secondary alcs.: to 2–3 g. (accurately weighed) of oil in a 250-cc. glass-stoppered Erlenmeyer flask add 5 g. phthalic anhydride and 20 cc. pure dry C<sub>6</sub>H<sub>6</sub>N (distd. over K and redistd. over BaO and kept in paraffined glass-stoppered bottles), let stand 18 hrs. at atm. temp., add 25 cc. H<sub>2</sub>O

and 10 drops phenolphthalein indicator and titrate the excess acid with standard KOH. A. P.-C.

**Essential oils of *Ocimum canum* Sims and of *Ocimum gratissimum* L.** L. S. Glichitch and Y. R. Naves. *Chimie & Industrie Special No.*, 1029 33 (June, 1933).—Oils obtained from *Ocimum gratissimum* L. produced at Alindao (Ubangi-Chari), Combani (Anjouan) and Bani-bari (Ubangi-Chari) contained considerable amts. of thymol, but no eugenol. Oils obtained from *O. gratissimum* L. produced at Roulé (Comoro Islands) and Romba (Madagascar) contained considerable amts. of eugenol, but no thymol. Oils obtained from *O. canum* Sims, produced in Mayotte, Kenya, Anjouan (Comoro Islands) and at Antibes (Alpes-Maritimes, France) contained considerable amts. of *d*-camphor, but no *Me* cinnamate. Oils obtained from *O. canum* Sims, produced in the Comoro Islands, Madagascar and Ubangi-Chari contained considerable amts. of *Me* cinnamate, but no *d*-camphor. This would indicate that there exist botanical species which can be differentiated only by their chemism. A. Papineau-Couture

**Essential oil of *Canarium zeylanicum* (Thw.).** J. P. C. Chandrasena and Hans Lourens. *J. Soc. Chem. Ind.* 52, 362T (1933).—The fresh resin from the tree *Canarium zeylanicum* gave 10–15% essential oil. This, upon fractionation, gave  $\alpha$ -phellandrene and a fraction b<sub>5</sub> 120–2° consisting of a copd., C<sub>7</sub>H<sub>10</sub>O, m. 164°, obtained by cooling and filtering, and a liquid sesquiterpene, C<sub>15</sub>H<sub>24</sub>, which formed a nitrosite m. 113°. E. W. Scott

**Essence of lavender.** Antonio Illera Camino. *Quim. e ind.* 10, 245–55 (1933).—Some Spanish soils are well suited to lavender cultivation. Test plots have been grown, the essence has been recovered, and characteristics of the latter were detd. E. M. Symmes

**Industrial preparation of twice-distilled water; physico-chemical characters of the water.** R. Cliquet, J. Guilbert and H. Pénau. *J. pharm. chim.* 18, 321–34 (1933).—A semi-industrial distn. app. of Pyrex glass is sketched; by its means a twice-distd. water meeting all pharmaceutical and biol. requirements is obtained from ordinary distd. water at the rate of 3 l. per hr. The elec. cond. of Seine water is  $400 \times 10^{-4}$ ; of once-distd. 100–200  $\times 10^{-4}$ ; twice-distd. 2–3  $\times 10^{-4}$ . The av. *p*<sub>H</sub> of twice-distd. water detd. by potentiometry is 5.5, caused by dissolved traces of CO<sub>2</sub> (about 0.5 mg. per l.). Mineral impurities detd. by sensitive colorimetric methods were: Pb less than  $1:2 \times 10^6$ ; Cu  $1:2 \times 10^7$ ; B  $1.5 \times 10^7$ ; NH<sub>3</sub> less than  $1:5 \times 10^6$  org. matters: none; solids: 5 mg. per l. S. Waldbott

**Some fundamentals of perfumery.** H. Stanley Red grove. *Pharm. J.* 131, 395, 452–3 (1933).—A summary is given of present-day "formulating a perfume" and modern methods of prepn. of perfumes. S. Waldbott

**Surgical dressings. Consumption and Government regulations.** J. Widdiffe Peck. *Pharm. J.* 131, 421.—**Manufacture of cotton.** *Ibid.* 484 6.—The history of cotton, and its manuf. are given; illustrated. Lint bandages and gauze. *Ibid.* 513.—Modes of prepn. are described; special definitions are recorded. Plasters and ligatures. *Ibid.* 540. Sterilization of dressings by steam. *Ibid.* 568–9 (1933). S. Waldbott

**The new Swiss pharmacopeia (Ed. V).** C. H. Hampshire. *Pharm. J.* 131, 511–12 (1933).—The characteristic features and differences from other pharmacopeias are pointed out. S. Waldbott

**Constituents of the volatile oil from the wood of *Chamaecyparis formosensis* Matsum** (Kafuku, Ichikawa) 22 Sepn. of the opium alkaloids (Busse, Busse) 10. Hydroxy compds. of phenazone (Ger. pat. 577,631) 25. Org. Hg compds. (Ger. pat. 580,352) 10. Disinfectants (Brit. pat. 396,064) 15. Naphthalene derivs. [intermediates in the production of drugs] (Swiss pat. 162,350–1) 25. Porphrin (Swiss pat. 162,355) 25.

**Therapeutic preparation suitable for use in "non-specific protein therapy."** Maxwell M. Becker (to Geo. A. Breon & Co.). U. S. 1,935,497, Nov. 14. Mr

butyrate is used with proteins such as those of milk and with substances such as Na citrate which are suitable for providing a buffer soln. having a  $p_H$  of about 6.2.

**Medicinal silica preparations.** Chem. Fab. von Heyden A.-G. (Rudolf Zellmann, inventor). Ger. 542,448, Oct. 28, 1933. Colloidal silicic acid solns. are mixed with colloidal metals or nonmetals or their compds., or with reagents yielding colloidal ppts. of metals or nonmetals or their compds. The mixts. are then dried, preferably by spraying. Examples are given.

**Basic bismuth salts of organic arsonic acids.** Karl Streitzwolf, Alfred Fehle and Walter Herrmann (to Winthrop Chemical Co.). U. S. 1,934,017, Nov. 7. New basic Bi salts of org. arsonic acids of the probable formula  $HOBi.O.As(:O)R.O$ , wherein R stands for an

aromatic nucleus which may be substituted by one side chain, a heterocyclic nucleus, hydroxy, alkyl, halogen, amino, nitro or further groups, are obtainable by causing the alk. salts of org. arsonic acids to react with a soln. of a Bi salt other than bismuthyl K Na tartrate. These preps. which in contradistinction to the compd. of Levaditi are insol. in alkali, and which possess the combined therapeutical action of As and Bi, show antiparasitary properties and are especially suitable for the depot treatment of *trypanosoma* and *spirochete* diseases. Examples are given in which, as initial materials, there are used 3-acetylaminio-4-hydroxybenzenearsonic acid, *p*-acetylaminobenzenearsonic acid, 3,4-benz(4-*N*-methyl)imidazolonecarsonic acid and the formaldehyde bisulfite compd. of 3-amino-4-hydroxybenzenearsonic acid.

**Calcium citrate.** Klemens Bergl. Ger. 586,371, Oct. 20, 1933. Colloidal Ca citrate for medicinal use is prepd. by mech. disintegration of the citrate in the presence of a protective colloid comprising juice, pulp, or like products obtained from fruits of the genus *Citrus*.

**Use of sodium iodoarsenite, etc., for combating Vincent's angina and similar affections.** Charles Gurchot. U. S. 1,934,977, Nov. 14. Na iodoarsenite or a similar compd. of Hg, Bi, Sb or V are used as the therapeutic agents.

**Water-soluble formaldehyde bisulfite aminoaryl antimony compounds.** Hans Schmidt (to Winthrop Chemical Co.). U. S. 1,934,010, Nov. 7. From compds. of the type  $H_2NC_6H_4As:SbC_6H_4NH_2$ , such as 3-amino-4-hydroxy-1'-amino-1'-arseno-1'-stibiobenzene, etc., by treatment with formaldehyde bisulfite in aq. soln., water-sol. derivs. are obtained which are brownish colored powders, difficultly sol. in usual org. solvents and suitable for therapeutic use. Several examples with details of procedure are given. U. S. 1,934,012 also relates to similar compds. of the type  $H_2NC_6H_4As:Sb.AsC_6H_4NH_2$ ,  $Sb:AsC_6H_4NH_2$ .

**Esters of amino alcohols.** F. Hoffmann-La Roche & Co. A. G. Ger. 580,247, Oct. 19, 1933; Brit. 396,318, Aug. 3, 1933. Esters of aryl-substituted aliphatic acids with ams. of the formula  $RR'C(C_6H_4OH)CH_2NR_2$ , in which R is an alkyl group and R' is H or an alkyl group, are prepd. by standard processes. The products have antiparasmodic properties. Examples are given of the prepn. of (1) esters of 2,2-dimethyl-3-diethylaminopropanol with phenylacetic acid (ester  $b_p$  173°, HCl salt m. 80°),  $\alpha$ -phenylbutyric acid (ester  $b_p$  147°), phenylbromacetic acid (ester  $b_p$  186°),  $\alpha$ -phenyl- $\beta$ -hydroxypropionic acid (ester HCl salt m. 92°), and  $\alpha,\alpha$ -diphenylglycolic acid (ester HCl salt m. 141°); (2) esters of 2,2-dimethyl-3-dimethylaminopropanol with  $\alpha$ -phenyl- $\alpha$ -acetyloxypropionic acid (ester HCl salt m. 161°), acetylmandelic acid (ester HCl salt m. 179°), and propionylmandelic acid (ester HCl salt m. 139°); (3) esters of  $\alpha$ -phenyl- $\beta$ -acetyloxypropionic acid with 2,2-dimethyl-3-benzylmethylaminopropanol and 2,2-dimethyl-3-piperidylpropanol; (4) the quaternary methyl sulfate, m. 133-4°, of the ester from  $\alpha,\alpha$ -diphenylglycolic acid and 2,2-dimethyl-3-methyldiethylaminopropanol.

**Halogenated bis(hydroxyaryl) oxides.** Friedrich Muth and Georg Wessenberg (to Winthrop Chemical Co.). U. S. 1,932,595, Oct. 31. See Ger. 569,726 (C. A. 27, 3721).

**Chlorohydroxybiphenyls.** The Dow Chemical Co. Brit. 396,251, Aug. 3, 1933. 3- and 5-chloro-2-hydroxybiphenyls are obtained by chlorinating 2-hydroxybiphenyl by usual methods, with or without catalysts and solvents. Good yields are obtained with somewhat less than 1 mol. of Cl. The mixt. of monochloro compds. of close b. ps. may be sepd. from unchlorinated and polychlorinated products by a preliminary distn. and are then sepd. by fractional crystn., involving at 1 stage conversion into alkali or alk. earth metal salts. The products are suitable as germicides, disinfectants, etc.

**7-Ethoxy-4-methylcoumarin.** Arthur A. Levinson (to Selected Chemicals Inc.). U. S. 1,934,361, Nov. 7. This compd., which is suitable for use as a flavoring or perfume and m. about 115°, is produced by ethylating 7-hydroxy-4-methylcoumarin (various alternative methods of manuf. being described).

**Basic esters of fatty-aromatic acids.** Marcus Guggenheim (to Hoffman-La Roche Inc.). U. S. 1,932,341, Oct. 24. Details are given of the production of various esters which, in general, possess a strong antispasmodic action. Examples are given of the manuf. of: (1) 1-phenylacetyl 2,2-dimethyl-3-diethylaminopropanol ester,  $b_p$  173-4°; (2)  $\alpha$ -phenylbutyryl ester of 2,2-dimethyl-3-diethylaminopropanol,  $b_p$  147°; (3) phenylbromacetyl 2,2-dimethyl-3-diethylaminopropanol ester,  $b_p$  186°; (4) the hydriodide of the acetyltropyl ester of 2,2-dimethyl-3-diethylaminopropanol, m. 92°; (5) acetylacetyl 2,2-dimethyl-3-dimethylaminopropanol ester-HCl, m. 161°; (6) acetylmandelic acid 2,2-dimethyl-3-dimethylaminopropanol ester-HCl, m. 179°; (7) propionylmandelic acid 2,2-dimethyl-3-dimethylaminopropanol ester-HCl, m. 139°; (8) acetyltropyl 2,2-dimethyl-3-benzylmethylaminopropanol ester (a yellow oil which cannot be distd.); (9) acetyltropyl 2,2-dimethyl-3-piperidylpropanol ester (a yellow oil); (10) benzilic acid 2,2-dimethyl-3-diethylaminopropanol ester-HCl, m. 141-2°; (11) benzilic acid 2,2-dimethyl-3-methyldiethylammoniumpropanol ester methylsulfate, m. 133-4°; and, (12) tropyl 2,2-dimethyl-3-diethylaminopropanol ester (a colorless thick oil). The amino ams. used as starting materials may be prepd. by reduction with Na amalgam in a dil. HOAc soln. of the amino aldehydes made as described in U. S. 1,824,676 (C. A. 26, 258).

**Dilodoimidazoleacetic acid.** F. Hoffmann-La Roche & Co. Swiss 159,795, Apr. 17, 1933. I in alk. soln. is caused to react on Na imidazoleacetate, the resulting Na salt being converted to the acid by treatment with mineral acid. The substance m. 165° with decompn. and its HCl m. 186°. It is used as Rontgen ray contrast agent.

**Compounds of sparteine with barbituric acids.** F. Hoffmann-La Roche & Co. A.-G. Ger. 580,245, Oct. 19, 1933. Cryst. compds. are obtained by combining 1 mol. of sparteine with 1 or 2 mols. of a C,C-disubstituted barbituric acid (I). The reaction may be effected by fusing the components together, or by heating them in a solvent, or by double decompn. in a solvent between salts of the components. The products are sol. in water, alc., ether, and benzene, and exert a beneficial action on the circulatory system. Examples are given of the manuf. of compds., m. at the temps. stated, from sparteine and diethyl-I (1 mol.) (138°); phenylethyl-I (1 mol. and 2 mols.) (151° and 157°, resp.); ethylisopropyl-I (1 mol.) (140°); diallyl-I (1 mol. and 2 mols.) (139-40° and 140° resp.); and isopropylallyl-I (2 mols.) (122-3°).

**Adenosinephosphoric acids.** I. G. Farbenind. A.-G. Brit. 396,135, Aug. 3, 1933. Yeast adenylc acid (adenosine triphosphate) is converted into muscle adenylc acid (an adenosinephosphoric acid) by hydrolysis at 10-50°. The starting material, or crude ext. contg. it, is treated with the hydrolyzing agent, e. g.,  $Ba(OH)_2$ ,  $NaOH$  or mineral acid soln., a precipitant is then added and the product sepd. from the ppt. It is useful in the therapy of the circulation of the blood. The starting material may be prepd. by (1) extg. yeast in the cold with trichloroacetic acid, mixing with Hg acetate under feebly alk. conditions, decompg. with  $H_2S$  and pptg. the adenosine triphosphate as its Ca salt by adding  $CaCl_2$  and alc.,

(2) treating with  $H_2O$  plasmolytes obtained at a low temp. from yeast, eliminating the undissolved constituents and, if desired, treating the soln. with adsorbents, *e. g.*, bentonite, and pptg. with org. solvents, *e. g.*,  $MeOH$ , the soln. remaining after removing the adsorbent, (3) extg. yeast with trichloroacetic acid before or after plasmolysis, a crude material being obtained, and (4) plasmolyzing yeast with  $EtOAc$  at below  $15^\circ$  and introducing into boiling  $H_2O$ .

**Salts of adenylypyrophosphoric acids.** I. G. Farbenind. A.-G. Brit. 396,647, Aug. 10, 1933. Alkali metal salts of adenylypyrophosphoric acids are prep'd. by neutralizing the acid with an alkali metal hydroxide or carbonate, or by double decompn. of a sparingly sol. salt of the acid with an alkali metal salt, and isolating the product by evapn. or by pptn. with an org. solvent. The salts are stable, readily  $H_2O$ -sol. and useful therapeutically. Among examples (1) the Ca salt of the adenylypyrophosphoric acid isolated from the cardiac muscles is dissolved in  $HCl$ ,  $Na_2C_2O_4$ , and  $NaOH$  are added and, after standing, the Na salt is ppt'd. from the filtrate by alc. and (2) Pb adenylypyrophosphoric acid is decomp'd. with  $H_2S$ ,  $NaOH$  is added to the filtrate and the Na salt ppt'd. with alc.

**Double compounds.** Chemische Fabrik vorm. Sandoz. Swiss 161,244-5, July 1, 1933. Addn. to 158,387 (C. A. 27, 4630). New double compds. useful in therapy are prep'd. by heating Ca mannonate and Ca lactobionate (161,244) or Ca glyconate and Ca maltobionate (161,245) in an aq. medium.

**Quinoline derivatives.** Carl A. Rojahu. Ger. 586,335, Oct. 20, 1933. Addn. to 582,320 (C. A. 27, 5152). Salts are prep'd. by the usual methods from 2-phenylquinoline-4-carboxylic acid or its derivs. and mono- or diethanolamine or a mixt. of the three ethanolamines. An example is given. The salts are sol. in water, alc., and oils, and are of therapeutic value.

**Stable aqueous emulsions of lecithin and oil.** Bruno Rewald (to Hanscatische Mühlenwerke A.-G.). U. S. 1,934,005, Nov. 7. An oil-in-water emulsion is prep'd. contg. lecithin as the essential emulsifying agent and also contg. a small proportion of benzyl alc. Various examples and details of procedure are given.

**Alkaloid.** Chinoin Gyógyszer és Vegyészeti Termékek Gyára R. T. (V. Kereszty & Wolf) and Paul Wolf. Swiss 160,898, June 1, 1933. A new alkaloid is obtained by treating ergot with alkali and extg. with an org. solvent. The alkaloid is recrystd. in a chlorinated org. solvent such as  $CHCl_3$  to which the alkaloid is indifferent. It m.  $180-4^\circ$  with decompn.

**Vegetable extracts.** Chemische-Pharmazutisch A.-G. Bad Homburg, Werk Frankfurt a. M. Ger. 577,653, June 2, 1933. Exts. of plants such as camomile, sage, arnica, etc., are treated with active light ether during or after extn.

**Refining the vitamin-containing unsaponifiable matter of oils such as cod-liver oil.** Archie Black (to E. R. Squibb & Sons). U. S. 1,935,042, Nov. 14. The unsaponifiable matter is dissolved in a substantially oil-immiscible solvent such as alc. or dioxane and the soln. is washed with small portions of an oil such as corn oil to remove certain inert substances.

**Contrast media for x-ray photography.** I. G. Farbenind. A.-G. Brit. 396,114, July 18, 1933. See Fr. 728,631 (C. A. 26, 6071).

**Hormones.** F. Hoffmann-La Roche & Co. A.-G. Swiss 161,179, July 1, 1933. Hormones are adsorbed from liquids contg. them by animal charcoal and extd. from the latter by a mixt. of  $MeOH$  and  $CHCl_3$ .

**Hormones.** I. G. Farbenind. A.-G. Ger. 586,246, Oct. 19, 1933. Materials contg. growth-promoting

hormones are treated with acid and extd. with water or an org. solvent, and the ext. is transferred, if necessary, to a water-insol. org. solvent. The hormones are then extd. from the org. solvent with a weak aq. alkali soln., or with a stronger alkali soln. which is afterward partly neutralized. The hormones may then be extd. again from the weak alkali soln. and purified by standard processes, various methods of procedure being described. The starting material may be substrates on which fungi, algae or bacteria have been cultivated, or residues from the fermentation industries, or human or animal urine. If the starting material contains sexual hormones, these may be separately recovered from the portion of the original ext. which is insol. in weak aq. alkali. Numerous details are given. C1. C. A. 27, 4032.

**Antiseptic, anesthetic and antispasmodic preparations.** Fitzgerald Dunning (to Hynson, Westcott and Dunning). U. S. 1,932,886, Oct. 31. A compn. suitable for therapeutic uses contains a halogen deriv. of *o*-hydroxybenzyl alc. such as a mono- or di-chloro, bromo or iodo deriv. which may be formed into sol. tablets or used for intramuscular injection.

**Antiseptics; fungicides.** I. G. Farbenind. A.-G. Brit. 396,737, Aug. 9, 1933. Animal and vegetable glues, photographic and other gelatins, casein, vegetable mucilages and tech. and pharmaceutical preps. contg. such substances are preserved against attack by bacteria, molds, etc., by incorporation therewith of a monohydric halogen-free phenol of the diphenylmethane series, *e. g.*, the benzyl phenols and benzyl cresols, or a salt thereof with an org. or inorg. base. Substances, *e. g.*, glycerol diacetate, ethanolamine, may be added to increase the solv. of the phenols.

**Bandages.** Deutsche Gold- und Silber-Scheideanstalt vormals Roessler. Ger. 577,798, June 3, 1933. Bandages are impregnated with substances such as percarbonates or perborates which give off active O when moistened, a stabilizer such as  $MgSiO_3$  being present.

**Dentifrices.** Sigurd Gustav Gulbrandsen. Brit. 396,055, July 21, 1933. See Fr. 730,168 (C. A. 27, 375).

**Use of bentonite in dentifrices.** John J. Harris. U. S. 1,933,977, Nov. 7. Bentonite is used with various other ingredients such as water, oils and flavoring materials.

**Perfume.** Henri Terrisse. Swiss 161,018, June 16, 1933. An iris perfume is prep'd. by treating 2,6-dimethyl undecane-2,6,9-triene-8-one with an acid, *e. g.*,  $H_2SO_4$ . The perfume is purified by passage through the semicarbazone and b.  $125-135^\circ$ .

**Disinfectant.** Hans Finkelstein and Jakob Willem (to I. G. Farbenind. A.-G.). U. S. 1,932,338, Oct. 21. A cyanophenol in which the benzene nucleus is at least substituted by one hydroxy group and at least one cyano radical, such as 4-cyano-2-chlorophenol is used as a disinfectant (suitably in preserving glue or the like).

**Disinfectant.** Hans Priewe (to Schering-Kahlbaum A.-G.). U. S. 1,933,757, Nov. 7. The double comp'd. of equimol. proportions of urea and *m*-cresol is used with a diluent such as powd. talc or Na naphthalenesulfonate.

**Fumigants.** James G. Wright, Geo. A. Graham and Alfred K. Light. Brit. 396,004, July 27, 1933. A deodorizing fumigant consists of a mixt. of gum benzoin, balsam of tolu, gum olibanum, powd. sandalwood, salt peter, gum tragacanth and  $H_2O$ . A little C black may be added and the finished compn. dipped in an essential oil. The paste may be applied to wood or paper matches or spread between layers of thin paper.

**Solution for use in curling hair.** Frederic Maeder and Brian M. W. Sims (Sims to Maeder). U. S. 1,933,021, Oct. 31. See Brit. 360,900 (C. A. 27, 1120).

## 18 ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

**Phosphoric acid and double superphosphates.** Modern industrial process for their preparation by the wet process.

H. Tiedemann and W. Gundelach. *Chem. Fabrik* 1933, 497-9.—The Dorr washer-filter operation in Trail is

outlined and the general mfg. principles are discussed briefly with 4 cuts and 14 references; cf. Weber, *C. A.* 27, 166, 1702.

**Study on contact sulfuric acid manufacture. I. Barium-vanadium catalyst.** Mototarō Matsui, Kikujō Ōki and Ken-ichi Oda. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 546-9(1933).—Exptl. results, obtained with a special app. which is described, are reported. Good conversions were obtained at temps. above 475°, but a rapid decrease occurred below 450°. Karl Kammermeyer

**New process for the manufacture of alkali nitrates.** Wilhelm Schneider and Paul Kubelka. *Chimie & Industrie Special No.*, 743-6(June, 1933); cf. Fr. pat. 736,815, *C. A.* 27, 1457; Ger. pat. 572,722, *C. A.* 27, 4354.—The manuf. of  $\text{NaNO}_3$  or  $\text{KNO}_3$  by double decompn. of an alk. earth nitrate and  $\text{NaCl}$  or  $\text{KCl}$  in aq. soln. is not economical, because of the relatively poor yield, which, under optimum conditions, cannot exceed 80%. It may be increased to 100% in theory and to 98% in practice by making use of the low soly. of basic  $\text{CaCl}_2$  ( $\text{CaCl}_2 \cdot 3\text{CaO} \cdot 16\text{H}_2\text{O}$ ). A process has been developed (Fr. Pat. 333,989; Brit. Pat. 304,365) consisting essentially in mixing  $\text{Ca}(\text{NO}_3)_2$  and  $\text{NaCl}$  (or  $\text{KCl}$ ) solns., adding  $\text{CaO}$ , filtering and washing the basic  $\text{CaCl}_2$ , evapg. the soln., and reintroducing the mother liquor into the cycle. Optimum operating conditions are given. A. Papineau-Couture

**New processes used in the manufacture of ammonium nitrate.** L. Tamié. *Chimie & Industrie Special No.*, 906 20(June, 1933).—A description of the processes developed by the Société Kestner, of which the following are the essential features: (1) Neutralization of  $\text{HNO}_3$  by  $\text{NH}_3$  is carried out at atm. pressure and the heat of the reaction is used for evapg. part of the  $\text{H}_2\text{O}$  of the soln. by passing the latter through a series of vessels under increasing vacuum, part of the cooled liquid from the last stage being returned to the neutralizer to maintain the proper temp. (2) The vapor given off in each vacuum stage is used for heating the acid. (3) Crystn. is carried out in vacuum, removal of the heat of crystn. being effected by evapg. of the last traces of  $\text{H}_2\text{O}$ . A. P.-C.

**Wet process of manufacturing calcium chromate.** J. Milbauer and J. Doškač. *Chimie & Industrie Special No.*, 784 6(June, 1933).—The following are the optimum conditions for production of pure  $\text{CaCrO}_4$  by wet pptn.: ppt. a cold satd.  $\text{Na}_2\text{CrO}_4$  soln. with 1.6 times the theoretical amt. of  $\text{CaCl}_2$  as a soln. contg. 400-450 g.  $\text{CaCl}_2$  per 1000 cc.  $\text{H}_2\text{O}$ . When using  $\text{CaO}$ , the ppt. occludes considerable amts. of Na and K ions. A. P.-C.

**Notes on the manufacture of lime.** Maurice Dérivière. *Rev. matériaux construction trav. publics* 1933, 300-5.—Material and heat balances for a vertical kiln are carried out based on operating data. A discussion of kiln lining and the descent of the materials in the kiln is presented. Karl Kammermeyer

**Studies on the preparation of sodium sulfide from sodium sulfate and its causticization. II. Reduction of sodium sulfate by the use of carbon.** T. Okuno, T. Masumi and M. Fukuyama. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 562 3(1933); cf. *C. A.* 27, 5900.—It was found that the ratio  $3\text{Na}_2\text{SO}_4:1\text{C}$  gave the max. yield of  $\text{Na}_2\text{S}$  and that the reduction occurs readily above 800°. The relation between gas vol. evolved and time of heating is presented graphically. **III. Causticization of sodium sulfide by the use of cupric oxide.** *Ibid.* 563-5.—The relative proportion of  $\text{Na}_2\text{S}$  and  $\text{CuO}$  and the duration of the reaction were studied. The ratio  $1\text{Na}_2\text{S}:1.2\text{CuO}$  seemed to give the best yields of  $\text{NaOH}$  according to the reaction  $\text{Na}_2\text{S} + \text{CuO} \rightarrow \text{H}_2\text{O} = 2\text{NaOH} + \text{CuS}$ . Reaction temps. between the b. p. and 184° corresponding to pressures from 1 to 10 atm. gave essentially the same yields. The roasting reaction of  $\text{CuS}$  was also investigated and the effects of temp. and time are presented graphically. Karl Kammermeyer

**Preparation of the hyposulfite-formaldehyde of soda.** Factory of Emile Zundel. *Bull. soc. ind. Mulhouse* 99, 463-7(1933)(Scaled note of 1904). Report. M. Battenay and T. Lichtenberger. *Ibid.* 474-5.—Zn powder is

added to a soln. of  $\text{NaHSO}_3$  contg.  $\text{H}_2\text{SO}_4$ . The Zn is removed by pptn. with  $\text{Na}_2\text{CO}_3$ . The hyposulfite is then salted out and filtered, and the press cake introduced into a slightly less than equiv. quantity of  $\text{CH}_2\text{O}$ . More  $\text{CH}_2\text{O}$  is then added to complete the reaction, tounesol being used as an indicator. B. and L. report that this process was used for several years after 1904. I. H. Odell

**The behavior of alumina and silica with metal sulfides in relation to alumina recovery from siliceous raw material.** X. Siebers and E. J. Kohlmeier. *Arch. Erzbergbau Erzaufbereit. Metallhüttenw.* 1, 97-129(1931).—In the Haglund process for recovery of  $\text{Al}_2\text{O}_3$  from bauxite, bauxite is melted in an elec. furnace with  $\text{FeS}$  and C. Silica seps. as an Fe-Si alloy, while  $\text{Al}_2\text{S}_3$  lowers the m. p. of the  $\text{Al}_2\text{O}_3$ , improving it for electrolysis.  $\text{Al}_2\text{S}_3$ - $\text{Al}_2\text{O}_3$  mixts. give the lowest m. p. (1008°) with a 1:1 mixt.  $\text{Al}_2\text{O}_3$  begins to react with  $\text{FeS}$  or  $\text{ZnS}$  and C at 1300°. At 1500° reaction proceeds with considerable velocity. Because of soln. of reaction products in the melt, only part of the  $\text{Al}_2\text{O}_3$  is converted to  $\text{Al}_2\text{S}_3$ . Metallic Si does not react with  $\text{Al}_2\text{S}_3$  at 1000-1500°, but  $\text{SiO}_2$  reacts with  $\text{Al}_2\text{S}_3$  in a graphite crucible at 1150°, almost completely to form  $\text{SiS}$  at 1450°. In  $\text{N}_2$  at atm. pressure  $\text{ZnS}$  begins to volatilize at 1150°, sublimes at 1470°.  $\text{ZnS}$  plus C begins to volatilize at 1000°, sublimes at 1350°.  $\text{ZnS}$  plus Si begins to volatilize at 900°, sublimes at 1150°.  $\text{ZnCS}$  is first formed, which reacts with  $\text{SiO}_2$  in the presence of more C.  $\text{SiO}_2$  can be volatilized from kaolin, alumina and bauxite mixts. with  $\text{ZnS}$  and C as easily as with  $\text{SiO}_2$  alone, but when  $\text{FeS}$  and C are used, reaction products are partly sol. in the melt, and complete volatilization of the  $\text{SiO}_2$  does not occur.  $\text{TiO}_2$  reacts with  $\text{ZnS}$  and C to form a sulfide, which is not easily volatilized. Up to 1600° the  $\text{TiO}_2$  in bauxite is not reduced, so that the Fe-Si alloy is free from Ti. John G. Attwood

**Subsurface concentration of chloride brines.** Wm. L. Russell. *Bull. Am. Assoc. Petroleum Geol.* 17, 1213-28(1933).—Evapg. of  $\text{H}_2\text{O}$  into natural gas or evapg. of  $\text{H}_2\text{O}$  in coarse-grained rocks and its pptn. in very fine pores have not been important in producing concd. chloride brines. Under some conditions brines may have been concd. after deposition by deep evapg. during periods of long aridity. Settling of sol. mols. probably occurs, but its effect is slight. Certain rocks contain large amts. of unstable minerals and in such formations there may have been considerable concn. by hydration. Osmosis may have had an important influence, but little is known about it. It is probable that the bases of chloride brines are adsorbed from sea water by very fine sediments during deposition, and if Cl also is entombed, adsorption may be a very important agency in the subsurface concn. of chloride brines. Alden H. Emery

**The manufacture of natural Vichy salt at the Compagnie Fermière de Vichy. Description of the apparatus.** R. Perrot. *Bull. sci. pharmacol.* 40, 513-19(1933).—The app. causes the  $\text{CO}_2$ , given off during evapg., to be reabsorbed by the salt. The final compn. is: Na 27.181, K 1.040, Ca 0.032, Mg 0.009, Fe, Al, Mn 0.021, Li-Sr traces, Cl 2.482, As traces,  $\text{CO}_2$  63.929,  $\text{SiO}_2$  0.682. A. R. M.

**The activation of earths.** A. Travers. *Chimie & Industrie Special No.*, 793 6(June, 1933).—Activation of earths (such as bentonite, etc.) by treatment with dil. acids is due, at least to a large extent, to the liberation of free  $\text{SiO}_2$ , which acts as a  $\text{SiO}_2$  gel. Earths which are not attacked by dil. acid cannot be activated; if such earths can be converted into permutites by treatment with alkali, they can be activated by treating the permutite with dil. acid. A. Papineau-Couture

**Production of adsorbent carbon from carbonaceous material by steam activation.** Eduard Deisenhammer. *Chem.-Ztg.* 57, 781-2(1933).—Carbonaceous material, coal, peat, or the like, is mixed with equal parts of tar and molded into small briquets. The briquets are hardened by heating in a furnace at 400° in an atm. free of  $\text{O}_2$ , which is changed continuously. The activation is accomplished by heating the hardened briquets in a rotary furnace at 800° for 8-16 hrs. while steam is passed through the fur-

nace. A hard adsorbent C of high capacity is produced.

L. W. T. Cummings

**Occurrence of indium in Japan.** II. Yoshio Imaizumi. *J. Chem. Soc. Japan*, **54**, 1009 10(1933).—The In content of Zn blends from various districts in Japan has been found by detg. In as  $\text{In}_2\text{O}_3$ .

T. Katsurai

**Recovery of sulfur from sulfur dioxide.** Arthur J. Caddick. *Mining Mag.* **49**, 282 5(1933); cf. *C. A.* **23**, 5014.—A review of the procedure adopted by different investigators for the recovery of S from  $\text{SO}_2$  by the use of incandescent carbonaceous matter. Independent expts. showed that the  $\text{SO}_2$  content of the ingoing gas at which a coke column can be maintained in an incandescent condition is about 7% by vol. Tabulated results show that S recovery is a max. and coke consumption a min. for this condition. A further set of expts. was made to ascertain the effect of varying amts. of steam admitted at the bottom of the coke column together with the incoming  $\text{SO}_2$ . Results of these are given, including one showing S recoverable 74.14%. Coke and steam used are 1.12 tons and 0.08 tons, resp., per ton of recoverable S.

A. W. Furbank

**Urea-formaldehyde: Types and their uses.** Kennet M. Chance. *Australian Plastics & Allied Trades Rev.* **2**, No. 2, 13-17(1933).

E. H.

**Roasting of disintegrated pyrites containing sulfates.** J. Jelinek. *Chimie & industrie Special No.*, 725 6(June, 1933).—A brief discussion of the troubles encountered in the roasting of pyrites which have been exposed to atm. agents so that part of the S has been converted into sulfates. Even 3.5% sulfate S can interfere seriously with the normal operation of a pyrites burner.

A. P.-C.

**Asbestos milling in the Urals.** Walter A. DuRever. *Eng. Mining J.* **134**, 415 9(1933).—A description of Canadian asbestos milling methods applied in Russia. Flowsheets show the Ilvinski mill with Russian technique and the "Gigant" crushing plant.

W. H. Boynton

**Australian non-metallic minerals. II. Asbestos.** Harold S. Elford. *Chem. Eng. Mining Rev.* **25**, 395 400 (1933); cf. *C. A.* **27**, 5486.—Occurrence, imports, prepn. for market and uses of asbestos are given.

W. H. B.

**Canadian Kaolin Silica Products, Limited.** W. M. Goodwin. *Can. Mining J.* **54**, 377 80(1933).—A description of a new 300-ton mill at Lac Remi, Quebec. Flowsheets are shown for the raw ore, kasil and silica circuits.

W. H. Boynton

**Garnets.** Joseph W. Howard. *J. Chem. Education* **10**, 713 16(1933).—A review.

E. H.

**Examination of composition tumblers with reference to possible liberation of formaldehyde.** H. J. Fisher. *Conn. Agr. Expt. Sta., Bull.* **354**, 804 12(1933).—Of the many methods for the detection and detn. of HCHO, the ferricyanide and Shrewsbury tests alone were satisfactory. Details of both tests are given. Only traces of CHOH could be obtained from 3 different lots of tumblers. However, the evolution of CHOH is continuous and is due to the decompn. of the plastic itself, rather than to extn. of a sol. impurity. At least a part of the CHOH extd. from tumblers is free  $\text{CHOH}$ , the total amt. extd. being a function of the amt. of tumbler surface exposed to the liquid. A ground sample gave up 190 p. p. m. of CHOH to 10 times its wt. of water in 24 hrs. at room temp. At higher temps. the amt. extd. increased greatly. At 75° all tumblers cracked after standing for a time. It is not believed that the same amts. of CHOH which might be extd. from plastic tumblers are of physiol. significance.

C. R. Fellers

**Impregnation composition for stiffening shoe tips.** G. S. Guseynnikov. *Izvestiya Tsentral. Nauch-Issledovatel. Inst. Kozhevnoi Prom.* **1932**, No. 2, 5-6.—Satisfactory results carried out on a lab. scale were obtained with the following prepn.: glue 250, water 250, portland cement 300, ceresin 100, coal-tar pitch 100 g. Various other compns. were tried but without success.

A. A. B.

**Shoe polishes.** A. A. Pechelin. *Izvestiya Tsentral. Nauch-Issledovatel. Inst. Kozhevnoi Prom.* **1932**, No. 2, 6.—Best results were obtained with a shoe polish com-

posed of peat wax, the polymerization product of linseed oil with  $\text{CaO}$ , paraffin, stearin, beeswax, ceresin and other ingredients (the proportion is not given).

A. A. B.

**A new pest exterminator (Fosfolon).** Otto Rebmann. *Z. Gesundheitstsch. Stadtehyg.* **25**, 279 88(1933).—Fosfolon, a proposed exterminator, consists chiefly of  $\text{Ca}_3\text{P}_2$  and  $\text{CaC}_2$ ; in contact with moisture,  $\text{PH}_3$  and  $\text{C}_2\text{H}_2$  are liberated.

B. C. Brunstetter

**T gas, an agent for the eradication of vermin in single rooms in the midst of occupied buildings.** Bruno Tesch. *Z. Gesundheitstsch. Stadtehyg.* **25**, 325 42(1933).—A review of German practice in fumigating with a mixt. of  $(\text{CH}_3)_2\text{O}$  and  $\text{CO}$ .

B. C. Brunstetter

**Foam fire-fighting methods: Past, present and future.** Henry S. Simonis. *Chemistry and Industry* **1933**, 957-8.

E. H.

**Influence of thermal cond. of metals on their utilization in the manuf. of acids (Stefan).** 9. Fillers for plastic compns. (Brit. pat. 396,243) 25. Utilizing by-product gas from petroleum cracking for  $\text{NH}_3$  synthesis (U. S. pat. 1,935,469) 22. Centrifugal sepn. of materials such as in drying salt (U. S. pat. 1,933,644) 28.

**Hydrocyanic acid.** Thomas S. Wheeler (to Imperial Chemical Industries Ltd.). U. S. 1,934,610, Nov. 7. A gas contg. a hydrocarbon such as  $\text{CH}_4$  or  $\text{C}_2\text{H}_2$ , together with more than one mol. proportion of  $\text{NH}_3$  for each atomic proportion of C is rapidly passed, at a temp. of at least 1150°, through an unpacked reaction chamber under conditions (such as those of suitable "space velocity") which are unfavorable to decompn. of the reagents into their elements.

**Hydrocyanic acid.** Leonid Andrusow (to I. G. Farbenind. A.-G.). U. S. 1,934,838, Nov. 14. A gaseous mixt. contg.  $\text{NH}_3$ , a vaporous or gaseous hydrocarbon material such as  $\text{CH}_4$ , etc. and sufficient O to make the reaction exothermic (but less than would cause complete combustion) is contacted with a hot oxidation catalyst such as Pt contg. Rh (suitably at 900-1000°).

**Hydrocyanic acid.** Imperial Chemical Industries Ltd. Fr. 749,665, July 27, 1933. A rapid liberation of a detd. amt. of gaseous HCN is obtained by causing a detd. amt. of an alkali metal cyanide to react with about the stoichiometric amt. of an alkali metal bisulfate, in the presence of a detd. amt. of water such that the av. liberation of HCN, measured during a relatively short time, is a max. or nearly so.

**Vaporizing formamide.** Burrill S. Lacy (to E. I. du Pont de Nemours & Co.). U. S. 1,934,433, Nov. 7. In vaporizing formamide, as in the production of HCN, liquid formamide is brought into contact with a surface such as a silica tube heated to a temp. above the atm. b. p. of formamide at such a rate that no liquid formamide remains unvaporized in contact with the heating surface for any appreciable period of time. App. is described.

**Separating phosphoric acid from decomposed monazite sands.** I. G. Farbenind. A.-G. Brit. 395,305, July 13, 1933.  $\text{H}_3\text{PO}_4$  and excess  $\text{H}_2\text{SO}_4$  are sepd. from the rare earth sulfate pulp obtained by decompn. monazite sand with cond.  $\text{H}_2\text{SO}_4$  by introducing the pulp into aliphatic ales., e. g.,  $\text{MeOH}$ , or ketones, e. g.,  $\text{Me}_2\text{CO}$ , preferably at a low temp., e. g., 0°, sepg. the undissolved sulfates from the liquid and washing and drying them. The alc. or ketone is recovered by distn. after neutralization of the acid-contg. liquid with  $\text{Na}_2\text{CO}_3$  or lime.

**Purifying and concentrating weak acids such as those resulting from treatment of hydrocarbon oils with sulfuric acid.** Laurance V. Phillips (to Texas Co.). U. S. 1,934, 234, Nov. 7. Sludge acid which contains carbonaceous material which decomposes and reacts with the acid during concn. by heating is subjected to prolonged heating at a temp. insufficient to effect substantial vaporization and below that at which decompn. of the carbonaceous material occurs, to effect pptn. of the carbonaceous material from the acid; the ppt. is sepd. and the purified acid is

then exposed to higher temps. to effect concn. App. is described.

**Apparatus for regulating the temperature of gases such as in sulfuric acid manufacture.** Lowry Gillett (to General Chemical Co.). U. S. 1,934,419, Nov. 7. Various structural and operative details are described.

**Ammonia synthesis.** Walter H. Kniskern (to Atmospheric Nitrogen Corp.). U. S. 1,932,247, Oct. 24. H-N synthesis gas is passed under pressure into a chamber in which it is caused first to pass lengthwise through a passage situated in the space between the inner wall of the chamber and the outer wall of the catalyst container and then caused to travel as a plurality of individually isolated gas streams flowing through a body constituting a united mass of catalyst in direct heat-exchange relation but out of contact; the isolated streams are then merged and the merged gas stream is immediately passed as an integral stream in the opposite direction through and in actual contact with the united mass of catalyst, and the product is withdrawn from the chamber. App. is described.

**Ammonia synthesis, etc.** Frank Porter (to Atmospheric Nitrogen Corp.). U. S. 1,931,678, Oct. 24. In effecting  $\text{NH}_3$  synthesis, etc., the inert content of a cyclic system may be maintained and controlled by reaction of a mixt. contg. inert material in a primary cyclic system, withdrawing a portion of the reaction mixt. circulating in the primary system, and introducing the withdrawn mixt. into a secondary system at a pressure substantially not greater than that in the primary system. Various details of app. arrangement and operation for  $\text{NH}_3$  synthesis are described.

**Apparatus for catalytic reactions such as ammonia synthesis.** Wm. W. Tuck (to Atmospheric Nitrogen Corp.). U. S. 1,931,636, Oct. 24. Various details of heat-exchange tubes, etc., are described.

**Pressure-reducing valve suitable for use with ammonia.** Paul C. Temple (to A. W. Cash Co.). U. S. 1,934,832, Nov. 14. Structural and mech. details.

**Alkali carbonates.** I. G. Farbenind. A.-G. Fr. 41,-20, Jan. 28, 1933. Addn. to 721,307 (C. A. 26, 4138).  $\text{KHCO}_3$  is produced by treating  $\text{KCl}$  with  $\text{CO}_2$ , or its compds. with  $\text{NH}_3$ , in the presence of a mixt. of  $\text{NH}_3$  and water, contg., on the one hand, a proportion of  $\text{NH}_3$  higher than that which corresponds to its soly. in water at ordinary temp. and pressure and, on the other hand, at least the amt. of water necessary to saponify the carbonate to bicarbonate, operating at a temp. at which the  $\text{NH}_2\text{COOK}$  is no longer stable.

**Alkali chlorates.** Charles Carter and Imperial Chemical Industries Ltd. Brit. 396,701, Aug. 4, 1933. Alkali metal chlorates or solid products contg. the same are prep'd. by reaction of  $\text{Cl}_2$ , either pure or in admixt. with inert gases, with alkali of metal carbonate and, optionally, bicarbonate in the presence of 3-20% of  $\text{H}_2\text{O}$ , calcd. on the wt. of the carbonate. The solid product may be used as a weed killer or may be leached to obtain the chlorate by evapn. and crystn.

**Alkali metal phosphates.** Otto Laubi (to Bozel-Maletra société industrielle de produits chimiques). U. S. 1,935,-11, Nov. 14. An alloy of P such as ferro-P is caused to react with an alkali metal compd. which gives an alk. reaction, such as  $\text{Na}_2\text{CO}_3$ , in the presence of water and of an oxidizing agent such as O or air (suitably at a temp. of about 200-350°).

**Arsenates.** Gustav Fester and Francisco Bertuzzi. Ger. 586,349, Oct. 20, 1933.  $\text{As}_2\text{O}_3$  is treated in the cold with an alkali hypochlorite soln. or with an alk. earth hypochlorite soln. not contg. an excess of free alk. earth. Alternatively,  $\text{Cl}_2$  is passed into an aq. mixt. of  $\text{As}_2\text{O}_3$  with the calcd. amt. of an alk. earth required to neutralize the  $\text{HCl}$  produced in the reaction. A soln. of  $\text{H}_3\text{AsO}_4$  is obtained in each case, and is converted into arsenates in known manner.

**Nitrates.** Ludwig Rosenstein (to Shell Development Co.). U. S. 1,932,939, Oct. 31. A substantially anhyd. liquid oxide of N higher than nitric oxide is caused to react with a substantially anhyd. solid inorg. halide to form the

1 corresponding nitrate; the mixt. of nitrate and unconverted halide is treated with substantially anhyd. liquid  $\text{NH}_3$  to dissolve the nitrate formed, and the ammoniacal soln. is sepd. and substantially pure nitrate is recovered from it.

**Phosphides.** Sylvain M. Perraud. Fr. 750,035, Aug. 3, 1933. The handling, use and preservation of phosphides, particularly Zn phosphide, are facilitated by coating the particles with a waterproofing substance such as 2 oils or fats.

**Silicates.** Philadelphia Quartz Co. of California Ltd. (Chester L. Baker, inventor). Fr. 41,736, Mar. 20, 1933. Addn. to 725,923 (C. A. 26, 4919). Cryst. hydrates of alkali silicates, e. g., hydrates of Na metasilicate, are prep'd. from solns. of alkali silicates in which the mol. ratio of  $\text{SiO}_2$  to alkali oxide corresponds to that of the crystals to be made, the amt. of water being regulated, at a high temp., approx. to that required for the hydrate. The solns. are brought to partial crystn. at a temp. slightly below the f. p. of the hydrate desired, with very gradual admission of heat and energetic agitation during a prolonged period. The mother liquor is afterward eliminated, e. g., by centrifugation, from the cryst. paste formed and the crystals are dried.

**Metal carbonyls.** I. G. Farbenind. A.-G. (Leo Schlecht and Fritz Spoun, inventors). Ger. 586,162, Oct. 18, 1933.

4 Substances contg. compds. of Ni, Co, Mo or W are reduced with H at a relatively low temp. under pressure, e. g., at 200-250° and 200 atm., and then treated with CO at a relatively low temp., e. g., 120-160°, preferably under the same pressure.

**Aluminum compounds.** Heinrich Specketer, Fritz Rosstetscher and Konrad Rosenberger (to I. G. Farbenind. A.-G.). U. S. 1,931,515, Oct. 24. An alkali metal chloride such as  $\text{NaCl}$  and an alkali metal sulfate such as 5  $\text{Na}_2\text{SO}_4$  are added to an Al salt soln. contg.  $\text{AlCl}_3$  and  $\text{Al}_2(\text{SO}_4)_3$  so as to produce an aq. salt mixt. approx. corresponding to the formula  $\text{Al}(\text{Fe})_2(\text{SO}_4)_3 + \text{Al}(\text{Fe})_2\text{Cl}_3 + 6\text{MCl}$ , in which M represents alkali metal. The product is evap'd. to dryness and heated to about 600-800° by a co-current of direct heating gases until the  $\text{HCl}$  is expelled. The resulting sintered product is mixed with coal, and the mixt. is heated to 800-1100° and the aluminate thus 6 formed is sepd., and may be used to form alumina, etc.

**Potash salts.** Geo. F. Thomson. Brit. 396,111, Aug. 3, 1933. Potash salts are recovered from the dusts collected from the flues of hot-air stoves, blast furnaces, etc., by treating with  $\text{H}_2\text{O}$ , removing the pptd. dust and evapp. the solns. obtained by the waste heat of the flue gases, e. g., in flat Fe pans which can be slid or inserted on top of the flues or by drawing the hot gases off through pipes and passing directly into the soln.

7 **Complex compounds of tungsten and molybdenum.** I. G. Farbenind. A.-G. (Balo Zschimmer, inventor). Ger. 577,703, June 3, 1933. Oxy compds. of W and Mo are mixed and treated with a reducing agent to produce complex W-Mo compds. Alternatively, compds. of W and Mo contg. O are reduced separately and the products mixed in an acid soln. In an example, aq. solns. of  $\text{Na}_2\text{WO}_4$ ,  $\text{Na}_2\text{MoO}_4$  and  $\text{Na}_2\text{HPO}_4$  are mixed and treated with 8 hyposulfite to give a complex compd. contg.  $\text{WO}_3$ ,  $\text{MoO}_3$ ,  $\text{P}_2\text{O}_5$ ,  $\text{Na}_2\text{O}$  and water. Other examples are given.

**Ammonium sulfate.** Adrianus J. van Peski (to N.-V. de Bataafsche Petroleum Maatschappij). U. S. 1,934,-573, Nov. 7.  $\text{NH}_3$  and  $\text{SO}_2$  are caused to react, with water practically absent, and the reaction product is contacted with water and O to form  $(\text{NH}_4)_2\text{SO}_4$ .

**Ammonium sulfate.** Daniel Pyzel (to Shell Development Co.). U. S. 1,932,674, Oct. 31.  $\text{NH}_3$  and  $\text{H}_2\text{SO}_4$  9 are introduced into a container which is maintained under vacuum. This serves to facilitate operation at lowered temp. with production of large crystals.

**Beryllium fluoride.** Comp. de produits chim. et électrométallurgiques Alais, Froges et Camargue. Ger. 586,-244, Oct. 19, 1933. A double fluoride of Be and an alkali metal is treated at atm. or raised temp. with  $\text{AlF}_3$  in the presence of water. A soln. of  $\text{BeF}_2$  and an insol. double

fluoride of Al and an alkali metal are obtained. Various methods of procedure are described.

**Calcium carbide.** Soc. anon. pour l'exploitation des brevets Jullien. Fr. 750,039, Aug. 3, 1933. The  $\text{CaO}$  contained in  $\text{CaC}_2$  is converted to  $\text{Ca}_3\text{N}_2$  in a reaction independent of the formation of the  $\text{CaC}_2$ , which allows of the optimum temp. being used. The reaction is carried out in the elec. furnace by the addn. of not only N but also C or C and Ca. An app. is described.

**Double compound of calcium cyanide and ammonia.** Curt Schumann and Erwin Oberreit (to I. G. Farbenind. A.-G.). U. S. 1,934,823, Nov. 14. A double compd. of Ca cyanide and  $\text{NH}_3$  in the form of macroscopic crystals having a diam. of at least 0.2 mm. is produced by reaction of a Ca compd. such as  $\text{CaO}$ ,  $\text{Ca(OH)}_2$ , or a water-sol. Ca salt such as  $\text{Ca(NO}_3)_2$  with HCN and  $\text{NH}_3$  in the presence of water. This double compd. decomposes into  $\text{Ca(CN)}_2$  and  $\text{NH}_3$  on heating.

**Calcium hypochlorite.** Heinrich Reitz and Hans Ehlers (to Pen-Chlor, Inc.). U. S. 1,931,622, Oct. 24. For recovery of Ca hypochlorite from an aq. soln., a substance such as NaOH is added to give a slight but lasting alkalinity, and the resulting product is atomized in heated dry air. Cf. C. A. 27, 4887.

**Apparatus for dehydrating materials such as calcium and magnesium chlorides by heated gas.** Otto V. Martin (to Texaco Salt Products Co.). U. S. 1,932,364, Oct. 24. Various structural and operative details are described.

**Calcium sulfate.** Peter Spence & Sons Ltd. Ger. 586,007, Oct. 14, 1933. See Brit. 319,228 (C. A. 24, 2555).

**Lead sulfate containing lead oxide.** Shin Negishi (to Empun Toryo Kabushiki Kaisha) U. S. 1,933,750 Nov. 7. A suspension of Pb suboxide powder in a current of air is blown into a high-temp. chamber provided with a supply of sulfurous acid gas (in a described app.) and reaction of the material in suspension is effected.

**Anhydrous magnesium chloride.** Wilhelm Moschel (to Magnesium Development Corp.). U. S. 1,933,499, Oct. 31. A preheated loose unbonded mixt. of crude pieces of magnesite and charcoal is heated to about 700–900° above a heated pervious layer of inert carbon through which  $\text{Cl}_2$  is passed into the mixt. at a temp. above the m. p. of  $\text{MgCl}_2$ , and molten  $\text{MgCl}_2$  formed is withdrawn from a lower level of the carbon layer. App. is described.

**Nickel carbonyl.** I. G. Farbenind. A.-G. Fr. 749,434, July 24, 1933. CO or gases contg. it are caused to react, under high pressure, on materials contg. Ni and S obtained by a fusion operation. The presence of heavy metals such as Cu, Fe or Co to fix the S is preferred. The product known as "Ni matte" or "Ni stone" obtained in the manuf. of Ni from its ores may be used.

**Potassium carbonate.** Friedrich Rusberg (to Kali-Chemie, A.-G.). U. S. 1,933,452, Oct. 31. In the cyclic manuf. of  $\text{K}_2\text{CO}_3$  from K salts of strong inorg. acids such as KCl by the Engel-Precht method, the impure  $\text{MgCO}_3$  trihydrate obtained by decompn. of the Engel salt is regenerated by converting it into an aq. soln. of  $\text{Mg(HCO}_3)_2$ , sepg. the solid residue from the soln., recovering  $\text{MgCO}_3$  trihydrate from the soln. and reusing this trihydrate for making fresh Engel salt.

**Potassium nitrate.** Paul Hofer. U. S. 1,932,587, Oct. 31. A mixt. of solid Al nitrate and solid HCl is heated to about 200° to expel nitrous gases and  $\text{Cl}_2$ ; the residue is treated with hot aq. liquid to dissolve the  $\text{KNO}_3$  formed and the latter is sepd. by crystn.

**Commercial phosphates of soda.** Louis Neuberg (to Warner Chemical Co.). U. S. 1,935,575, Nov. 14. A substantial vol. of a hot liquid aq. Na phosphate material sufficiently concd. to crystallize on cooling is maintained at temps. above the crystg. point pending use (as for use in the textile arts) and portions of the liquid material are withdrawn as desired for use.

**Sodium pyrophosphate.** Chemische Fabrik Joh. A. Benckiser G. m. b. H. Brit. 395,642, July 20, 1933. Neutral Na pyrophosphate is obtained by dehydrating and igniting the salt,  $\text{Na}_2\text{HPO}_4 \cdot 2\text{H}_2\text{O}$ . The process may be conducted in a rotary furnace, dehydration being effected

in 1 zone and decompn. in a succeeding zone. A small quantity of an oxidizing agent, e. g.,  $\text{NaClO}_3$ , may be added to avoid discoloration.

**Purifying sodium hydroxide solutions.** Harold M. Broadhurst and Imperial Chemical Industries Ltd. Brit. 390,456, Aug. 10, 1933. Aq. NaOH solns. are freed from their sulfate content by treatment with  $\text{CO}_2$  or salt(s) of  $\text{H}_2\text{CO}_3$  and sepn. of the ppt., contg. sulfate and carbonate, from the clear liquor. Thus the soln. may be passed slowly through a filter bed comprising  $\text{Na}_2\text{CO}_3$  and (or)  $\text{CaCO}_3$ .

**Caustic soda.** Leonardo Cerini. Ger. 577,606, June 2, 1933. Addn. to 537,993 (C. A. 26, 1401). App. for extg. pure NaOH from waste NaOH lye contg. colloidal substances is described.

**Titanium dioxide.** Hartmut W. Richter. U. S. 1,932,087, Oct. 24. Ground rutile is mixed with NaOH in at least sufficient amount to produce Na titanate, the mixt. is heated without fusion to 280–650°, and subsequently  $\text{TiO}_2$  is recovered from the residues (after removing NaOH as by use of  $\text{H}_2\text{SO}_4$ ) without further heating to high temps.

**Use of tannic acid for peptizing hydrosols of zirconium.** John L. Brown. U. S. 1,934,294, Nov. 7.

**Decomposing thiocyanogen compounds as in producing hydrogen sulfide and ammonia from ammonium thiocyanate.** Christian J. Hansen (to Koppers Co. of Del.). U. S. 1,932,819, Oct. 31. Thiocyanogen compds. other than those of the alkali-forming metals are decomposed by the action of water substantially free from strong inorg. acid, under pressure and at a temp. above 200°.

**Carbon monoxide and hydrogen mixture.** S. I. R. I. (Società italiana ricerche industriali). Swiss 162,458, Sept. 1, 1933. A mixt. of CO and H free from O is produced by leading II contg. O as an impurity into a solid fuel distn. retort at a zone where the temp. is sufficiently high to ensure that the O reacts with the fuel. The CO-H mixt. is suitable for the synthesis of MeOH, etc., by passage over suitable catalysts.

**Sulfur dioxide.** Manufacture de produits chimiques de Jouy-en-Josas (Anciens établissements Louis Descamps) Fr. 41,605, Feb. 15, 1933. Addn. to 715,872 (C. A. 26, 2022).  $\text{SO}_2$  is sepd. from the mixt. obtained by Fr. 715,872 by passing the mixt. in countercurrent to a fine spray of water. An app. is described.

**Blanc fixe.** Gewerkschaft Gevenich, Otto Englert and Wilhelm Becker (trading as R. Englert & F. Becker, Chemische Fabrik). Brit. 397,001, Aug. 17, 1933. See Fr. 747,872 (C. A. 27, 5161).

**Fluorspar.** Edmond Hubert, Pierre J. Herbinger and Paul Jeancard. Fr. 749,732, July 28, 1933. Fluorspar is purified and enriched by grinding, classifying, heating it quickly to 700–900°, preferably by causing it to fall into hot gases, and again classifying.

**Litharge.** Genzo Shimadzu. Fr. 749,898, Aug. 1, 1933. Fine powders of Pb oxide having a high content of O and composed for the greater part of litharge are prep'd by passing an oxidizing gas into contact with pieces of Pb in a rotating drum so as to oxidize only the exterior surfaces and form an oxide having a content of O lower than the stable oxide, evacuating the unstable oxide continuously to expose fresh Pb and oxidizing immediately, in the solid phase, the Pb oxide produced. An app. is described.

**Adsorbent silica from greensand.** John W. Turrentine. U. S. 1,932,832, Oct. 31. Greensand is ext'd. with an excess of acid such as  $\text{H}_2\text{SO}_4$  over the theoretical amt. necessary to combine with the non-siliceous constituents, substantially completely to dissolve metallic oxides, adsorbed impurities of the residual silica are removed by washing, and the product is dried. It is suitable for use as a decolorizing agent, etc.

**Decomposing monazite sand, etc.** I. G. Farbenind. A.-G. Brit. 395,657, July 20, 1933. Monazite sand or similar ores contg. rare earth compds. are heated with C, in amt. sufficient only for reducing the phosphates to P, in conjunction with Ca, Ba, Sr or Mg oxide or carbonate in proportions not exceeding 3 mols. alk. earth or  $\text{MgO}$  per mol. of rare earth metal oxide. The rare earths are

obtained as compds. of a compn. analogous to Ca aluminate. Reaction may be effected in a rotary-drum furnace at about 1500°, a sintered product being obtained, or in an elec. furnace at 1650–1750°, the melt produced being granulated in H<sub>2</sub>O and then ground. The product is dissolved in HCl and Th or the entire group of rare earth metals recovered by known methods or that of Brit. 395,300 (C. A. 28, 266).

**Treatment of carbides and like reactive compounds.** Georges Baume and André Glorifet. Brit. 395,421, July 20, 1933. Solid compds. that react with aq. liquids, *e. g.*, sulfides, silicides, carbonates, peroxides, nitrides, phosphides, hydrides and carbides, are impregnated with a compn. comprising (a) a distn. product, boiling at 175° or above, of a carbonaceous material, *e. g.*, petroleum, bituminous schist, wood tar, coal, brown coal, lignite or their cracking or hydrogenation products, (b) a substance having as such or in soln. a lower surface tension than H<sub>2</sub>O, *e. g.*, aliphatic esters (including animal and vegetable fats and oils), alkali salts of aliphatic acids (including soaps), saponin, amino acids and their esters, camphor and animal and vegetable gums, and (c) a H<sub>2</sub>O-sol. mono-, di- or tri-hydric alc. or a ketone. The treatment protects the solids against H<sub>2</sub>O vapor during storage or after use and also restrains and regulates their reactions with aq. liquids. Cf. C. A. 26, 4894.

**Removing water from solutions of ammonium salts.** Joseph A. Wyler (to Trojan Powder Co.). U. S. 1,932,434, Oct. 31. Water is removed from a soln. such as one of NH<sub>4</sub>NO<sub>3</sub> in the presence of an aq. soln. of Na silicate, until a substantially dry pulverulent mass is obtained, which is of non-caking character.

**Separating bismuth from lead.** American Smelting and Refining Co. Ger. 586,112, Oct. 18, 1933. See Can. 325,126 (C. A. 26, 5540).

**Carbon, hydrogen and hydrocarbons.** Carlo Padovani. Brit. 395,893, July 27, 1933. C black, H and liquid hydrocarbons, particularly those of a light aromatic character, are produced by heating (gases contg.) CH<sub>4</sub>, preheated to about 800°, at about atm. pressure to 1000–1300° while passing through a retort of such dimensions that the ratio between its area (in sq. cm.) of contact with the gas and its unobstructed capacity (in cc.) is 0.25–1, the period of heating being 0.5–6 sec. and such that for each 100 vols. CH<sub>4</sub> dissoed. into C and H 5–100 vols. are converted into higher hydrocarbons. The properties of the C black may be varied by effecting its sepn. at 150–600° or by heating in air, steam or other oxidizing gas at 300–1000°.

**Apparatus (with spaced rotating electrodes) for effecting reactions such as production of carbon black from petroleum oils.** John J. Jakosky and Herbert J. Wieden, Jr. (to Electroblacks, Inc.). U. S. 1,931,800, Oct. 24. Various structural and operative details are described.

**Hydrogen from methane.** Wm. Hennicke (to I. G. Farbenind. A.-G.). U. S. 1,931,492, Oct. 24. CH<sub>4</sub> is passed at a temp. of about 1200–1250° over a catalyst consisting of a mixt. prepd. from Al(OH)<sub>3</sub>, about 100, boric acid 20 and silica 20 parts.

**Hydrogen production by catalytic conversion of hydrocarbons by steam.** Gustav Wietzel and Wm. Hennicke to I. G. Farbenind. A.-G.). U. S. 1,934,836, Nov. 14. Initial materials such as illuminating gas and steam are continuously passed over an activated catalyst (such as Ni activated with alumina) arranged in a vertical space having a length very large in proportion to its cross-sectional area and confined by a surface consisting of a highly alloyed steel such as one contg. Cr and Ni which is externally heated to about 600–1000°. App. is described.

**Phosphorus.** Victor Chemical Works. Brit. 395,844, July 27, 1933. See Fr. 738,265 (C. A. 27, 1723). Brit. 395,865, July 27, 1933. See Fr. 739,712 (C. A. 27, 2258).

**Sulfur.** Saurefabrik Schweizerhall. Swiss 162,140, Aug. 16, 1933. Pure S is obtained by extg. S masses with a solvent, removing the impurities from the soln., *e. g.*, by H<sub>2</sub>SO<sub>4</sub>, oleum, ClHSO<sub>3</sub> or H<sub>2</sub>SO<sub>4</sub> contg. HNO<sub>3</sub>, and crystg. the S from the purified liquid.

**Recovery of sulfur.** Zahn & Co. G. m. b. H. Fr. 749,495, July 25, 1933. S is recovered from the mass used for gas purification by heating the gas indirectly and using only a small fraction of the combustion gas, almost deprived of O, to carry over the S vapor. An app. is described.

**Sulfur recovery from roaster gases.** Raymond F. Bacon. U. S. 1,934,474, Nov. 7. Materials such as sulfide ores are roasted in the presence of regulated amounts of air and under pressure (sufficient O being provided for the conversion of substantially all the S available in the material to SO<sub>2</sub> without much diln. of the resulting gases with uncombined O) and the resulting SO<sub>2</sub>-bearing gas, without any substantial loss of heat, is subjected to reduction under superatn. pressure in the presence of incandescent carbon. App. is described.

**Sulfur ores.** Imperial Chemical Industries Ltd. Fr. 749,570, July 26, 1933. PbS is recovered from ores such as pyrites contg. small amts. of Pb, by roasting the ore with a limited amt. of air in a rotary or vertical furnace, so that the whole of the O is absorbed and a part of the heated material is in contact with a gas free from O. A current of gas free from O, *e. g.*, N or SO<sub>2</sub>, is introduced at one or more points in amt. and at a speed sufficient to volatilize the PbS and remove it from the furnace as a vapor. A small amt. of coke may be added to the ore.

**Catalysts.** Silica Gel Corp. Brit. 396,712, Aug. 8, 1933. Catalysts for the oxidation of SO<sub>2</sub> to SO<sub>3</sub> comprise a carrier, consisting of 1 or more dried hydrous oxide gels or a base-exchange compd., Pt introduced by impregnation and a promoter consisting of a compd. of 1 or more of the metals Fe, Ni, Al, Cu, Bi, Mo, Be, V, Sn, Cr or, preferably, Mn in amt. up to 5% of the mass. Suitable oxides are those of Si, Ge, Cr, W, Ti, Al or Sn. Various methods of prepn. are described. To obtain a rigid catalyst a reinforcing material may be incorporated at any stage of the prepn., suitable substances being clays contg. a large percentage of Al silicate or Al<sub>2</sub>O<sub>3</sub> and SiO<sub>2</sub>. Among numerous examples silica gel is charged with H<sub>2</sub>S and treated with a soln. of PtCl<sub>4</sub> and CuSO<sub>4</sub>, and the mass is dried and heated in air at 500° to convert the sulfides into Pt and CuO.

**Catalyst preparations.** Howard Spence, Ivor P. Llewellyn and Peter Spence & Sons Ltd. Brit. 396,780, July 31, 1933. Siliceous material suitable as a catalyst or a carrier is obtained by treating, in small lump or granular form, naturally occurring indurated (either naturally or by calcination) Al silicates, *e. g.*, aluminous fire clays, with mineral acids to ext. any desired proportion of the basic constituents. The residue may be calcined, *e. g.*, at 600–700°. In the case of silicates contg. Ti the extn. may be effected without removal of the Ti which may act as a catalyst or assist other catalysts deposited thereon. In an example an indurated fire clay is treated with H<sub>2</sub>SO<sub>4</sub>, calcined at 600–700°, moistened with Al(NO<sub>3</sub>)<sub>3</sub> soln. and calcined at 500° to deposit active Al within the pores.

**Catalyst.** S. I. R. I. (Società italiana ricerche industriali). Swiss 162,460, Sept. 1, 1933. A catalyst suitable for use in the synthesis of NH<sub>3</sub> is prepd. by fusing natural or synthetic magnetite and reducing so that the product does not contain an excess of FeO over Fe<sub>2</sub>O<sub>3</sub>.

**Catalysts.** I. G. Farbenind. A.-G. (Josef König, inventor). Ger. 577,628, June 2, 1933. Mo and W catalysts are prepd. by heating decomposable Mo and W compds., such as oxides or cyanides, to fusion or sintering temps. The heating takes place under pressure. Other substances such as Al<sub>2</sub>O<sub>3</sub> gel may be added to the Mo or W compds. before heating. Cf. C. A. 27, 2259.

**Catalyst carrier.** Johann A. Bertsch (to Monsanto Chemical Co.). U. S. 1,933,091, Oct. 31. A carrier suitable for use with Pt or V catalysts, etc., consists of fragments of a natural porous substantially pure silica such as tripoli, opalite, Carrara silica or geyserite (having greater mech. strength and resistance to self-abrasion than kieselsgruht).

**Catalyst carrier for use in sulfur trioxide manufacture.** Lloyd F. Nickell (to Monsanto Chemical Co.). U. S.

1,933,067, Oct. 31. See Russ. 25,111 (*C. A.* 27, 1463).

**Condensation products.** Soc. pour l'ind. chim. à Bâle. Swiss 162,213, Sept. 1, 1933. Covering layers are formed on materials of all kinds by applying a suspension of carbamide-aldehyde condensation products, drying, and hardening by application of heat and pressure. Urea- $\text{CH}_2\text{O}$  or urea-thiourea- $\text{CH}_2\text{O}$  condensation products are preferred. Examples are given.

**Condensation products.** I. G. Farbenind. A.-G. (Friedrich Frick and Adolf Kinsky, inventors). Ger. 577,706, June 3, 1933. In prepg. condensation products from polybasic acids and polyhydric alcs. (except sorbitol), the condensation is carried out in the presence of  $\text{H}_3\text{BO}_3$ ,  $\text{B}_2\text{O}_3$ , or esters of  $\text{H}_3\text{BO}_3$ . Thus, glycerol is condensed with phthalic acid anhydride in the presence of  $\text{H}_3\text{BO}_3$  by heating to  $250^\circ$ .

**Urea-aldehyde condensation products.** Fritz Pollak and Wilhelm Kraus (to Synthetic Plastics Co.). U. S. 1,935,411, Nov. 14. A soln. of the condensation product is sprayed quickly to evaporate the solvent and produce a pulverulent product only slightly polymerized and suitable for molding by heat and pressure.

**Artificial mass.** Paul Meyersberg and Georg Wolf. Swiss 162,156, Aug. 16, 1933. An elastic leather-like mass is produced by mixing chemically unchanged leather chips with vulcanized rubber and dehydrating. The leather waste may be mixed with a rubber dispersion, dehydrated and vulcanized. Substances such as  $\text{ZnO}$ , lithopone, stearic acid, dye, petrolatum, soot, linseed oil, etc., may be added according to the uses intended for the product.

**Plastic materials.** Jean de Granville and Léopold Davion. Fr. 749,733, July 28, 1933. Vegetable materials such as sorghum or maize are deprived of their fatty materials by a preliminary treatment, and the proteins are converted to hydrates by a current of steam, and then extd. by a solvent b. below  $80^\circ$ , e. g., acetone or ethylacetic ester. The soln. is concd. to a semi-fluid and used alone or with cellulose derivs. or resins for making films, threads, etc.

**Plastic materials.** The Bonnot Co. Fr. 749,810, July 29, 1933. An app. for homogenizing plastic materials, cements, etc., is described.

**Pressed articles.** Soc. pour l'ind. chim. à Bâle. Swiss 161,570, July 1, 1933. Articles are made by hot-pressing a mixt. of fibers and a binding agent prepd. from anhydro-*p*-aminobenzyl alc. or its nuclear homologs.

**Molded bodies.** Imperial Chemical Industries Ltd. and Rowland Hall. Brit. 395,687, July 17, 1933. Articles are manufd. by thermoplastic molding of products obtainable by known processes for polymerizing Me methacrylate, preferably in the presence of a known polymerization catalyst, e. g., an org. peroxide, an ozonide or (an agent giving off)  $\text{O}$ . The polymerization may be in the presence of a solvent or diluent and is preferably performed at  $60$ – $100^\circ$ , being controlled by cooling if necessary. The polymerization products are, if necessary, powdered, placed in a mold, preferably already hot, which is then closed and the powder heated and pressed, e. g., at  $80$ – $200^\circ$  and pressures of 0.1 ton per sq. in. and over. Molding may also be effected by extrusion. Plasticizers, e. g., camphor, tricresyl phosphate, fillers, e. g., powd. metals or crushed mica, or sol. or insol. coloring materials may be added to the polymer prior to molding, e. g., by milling on heated rolls, or to the Me methacrylate prior to polymerization. Variegated effects are obtainable by suitable choice of sol. dyes and by stratifying or otherwise filling the mold. The molded bodies are suitable for mfg. unsplinterable glass and the molded sheets may be used by themselves as a transparent medium of good mech. properties. Examples describe the molding of products obtained by the polymerization of Me methacrylate by (1) heating to  $100^\circ$  in presence of Bz peroxide, (2) heating to  $60^\circ$  in presence of  $\text{Ac}_2\text{O}$  and  $\text{NaBO}_3$ , (3) mixing with titanium white and china clay and heating to  $100^\circ$  in presence of Bz peroxide, and (4) mixing with the disazo dye obtained by coupling tetrazotized diaminodi-*p*-xylylphenylmethane

with  $\beta$ -naphthol and heating as in (3), transparent orange-red molded bodies being formed by molding the product.

**Molding nonplastic metallic oxides.** Reinhold Reichmann and Hans Kohl (to Siemens & Halske A.-G.) U. S. 1,934,091, Nov. 7. See Fr. 744,737 (*C. A.* 27, 4355).

**Molding composition consisting of hydrolyzed ligno-cellulose, furfural and an acid such as hydrochloric acid.** Earl C. Sherrard and Edward Beglinger (to the Government and People of the U. S.). U. S. 1,932,255, Oct. 24. A compn. is described which is suitable for molding under heat and pressure.  $\text{PhOH}$  or  $\text{PhNH}_2$  also may be added. Cf. *C. A.* 27, 5493.

**Polymerization products suitable for threads, films, coatings, etc.** Hans Fikentscher and Walter Wolff (to I. G. Farbenind. A.-G.). U. S. 1,933,052, Oct. 31. A product which is suitable for various uses is obtained by the conjoint polymerization of at least one aliphatic acrylic compd. free from salt groups such as acrylic acid, nitrile or ethyl ester with another polymerizable, monovinyl compd. such as vinyl acetate or vinyl chloride or styrene, etc.

**Adhesive.** Albert Benteli. Swiss 161,052, June 16, 1933. An adhesive contains nitrocellulose, softening agent, solvent and a urea-aldehyde condensation product.

**Latex adhesive.** Albert W. Holmberg (to Naugatuck Chemical Co.). U. S. 1,932,624, Oct. 31. Rosin oil is added to creamed latex; an emulsion of  $\text{CCl}_4$  also is added, and the odor of  $\text{NH}_3$  may be masked, as by the addition of oil of wintergreen.

**Adhesive tape.** Kenneth L. Osmun (to Union Selling Co.). U. S. 1,933,026, Oct. 31. A paper web is impregnated with a soln. of  $\text{NH}_4$  mono-phosphate and formaldehyde to which a soln. of ethylene glycol mono-ethyl ether acetate, triethanolamine and diethylene glycol has been added, and a coating of rubber latex is subsequently applied.

**Cementing composition.** Abraham Cohen (to General Elec. Co.). U. S. 1,935,434, Nov. 14. A compn. suitable for use on wood, cloth, etc., comprises blood albumin,  $\text{CH}_2\text{O}$ ,  $\text{NH}_3$  and  $\text{Co}$  oxide. Oxides of Mn, U or Cr also may be used.

**Cleaning agent.** Josef Floss. Swiss 160,416, May 1, 1933. A cleaning agent consists of  $\text{C}_2\text{H}_5\text{Cl}$  and benzene, preferably in the quantities 80 and 20%, resp.

**Cleaning agent.** Emil Frei. Swiss 161,520, July 1, 1933. A cleaning agent contains quartz sand, soft soap, borax; it may contain benzaldehyde.

**Cleaning preparations.** The Electric Smelting & Aluminium Co. Ger. 577,701, June 3, 1933. A water-free cleaning prepn. consists of  $\text{Al}_2\text{O}_3$  (e. g., kaolin),  $\text{SiO}_2$  (e. g., quartz sand), and alkali carbonate. These are fused together.

**Composition for cleaning white leather.** Sampson Blacher. U. S. 1,932,262, Oct. 24. A white coating material is used, such as lithopone together with an aq. vehicle, a substance such as phenolphthalein which changes color with change of  $\text{pH}$  and a second substance such as  $\text{Na}_3\text{PO}_4$  which reacts to form a water-sol. salt. Change of color is effected on application of the compn. to the leather. Soap,  $\text{CaCO}_3$  and Na benzoate also may be used.

**Polishing compositions.** Henkel & Cie. G. m. b. H. Brit. 395,538, July 20, 1933. A polishing compn. for floors, boots, etc., consisting of an aq. emulsion of wax and oil, is prepd. with sulfuric esters of alcs. or salts thereof as dispersing agents. In examples mixts. of waxes and stearin are melted and dissolved in turpentine (substitute) and the mixts. are then stirred with an aq. soln. contg. the Na salt of the sulfonation product of glycol mono-oleic acid ester or the Na salt of the  $\text{H}_2\text{SO}_4$  esters of the alcs. obtained by the catalytic hydrogenation of coconut oil glycerides.

**Bleaching powder.** I. G. Farbenind. A.-G. Brit. 396,256, Aug. 3, 1933. Bleaching powder of low  $\text{H}_2\text{O}$  content is obtained in an intermittent process by first chlorinating lime so that no substantial quantity of  $\text{H}_2\text{O}$  is removed and until a moderate Cl concn. at which the "wet point" is not

reached is attained and then, chlorination being continued, gradually removing  $H_2O$  in such measure that the granular character is preserved without impairing the capacity for absorbing  $Cl$ . The temp. in the first stage is kept below  $40^\circ$  and in the second stage above  $45^\circ$  with or without reduced pressure. In a modification in which a pulverulent product is obtained a continuous removal of a moderate amt. of  $H_2O$  in the first stage is effected under reduced pressure decreasing from 90 to 40 mm. Hg, a pressure of 30–50 mm. being maintained in the second stage. App. is described. Cf. C. A. 27, 4887.

**Tar remover.** Soc. pour l'ind. chim. à Bâle. Swiss 161,002, June 1, 1933. Tar spots are removed from surfaces coated with cellulose ester lacquers by *o*-dichlorobenzene.

**Polysulfide solutions.** Adriaan Nagelvoort (to Delaware Chemical Engineering Co.). U. S. 1,934,626, Nov. 7. S is rendered miscible with water by treatment with a dispersing agent such as tannin and is then caused to react in aq. suspension with a caustic alkali.

**Friction material for brake lining.** Adolph Rosner (to Bendix Brake Co.). U. S. 1,932,912, Oct. 31.  $BaCO_3$  is used in brake lining material such as that comprising asbestos fabric, NaCN and a synthetic resin in order to effect hardening of low-C brake drums when heated in use. Cf. C. A. 27, 1465.

**Brake lining material.** Hamilton Abert and Albert Whitelaw (to Raybestos-Manhattan, Inc.). U. S. 1,932,919, Oct. 31. Brake lining such as that formed of a rubber compn. and asbestos is hardened in a convolute strip having a plurality of turns, to such a degree that the strip may be bent without fracture to any curvature between the radii of 5 and 9 in. but not to a curvature of radius 10 times its thickness.

**Impregnated cloth for protecting metal articles from tarnishing.** Walter G. Aurand (to R. Wallace & Sons Mfg. Co.). U. S. 1,933,302, Oct. 31. Cd acetate is used as an impregnating agent in treating a dyed textile fabric or the like.

**Shoe-bottom filler.** Harold S. Miller (to Beckwith Mfg. Co.). U. S. 1,931,930, Oct. 24. A blank of substantially uniform thickness and shaped for insertion in a shoe bottom is formed from thermoplastic material and felt-like fibrous material such as box-toe scrap and rubber, proportioned to become plastic and sticky at a temp. of about  $95^\circ$ .

**Magnet core material.** Philip N. Roseby (to Automatic Electric Co. Ltd.). U. S. 1,932,639, Oct. 31. Finely divided magnetic particles of cores are sepd. from one another by a coating of metallic fluorides such as may be formed on the particles by treating them with HF.

**Laminated articles such as gaskets and packings.** Wm. B. Damsel and Wm. C. Damsel. U. S. 1,931,922, Oct. 24. A backing formed of resilient material such as rubber has a surface protected by a non-porous, non-corrosive plastic coating such as a compn. formed from olefinic compds. and polysulfides bonded to the backing and which will not interfere with its resiliency (the coating being vulcanizable at substantially the same temp. as the backing and being insol. in alc., benzene and various acids).

**Sound records.** Frazier Groff (to Carbide and Carbon Chemicals Corp.). U. S. 1,932,889, Oct. 31. A record-reproducing surface is formed from a compn. contg. a vinyl resin such as may be formed by the conjoint polymerization of at least 70% of a vinyl halide such as vinyl chloride together with a vinyl ester of an aliphatic acid such as vinyl acetate and which is less than about 30% sol. in toluene at  $20-30^\circ$ . Records thus formed have a low "surface noise level" and are tough and resistant to water and produce but slight wear on the needle.

**Moisture-preventing composition.** Hercules Powder Co. Fr. 740,013, Aug. 3, 1933. A compn. for protecting paper, Cellophane, etc., in sheet or other form, against

1 moisture contains chlorinated rubber and a wax, the proportion of wax being such that a transparent film is formed on the article protected. A plasticizer such as dibutyl phthalate may be added.

**Antifreeze composition.** Henkel & Cie G. m. b. H. (Eberhard Elbel, inventor). Ger. 580,003, Oct. 16, 1933. Water is prevented from freezing by adding a lower monoalkyl ether of glycerol.

**Dental filling material.** Werner Salzmann and Rudolf Funke. U. S. 1,935,418, Nov. 14. A dental cement is mixed with finely divided diamond or SiC (suitably in a proportion of about 10–30%).

**Dental wax.** Leon C. Hickok. U. S. 1,933,907, Nov. 7. A compn. which heats and chills quickly comprises beeswax 99 and impalpable Al powder 1%.

**Dental casting investment composition comprising cristobalite and a binder such as plaster of Paris.** Richard L. Coleman and Louis J. Weinstein (in part to Dorothy S. Dugan). U. S. 1,932,202, Oct. 24. The materials are proportioned to compensate for shrinkage of castings (such as Au inlays) from the molten to the cooled state.

**"High gelatinating" colloidal composition suitable for use as a detergent, etc.** Louis H. Heyl (to Wyodak Chemical Co.). U. S. 1,934,267, Nov. 7. Bentonite of the Wyoming variety is used with about 2.5% its wt. of an alk. agent for increasing the "gelling value" of the bentonite, this agent being formed of  $CaSO_4$  20.33 and  $MgO$  80.67%.

**Urethan substances for use as wetting agents, etc.** Heinrich Ulrich and Karl Saurwein (to I. G. Farbenind. A.-G.). U. S. 1,933,945, Nov. 7. Products suitable for use as wetting, dispersing or cleansing agents in the textile, paper or leather industry, etc., are obtained by reaction of an aliphatic amino acid contg. at least 1 H atom connected to a N atom, such as glycocoll, *N*-methyltaurine or the like, with a chlorocarbonic ester of an aliphatic alc. in which the C atom bearing the OH group is directly connected to at least 1 H atom, such as the chlorocarbonic esters of *n*-nonyl, *n*-decyl and *n*-undecyl alcs. (suitably at a temp. of  $20-30^\circ$ ). Various examples with details of procedure are given.

**Graining plate for reproducing the grain of wood on surfaces such as other kinds of wood.** Charles J. Fess. U. S. 1,934,114, Nov. 7. The surface of wood selected for the plate is provided with a smooth even surface and treated with a hot concd. aq. soln. of an alk. Na boric acid compd. such as borax and while still wet is treated with an abrasive to provide an ink-receptive surface, then rinsed, dried, smoothed with fine abrasive material and treated with a thin protective coating such as pyroxylin lacquer to prevent penetration of the ink used.

**Removing paint, etc.** Walter Gampp and Emil Sorensen. Swiss 161,568, July 17, 1933. Paint, etc., is removed by a mixt. of NaOH and spirit.

**Storing fire-extinguishing powder.** Komet Kompagnie für Optik, Mechanik und Elektro-Technik G. m. b. H. Brit. 396,779, Aug. 11, 1933. Caking of dry fire-extinguishing powder consisting mainly or wholly of  $NaHCO_3$  is hindered by treating with a soap soln., e. g., by spraying, and then drying and sieving. If the powder also comprises cryst. salt(s), e. g., borax,  $Na_2CO_3$ , the ingredients may be treated separately or after mixing.

**Inflammable links.** Francis Warren and Stanley F. Warren. Brit. 395,734, July 21, 1933. The inflammable element of inflammable links, particularly for fire-extinguishing app. is reinforced by non-extensible material. One form is a strip of Mg wire or ribbon to which celluloid, etc., is attached; another, a strip of celluloid reinforced by silk or like thread, which may be impregnated with nitrocellulose; another, celluloid strip reinforced by strip(s) of Cu, etc.

**Liquid carbon dioxide fire-extinguishing apparatus.** Alois Groer, and Heinrich Huebner. Ger. 577,774, June 3, 1933.

## 19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. E. KERR

**Essentials of glass technology based on American practice.** Samuel R. Scholes. *Ceram. Ind.* 21, 285-8 (1933); cf. *C. A.* 27, 5013; 28, 273. H. S. W.

What must the glass technician know about the new researches dealing with the refining of glass? II. Ludwig Springer. *Glashutte* 63, 455-6 (1933); cf. *C. A.* 27, 5013.—(1) The prolongation of the refining time improves the glass melt. (2) The greater the temp. of refining the better and the more rapidly the glass refines. It is important to increase the temp. suddenly and rapidly and then as rapidly lower it when sulfate is used as refining agent. With such a steep increase in temp. (called "temperature shock") O and SO<sub>2</sub> are chiefly sepd. from sulfate with a strong development of gases. The sudden fall in temp. checks the formation of new amts. of gas, but the bubbles present have time to escape from the melt. (3) It is generally thought that it is more difficult to refine a so-called hard glass (glass difficult to melt) than a corresponding soft glass at the same temp. However, expts. show that hard glass is refined better and more easily when employing a higher temp. and that soft glass is less well refined at lower temps. (4) An addn. of more than 50% cullet to the batch generally affects refining unfavorably, although some expts. contradict this. A literature index is given. M. V. Kondoidy

**The thermal endurance of glass.** Kōzo Tabata and Taro Moriya. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 575 6 (1933).—The ability of glass to withstand thermal shock depends on the following conditions: (1) chem. compn., (2) geometrical form and size of test piece, (3) temp. difference causing shock and its position on the temp. scale, (4) kind of cooling agent and its state and condition, (5) edge effect, and (6) vectorial anisotropy. Borosilicate glass rods were used as test pieces and water was used as cooling agent. Theoretical expressions are given for the temp. distribution, the thermal stress and for the relation between the radius of the glass rod and the crit. thermal shock. Exptl. results are presented. K. K.

**Investigations on coloration of glass by cementation.** A. Leclercq, P. Gilard and L. Dubrui. *Rev. belge ind. verrières* 4, 218 21 (1933); cf. *C. A.* 27, 4045. A paste made by mixing 1 part of CuO with 3 of Fe<sub>2</sub>O<sub>3</sub> is painted on the glass and given 3 firings at about 630°, the second firing being of a reducing nature. After the first firing a green color appears. The sample is then washed. The second firing gives a black color and the third produces a red. The effect of secondary constituents in the glass is: favorable—As<sub>2</sub>O<sub>3</sub>, SnO, F, Sb<sub>2</sub>O<sub>3</sub>, MnO, FeO and C; inactive—Sb<sub>2</sub>O<sub>3</sub>; unfavorable—MnO, NaCl, Sc, KNO<sub>3</sub> and Am<sub>2</sub>SO<sub>4</sub>. The effect of primary constituents is: ZnO and MgO very favorable; PbO—results in poor reduction; CaO and BaO—cement poor; K<sub>2</sub>O—better than Na<sub>2</sub>O. *Ibid.* 242 6.—A paste composed of CuSO<sub>4</sub> gives a more pronounced color, but more irregular, than one of CuO. Polished glass is less easily colored than untreated glass. The thickness of the coating does not affect the color. The color produced by the first firing is variable. Glass may also be colored by Cu vapors. The mechanism of coloration may be explained by assuming the formation of Cu oxide or finely divided metallic Cu in the glass. Both theories are discussed. Bibliography. Herbert S. Willson

**The English method of hand manufacture of glass crucibles.** H. Winnwood. *Rev. belge ind. verrières* 4, 225-7 (1933). Herbert S. Willson

**The physical properties of the system SiO<sub>2</sub>-Na<sub>2</sub>O-K<sub>2</sub>O-CaO.** W. Haulein. *Z. tech. Physik* 14, 418 24 (1933).—The glasses were prep'd. by fusion of analytical reagents. The results of the measurements are expressed graphically; one component is kept const. The devitrification limits move toward lower alkali content with increasing CaO content. The partially crystal state noted by Berger (cf. *C. A.* 23, 253) was not present

in this work and appeared as an extension of the glass region because of the rapid cooling of the melts. The sp. resistance increases with CaO content, while the alkalis present singly diminish it. With both present there is a sp. ratio for each glass where the resistance is the greatest. The coeff. of expansion of the annealed glasses and the sp. gr. are almost additive functions of the compn. The viscosity is diminished by Na<sub>2</sub>O to a greater extent than by K<sub>2</sub>O while CaO causes a large decrease. The results are in qual. agreement with previous workers. A. F.

**BaO and MgO as glass-forming oxides.** H. Kühl. *Glashutte* 63, 371-3 (1933).—The use of MgO in glass melting has been limited because of its high fusion temp. However, when MgO is introduced into the batch in the form of dolomite, melting is considerably facilitated. If alkalis and lime are replaced simultaneously by BaO, the quality of the glass is improved considerably. It increases d., the n, hardness and the modulus of rupture. In the production of enamels, BaO has an advantage over PbO in that it is not affected by the injurious influence of reducing gases in the kiln. M. V. Kondoidy

**Melting glass rods together.** M. A. Besborodov. *Glashutte* 63, 127-30 (1933).—A detailed description of attempts to fuse glass objects together. The results are tabulated and shown in curves. It has been found that this melting is not a function of the coeffs. of expansion (18-100°) of the glasses alone, but also of other factors as the shape of the glass objects and their size. M. V. Kondoidy

**Report on optical glass.** D. S. Rozhdestvenskii. *Trans. Optical Soc. (Leningrad)* 8, No. 84, 1-22 (1932).—A report dealing with (1) the principles of optical glass, (2) its manuf. and (3) the optical industry in Russia. M. V. Kondoidy

**Streaks in window glass manufactured on Fourcault machines.** S. V. Rodin. *Keram. i Steklo* 9, No. 7, 11-18 (1933).—The reasons for the formation of streaks in window glass when manuf'd. according to the Fourcault method are due to: (1) the thermal inhomogeneity of the glass mass, (2) crystn. and cooling of the glass ribbon, and (3) the effect of the Fourcault "boat," especially its shape. M. V. Kondoidy

**Scientific principles of fuel economy in the glass industry.** Combined low-temperature carbonization and partial gasification of coal. David Brownlie. *Glass* 10, 152-5 (1933); cf. *C. A.* 28, 274. H. S. W.

**X-ray examination of some ceramic raw materials.** III and IV. T. Nakai and Y. Fukami. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 559-62 (1933); cf. *C. A.* 27, 4644, 5163.—X-ray exams. on materials heated for 3 hrs. at 1100°, 1200°, 1300° and 1400° and for 1 hr at 1500° are reported. Karl Kammermeyer

**Combined testing methods.** V. Škola. *Ber. deut. keram. Ges.* 13, 157 77 (1932).—Data are given to show the advantage of testing several different properties on the same specimens. Results are given on the fire brick tested for both their resist. to spalling and slag action. H. G. Schurecht

**The ceramic properties of kaolins.** H. Lehmann. *Ber. deut. keram. Ges.* 14, 155-62 (1933).—The properties of kaolin from 7 different localities were studied in both raw and washed condition. The washed kaolins had the following analysis: SiO<sub>2</sub> 48.60, Al<sub>2</sub>O<sub>3</sub> 27-37, clay substance 70-90 and quartz 3.3-27%. H. G. S.

**Manufacture of tridymite brick.** H. Salmang and R. Wentz. *Ber. deut. keram. Ges.* 14, 141-55 (1933).—Silica brick with 1.5% Na<sub>2</sub>O and 1.5% Fe<sub>2</sub>O<sub>3</sub> can be changed to tridymite by firing to 1250°. At 1050° a silica brick with a sp. gr. of 2.45 can be produced. The alkali content can be reduced to 0.3% and there will still be full transformation of quartz to tridymite. Even with 0.1% Na<sub>2</sub>O considerable transformation may take place. By the addn. of alkali without the Fe<sub>2</sub>O<sub>3</sub> transformation

takes place but the brick does not develop strength. Good strength can also be produced by increasing the CaO content to 7%. The red spots become greater when CaO is increased. Phosphoric acid and  $B_2O_3$  retard quartz transformation. In order to prevent the alkalis from becoming deposited on the surface a frit is prep. composed of 1  $Na_2O \cdot 1Fe_2O_3 \cdot 3SiO_2$ . Expansion studies of cristobalite brick showed rapid changes at 230°. Tridymite brick has a more gradual expansion curve than cristobalite brick.

**Magnesite and chromite-magnesite brick and furnace-lining material.** P. P. Budnikov and A. A. Grebenik. *Ber. deut. keram. Ges.* 14, 197-202 (1933).—The manuf. of magnesite and chromite-magnesite brick is described in detail. The chromite-magnesite brick was found to be much more resistant to coal and slag action than magnesite brick. The chem. analyses of the magnesite were: MgO 46.08, CaO 0.30,  $Fe_2O_3$  1.30,  $Al_2O_3$  0.60,  $SiO_2$  0.90 and  $CO_2$  50.82%. The chromite-magnesite brick is made by mixing one part of dead-burned magnesite with five chromite.

**Effect of MgO on physicochemical properties of Dinas brick.** P. P. Budnikov and N. S. Kassiyev. *Domes* 1933, No. 7, 14-17.—Exptl. bricks, contg. 0, 0.2, 0.3, 0.5, 1 and 2% MgO, were prep. from mixts. of 2 kinds of quartzites. Micro- and macroanalysis and physicochem. tests showed that in every case the bricks were of good quality.

**Expansion of silica bricks of the coke-oven lining during firing.** M. I. Tagunov. *Coke and Chem.* (U. S. S. R.) 1932, No. 2, 55-61.—A study of heat resistance and expansion of fire bricks (approx. compn.:  $SiO_2$  95.5%; CaO, 2.3%;  $Al_2O_3$  1.1%;  $Fe_2O_3$  0.6%; fusion 1710°; sp. gr. 2.36) was made from plant observations. Data are tabulated. The following procedure is recommended for breaking in a newly lined coke oven: (1) drying for 20 days, av. temp. rise 4-5° per day; (2) during the following 23 days, the temp. is raised from 105° to 420°; (3) during the next 15 days the temp. is raised to 900°; (4) finally for 8 days it is raised from 900° to 980°.

**Burning defects in tunnel kilns and their possible prevention.** P. Gatzke. *Ber. deut. keram. Ges.* 14, 203-10 (1933).—Large wide cracks may develop around the edge of plates and saucers resulting from uneven heating. Fine cracks may develop if the kiln is cooled too rapidly from red heat. Porcelain pieces may have a dirty appearance because of a too rapid firing in the biscuit burn which causes the soda on the surface of the pieces to blister. "Reduction" yellow is caused by incomplete reduction of the ware in the center of the ear. "Atmospheric" yellow may result when the burning flue does not become entirely filled with the flame. Smoked ware contains C which cannot be burned out in subsequent firing. Smoked glazed ware is usually badly blistered because of the combustion of the dissolved hydrocarbons in the glaze and body.

**Efficient use of pyrometric cones demands care and judgment.** H. B. Henderson. *Ceram. Age* 22, 98-101 (1933).—Pyrometric cones indicate firing conditions and not temp.

**Highly sintered alumina as a commercial product.** H. Gerdien. *Glastech. Ber.* 11, 331 (1933).—Pure  $Al_2O_3$ , tab. red and formed above 1800° into a dense hard body, but at room temps. a heat cond. 18 times that of porcelain and has high elec. insulating properties up to around 1200°. Its resistance to HF, molten alkalis and molten glass makes it of special interest in glass labs. for small melts.

**The Steger method of measuring strains as a plant-control test in the manufacture of sanitary ware.** G. Hamner. *Ber. deut. keram. Ges.* 13, 557-68 (1932).—In the Steger method thin strips of glazed ceramic ware are heated in elec. furnaces. One end of the strip is held firmly while the other end is free to move. By recording the movements of the free end as the strip is heated up to 800° the strains between glaze and body may be noted.

H. G. Schurecht

**A new method of measuring the expansion of materials at high temperatures and results with the same.** E. Lux. *Ber. deut. keram. Ges.* 13, 549-56 (1932).—A modification of the Endell app. for measuring the expansion of materials at high temps. is described. Expansions up to 1700° were detd. for graphite, coke,  $SiC$ , granular graphite and flake graphite.

**Studies on the thermal and hydrothermal syntheses of mullite.** Takeo Ao. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 546 (1933).—The thermal and hydrothermal syntheses of mullite from "katō-kaolin", Kibushi, Gairone and Okayama clays contg. low  $Al_2O_3$  are carried out at temps. between 1000° and 1400°. The percentage of mullite produced by the hydrothermal synthesis proposed by A. is always greater than those formed by the hitherto known thermal synthesis. Crucibles and cones were made from these clays and Kahlbaums  $Al_2O_3$ ; their compn. corresponded to that of mullite. When burned at 1600° for 2 hrs. they are converted to amorphous mullite. If silicates are heated at temps. between 1000° and 1300° in a current of superheated steam the lowering of their melting temps. is much more pronounced than otherwise. An increased degree of vitrification occurred when various Seger cones were treated hydrothermally.

**Avoid iron contamination troubles with magnetic separator.** R. A. Weinhardt. *Ceram. Ind.* 21, 290 (1933).

**The classification of porcelains.** A. Granger. *Chimie & industrie Special No.*, 853-4 (June, 1933).—G. draws attention to the lack of precision of Brongniart's classification and suggests a new classification based on the nature of the fusible constituent and, if need be, of the glaze.

**The system  $SiO_2-Al_2O_3-TiO_2$ .** Vladimir Škola. *Chimie & industrie Special No.*, 822-4 (June, 1933).—In evaluating  $Al$  silicates the current practice of considering  $TiO_2$  as equiv. to  $Al_2O_3$  is inaccurate. Not only does  $TiO_2$  not improve the refractory quality, but generally lowers it. The equilibria of the system  $SiO_2-Al_2O_3-TiO_2$  should be thoroughly investigated to deduce the proper method of expressing  $Al_2O_3$  for com. purposes.

**Refractory materials.** 24th report of the Joint Subcommittee, Institution of Gas Engineers and Leeds University. The hot patching of gas retorts. Use of dry powdered cements containing silicon and aluminum. F. H. Clews, H. Booth and A. T. Green. *Gas J.* 204, No. 3676 Institution of Gas Engineers Suppl., 10 (1933).—The lab. work is sufficiently promising to make work on gas retorts themselves desirable. Grading, porosity and permeability to air of silica bricks. F. H. Clews and A. T. Green. *Ibid.* 10 (1933).—The permeability and porosity of silica bricks as affected by the pressure and the distribution of sizes in the ganister have been studied. The action of alkalis on refractory materials. F. H. Clews, A. Green and A. T. Green. *Ibid.* 10-11 (1933).—An examn. of the brickwork of continuous vertical retorts has furnished fairly definite evidence of attack on the refractories by alkalis in the liquid and gaseous condition. Preliminary expts. have been made on the disintegration of fire clay and  $SiO_2$  exposed to the action of KOH vapor at 900-1000°. The rate of volatilization of KOH from materials impregnated with it up to 4%  $K_2O$  at 1000° has shown that the loss from  $SiO_2$  materials is many times more rapid than from those contg. clay. Flaking of continuous vertical retorts. A. T. Green and F. H. Clews. *Ibid.* 11-12 (1933).—The nature, cause and cure of flaking are discussed.

**The action of sodium sulfate on refractory materials.** Otto Bartsch. *Glastech. Ber.* 11, 285-93 (1933).—The resistance of refractories to attack by melts of soda and mixts. of  $Na_2SO_4$  and C is similar and increases with increasing clay content. More evidence is furnished to establish the fact that the very corrosive action of sulfate melts, in which the gall has been removed by reduction, is due to the localized surface area with a high concn. of alkali. Certain clays cause a peculiar deforma-

tion of the refractory in fused  $\text{Na}_2\text{SO}_4$  which is minimized by proper pre-firing. This is suggested as a test to aid in detg. the proper firing conditions for refractories.

J. F. Hyde

**Fused refractory blocks.** Vladimir Škola. *Chimie et industrie Special No.*, 825 9 (June, 1933).—A brief pat. review, followed by a description of the manuf. of "Corhart" refractories (U. S. pats. 1,675,751, 1926; 1,700,288 (C. A. 23, 1487; 1,728,350, C. A. 23, 5291)).

A. Papineau-Couture

**Tin oxide.** Heinrich Sasse. *Emailwaren-Ind.* 10, 72-3 (1933).—Methods for obtaining  $\text{SnO}_2$  and the detn. of its opacifying power are discussed. M. V. K.

**Coating glass with rubber** (Ger. pat. 577,812) 30. **Sealing lead-in wires into vitreous envelopes** (Brit. pat. 306,103) 4. **Furnace operation [glass manuf.]** (U. S. pat. 1,933,571) 1.

**Glass.** Hobart M. Kraner. U. S. 1,933,739, Nov. 7. A partially vitrified material produced by firing a mixt. of clay and a flux is used with other glass-forming ingredients.

**Glass.** Robert H. Dalton (to Corning Glass Works). Brit. 396,015, July 27, 1933. Molten glass is fined by adding to the batch a small amt. of a material that contains Br or I, e. g., iodides,  $\text{C}_2\text{H}_5\text{I}$  or bromides.

**Apparatus for feeding mold charges of molten glass.** John W. Harding (to Brockway Machine Bottle Co.). U. S. 1,934,676, Nov. 7. Structural, mech. and operative details are described.

**Apparatus for feeding mold charges of molten glass.** Walter R. Sterrett (to Ball Bros. Co.). U. S. 1,935,527, Nov. 14. Structural and mech. features.

**Cut-off knife for machines that gather molten glass by suction, for severing the glass in a mold from the supply in the gathering-pool.** Europäischer Verband der Flaschenfabriken G. m. b. H. Brit. 397,030, Aug. 17, 1933.

**Timing mechanism for glass-forming apparatus such as used for the manufacture of bottles, etc.** Samuel G. Stuckey (to Ohear-Nester Glass Co.). U. S. 1,932,024, Oct. 24. Various mech. and operative details are described.

**Glass-blowing apparatus suitable for use in the manufacture of bottles and jars.** August Kadow and John P. McLaughlin (to Owens-Ill. Glass Co.). U. S. 1,931,497, Oct. 24. Mech. features.

**Device for melting off the rough ends of hollow glassware.** The Libbey Glass Manufacturing Co. Ger. 577,890, June 7, 1933.

**Surface treatment of glassware to increase its strength.** Thomas Wardley and John B. Murgatroyd (to Hartford-Empire Co.). U. S. 1,933,529, Oct. 31. A pulverulent glass-treating material such as Pb borate or S in suspension in a gaseous medium is injected into an annealing lehr while glassware is being passed through the lehr.

**Apparatus for manufacture of glass tubing.** Henry K. Richardson (to Westinghouse Lamp Co.). U. S. 1,933,341, Oct. 31. Various structural and operative details are described.

**Sheet-glass manufacture.** Luke C. Mambourg (to Libbey-Owens-Ford Glass Co.). U. S. 1,932,669, Oct. 31. Various details of app. and operation are described.

**Apparatus for sheet glass manufacture.** Wm. Wildermuth (to Libbey-Owens-Ford Glass Co.). U. S. 1,932,651, Oct. 31. Mech. features.

**Cylinders for drawing sheets of glass.** Pilkington Bros. Ltd. Fr. 749,572, July 26, 1933.

**Apparatus for making sheets of glass.** Soc. anon. des manufactures des glaces et produits chimiques de St.-Gobain, Chauny et Cirey. Fr. 41,791, Apr. 13, 1933. Addn. to 699,275 (C. A. 25, 3454).

**Rolling machine for plate-glass manufacture.** Georges P. Despret (to Compagnies réunies des glaces et verres speciaux du nord de la France). U. S. 1,933,167, Oct. 31. Mech. features.

**Hardening glass disks or plates by air-cooling.** Soc. anon. des manufactures des glaces et produits chim. de St.-Gobain, Chauny et Cirey. Ger. 586,478, Oct. 21, 1933.

**Grinding and polishing apparatus for sheets of compound glass.** Cyril W. Bonniksen. Brit. 396,713, Aug. 8, 1933.

**Silver-copper alloy mirror films on glass.** Wm. Peacock, Jr. U. S. 1,935,520, Nov. 14.  $\text{AgNO}_3$  is dissolved in an aq. soln. of  $\text{NH}_3$ . An aq. soln. of  $\text{CuSO}_4$  and addnl.  $\text{AgNO}_3$  are dissolved in an aq. soln. of Rochelle salts. Tartaric acid is dissolved in water. The resulting solns. are added, in the order mentioned, to a further quantity of water, and the soln. thus produced is poured upon the body to be treated.

**"Glass substitute."** Frank A. Canon (to Acetol Products Inc.). U. S. 1,933,616, Nov. 7. A reticular metal base such as one formed of galvanized wires of elliptical cross section is coated and its meshes are filled with a cellulose deriv. compn. which in the meshes has a general divergent-lens-shaped form.

**Reception and transport table for laminated glass sheets.** Herzogenrather Glaswerke Bicheroux & Cie G. m. b. H. Fr. 41,519, Jan. 28, 1933. Addn. to 600,182.

**Ceramic materials.** Soc. Quartz & Silice. Fr. 41,648, Feb. 15, 1933. Addn. to 620,356. Elec. insulators, etc., are made by mixing debris from fused  $\text{SiO}_2$  with an appropriate binder.

**Permeable ceramic material suitable for "acoustic tile," etc.** Wm. L. Stafford (to Johns-Manville Corp.). U. S. 1,934,383, Nov. 7. Bricks, slabs and the like are formed by mixing a body material of relatively low bonding strength, such as clay, with a volatile solid such as naphthalene and a cementitious material capable of hardening at a relatively low temp., such as calcined gypsum, and sufficient strength is imparted to the mixt. to prevent substantial disintegration or deformation during subsequent heating, the mixt. is formed into suitable shapes, and the shaped material is heated to volatilize the volatile solid.

**Firing ceramic articles.** Porzellanfabrik Kahla, Zweigniederlassung Freiberg. (Friedrich Dettmer, inventor). Ger. 586,424, Oct. 21, 1933. Addn. to 530,269 (C. A. 25, 5264). The system described in Ger. 530,269 is modified by maintaining an atm. of  $\text{CO}_2$  or other inert gas in the preheating chamber in which the oil vapors are evolved.

**Porous bricks.** Henrik Nielsen. Brit. 396,590, Aug. 10, 1933. Raw wet clay and org. substances, e. g., sawdust, peat, ground coke and coal are mixed, the mixt. is dried until it contains 10-17%  $\text{H}_2\text{O}$ , granulated, e. g., to granules 2.5 mm. diameter, dry molded, e. g., at 100-150 kg. per sq. cm. pressure, and fired, preferably in a tunnel kiln. The org. substances may form 2-75% of the total mix.

**Method and apparatus for making sand-faced bricks.** Herbert H. Bailey, Richard Barker and Thomas Jones. Brit. 395,696, July 18, 1933.

**Combined molding and re-pressing machines for bricks, tiles, etc.** Clayton, Goodfellow & Co. Ltd. and Thomas Whittaker. Brit. 395,986, July 27, 1933.

**Molding pipes, tiles, etc., by extrusion.** Rainford Potteries Ltd. and Francis Wilson Grundy. Bgt. 396,349, Aug. 3, 1933. In making pipes, tiles, etc., by extrusion and cutting up of clay tubes or bars the bar, etc., is subjected to a rapid drying of its surface layer, preferably by means of air jets, immediately after extrusion, whereby the surface layer is rendered sufficiently porous to allow entrapped air to escape so that blistering is avoided during subsequent firing. The articles are subjected to a slow final drying before firing.

**Burning and preheating tunnels, etc., for treating clay products as in brick and tile manufacture, etc.** Edward M. Hoover. U. S. 1,935,319, Nov. 14. Structural and mech. features.

**Furnace suitable for melting silica and alumina with alkali metal carbonate.** Alfred W. Scheidt (to Elec.

Smelting & Aluminum Co.). U. S. 1,932,354, Oct. 24. Various details are described relating to forming a refractory lining in part from material chilled in the furnace. U. S. 1,932,355 also relates to furnace construction and operation of generally similar character.

**Tunnel or enameling pottery kiln heated by electric resistors.** Wm. J. Millar (to Ajax Elec. Co.). U. S. 1,934,870, Nov. 14. Structural and elec. features.

**Pottery-making machine.** Wm. J. Miller. Brit. 395,855, July 27, 1933.

**Pottery.** Walter Bloch. Brit. 396,532, Aug. 10, 1933. Dense, refractory pottery ware is made by using a eutectic mixt. (approx. equal parts) of clay and talcum, or a mixt. having the clay or talcum slightly in excess, as a sintering flux for the main raw materials, *e. g.*, refractory clays, refractory oxides, silicates, nitrides or carbides. The main materials may contain clay but not feldspar, quartz or talc. The fluxing action of the clay-talcum mixt. may be modified by addns. such as  $MnO_2$ , rutile, marble, beryl, pyrolusite, bone ash, fluor spar, etc., up to 10% of the mixt. Examples are (1)  $Al_2O_3$  65 and eutectic mixt. 35 parts, (2) magnesite 20, Zr silicate 30 and eutectic mixt. 50 parts and (3)  $ZrO_2$  75, eutectic mixt. 20 and Lothian or Dorset clay 5 parts.

**Cast vitreous panels formed on reinforcing metal supports.** Walter N. Thurn (to Vitrolite Co.). U. S. 1,935,583-4, Nov. 14. Various details of manuf. are described.

**Transparent siliceous materials.** Compagnie française pour l'exploitation des procédés Thomson-Houston. Fr. 749,436, July 24, 1933. A material suitable for insulation in spark plugs, etc., is made by fusing together crystallized quartz and beryl ( $Si_2O_3 \cdot Al_2Be_3$ ). The best proportion is 3-5% of beryl.  $Al_2O_3$  may be added if desired.

**Refractory furnace lining.** Karl Hacks and Wm. S. Sprow. U. S. 1,934,263, Nov. 7. For fusing a refractory lining upon the interior surface of a furnace such as one for melting glass or metals, there is applied to the surface a layer formed of a mixt. of granular refractory material such as magnesite and particles of a readily oxidizable metal such as Al and the metal is oxidized (as by Fe oxide) to supply heat for fusing the refractory material.

**Checkerwork of regenerators.** Dorman, Long & Co. Ltd. and Harry W. Owston. Brit. 395,859, July 27, 1933.

**Checkerwork for regenerators, for gas retort settings, etc.** John R. Masters. Brit. 395,593, July 20, 1933.

**Ceramic nozzles for spinning rayon, etc.** Porzellan-fabrik Ph. Rosenthal & Co. A.-G. Ger. 577,562, June 1, 1933. A flux such as feldspar is mixed with the ceramic mass so that a glaze is formed on the nozzle during the firing without addn. of a glaze powder.

**Electrical insulators.** Frank J. Stevens (to Locke Insulator Corp.). U. S. 1,931,626, Oct. 24. Insulators are formed comprising at least one insulating component such as porcelain together with aluminate cement serving as a lining for the pin hole or the like.

**Forming articles such as collar-insulators from fused quartz.** Alexander O. Freiherr von Beaulieu Marconnay (to Thermal Syndicate Ltd.). U. S. 1,932,402, Oct. 31. Mech. features.

**Porous refractory articles.** N. V. Vereenigde Nederlandsche Chamotte-Fabrieken. Ger. 580,442, Oct. 21, 1933. A mixt. contg. chamotte, refractory clay and 50-90% by vol. of Scottish cannel coal is molded and fired. The coal employed should yield not more than 10% of ash, which should be of high m. p.

**Abrasive articles.** Sigel F. Hepp. U. S. 1,932,104, Oct. 24. Finely divided abrasive material is used with polymerized chloroprene.

**Emery and sand cloth, etc.** Behr-Manning Corp. Brit. 396,385, Aug. 1, 1933. In the manuf. of sand paper, etc., the abrasive particles are propelled onto the backing material by an elec. field. App. is described.

**Molding abrasive wheels, etc.** Orello S. Buckner. Brit. 396,231, Aug. 3, 1933. In the manuf. of abrasive wheels and other tools from bonded, irregularly shaped grains of abrasive material the grains are turned during the molding process so that their largest dimensions lie in a desired dimension, *e. g.*, approx. perpendicular to the working face. The positioning is achieved by coating the grains, when of non-magnetic material, with a layer of Fe, etc., dust and subjecting in the mold to a magnetic field. The coating may be secured to the grains by an adhesive, *e. g.*, dextrin, glue, or by means of ceramic, etc., bonding material.

**Grinding wheels for wood, etc.** The Carborundum Co. Brit. 396,060, July 26, 1933. The wheels comprise a bonded abrasive body in combination with another element, *e. g.*, cement or reinforcing-members, formed of material having substantially the same temp. coeff. of expansion as the abrasive body. As applied to a wheel built up of segments the cement may comprise synthetic resin, fused quartz and  $H_2O$ , with or without  $(CH_3)_4N_4$ , and where reinforcing rings are used these may be of high-Ni steel held in position by said cement. To allow for a slight difference of coeff. of expansion of the rings and abrasive body a cement comprising fine SiC, smoked rubber and S may be used. The cement joints may be caulked with a quick-setting cement of CuO and  $H_3PO_4$ .

**Enamels.** Ignaz Krcidl. Brit. 396,007, July 27, 1933. In clouding enamels by means of gas bubbles as described in Brit. 297,724 (C. A. 23, 2798), 297,725 (C. A. 23, 2798) and 297,737 (C. A. 23, 2798) the quantity of clouding agent used is not materially greater than can be adsorbed by the slip and retained during storage. Suitable clouding agents are org. dyes, *e. g.*, methylene blue, malachite green, or highly polymerized hydrocarbons or substitution products thereof, *e. g.*, resins, pitch, tars, asphalt.

**Enamel suitable for use on bathtubs, sinks and the like.** Charles J. Kaspar. U. S. 1,933,437, Oct. 31. An enamel is formed of flint, borax,  $NaNO_3$ ,  $Na_2CO_3$ ,  $Ph_3O_4$ ,  $BaCO_3$ , fluor spar, Sb oxide and Na antimonate, in specified proportions.

## 20—CEMENT AND BUILDING MATERIALS

J. C. WITT

**The story of cement.** Oliver Bowles and H. Herbert Hughes. *Trans. Can. Inst. Mining Met.* 1933 (in *Can. Mining Met. Bull.* No. 259) 525-36.—General.

Alden H. Emery

**Aluminate cements.** J. I. Packalén. *Teknillinen Aikakauslehti* 23, 316-26 (1933)—A review of the development of aluminate cements is given. The analyses and structure are compared with those of portland cements. The time of binding, consistency of vol., storing ability and corrosion resistance are described. S. A. K.

**Anhydrite cement, its preparation and properties.** Peter P. Budnikov. *Chem.-Zig.* 57, 822-3 (1933); cf. C. A., 28, 279. E. H.

**Comparison of the effect of high temperatures on con-**

cretes of high alumina and ordinary portland cements. Alfred L. Miller and Herbert F. Faulkner. Univ. Wash. Eng. Expt. Sta., *Bull.* 43, 5-23 (1927).—In structures where the possibility of exposure to greater than ordinary temps. is remote and the probable period of exposure is short high-alumina cement is a satisfactory substitute for portland cement. High-alumina cements are less stable under conditions of high temp. The application of heat at all temps. decreased the strength of both cements, the greatest loss occurring during the first hr. Numerous data and graphs are given. C. R. F.

**Correction of alkaline soils in road making.** J. Gollan, L. Hervot and V. Nicollier. *Rev. facultad quim. ind. agr., Univ. nacl.itoral* 2, 88-95 (1932).—A clay taken

from a dirt road was found to have a plasticity index of 16.3 in its natural condition ( $p_H = 7.35$ ); when converted into acid clay ( $p_H = 3.06$ ) the plasticity was 10.7. Satn. of the clay with Ca, Mg or Na gave plasticity indexes of 18.2, 21 and 34.3, resp.  $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ , applied at the rate of 2.52 kg. per sq. m. distributed through the top 30-cm. layer, is a practicable corrective, because it displaces the Na to which the clay owes its extreme dispersion.

O. W. Willcox

Note on a laboratory apparatus for the fractional distillation of road tars. Joseph Malette. *Chimie & Industrie Special No.*, 851-2 (June, 1933).—A detailed description of a distg. flask and condenser specially developed for carrying out distn. tests on tar for roads.

A. Papineau-Couture

The breaking of road-building emulsions in contact with Austrian road-building stones. II. Suida and G. Uiberreiter. *Petroleum, Z.* 29, No. 29, 1-6 (1933).—Tests for evaluating asphalt emulsions for street construction are discussed. It is of special importance in the emulsion-breaking test to employ the particular substance to which the emulsion is to be applied. It is shown that the same quantity of the same emulsion can suffer breaking to various extents between 1.4 and 25.4 g. according to the stone used in the test. The stones react differently to different types of emulsions but may be roughly classified according to their activity. This activity appears to parallel alkali adsorption of the stone. Deposition of asphalt due to evapn. of the water is greater the less active the stone. Thus in dry warm weather the emulsion is broken because of this factor, while in cold wet weather the specific action of the stone controls the behavior of the emulsion.

I. M. Levine

Microasbestos in the asphalt industry and street construction. Heinrich Rosenberg. *Petroleum, Z.* 29, No. 45, 1-12 (1933).—The literature depicting the advantages of microasbestos as a filler in asphalt and tar for bituminous coatings, cement, roofing and road building is reviewed. In the last, R. shows that microasbestos increases the viscosity and resistance to pounding, and reduces the danger of the formation of fissures in winter and flowing in summer. This is due to the formation of a mineral skeleton because of the fibrous structure. It is very useful for streets exposed to dampness, by which it is not affected. It has the property of adsorbing water from the asphalt emulsion, which is thereby more rapidly broken and the fixation of the stone and bitumen is hastened. This prevents the displacement of the emulsion by flowing, in the case of both the surface and subsurface structures, yielding a more uniform and stronger pavement. It also provides a rougher surface and, therefore, greater freedom from sliding.

I. M. Levine

Wood-fiber plates (insulating wall boards), their manufacture, properties and use. Ivar Lundback. *Tek. Tid. Upl. C. Kemi* 62, 73-80 (1933).—A new type of wall board, *Treetex*, is manufactured in Sweden; the method employed is similar to the insulite board method. Testing methods for the phys. properties and water absorption are described. Expts. on fireproofing of Treetex have proved successful. Treetex is manufactured in different grades of hardness. Another product, *Startex*, consists of 1 board of Treetex between 2 boards of plywood. These plates having a hard outer shell and a porous insulating inner core have been successfully employed for doors.

D. Thuesen

Mastic asphalt roofing. D. M. Wilson. *Chemistry and Industry* 1933, 959-60.

E. H.

Practical experiments on chemical fire protection for wooden timbers. L. Metz and R. Schlegel. *Gasschutz u. Luftschutz* 3, 296-9 (1933).—Small-scale and large-scale methods for testing the efficiency of fireproofing treatments are described. Some results of tests are given.

A. L. Kihler

Durability of posts and results of preservative treatment. Deane G. Carter, Harold T. Barr and John B. Woods. *Ark. Agr. Expt. Sta., Bull.* 287, 3-16 (1933).—Pine posts which were creosoted by the pressure process were entirely sound after 10 yrs. Galvanized steel posts

likewise showed no deterioration. Painted steel posts gave good service, but the paint was not weather resistant, and the posts were subject to corrosion. Home creosote treatment adds about 4 yrs. to the life of posts. About 50% of the home creosoted posts were sound after 10 yrs.  $\text{ZnCl}_2$  treatment was effective and can be carried out at home. Used cylinder oil gave some promise as a useful preservative. Best results were obtained when the oil treatments were of short duration and at lower temps. Cu compds. pptd. in the wood and were highly toxic to wood-destroying fungi. Molten S offered some mech. resistance to decay. C. R. Fellers

Insecticides [and wood preserving compns.] (Brit. pat. 396,064) 15. Treating sulfide ores [slag used in portland cement] (Brit. pat. 396,690) 9.

Cement. Charles H. Breerwood (to Valley Forge Cement Co.). U. S. 1,931,921, Oct. 24. In prep. a cement raw material mixt. approaching a predetd. analysis from original material contg. an excess of one constituent such as  $\text{SiO}_2$ , the material is reduced to workable sizes, at least part of the material is treated (as by a flotation sepn.) to sep. some of the constituent present in excess and such treated portion is then combined with the untreated part of the original material.

Apparatus for cement manufacture. Walter M. Keenan (to Metropolitan Engineering Co.). U. S. 1,932,467, Oct. 31. A rotary kiln is provided with a nozzle burner projecting into the kiln, and with a water wall within the lower end of the kiln comprising longitudinal tubes lining the shell, headers at opposite ends of the tubes and connections for circulating water from the lower to the upper ends and for taking off hot water or steam from the upper header.

Shaft kiln for cement burning. Arno Andreas. Ger. 577,616, June 2, 1933.

Rotary kilns for the wet process manufacture of cement, etc. Gustave Coovmans. Brit. 396,265, Aug. 3, 1933.

Filtering cement slurry. The Dorr Co. Ger. 586,237, Oct. 19, 1933. See Brit. 380,239 (C. A. 27, 2742).

Apparatus for thickening crude cement slurry. Fried Krupp Grusonwerk A.-G. Ger. 577,521, June 1, 1933. Addn. to 530,640 (C. A. 26, 277).

Hardening cementitious products such as asbestos cement pipes. Manabu Tada (to Frank W. Plane). U. S. 1,932,150, Oct. 24. The product is formed on a core while in plastic condition and is subjected to an atm. contg.  $\text{CO}_2$  to effect surface hardening while still on the core, then removed from this atm. and sepd. from the core, and further hardened and dried under normal atm. conditions.

Porous compositions. Leichthausstoff-Ges. m. b. H. Ger. 586,236, Oct. 19, 1933. Cement or the like is mixed with gas-evolving reagents, and the mixt. is subjected to reduced pressure during the evolution of the gas.

Porous agglomerates. Hugo Ippach and Otto Bielgk. Fr. 750,117, Aug. 5, 1933. Finely divided quartz or rocks composed principally of  $\text{SiO}_2$  are mixed with  $\text{CaO}$  and an excess of water. The mass is molded and hardened by steam.

Heat-treating apparatus for manufacture of cellular aggregate from clay, shale or argillites, etc. Thorne E. Lloyd (to Dwight & Lloyd Sintering Co.). U. S. 1,932,415, Oct. 31. Mech. features.

Apparatus for treating concrete by vibration. Walter H. Horsch (to Massey Concrete Products Corp.). U. S. 1,932,520, Oct. 31. Various structural, elec. and operative details are described.

Tamping machines for molding concrete, etc., blocks. Leonard Hall. Brit. 396,381, July 27, 1933.

Apparatus for heat treatment of materials (such as clay in forming a concrete aggregate). Reed W. Hyde. U. S. 1,932,409, Oct. 31. Structural and mech. details of an app. adapted for heating clay, shale, etc., in the presence of a hot gaseous medium such as that from fuel burners.

**Road-making materials.** Giovanni D. Coletta. Ger. 586,423, Oct. 21, 1933. Sand or comminuted stone is warmed to about 45° and mixed with melted bitumen. A cold mixt. of powd. asphalt and powd. stone is then added, and mixing continued until a loose nonadhesive product is obtained.

**Bituminous dispersions and compositions for road-making.** Wilhelm R. Roederer. Brit. 395,384, July 3, 1933. See Fr. 727,328 (C. A. 26, 5192).

**Colored asphaltic compositions.** Highways Construction Ltd. and Cecil W. Rhodes. Brit. 396,545, Aug. 10, 1933. Asphaltic material is comminuted and heated under such conditions that it does not melt and a powd. pigment, e. g.,  $\text{Fe}_2\text{O}_3$ ,  $\text{Cr}_2\text{O}_3$ ,  $\text{PbO}$ ,  $\text{BaSO}_4$ ,  $\text{PbCrO}_4$ , ultramarine, etc., is incorporated with the heated material. A further quantity of bitumen may be added if necessary. The compn. may be applied to a road or other surface in powder form or molded into slabs, etc.

**Artificial stone.** Siemens-Schuckertwerke A.-G. (to Siemens & Halske A.-G.). Brit. 396,234, Aug. 3, 1933. Highly pure calcined  $\text{Al}_2\text{O}_3$  is made into a slip with a dil. mineral acid, e. g.,  $\text{HCl}$ , without any binding agent, and cast into porous molds or press molded. The shaped bodies are dried and sintered at below 1600°. They have a porosity of about 6–15% by vol. and may be used as grinding tools, polishing stones and oilstones, particularly for use in Cu plate printing and dentistry.

**Artificial stone.** Berliner Städtische Elektrizitätswerke A.-G., Friedrich Gropp and Helmut Richter. Ger. 586,332, Oct. 20, 1933. Flue ash is mixed with 15–30% of clay, with or without a flux, and the mixt. is molded, dried and fired in the usual way.

**Artificial marble.** Herman Ziegler. U. S. 1,935,535, Nov. 14. A liquid cement mixt. is subjected to air under pressure to produce a smooth close-grained product and is then permitted to dry under atm. pressure.

**Artificial stone surfaces.** Frederick R. Cooper (one-third each to Theodore L. Swoboda and Charles Steed). U. S. 1,931,573, Oct. 24. Dry cement is added to a batch of wet cement to form a mixt. of stiff lumpy consistency; the material is rolled into a layer on a flexible backing sheet such as paper, and a flexible cover sheet such as cloth is applied over the layer; the layer is rolled by pressure applied through the cover sheet, the latter is then removed, the layer is applied to a suitable base surface such as a plaster coated wall and the backing sheet is then removed.

**Decorative artificial stone from alumina cement and hard mineral granules.** Victor Langer. Ger. 586,333, Oct. 20, 1933. Numerous mfg. details are given.

**Building blocks from calcium carbonate and lime.** Arthur H. Harrison (to Carbonated Lime Processes Ltd.). U. S. 1,934,534, Nov. 7. Cellular particles of  $\text{CaCO}_3$  are incorporated with an aerated slurry of lime, the mixt. is molded, and the molded material is subjected to the action of  $\text{CO}_2$  gas in a heated chamber.

**Ornamental effects simulating marble on surfaces of building materials.** Emil C. Loetscher. U. S. 1,931,667, Oct. 24. An oil pigment is dropped upon the surface of a water bath contg. alum in soln. and allowed to spread in a thin film of a predetd. pattern which is then transferred to the surface of a sheet of material such as sized paper by surface contact and may be dried, varnished and applied by heat and pressure.

**Apparatus for continuous treatment of building bricks, etc., in drying, preheating, burning and cooling zones.** Ferdinand Fanta. U. S. 1,933,051, Oct. 31. Structural and mech. features.

**Fireproof building material.** Arthur Sprenger. Ger. 577,932, June 7, 1933. Oxides of Cr, Al, Mg and Si are fused together at high temps. the amts. being arranged so that the compds.  $\text{MgO} \cdot \text{Al}_2\text{O}_3$ ,  $\text{MgO} \cdot \text{Cr}_2\text{O}_3$  and  $\text{Al}_2\text{O}_3 \cdot \text{SiO}_2$  result. Minerals or compds. contg. oxides of the above may be used as starting materials.

**Filling porous masonry surfaces.** Warren G. Brown. U. S. 1,931,643, Oct. 24. For preventing penetration of water, surfaces such as those of masonry joints are treated with a coating essentially comprising a cement such as

portland cement and a finely pulverized oxidizable metal such as iron which swells in oxidation, and excess of the coating, not embedded in the surface, is subsequently removed.

**Impregnating and coating structural material such as stone, concrete or brick.** Ralph A. Altenhof (to Koppers Co. of Del.). U. S. 1,932,502, Oct. 31. S-treated tar is used as a pore filler and the surface of a concrete block or the like is provided with a continuous film of metal such as Al or Cu bronze which may be applied by use of metal flake powder with the tar.

**Fibrous compositions.** Bart T. Neervoort and Jan S. Volker. Brit. 396,652, Aug. 10, 1933. A compn. for making building elements, e. g., bricks, slabs, etc., comprises at least 3 parts of a hydraulic binder and 1 part of sugar-free bagasse. In an example the binder comprises cement 18.75, lime 9.7 and trass 6 kg. This is added to 6 kg. bagasse and made into mortar by mixing with  $\text{H}_2\text{O}$ .

**Roofing material.** Carl J. Pater (to Philip Carey Mfg. Co.). U. S. 1,932,144, Oct. 24. A foundation portion such as rag felt carries an exposable surface of weather-resisting material such as asphalt and mica and on its opposite side is provided with cellular heat-insulating material such as granular cork.

**Air-blown asphalt roofing.** Morris Levine (to Lehou Co.). U. S. 1,934,315, Nov. 7. Asphalt roofing comprises a roofing base such as a roofing felt coated with an air-blown asphalt of the Mid-Continent type with a thin overlying coating of rosin for preventing discoloration.

**Apparatus for coloring and drying roofing granules.** Paul S. Denning. U. S. 1,931,754, Oct. 24. Various structural and operative details are described.

**Plastering compositions.** N. P. Development Syndicate Ltd. and Henry L. Beresford. Brit. 395,426, July 20, 1933. A plastering compn. comprises cement and a larger quantity of finely comminuted pumice, or other material having similar vesicular structure and chem. compn., e. g., certain blast furnace slags, which is graded so that none of the particles exceeds  $1/16$ th in. in size and an appreciable portion passes a 150-mesh sieve but some is retained thereby. A suitable compn. comprises portland cement 1, pumice 4–20 and, optionally,  $\text{Ca}(\text{OH})_2$ , 1–2 parts. Coloring matter and micaceous sand and also a small proportion of  $\text{CaCl}_2$  may be added.

**Plaster.** Jean C. Seailles. Fr. 41,705, Mar. 29, 1933. Addn. to 730,011. A plaster of higher resistance is obtained by using water above 35°, preferably 50–100° or higher in the presence of a substance giving an alk. reaction in water.

**Plaster composition resembling natural gypsite.** Carlisle K. Roos and Richard Ericson (to U. S. Gypsum Co.). U. S. 1,932,120, Oct. 24. A ball-milled mixt. is prepd. with a major proportion of calcined gypsum and a minor proportion of clay, together with a trace of a deliquescent substance such as  $\text{CaCl}_2$ . Cf. C. A. 27, 2783.

**Calcium sulfate plaster.** Victor Lefebure. Ger. 586,331, Oct. 20, 1933. See Brit. 337,926 (C. A. 25, 2264).

**Plastic "acoustic pulp" for wall plaster.** Mario Valdastri. U. S. 1,932,807, Oct. 31. Cellulosic material such as cotton, sawdust, chaff or straw is used with asbestos,  $\text{ZnSO}_4$  and a binder comprising dextrin, casein, albumin or glue.

**Wallboard.** Dean D. Crandell (to National Gypsum Co.). U. S. 1,932,956, Oct. 31. In making wallboard, a cover paper is overlaid with a core paste having an alkalinity equiv. to more than 0.03%  $\text{NaOH}$ , which serves to give a strong bonding action. App. is described.

**Toughening wood and other fibrous materials with gum hydrocarbons.** Felix F. v. Wilmowsky. U. S. 1,933,573, Nov. 7. Fibrous material, free from resinous, oily and fatty substances and from starch, is impregnated with a soln., in a neutral volatile petroleum hydrocarbon menstruum or the like, of teneaceous gum hydrocarbons substantially free from resin, such as those of rubber or chicle, and the solvent is then volatilized at a temp. below that at which the gum hydrocarbons soften; the temp. is then raised to the coalescing point of the gum hydrocarbons.

"Artificial lumber" from excelsior or the like. Horatio W. Brown and Cyrus J. Taylor (to Bemis Industries, Inc.). U. S. 1,931,570, Oct. 24. Excelsior or the like is formed into a continuous uniform mat by uniformly distributing it in a passage (of a described app.) under air pressure; the mat is gradually and partially compressed, impregnated with a cementitious binder such as a Mg oxychloride cement mixt. and the impregnated material is held under pressure until the binder has at least partially set.

Adhesive for floor coverings. I. G. Farbenind. A.-G. (August Runte and Adolf Menger, inventors). Ger.

577,885, June 6, 1933. Linoleum, etc., is attached to floors by an adhesive prep'd. from an aq. emulsion of resinous condensation products obtained from a polyhydric alc., a polybasic org. acid and a monobasic org. acid. The example mentions an emulsion of the product obtained by condensing glycerol, phthalic acid and linseed oil fatty acid, with a small addn. of casein,  $\text{NH}_3$  and a Mn or Pb salt of a high mol. org. acid.

Floor-covering material, etc., containing porous rubber. Dunlop Rubber Co. Ltd. and The Anode Rubber Co. Ltd. Ger. 586,111, Oct. 16, 1933. See Brit. 358,561 (C. A. 27, 446).

## 21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER AND ALDEN H. EMERY

Briquets prepared by Averkiev's method. Shapovalov. *Domes* 1933, No. 5-6, 30-34.—Averkiev's method for briquetting iron ore fines consists in binding a mixt. of ore, lime and coke breeze with liquid glass. Briquets thus prep'd proved satisfactory as regards mech. strength, resistance to abrasion, gas permeability, reducibility, sp. gr. and chem. compn. The fear that  $\text{Na}_2\text{SiO}_3$  would corrode the furnace lining seems to be groundless. The use made of lime and coke fines helps to reduce cost of briquetting.

Some chemical aspects of coal utilization. H. H. Lowry. *Am. Inst. Chem. Eng.*, Roanoke Meeting, Dec., 1933 (preprint), 18 pp.—A brief review is given of the chem. nature of coal, and certain chem. aspects of the utilization of coal for hydrogenation, coking, combustion and gasification are discussed. The present knowledge of the chemistry of coal utilization is extremely incomplete. Need for addnl. work on the fundamental chemistry of coal and its reactions is emphasized. The engineer has achieved much in coal utilization with the limited knowledge of the nature of coal itself at his disposal.

C. L. Mantell

Report of experimental work on the hydrogenation of Canadian coal, coal tar and bitumen for the production of motor fuel. I. Batch experiments on the hydrogenation and cracking of low-temperature coal tar. T. E. Warren and A. R. Williams. *Can. Dept. Mines, Mines Branch Rept.* 737-3, 1-10 (1933).—Tar from the low-temp. carbonization of Sydney bituminous coal in an Illingworth retort contained 58.9% neutral oil, 33.05% tar acids and 7.5%  $\text{H}_2\text{O}$ . An Engler distn. of the dehydrated tar gave 4% up to  $410^\circ\text{F}$ . ( $210^\circ\text{C}$ .) and 35%  $410^\circ$  to  $572^\circ\text{F}$ . ( $300^\circ\text{C}$ .). The fraction to  $410^\circ\text{F}$ . contained acids 48, bases 2, olefins 20, aromatics 20 and paraffins and naphthenes 10%. The fraction  $410$ – $572^\circ\text{F}$ . contained acids 31, bases 4, olefins 7, aromatics 50 and paraffins and naphthenes 8%. Cracking this tar by the Cross exptl. procedure gave (2 expts.) crude gasoline, b. to  $410^\circ\text{F}$ ., 7.0, 8.9%; crude kerosene, b. 410– $572^\circ\text{F}$ ., 17.6, 17.2%;  $\text{H}_2\text{O}$  1.3, 1.3%; loss as gas, —, 4.1%; loss as coke, —, 23.1%. Petr. ether extd. 24.8% of the coke and raised yields of gasoline and kerosene in the second expt. to 9.3 and 18.5%, resp. In hydrogenation expts. Cu and  $\text{MoO}_3$  catalysts were effective in reducing coke formation. The best results were obtained with 10% of the wt. of the charge of  $\text{MoO}_3$  at  $476^\circ$ , 252 atm. for 30 min. Recoveries were total oil 90.4, coke 0.6, gas 9.0, fraction b. to  $410^\circ\text{F}$ . (gasoline) 17.8, fraction b. 410– $572^\circ\text{F}$ . (kerosene) 29.0. Also Fe oxide,  $\text{MoS}_2$ , and  $\text{MoO}_3 + \text{S}$  were tested as catalysts. II. Description of an apparatus for continuous hydrogenation and experiments on coal tar, bitumen and a suspension of powdered coal in coal tar. T. E. Warren and K. W. Howles. *Ibid.* 11-31.—A continuous lab.-scale, liquid-phase hydrogenation app. has been constructed. The volatile oil is removed as vapor in a stream of  $\text{H}_2$  at high pressure. About 260–280 g.  $\text{MoO}_3$  on 8–10 mesh coke was used as catalyst for 2800 cc. liquid. Temp. was  $428$ – $452^\circ$ , pressure 183–187 atm. and  $\text{H}_2$  circulation 87–112 cu. ft. per hr. Somewhat similar results were obtained with tar described in I, Alberta

bitumen and 40% powd. Cape Breton bituminous coal in tar. C formation was avoided. Loss as gas and vapor was about 10%.  $\text{H}_2$  combined or lost was 5.7–7.2% of material charged. Yields of volatile oil were 67.5, 73.3 and 65.5% by vol. of tar, bitumen and coal in tar, resp. Yields based on total charge — partly converted oil left in chamber at end of run were 90, 102 and 89%, resp. These are nearer to the results to be expected from continuous operation. Approx. 90% distd. below  $572^\circ\text{F}$ . and 45% below  $410^\circ\text{F}$ . About 10% of olefins was present.

Alden H. Emery

New process for the pressure gasification of brown coal with oxygen. A. Sander. *Arch. Warmewirt.* 14, 303-4 (1933).—A brief description is given of an exptl. installation of 1 sq. m. grate area, fed with O and steam at 20 atm. The combustion zone was very cool so that no clinker formed. Twenty tons of coal was gasified per 24 hrs. The gas contained 31%  $\text{CO}_2$  which could easily be washed out at this pressure.

Ernest W. Thiele

New combustion chart insures speed, ease, accuracy. Eric Therkelsen. *Power* 77, 600-1 (1933). A. H. B.

The Kreisa system in the Tokyo Gas Company. S. Minoru. *J. Fuel Soc. Japan* 12, 893-901 (1933) (in English 83-5).—M. discusses the merits and demerits of the 3 gasification systems, viz., the Baniag, Strache and Kreisa. The Kreisa system is far superior to the other 2 in principle and practice for the generation of water gas and the decompn. of tar, which are the chief elements for a mixed gas producer.

F. I. Nakamura

Gas power at the Sons of Gwalia Mine, Western Australia. V. T. Edquist, C. Valentine and Norman Dunstan. *Bull. Inst. Mining Met.* No. 350, 33-6 (1933). cf. C. A. 27, 3802.—Discussion.

Alden H. Emery

The mechanically operated gas producer, its origin and development. Gottfried Reitböck. *Feuerungstech.* 21, 148-52 (1933).—A review, including a list of about 80 German patents.

Ernest W. Thiele

Experiments with gas main stoppers and bags. Zumbusch and Hinze. *Gas u. Wasserfach* 76, 753-6 (1933).—The pressure necessary to cause leakage was det'd. for a series of stoppers. One cause of failure was displacement of the stopper rather than failure of it. To eliminate this feature the stopper was redesigned and fitted with handles that prevented displacement. While rubber bags are convenient means of stopping gas mains, the thin rubber required for convenience in handling is readily torn.

R. W. Ryan

Economic evaluation of benzene removal from gas. R. Mezger. *Gas u. Wasserfach* 72, 775-7 (1933).—A study of the economics relative to the removal of light oils from gas, with special reference to Stuttgart conditions.

R. W. Ryan

Distillation of crude benzene in continuous fractionation columns. G. N. Tyutyunnikov. *Coke and Chem.* (U. S. S. R.) 1932, No. 2, 26-9.—A discussion of technology of the continuous crude benzene-distn. plant for sepn. of benzene, toluene and xylene.

J. S.

Synthesis of benzene from carbon monoxide and hydrogen at ordinary pressures. XI. Cobalt-copper-thorium and cobalt-copper-uranium catalysts. K. Fuji-

- mura and S. Tsuneoka. *Sci Papers Inst. Phys. Chem. Research* (Tokyo) 22, 189-97(1933).—See C. A. 26, 4444. G. G.
- Method of determination of sulfur in solid fuels.** G. L. Stadnikov and N. G. Titov. *Coke and Chem.* (U. S. S. R.) 1932, No. 5-6, 29-36.—A review of methods for S detn. in solid fuels. The following methods are recommended: for S of sulfates and pyrites—Parr and Powell; for total S—Eschka; org. S by difference.
- Ferro-ammonium method for recovery of sulfur from coke-oven gas.** S. G. Aronov. *Coke and Chem.* (U. S. S. R.) 1932, No. 4, 42-8.—A study of data obtained in a series of expts. with  $H_2S$  absorption from coke-oven gas with a base contg. suspended  $Fe(OH)_3$ , as an absorbing liq. The probable reactions taking place are: (a)  $2NH_3 + H_2S = (NH_4)_2S$ ; (b)  $3H_2S + 2Fe(OH)_3 = 2FeS + S + 6H_2O$ ; (c)  $3(NH_4)_2S + 2Fe(OH)_3 = 2FeS + S + 6NH_4OH$ , etc. The results of the expts show: (1) absorption of  $H_2S$  renders the gas practically free from S compds.; (2) a considerable amt. of S can be recovered by regeneration of the absorbing liq.; (3) 25%  $NH_3$  can be recovered by regeneration; (4) secondary reactions during regeneration are negligible.
- Analysis of coke-oven gas and its components.** P. K. Sakmin. *Coke and Chem.* (U. S. S. R.) 1932 No. 4, 31-4.—A description of an improved app. for coke-oven gas analysis (detn. of  $CO_2$ , olefins,  $O_2$ , CO and  $H_2$ ,  $C_2H_4$ ,  $C_2H_6$ ). App. is essentially a modified Rasfeld app. The improvement consists of two-way stop cocks on each of the burets and an arrangement for a closer Hg-level control in the burets.
- Separation of benzene hydrocarbons from coke-oven gas by absorption.** G. V. Kopcelevich. *Coke and Chem.* (U. S. S. R.) 1932, No. 2, 62-6.—A theoretical scheme for recovery of benzene hydrocarbons from coke-oven gas by absorption in oil. The process consists of the absorption of  $C_6H_6$ ,  $C_7H_8$ ,  $C_8H_{10}$ ,  $C_9H_{12}$  in oil circulating in absorption towers and the distg. out of each of the hydrocarbons separately by raising the temp. of the oil and circulating it in a distn. column.
- The causes of the decomposition of absorbing oils in the absorption of benzene from coke-oven gas.** G. V. Kopcelevich and A. I. Brodovich. *Coke and Chem.* (U. S. S. R.) 1932, No. 4, 35-42.—An extensive study of exptl. data in changes of properties of oils used for absorption of benzene from coke gas.
- Determination of the extent of outgassing of cokes.** Walter Ludewig. *Gas u. Wasserfach* 76, 733-6(1933), (C. A. 26, 580)—The previous method of detg. the extent to which a coke had been outgassed was modified by increasing the vol. of the system to 3.2 l and evacuating the whole system to 5 mm. pressure before heating, so that the av. pressure was 20-36 mm. during the detn. In 60 min. the vol. of gas evolved was 90% of that from 6 hrs. heating. The app. is said to be simpler than that formerly used. A fully carbonized coke is now defined as one giving off not over 30 cc. gas at 0° and 760 mm. pressure per g. of air-dried coke, when heated at 1000° for 60 min. with an initial pressure of 5 mm. under the given conditions.
- Recent developments in coking practice.** Heinrich Koppers. *Colliery Guardian* 147, 724-8, 770-3(1933); *Gas World* 99, No. 2574, Coking Sect. 124-9; cf. C. A. 28, 290.
- Improvement of water cooling in a coke-benzene plant.** Sh. M. Levin. *Coke and Chem.* (U. S. S. R.) 1932, No. 4, 16.—Some practical suggestions are given for improvement of design and operation of natural draft water cooling towers used in the U. S. S. R.
- Expansion of silica bricks of the coke-oven lining during firing.** (Tagunov) 19. **Naphthylamines in coal tar.** (Kruiber) 10. **Assortment and technology of N fertilizers in relation to the coke chemical industry.** (Assinovskii) 15. **Fuel economy in the glass industry.** (Brownlie) 19. **Production of oil from British coal.** (Ormandy, Burns) 22.
- Refractory materials—hot patching of gas retorts.** (Clews, et al.) 19. **Mfg. processes for liquid org. products from industrial gases.** (Audibert) 10. **Destructive hydrogenation.** (Brit. pat. 395,345) 22. **Centrifugal gas cleaner.** (Brit. pat. 396,157) 1. **App. for oxidizing CO produced by internal-combustion engines.** (U. S. pat. 1,933,977) 1. **Liquefiable aromatic hydrocarbons from coke-oven gas.** (U. S. pat. 1,933,845) 22.
- Fuel.** Fred L. Mennie. Brit. 395,282, July 13, 1933. A compn. for treating coal or prepg. fuel briquets comprises  $NaCl$ ,  $NaClO_3$  and  $KClO_3$  and (or)  $KMnO_4$ . In an example 1 lb. of a mixt. comprising crushed rock salt passing a 7-mesh sieve 27, dried medium salt passing a 12-mesh screen 40,  $NaClO_3$  15,  $KClO_3$  15 and  $KMnO_4$  3% is dissolved in 8 gallons  $H_2O$  and distributed over 2 tons coal.
- Fuel.** Fritz Stotzel. Ger. 586,159, Oct. 18, 1933. App. is described in which town refuse, low-grade fuel or like carbonaceous material is mixed with appropriate substances and treated with air or  $O$  under pressure to produce fuel resembling coal.
- Fuel containing nitrocellulose.** S. Sternau & Co., Inc. Ger. 586,444, Oct. 21, 1933. See Brit. 380,467 (C. A. 27, 4058).
- Liquid fuels.** Robert E. Goldsborough. Fr. 41,595, Feb. 7, 1933. Addn. to 705,206 (C. A. 25, 5274). The catalytic surfaces used in the process of Fr. 705,206, are made of a Ni-Cr alloy contg. small amts. of Si, Zn, Al and Fe, e. g., Ni 60, Cr 30, Si 1, Zn 2, Fe 4 and Al 3%.
- Motor fuels.** Universal Oil Products Co. Brit. 395,448, July 20, 1933. Hydrocarbon motor fuels are purified by treatment of the vapor with  $HCl$  in presence of a solid contact material contg. free and (or) combined metal adapted to catalyze the action of the acid. Treatment with  $H_2SO_4$  may follow and steam and an or other  $O$ -contg. gas may be used with the  $HCl$  gas or aq. soln. In examples granulated Cu or Zn, Fe or brass turnings, mixts. of Cu with Fe or Zn, chlorides of Sn, Fe or Zn and mixts. of naturally occurring minerals or ores are used with  $HCl$  as vapor or as 20% soln. App. is described.
- Motor spirit.** W. C. Holmes & Co. Ltd. Brit. 395,635, July 20, 1933. Hydrocarbon motor spirit, especially that produced by cracking or low-temp. carbonization, is purified by treating with alkali before prolonged storage, preferably before or during condensation, then with such a proportion of about 95-96%  $H_2SO_4$  as to remove only the basic and the more unsatd. compds., e. g., diokfins, and then with alkali for a prolonged time, the acid-treated spirit being allowed to stand for a prolonged time before neutralization. Fractional distn. may follow. The first alkali treatment may be in 2 stages, e. g., with an aq. suspension of lime to remove S and easily decompd. compds. and then with  $NaOH$  to remove phenols. The acid wash may also be in 2 stages, e. g., first by agitation with 1-1.5% of acid tar from the 2nd stage, followed by settling, and then with 0.5% of 95-96% acid, followed by settling. The neutralization is preferably with  $Na_2CO_3$  soln.
- Synthetic fuel.** Urban P. M. Chandeysson. Fr. 41,613, Feb. 15, 1933. Addn. to 729,016 (C. A. 26, 6114). Charcoal from any source, a carbonate or CO is allowed to remain in a hermetically closed vessel in contact with  $NH_3$  or a compd. thereof to form a more or less oily hydrocarbon according to the charcoal or carbonate used.
- Colloidal fuel.** The Cunard Steam Ship Co. Ltd., Robert A. Adam, Frederick C. V. Holmes and Arthur W. Perrins. Brit. 396,432, Aug. 2, 1933. A stable mixed fuel is obtained by intimately mixing coal ground so that 100% passes through a sieve with about 180 meshes per linear in. with a hydrocarbon oil having a "fixed" C content of at least 5%. "Fixed" C is the residue when 1 g. of oil is heated in 7 min. to about 900° in a fused  $SiO_2$  crucible 3.5 cm. deep, 2.0 cm. wide at the bottom and 4.0 cm. at the top, having a loose porcelain lid and arranged

6.8 cm. above the top of a Bunsen burner having a flame 20 cm. high.

**Solid fuel comprising alcohol and nitrocellulose.** Griffnell Jones and Albert F. York (to S. Sternau & Co.). U. S. 1,934,860, Nov. 14. Nitrocellulose is mixed with an abs. monohydric alc. such as EtOH or MeOH (the nitrocellulose being insol. in the alc. at ordinary temp.) and the mixt. is subjected to a temp. of  $-20^{\circ}$  or lower, there is added an amt., not materially less than that of the abs. alc. used, of an aq. monohydric alc. such as EtOH chilled to a substantially similar temp., and the mixt. is warmed to atm. temp.

**Hydrogenating solid fuel.** Standard-I. G. Co. Fr. 41,609, Mar. 10, 1933. Addn. to 712,617 (C. A. 26, 2039). Means is provided to treat the fuel with H as a suspension under high pressure and at a high temp. before the treatment described in Fr. 712,617.

**Gasification of fuel.** Henri Philippon. Fr. 41,650, Feb. 15, 1933. Addn. to 674,061 (C. A. 24, 2580). Water or steam is introduced into the blast to the tuyères in amt. varying according to the working of the gas producer and such that the slag obtained preserves a practically const. compn.

**Smokeless fuel.** Thomas M. Davidson. Brit. 396,087, July 31, 1933. Coking coal in lumps free from fines is distd. with powd. non-coking coal or coke breeze in the production of smokeless fuel. The coking coal is screened to the size of peas, beans, nuts or balls of 2 in. av. diameter and the non-coking coal is powd. through a sieve having 16 mesh to the inch.

**Apparatus for preparing and conveying pulverized fuel for combustion.** Harlowe Hardinge (to Hardinge Co.). U. S. 1,933,111, Oct. 31.

**Briquets.** Wilhelm Groth. Ger. 577,766, June 3, 1933. Coked briquets are made from non-coking fuel such as anthracite coal dust, by mixing the latter with a slmy dispersion contg. coking coal, briquetting and coking.

**Furnace with rotating hearth for carbonizing fuel.** Otto Hellmann. Pt. 749,806, July 29, 1933.

**Destructive hydrogenation.** Mathias Pier and Karl Winkler (to Standard-I. G. Co.). U. S. 1,933,069, Oct. 31. In a H-recovery process involving washing of vapors and gases such as those produced in the destructive hydrogenation of coal, tars, oils, etc., a washing oil is introduced into the mixt. of gases and vapors leaving the reaction zone and prior to substantial condensation, and substantially all the normally condensable vapors are condensed while the gases and vapors are in contact with the washing oil (which is a solvent for S compds. and hydrocarbons) and while providing for a sufficient, indirect heat exchange with a cooling medium. App. is described.

**Destructive hydrogenation.** Francis S. Woidich. Brit. 396,054, July 20, 1933. Motor spirit and fuel oils contg. a high percentage of finely divided C are obtained by heating a mixt. of finely ground bituminous fuel and oil under pressure and then passing into a "shock" separator where light fractions are sepd. in the vapor phase while the liquid residues are passed in countercurrent to vapors from a converter and finally into the converter where they are heated under pressure in presence of hydrogenating gases while flowing over molten metal surfaces disposed on superposed trays. App. is described.

**Destructive hydrogenation of bituminous materials.** Mathias Pier and Karl Winkler (to Standard-I. G. Co.). U. S. 1,932,673, Oct. 31. A body of liquid bituminous material such as a coal-oil sludge or tar or oil is subjected to destructive hydrogenation under pressure in the presence of a solid finely divided catalyst immune from poisoning by S, such as one formed from tungstic acid, molybdic acid and ZnO which is uniformly dispersed in the material. For this purpose, the catalyst is mixed with a suitable material to form a mixt. of a sp. gr. such that it is more readily mixed uniformly with the material under treatment, and a hydrocarbon material of about the same sp. gr. is also added. Various examples with details are given.

**Catalytic destructive hydrogenation of heavy hydro-**

**carbons.** Edward B. Peck (to Standard-I. G. Co.). U. S. 1,933,508, Oct. 31. In the destructive hydrogenation of heavy hydrocarbon material contg. bituminous substances, in the presence of sulfactive catalytic materials comprising oxides and sulfides of metals of the 2nd and 6th groups of the periodic system, the catalytic material is maintained in active condition by withdrawing a portion of the partially spent catalyst and treating it with a solvent for high-mol.-wt. tarry material such as a low-boiling naphtha. App. is described.

**Motor-fuel production by destructive hydrogenation of heavier oils.** Edwin J. Gohr (to Standard-I. G. Co.). U. S. 1,934,054, Nov. 7. Oils such as crude oils or heavy distillates are subjected to destructive hydrogenation under pressures above 50 atm. and at temps. in the upper portion of the range suitable for destructive hydrogenation under intense destructive hydrogenation conditions, to form both motor fuels and "asphalt;" a portion of the product contg. the "asphalt" is withdrawn, the "asphalt" content of this portion is reduced and this portion is then returned to the destructive hydrogenation step. App. is described. U. S. 1,934,055 relates to a method in which sepn. of products of hydrogenation of hydrocarbon oils with H at a pressure over 20 atm. and with sulfactive catalysts is effected by discharging the products into a sepn. zone maintained at a pressure over 20 atm. but not greater than the pressure in the hydrogenation zone and packed with a sulfactive catalyst of large surface area in which cooling and partial condensation is effected. App. is described.

**Destructive hydrogenation of liquid bituminous materials such as oils and tars.** Mathias Pier and Kurt Wissel (to Standard-I. G. Co.). U. S. 1,934,001, Nov. 7. The material is treated with H at a temp. and pressure suitable for destructive hydrogenation, in several stages, at least the first stage being effected in a reaction zone in the liquid phase with a pressure of the gas of 100-1000 atm. and at a temp. slightly below the midpoint of the usual destructive hydrogenation range such that the bituminous materials are entirely converted into oils of middle oil character; in the final stage, the oils are expanded into a reaction zone in which they are treated in the vapor phase at a higher temp. than in the first stage, but not exceeding  $60^{\circ}$  higher, and under a pressure of between 20 and 50 atm., to produce oils contg. benzines. App. is described.

**Destructive hydrogenation of materials such as coal, tar or petroleum.** Clarence A. Wright (to Standard-I. G. Co.). U. S. 1,934,023, Nov. 7. A stream of heavy liquid hydrocarbon material such as a coal-oil mixt. and H is passed upwardly between closely spaced substantially vertical and parallel catalytic surfaces disposed in a reaction zone, so that substantially unobstructed flow is permitted, at a temp. above  $400^{\circ}$  and under a pressure above 20 atm. App. is described.

**Destructive hydrogenation of materials such as coal, lignite and bitumen.** Willard C. Ashbury (to Standard-I. G. Co.). U. S. 1,934,028, Nov. 7. Material such as coal or lignite while preheated to a point below its carbonizing temp. is forced into a zone of destructive hydrogenation maintained under a H pressure of at least 50 atm.; a hydrocarbon oil is heated separately to a temp. above the reaction temp. and the oil is forced into the reaction zone, the temp. of the oil being sufficient to maintain the reaction zone at a destructive hydrogenation temp. above  $400^{\circ}$ . App. is described.

**Destructive hydrogenation of materials such as brown coal, tar or oil residues.** Carl Krauch and Mathias Pier (to Standard-I. G. Co.). U. S. 1,931,549, Oct. 24. Solid or liquid fuels or products from their distn. or extrn. are treated with an excess of added free H in the presence of an inorg. N compd. such as  $\text{NH}_3$ , serving as a catalyst at a suitable conversion temp. (which may be about  $500^{\circ}$ ) and under a pressure of at least 20 atm. An arrangement of app. is described. Cf. C. A. 27, 1738. U. S. 1,931,550 relates to a generally similar process in which the reaction with H is effected in the presence of a solid inorg. nitride

such as that of Cr, Mn, Si, Ti or V as a catalyst, at temps. of about 300-700° and under a pressure of 20 atm. or more. An arrangement of app. is described.

**Hydrocarbons.** *Gewerkschaft Kohlenbenzin.* Ger. 577,608, June 2, 1933. App. for the low-temp. distn. of fuel and subsequent catalytic treatment of the products to produce hydrocarbons is described.

**Apparatus for heating distillation tubes such as those used for laboratory coal distillation.** Stanton I. Charlesworth and Arch W. Harris. U. S. 1,933,414, Oct. 31. Various structural and operative details are described.

**Carbonizing solid fuels such as coal.** Walter E. Trent (to Trent Process Corp.). U. S. 1,932,296, Oct. 24. The subdivided material is continuously fed downwardly by gravity through a heating zone, at such a rate in relation to the heating to allow time for substantially all constituents which are volatilizable below the normal fusion temp. to be removed below such temp.; thereafter, the temp. of the material is raised to above its normal fusion temp. to complete the devolatilization and carbonization without substantially coking, by slowly increased temp. and regulated heating, and the material is continuously discharged (from a described app.) at a rate proportionate to that of its supply to the heating zone.

**Vertical-shaft apparatus for carbonizing solid bituminous fuels such as coal.** Carl J. Wright (to Combustion Utilities Corp.). U. S. 1,931,972, Oct. 24. Structural details.

**Vertical carbonization retorts.** Frederick J. West, Ernest West and West's Gas Improvement Co. Ltd. Brit. 395,092, July 13, 1933.

**Heating flue for retort furnaces.** Gas Chambers & Coke Ovens Ltd., Arthur H. Lynn and Frank Ritson. Brit. 395,052, July 13, 1933.

**Treating coal.** Harold J. Rose and Wm. H. Hill (to Koppers Co. of Del.). U. S. 1,932,535, Oct. 31. Coal is treated with a S-pptg. material (such as Cu or Pb or their oxides or CaO) adapted to remove org. S from coal; heated oil is passed through the mixt. to dissolve the coal and the soln. is sepd. from the undissolved matter. App. is described.

**Hydrogenating coal, tar, mineral oils, etc.** I. G. Farbenind. A.-G. (Carl Krauch and Mathias Pier, inventors). Ger. 577,835, June 6, 1933. Coal, tar, mineral oils, etc., their extn. and distn. mixts. and residues are improved by subjection to H at high-pressure in the presence of a contact mass contg. oxides of Th, the rare earths or oxides or carbonates of U, Mn or V.

**Apparatus for heating coal or the like in order to condition it for coking.** Franz Puening (to Koppers Co. of Del.). U. S. 1,932,830, Oct. 31. Structural features.

**Adsorbent carbon from non-coking coal.** Maurice E. Barker. U. S. 1,933,579, Nov. 7. Coal such as that of the anthracite, semi-anthracite or semi-bituminous grade is sorted and crushed and the granular material is distd. in a partial vacuum at about 300° until substantially all water and loosely held hydrocarbons are removed; the crushed particles are oxidized by heating in a current of air, and are carbonized by heating while passing over them a flue gas mixt. contg. less than 5% free O.

**Coal, etc., screening and grading apparatus.** James A. Cook. Brit. 396,748, Aug. 8, 1933.

**Crushing apparatus for coal, loam, etc.** Pennsylvania Crusher Co. Ger. 577,750, June 6, 1933.

**Apparatus for dehydrating peat.** Wilhelm Nachtigall. Ger. 577,778, June 3, 1933.

**Montan wax.** A. Riebeck'sche Montanwerke A.-G. Ger. 586,435, Oct. 21, 1933. Brown coal contg. not more than 25% of water is extd. with benzene or toluene mixed with the water-insol. portion of fusel oil or of wood spirit. Cf. C. A. 27, 2789.

**Removing carbon deposits from internal-combustion engines, etc.** Eugene Lieber (to Standard Oil Development Co.). U. S. 1,934,076, Nov. 7. A compn. comprising an aliphatic diamine such as ethylenediamine together with a compd. of the "pyridine type" such as pyridine, quinoline or the like dissolved in anhyd. NH<sub>3</sub>

is used as a C-deposit remover, being applied for just sufficient time to loosen the deposits.

**Apparatus for burning carbon monoxide in engine exhaust gases.** Livius V. Fogas. U. S. 1,934,596, Nov. 7. Structural features.

**Oil filter suitable for use with pressure oiling systems of internal-combustion engines.** Harvey D. Austin (to Briggs & Stratton Corp.). U. S. 1,934,251, Nov. 7. Structural details.

**Diffusion flame combustion using liquid fuel.** Albert L. Klees (to Combustion Utilities Corp.). U. S. 1,931,927, Oct. 24. In operating furnaces, heavy hydrocarbon fuel such as fuel oil is fed in liquid form into an enclosed chamber while the fuel is simultaneously atomized and a regulated part at least is vaporized by heat developed in the method, in the presence of a gas low in uncombined O and at an elevated temp. near but below that at which substantial thermal decompn. occurs. The gas and hydrocarbon material are proportioned to give a mixed fluid fuel having a heating value of 200-2000 B. t. u. per cu. ft., and this fuel and combustion-supporting gas are simultaneously flowed into a highly-heated enclosed space in parallel contacting streams at approx. equal velocities below the turbulent velocity range, to effect complete combustion. App. is described.

**Superheater for steam.** Wilbur H. Armacost (to The Superheater Co.). U. S. 1,931,639, Oct. 24. Structural features.

**Steam superheater.** Henry E. Geer (to Superheater Co.). U. S. 1,935,049, Nov. 14.

**Proportioning gases of different heating value per unit of volume.** Edwin X. Schmidt (to Cutler-Hammer, Inc.). U. S. 1,933,641, Nov. 7. Various details of construction and operation of an automatic control app. are described, suitable for regulating and proportioning mixts. of fuels such as different gases.

**Gas rich in free hydrogen.** Willard C. Asbury (to Standard Oil Development Co.). U. S. 1,934,029, Nov. 7. A gas contg. H such as a mixt. of H and hydrocarbon gases is scrubbed under superatm. pressure with a non-aq. liquid solvent such as naphtha in which H has a pos. temp. coeff. of soly. and in which the other gas assocd. with the H has a neg. coeff. of soly.; the solvent is withdrawn and part of the dissolved gas is separately removed by heat while maintaining substantially the same pressure under which soln. was effected, and the solvent is cooled and returned to the absorption step. App. is described.

**Treating coke-oven gas for obtaining hydrogen, etc.** Marcel C. Jean and Pascal Matile (to Société l'air liquide (Soc. anon. pour l'étude & l'exploitation des procédés Georges Claude)). U. S. 1,935,505, Nov. 14. Coke-oven gas is freed from its N oxides (suitably by use of hot Cu) and is then liquefied.

**Producer gas.** Frank N. Becker (to Jeddo-Highland Coal Co.). U. S. 1,931,716, Oct. 24. In producing gas by the combustion of solid fuel of substantially low volatile content such as coke or anthracite, a body of the fuel in lump form is enclosed within a combustion chamber and all air required for combustion is passed upwardly through the fuel body; a portion of this fuel body below its upper surface is maintained in a state of combustion, fresh fuel is added and ashes are removed from time to time, and gases are removed from that portion of the substantially continuous top surface of the fuel bed which lies adjacent the chamber walls separately from gases arising from the remaining portion of the fuel surface. App. is described.

**Gas production.** Humphreys & Glasgow Ltd. Fr. 749,986, Aug. 2, 1933. In a complete gasification process, water gas produced in the water gas production zone is drawn off and burnt to produce heat which is utilized to effect the carbonization of coal in excess of that carbonized in the generator.

**Gas producers.** I. G. Farbenind. A.-G. (Walter Gross, inventor). Ger. 577,725, June 3, 1933. In operating gas producers, the fire zone is allowed to reach temps. at which a liquid slag forms for part of the period only, the temp. for the remaining period being lower.

- Gas producer using finely granular or pulverulent fuel.** Carl Geissen. Ger. 586,182, Oct. 17, 1933.
- Apparatus for producing gas at a predetermined temperature.** Julius Pintsch A.-G. Ger. 576,016, May 6, 1933. Addn. to 572,942 (C. A. 27, 4139)
- Apparatus for the gasification of fuels which tend to agglomerate.** I. G. Farbenind. A.-G. Brit. 394,747, July 6, 1933.
- Apparatus for gasifying coking fuel.** I. G. Farbenind. A.-G. (Fritz Winkler, inventor). Ger. 577,888, June 6, 1933.
- Apparatus for gasifying heavy oils for engine fuel.** George L. Reichhelm (to Gasifier Co.). U. S. 1,932,478, Oct. 31. Various structural and operative details are described.
- Water-gas plant.** Humphreys & Glasgow Ltd. and Arthur R. Griggs. Brit. 395,473, July 20, 1933.
- Water-gas generation.** I. G. Farbenind. A.-G. Brit. 396,718, Aug. 8, 1933.
- Generators for producing a mixture of water gas and coal gas.** Vergasungs-Industrie A.-G. Brit. 395,991, July 27, 1933.
- Apparatus for manufacture of carbureted water gas.** Gerald J. Nordmeyer (to Koppers Co. of Del.). U. S. 1,932,828, Oct. 31. Structural features.
- Device for collecting the gases from fuel-distillation retorts.** Società anon. Forni ed Impianti industriali. Swiss 161,001, June 16, 1933.
- Gas purification.** Gillert A. Bragg, David L. Jacobson and Philip J. Wilson, Jr. (to Koppers Co. of Del.). U. S. 1,932,507, Oct. 31. Gas such as coal, coke-oven or water gas contg.  $\text{NH}_3$  and  $\text{H}_2\text{S}$  is washed with an alk. soln. to remove the  $\text{H}_2\text{S}$ ; the alkalinity of the soln. is maintained by absorption of the  $\text{NH}_3$  in the soln. simultaneously with the  $\text{H}_2\text{S}$  removal, and the alkalinity of the soln. is regulated by regulating the  $\text{NH}_3$  content of the total quantity of gas washed by the soln. This regulation is effected previous to the washing of the gas by dividing the total quantity of gas, removing substantially all the  $\text{NH}_3$  from one divided part while leaving the  $\text{H}_2\text{S}$  in it, by-passing the other divided part relative to the  $\text{NH}_3$ -removal, combining the  $\text{NH}_3$ -freed part (which still contains its  $\text{H}_2\text{S}$ ) with the by-passed part which still contains substantially all its  $\text{NH}_3$  and  $\text{H}_2\text{S}$ , to form the total quantity of gas previously to the mentioned  $\text{H}_2\text{S}$  washing step, and the by-passed portion is varied suitably to regulate the  $\text{NH}_3$  content of the recombined gas mixt. as desired. App. is described.
- Gas purification.** George M. Carvlin (to Koppers Co. of Del.). U. S. 1,932,812, Oct. 31. In purifying gas such as coal, coke-oven or water gas from acidic constituents, a soln. contg. a Na compd. and an As compd. is recirculated through a stage in which the soln. absorbs acidic constituents from the gas, and then through a stage in which the fouled soln. is aerated and S is liberated, forming Na thiosulfate in the recirculated soln.; part of the soln. is withdrawn from the purifying system, concd. to about half its original volume, cooled to about  $0^\circ$  to crystallize thiosulfate substantially without crystg. the As compd., and the crystd. thiosulfate is sepd. and the remaining soln. is returned to the purifying system.
- Purifying gases.** Soc. anon. des hauts-fourneaux et fonderies de Pont-à-Mousson. Fr. 750,102, Aug. 5, 1933. Furnace and other gases are purified by washing with acids or other substances capable of dissolving dust contained in the gases. The acid may be  $\text{HCl}$ ,  $\text{H}_2\text{SO}_4$  or  $\text{CO}_2$ .
- Material for gas purification.** Arthur L. Smyly. U. S. 1,934,242, Nov. 7. For removing impurities from gas contg.  $\text{H}_2\text{S}$ , rigid paper pulp wood chips are used coated with Fe oxide compn. (various details of size, etc., being described).
- Apparatus for cooling or purifying gases, e. g., from flue dust or lamp black, by passage between wetted blades mounted on a shaft revolving in a chamber partly filled with liquid.** Johannes J. Cos. Brit. 396,648, Aug. 10, 1933.
- Separating gases.** American Smelting & Refining Co. 1 Brit. 395,641, July 20, 1933. A condensable constituent of a gas mixt., e. g.,  $\text{SO}_2$  in furnace gases or volatile hydrocarbon in petroleum gases, is recovered by dividing the gas into 2 portions, 1 of which is cooled by expansion of cold stripped gas and the other by evapn. of liquid. The gas is first compressed and dried. App. is described.
- Removing gum-forming substances from fuel gas.** David L. Jacobson and Walter L. Shively (to Koppers Co. of Del.). U. S. 1,932,525, Oct. 31. Fuel gas is scrubbed with a solvent such as a heavy oil which absorbs gum-forming compds., and the resulting enriched solvent is treated with a  $\text{H}_2\text{O}$ -contg. gas to reduce the vapor pressure of the gum-forming compds. present. The solvent is then recirculated to treat more fuel gas. App. is described, also various other details and modifications of procedure.
- Revivifying gas-purifier waste.** Thomas Coxon and Imperial Chemical Industries Ltd. Brit. 395,028, July 13, 1933. In revivifying an alk. Fe hydroxide suspension liquor used for removing  $\text{H}_2\text{S}$  from coke oven and like gas a part of the liquor is treated with  $\text{FeSO}_4$  to ppt. Fe compds. which are returned to the purification system, the clear liquor being discarded.
- Hydrogen recovery from wash water containing gases in solution.** Gunther Hornung. U. S. 1,933,734, Nov. 7. Wash water under pressure contg. H and other gases in soln., such as wash water derived from coke-oven gas, is finely subdivided and simultaneously relieved of the pressure upon it; part of the H is allowed to escape for further use; the remaining water is subdivided again and treated by contact countercurrentwise with a scavenging gas such as a gas rich in N, and the latter and the escaping H are collected. App. is described.
- Gas-washing oils.** W. C. Holmes & Co. Ltd. Fr. 750,011, Aug. 3, 1933. Oils such as tar oils used for removing hydrocarbons from gases are recovered by vaporizing the whole of the volatile constituents from the oil and submitting the vapors to a selective condensation by bringing them into direct or indirect contact with a cooling agent in one or more vessels, including at least one fractionating condenser. The temp. of the vapor flowing from the condenser or last of the condensers is used to control automatically the degree of cooling in the condenser or condensers.
- Gas-distribution system.** Herbert D. Straight (to Koppers Co. of Del.). U. S. 1,932,537, Oct. 31. In a distribution system comprising a low-pressure gas main and a high-pressure gas main for supplying gas to the low-pressure main, a motor is driven by the pressure of gas from the high-pressure main which exhausts into the low-pressure main and drives a compressor utilizing gas from the high-pressure main for supplying gas to an oil atomizer which discharges into the low-pressure main. Various details of app. are described.
- Detecting leaks in closed gas systems.** Harold W. Crouch (to Eastman Kodak Co.). U. S. 1,933,791, Nov. 7. For detecting leaks in gas systems such as solvent-recovery drying app., an extraneous gas such as H or He is introduced into the system in sufficient quantity readily to be detected by analysis, and leakage is detd. by analysis of the gas mixt. from time to time.
- Sealing material for gas holders.** Eric Laue (to Koppers Co. of Del.). U. S. 1,932,825, Oct. 31. A gas holder of the disk-closure type is sealed with a viscous aq. soln. of waste sulfite material from the digestion of wood by the sulfite process. Cf. C. 1, 27, 1489.
- Device for oxidizing carbon monoxide such as that produced by internal-combustion engines.** Frederick C. Fischer. U. S. 1,932,927, Oct. 31. Structural details are described of a device formed with concentric cylinders in one of which an Al sheet is placed which serves as a catalyst.
- Separating carbon dioxide from flue gases.** Albert S. Allen and Arthur Michalske. U. S. 1,934,472, Nov. 7. Flue gas is contacted with a liquid such as  $\text{Na}_2\text{CO}_3$  soln. having an affinity for  $\text{CO}_2$  while the liquid and gas are

passing in the same general direction (in a described app.), and the sepd. liquid is subsequently heated under reduced pressure to recover the  $\text{CO}_2$ .

**Absorption apparatus for recovery of carbon dioxide from stack gases.** Francis W. Hogan and Harry M. Bulbrook (one-third to H. H. Adams). U. S. 1,931,817, Oct. 24. Various structural and operative details are described suitable for use in scrubbing gases with  $\text{Na}_2\text{CO}_3$  or  $\text{K}_2\text{CO}_3$  soln.

**Removal of hydrogen sulfide and ammonia from gases.** Christian J. Hansen (to Koppers Co. of Del.). U. S. 1,932,820, Oct. 31. A coal distn. gas is divided into 2 portions; at least part of the  $\text{NH}_3$  is sepd. from one portion, and the portion thus treated is washed with a suspension of a metal hydroxide of the Fe group. The other portion of the gas is washed with a soln. of a metal thionate of the Fe group in the presence of at least part of the  $\text{NH}_3$ , previously sepd. An arrangement of app. is described. Cf. C. A. 27, 3063.

**Removal of phenols from hydrocarbons.** Hans Roos and Emil Schwamherger (to I. G. Farbenind. A.-G.). U. S. 1,934,007, Nov. 7. A liquid hydrocarbon material contg. a phenol, such as a tar oil, is treated with formic acid to dissolve the phenol; the mixt. of phenol and formic acid is sepd. from the hydrocarbon, the formic acid is distd. from the mixt. and is again employed in the phenol extn. App. is described. Cf. C. A. 27, 308.

**Removing phenols in a pure state from tars or tar oils.** Jeno Kárpáti and Muri G. Hubsch. U. S. 1,934,861, Nov. 14. The materials are treated under a moderate superpressure (not exceeding 6 atm.) and at a temp. of about 90–150° with an aq. soln. of a phenol solvent such as aq.  $\text{MeOH}$ , and the mixt. is allowed to stand until it seps. into 2 layers; the aq. solvent layer which contains the dissolved phenols is removed and by cooling and release of pressure is caused to sep. into 2 layers consisting of phenols and aq. solvent, resp., and the phenols are removed.

**Treated coke.** Joseph D. Doherty (to Koppers Co. of Del.). U. S. 1,932,815, Oct. 31. Colored paper pulp and  $\text{CaCl}_2$  soln. are applied to the surface of coke to restrict dusting and for identification.

**Coking fuel.** Josef Plassmann. Ger. 577,623, June 2, 1933. App. for shaking the fuel to form a compact mass in the coking chamber is described.

**Coking pitch.** Marston L. Hamlin (to Barrett Co.). U. S. 1,935,317, Nov. 14. Pitch is added to an oven or retort in a plurality of steps and the pitch charged in each step is heated until violent ebullition ceases before adding more pitch. The amt. of pitch charged in each step is less than that charged in any preceding step, and the heating is continued until the pitch is coked. App. is described. Cf. C. A. 27, 2020.

**Dip or seal pipes for use in gas and coke-oven plants.** The Gas Light & Coke Co., Wm. J. B. Leach, Stephen Hay, Harold Hollings and Albert E. Burton. Brit. 396,552, Aug. 10, 1933. Addn. to 325,173 (C. A. 24, 4140).

**Coke and gas ovens.** Firma Carl Still. Fr. 41,600, Mar. 10, 1933. Addn. to 710,578 (C. A. 26, 1760).

**Horizontal coke ovens.** Evence Coppée & Cie. Fr. 41,652, Mar. 10, 1933. Addn. to 616,460.

**Vertical-flue coke oven.** Société générale de fours à coke systèmes Lécocq. Brit. 395,914, July 27, 1933.

**Coke-oven bracings.** Evence Coppée et Cie. Brit. 395,292, July 13, 1933.

**By-product coke-oven operation.** Stuart P. Miller (to Barrett Co.). U. S. 1,935,320, Nov. 14. For distg. tar and producing pitch and distillate oils, fresh hot coal-distn. gases are sprayed with a limited amt. of  $\text{NH}_3$  liquor to cool them somewhat but still leave them at a sufficiently high temp. to permit their use for effecting the distn. of tar to pitch; non-volatized  $\text{NH}_3$  liquor from the spraying is collected, and the still hot gases are used for the distn. of tar by spraying it into them to vaporize oils from the tar and produce pitch. An arrangement of app. is described.

**Utilizing waste heat of coke-oven plants, gas works, etc.** Harald Kemmer. U. S. 1,932,076, Oct. 24. The waste heat is used for "producing cold" by means of absorption-type refrigerating app., and the "cold so produced" is used for the purification of the produced gas by cooling at low temps. App. is described.

**Operation of regenerative coke-oven batteries.** Roger F. Richardson (to Smet-Solvay Co.). U. S. 1,935,298, Nov. 14. Various details of operation are described involving heating by combustion in the heating flues of atomized coal-tar oil or petroleum oil together with preheated air. App. is described.

**Closure for coking retorts.** Gottfried Goetz (to Ludwig Kern). U. S. 1,933,729, Nov. 7. Mech. features.

## 22--PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. FARAGHER

**Twenty years of petroleum research. A retrospect.** A. E. Dunstan. *Chemistry and Industry* 1933, 938–45.

**The petroleum industry in 1931–1932.** R. Kissling. *Industriell. Umschau* 40, 175 6(1933).—A list of references with titles. P. Escher

**The petroleum industry in 1932.** Richard Kissling. *Chem.-Ztg.* 57, 814 5(1933). E. H.

**Rationalization of the petroleum industry.** J. B. Kessler. *Petroleum Z.* 29, No. 30, Spec. paging, 1–11 (1933).—Lecture. I. M. Levine

**Science in the petroleum industry.** John Cadman. *Petroleum Z.* 29, No. 39, 1–8(1933).—Lecture.

**The position of the geoelectrical methods of applied geophysics for the investigation of petroleum strata.** Otto Keunecke. *Petroleum Z.* 29, No. 30, 5–6(1933).—Geoelectrical methods in the search for oil have not been accepted in Germany because of the difficulty involved in the interpretation of the results due to the many factors that influence them. A new method is discussed where an alternating current of a frequency of about 500 is passed through a loop on the ground and the induced current through the ground measured as a basis for detg. the nature of the subsurface. The theory involved is well known so that skin-effect and the influence due to unevenness

in the surface can be evaluated. The method cannot be used directly for establishing petroleum strata since it requires a good conductor to obtain a sufficiently high induced current; it is useful in locating salt-water levels and is thus of importance indirectly in petroleum search.

I. M. Levine

**Chemical study of several menillite schists from the Flyschrand zone of the East Carpathians.** R. Casimir, M. Dimitriu and V. Pascu. *Petroleum Z.* 29, No. 37, 1–4(1933).—Of the 7 schists studied (4 from Agapea and 1 each from Seaca, Horaita and Harja), 2 were basically  $\text{CaSO}_4$  and quartz and very poor in org. matter. The content of org. matter varied in the others (basically  $2\text{SiO}_2 \cdot \text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$  and quartz), from 2.54 to 14%. High org. content was accompanied by high  $\text{FeS}_2$  ( $\text{FeS}$ ) which accounted for 77–87% of the S present (0.29–4.5%). Upon heating the schists to 650°, 27% of the org. matter (90% of which was insol. polybitumen) was obtained as oil ( $\text{H/C}$ , 0.128) and 15% as gas. Humic acid-like substances were formed as the result of heating to 250° with 50%  $\text{KOH}$ .

I. M. Levine

**The results obtained to date in petroleum production and search in Czechoslovakia.** Jaroslav J. Juhn. *Petroleum Z.* 29, No. 33, 10–12(1933).

**Physical and chemical properties of North German petroleum.** G. Keppeler. *Petroleum Z.* 29, No. 37, 6–7

(1933).—With few exceptions, viscosity, paraffin, asphalt and naphtha contents and amt. of residue from distn. to 300° vary regularly with sp. gr. The olefinoids (sol. in 92% H<sub>2</sub>SO<sub>4</sub>) decrease from 59 to 12% and the aromatics (further sol. in 100% H<sub>2</sub>SO<sub>4</sub>) increase from 12 to 53% with drop in sp. gr., while the paraffin-naphtha content was const. at 35% for the light and 26-9% for the heavy oils.

I. M. Levine

**Constituents of petroleum. II. Preparation of the first homogeneous naphthenic acid.** Julius v. Braun, Ludwig Mannes and Martin Reuter. *Ber.* 66B, 1499-505 (1933); cf. C. A. 26, 2306. The complex mixt. of isomeric acids of which a naphthenic acid of given compn. generally consists cannot be sepd. into the pure individual acids by fractional distn. of the acids or their esters or fractional crystn. of the salts. Degradation products, especially the ring ketones obtained from the acids, can be sepd. Thus, a mixt. of isomeric acids R<sup>1</sup>CHCH<sub>2</sub>CO<sub>2</sub>H, R<sup>2</sup>CH-CH<sub>2</sub>CO<sub>2</sub>H, etc., R<sup>1</sup>CHCH<sub>2</sub>CH<sub>2</sub>CO<sub>2</sub>H, R<sup>2</sup>CHCH<sub>2</sub>CH<sub>2</sub>CO<sub>2</sub>H, R<sup>3</sup>CHCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CO<sub>2</sub>H, etc., (R<sup>1</sup>, R<sup>2</sup>, etc. = rings) can be degraded into mixts. of isomeric ketones R<sup>1</sup>CO, R<sup>2</sup>CO, etc., (from which at least one and sometimes more ketones can generally be isolated in pure form by means of ketone reagents), and of isomeric acids, R<sup>1</sup>CHCO<sub>2</sub>H, R<sup>1</sup>CHCO<sub>2</sub>H, etc., R<sup>1</sup>CH-CH<sub>2</sub>CO<sub>2</sub>H, R<sup>1</sup>CHCH<sub>2</sub>CO<sub>2</sub>H, etc., and the latter by a 2nd degradation can be converted into R<sup>1</sup>CO, R<sup>2</sup>CO, etc. From the structures of the ketones thus isolated can be deduced the structures of the naphthenic acids from which they were formed and these acids can be synthesized from the ketones by a reversal of the degradation. The monocyclic ketone C<sub>7</sub>H<sub>14</sub>CO (I) obtained from the C<sub>10</sub>H<sub>18</sub>O<sub>2</sub> naphthenic acids from various sources, must be one of 11 possible alkylated cyclohexanones and cyclopentanones (if the very improbable presence of a 3-, 4-, 7- or 8-membered ring is excluded). Preference had been given to 3,3,4-trimethylcyclopentanone (II) as the probable structure of I; this has been confirmed by synthesis of the 2 still unknown possible isomers, viz., 3- (III) and 4-ethylcyclohexanone (IV), which proved to be quite different from I, and by degradation of I. The amine (V) formed by reduction of the oxime of I gives on Hofmann degradation after exhaustive methylation a mixt. (VI) of 3,3,4- and 3,4,4-trimethylcyclopentenes, oxidized to a dicarboxylic acid (VII), which is evidently a mixt. of Me<sub>2</sub>C(CO<sub>2</sub>H)CHMeCH<sub>2</sub>CO<sub>2</sub>H and Me-C(CH<sub>2</sub>CO<sub>2</sub>H)CHMeCO<sub>2</sub>H. *p*-Ethylcyclohexanol (mixt. of stereoisomers), m. 194.6°, d<sub>4</sub><sup>20</sup> 0.9194, n<sub>D</sub><sup>20</sup> 1.4663, obtained in 80% yield from *p*-EtC<sub>6</sub>H<sub>4</sub>OH with Ni and H in an autoclave, yields 2 phenylurethans, m. 116°, b<sub>0</sub> 165°, and m. 57.9°. IV (75% from the hexanol with Beckmann's mixt.), b. 192-4°, d<sub>4</sub><sup>20</sup> 0.9211, n<sub>D</sub><sup>20</sup> 1.4533; oxime, b<sub>0</sub> 120.1°; semicarbazone, m. 174°; bis(*p*-nitrobenzylidene) deriv., yellow, m. 156°; *p*-nitrophenylhydrazone, m. 101°. III was prep'd. as follows: CH<sub>3</sub>(CO<sub>2</sub>Et)<sub>2</sub> + NaOEt → EtCH(CO<sub>2</sub>Et) + ClCH<sub>2</sub>CH<sub>2</sub>CO<sub>2</sub>Et → the ester EtC(CO<sub>2</sub>Et)<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CO<sub>2</sub>Et (b<sub>0</sub> 169-72°) + boiling HCl → free acid (oil) + heat *in vacuo* → the acid EtCH(CO<sub>2</sub>H)CH<sub>2</sub>CH<sub>2</sub>CO<sub>2</sub>H (b<sub>0</sub> 175°) → di-Et ester (b<sub>0</sub> 120-3°, d<sub>4</sub><sup>20</sup> 0.9916, n<sub>D</sub><sup>20</sup> 1.4295) + Na + EtOH → the glycol HOCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>OH (b<sub>0</sub> 140-2°) + fuming HBr at 120-30° → the dibromide (b<sub>0</sub> 120°) + NaCN → 5-ethylmelic dinitrile (b<sub>0</sub> 175-80°) + HCl at 120° → the acid (b<sub>0</sub> 205°) + Ca(OH)<sub>2</sub> → Ca salt + dry distn. → III (60% yield), b. 192-4°, d<sub>4</sub><sup>20</sup> 0.9196, n<sub>D</sub><sup>20</sup> 1.4543; oxime, b<sub>0</sub> 116.18°; semicarbazone, m. 184°; *p*-nitrophenylhydrazone, m. 130°; bis(*p*-nitrobenzylidene) deriv., m. 176°. V (82% yield), b. 164-8°, d<sub>4</sub><sup>20</sup> 0.8458; HCl salt, hygroscopic; picrate, m. 174.6°; chloroplatinate, yellow, becomes discolored 250°, decomps. 255°. V, exhaustively methylated with alk. Me<sub>2</sub>SO<sub>4</sub> and subjected to the Hofmann degradation, gives 30% of the *N*-di-Me deriv., m. 183.6° (HCl salt, unusually hygroscopic; picrate, m. 153-5°; chloroplatinate, m. 160-1°; chloraurate, m. 60-2°; methiodide, m. 242-3°), and 53% VI, b. 117-23°, d<sub>4</sub><sup>20</sup> 0.782. VII, b<sub>0</sub> 160-70°; di-Ag salt. I with R<sup>1</sup>CH<sub>2</sub>CO<sub>2</sub>Et and Zn gives 75% of Et 1-hydroxy-3,3,4-trimethylcyclopentane-1-acetate, b<sub>0</sub> 140°, d<sub>4</sub><sup>20</sup> 0.9813,

1 dehydrated by KHSO<sub>4</sub> at 150° to Et trimethylcyclopentene-acetate, b<sub>0</sub> 112-20° (60% yield), which with Pd and H yields Et 3,3,4-trimethylcyclopenteneacetate, b<sub>0</sub> 113-15°, d<sub>4</sub><sup>20</sup> 0.8285, n<sub>D</sub><sup>20</sup> 1.4472; the free acid, b<sub>0</sub> 144-5°, d<sub>4</sub><sup>20</sup> 0.9783, n<sub>D</sub><sup>20</sup> 1.4609, is the first homogeneous naphthenic acid which has ever been isolated. The chloride, b<sub>0</sub> 105-8° (prep'd. with SOCl<sub>2</sub>); amide, m. 122-3°; anilide, obtained in solid, cryst. form only by distg. under 0.5 mm., m. 55-8°; ureide, from the chloride and urea, m. 197-8°.

C. A. R.

The application of adsorption phenomena in the purification and refining of petroleum products. Dubrisay. *Ann. combustibles liquides* 8, 607-18 (1933).—Sols. of petroleum pitch, nitrogenous substances, S compds. and ethylene derivs. in refined white spirit were treated with the following adsorbents: (1) kaolin, (2) SiO<sub>2</sub>, (3) kieselguhr, (4) Fe<sub>2</sub>O<sub>3</sub>, (5) Al<sub>2</sub>O<sub>3</sub>, (6) vegetable charcoal, (7) animal charcoal, (8) sugar charcoal, (9) pulverized quartz and (10) pulverized talc. All adsorbents show more or less decolorizing power, always most markedly upon pitch sols. The best adsorbents for other impurities were C and talc for the amines: C, Al<sub>2</sub>O<sub>3</sub> and Fe<sub>2</sub>O<sub>3</sub> for S compds.; and finely divided SiO<sub>2</sub> for ethylene derivs. Fineness of the powder always increased the adsorbent power, while increasing moisture was always harmful. The influence of moisture was studied in detail on several Al<sub>2</sub>O<sub>3</sub> prep'd. by different methods. Exptl. results are reported.

Karl Kammermeyer

**Nomenclature for oil products in various countries.** Robert Schwarz. *Petroleum Z.* 29, No. 39, Spec. paging 4 (1933).

I. M. Levine

The production of oil from British coal. W. R. Ormandy and J. Burns. *Petroleum Times* 30, 551-2, 579 81, 607 8 (1933).—The quality of oils from coal is discussed with reference to price competition with petroleum. The production of oil from coal is considered under the headings (1) distn. with variation in temp., (2) hydrogenation and (3) distn. of coal and conversion of coke into water gas, which by catalytic reactions is converted into a wide range of products. A comparison is made between fuel oil and coal oil mixts. C. Wirth, III

**Common constituents of Japanese crude oils. IV. The constituents of the fractions distilled at atmospheric pressure above 200°.** Ryōsaku Kobayashi. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 553-6 (1933); cf. C. A. 27, 183. The distn. range was 200-250° and the pressure 5 ± 0.2 cm. of Hg. Four crude oils were exam'd. Sp gr, *n*<sub>D</sub><sup>20</sup>, unsatd. and aromatic hydrocarbon contents for the treated cuts collected at 10° intervals are given. After removal of unsatd. and aromatic compds., the sp gr. and *n*<sub>D</sub><sup>20</sup> were again det'd. For 2 of the crude oils the paraffin wax content was also det'd.

K. K.

The action of elevated temperatures upon mineral oils Ribagac. *Ann. combustibles liquides* 8, 875 82 (1933) — A no. of expts. carried out by heating oils by an elec filament are described. A cut of the app. and exptl results are presented.

Karl Kammermeyer

**Utilization of the waste products from the acid refining of mineral oils.** Gino J. L. Paganini. *Petroleum Z.* 29, No. 34, 6-8 (1933).—Acid sludge from a primary treatment of oil and clay filter cake may be treated to recover the lubricating oil they contain, to the extent of 20-35% of the waste products, or they may be converted into fuel by mixing them in a ratio of about 4:1 with 55-60% fine coal or 70-5% coke. Sludge from a second or subsequent application of acid, which contains a high proportion of sulfonic acids, is rationally reduced to fuel. The oil-free clay may be burned to yield an active product and advantageously added to unactivated clay for oil purification.

I. M. Levine

The refining industry of France. N. Pervonchine *Petroleum Times* 30, 559 (1933).—A review.

C. Wirth, III

Technical and theoretical questions in the designing of natural gasoline plants. Nikolaus Meyer. *Petroleum Z.* 29, No. 38, 1-5 (1933).—A discussion of the basic principles connected with the recovery of natural gasoline.

I. M. Levine

**The irradiation of cracking gasoline.** E. Vellinger and G. Radulesco. *Ann. combustibles liquides* 8, 883-5(1933). —Expts. were made by exposing cracked gasoline to Hg lamp irradiation. Curves are presented for the absorption of  $O_2$  as a function of the time of irradiation.

Karl Kammermeyer

**Investigation on sulfur and sulfur compounds in gasoline.** René Dubrisay. *Ann. combustibles liquides* 8, 871-4(1933).—A qual. method which in many cases permits detns. of S in gasoline is described. It is based upon the action of S upon Cu or Ag strips immersed in the gasoline for 12 hrs. The actions of S, allyl sulfide,  $H_2S$ , Et mercaptan, thiophene and  $CS_2$  are described.

Karl Kammermeyer

**New experiments on the condensation of hydrocarbons in kerosene.** I. Ciocchina. *Petroleum Z.* 29, No. 33, 1-8 (1933).—Some degree of condensation (polymerization) was effected by (1) refluxing with water for 6 hrs. or with  $H_2SO_4$ , (2) heating at 400-50° with  $C_2H_2$  with or without  $H_2$  ( $C_2H_2:H_2$ , 2:1), or (3) chlorination and refluxing with metals or  $CaC_2$  to effect dechlorination. The residue (I) b. above 260° was increased from 10 to 15-25%; 17% was obtained where  $CaC_2$  was used. Cracking accompanied the heating with  $C_2H_2$  to a greater extent than in its absence, while the loss was lowered. I compares well with com. middle oils except for lower flash and fire pts. (and darker color). C was formed when the kerosene was boiled with  $H_2SO_4$ ; with an excess of acid, CO and  $CO_2$  were produced. This may explain the resulting lowering of the initial b. p. I. M. L.

**The physical significance of the knock problem.** J. J. Zeehuisen. *Petroleum Z.* 29, No. 31, *Motorenbetrieb und Maschinen-Schmierung* 6, No. 8, 2-5(1933).—An attempt is made to analyze the chem. and phys. processes occurring in the cylinder of an engine which lead to knocking, on the basis of Schmidt's values of the HUCR of a no. of fuels. B. C. A.

**Kinematic viscosity and conventional viscosity values.** I. H. Garner and C. I. Kelly. *Petroleum Z.* 29, No. 28, 1-12(1933); cf. C. A. 27, 4455. —The advantages of reporting viscosity in terms of C. G. S. units are discussed. As a result of very careful work, equations showing  $\nu$  in terms of Redwood, Saybolt Universal and Furol sec. and  $E^\circ$  were constructed, based on the equation  $\nu = at - b/t$ , where  $t$  is time in sec. or  $E^\circ$  and  $a$  and  $b$  are consts. The values for  $a$  and  $b$  are: Redwood No. 1, for  $t = 34-100$ , 0.260, 179,  $t > 100$ , 0.247, 50; Redwood No. 2, 2.467, 0; Saybolt Universal,  $t = 32-145$ , 0.226, 197,  $t > 145$ , 0.220, 80; Furol,  $t = 25-40$ , 2.24, 181,  $t > 40$ , 2.16, 60; Engler,  $E^\circ 1.35-3.2$ , 8.0, 8.64,  $E^\circ > 3.2$ , 7.6, 4.0. The  $E^\circ$  equations give results in good agreement with those obtained from the use of the Vogel formula which must be applied for  $E^\circ < 1.35$ .

I. M. Levine

**Oxidation of hydrocarbons from the lubricating oil fractions of crude oil.** III. N. I. Chernozhukov and S. E. Krut (Crane). *Neftyanoe Khozyaistvo* 25, 35-8, 102-5 (1933); C. A. 27, 5178. —Oxidation of synthetic mixts. of naphthene hydrocarbons and aromatic hydrocarbons. A pure medicinal white oil having an acidity of 0%, av. mol. wt. of 397,  $d_{44}^{20}$  of 0.8806,  $E_{50}$  viscosity of 4.25,  $n_{20} = 1.4800$  and S (lamp method) 0%, was oxidized by the Butkov method with  $O_2$  at 15 atm. and 150° and for 3 hrs. in the presence of the following aromatic hydrocarbons: (1) Individual aromatic hydrocarbons: (a) without side chains (naphthalene, anthracene, phenanthrene); (b) with side chains ( $\alpha$ -methylnaphthalene, propylbenzene, decylbenzene); (c) aromatic hydrocarbons with rings connected through an intermediate C atom (diphenylmethane, triphenylmethane, acenaphthene); (d) aromatic hydrocarbons sepd. from various fractions of petroleum lubricating oils; (2) O-contg. compds.; (3) S-contg. compds.; (4) resins; (a) sepd. from natural products; (b) obtained as a result of oxidation of various hydrocarbons of the naphthene as well as of the aromatic series; (5) N-contg. compds.; (a) amines (aniline,  $\beta$ -naphthylamine); (b) heterocyclic compds. (pyridine, quinoline). From 0.1 to 10% of the above compds.

were introduced. The expts. are described in detail and the following conclusions are made. (1) The oxidation ability of naphthene hydrocarbons is lowered in the presence of aromatic compds. without side chains whereby the latter are consumed in the course of oxidation. (2) The lowering of the oxidizability of the naphthenes does not increase in direct proportion to the concn. of the aromatic compds. The presence of more than 5% of aromatic compds. is of no practical effect. (3) Aromatic hydrocarbons without side chains when present in soln. in naphthenes act in the presence of  $O_2$  quite differently than if present as individuals. Naphthenes induce the oxidation of aromatic compds. (4) In a mixt. with naphthenes the aromatic compds. are oxidized more rapidly than the naphthene hydrocarbons. (5) The antioxidation effect of aromatic compds. increases with increase in the no. of rings. (6) Aromatic compds. contg. a trivalent C are very effective antioxidants. (7) Hydrocarbons of the acenaphthene and diphenylmethane type are less effective. (8) Aromatic compds. having long (satd.) side chains of normal structure and in low concns. practically do not improve the antioxidizing properties of naphthenes, and even increase the tendency of naphthenes to oxidize. (9) The products of oxidation of aromatic hydrocarbons are of the type of phenols and condensation products which are more active as antioxidants and thus retard the process of oxidation.

A. A. Boehtlingk

**Problems of lubrication.** Hilliger. *Oberflächentechnik* 10, 221(1933).—Lubrication is discussed as a mech., chem. and mol.-phys. problem. A schedule for the valuation of a lubricant derived on the basis of these considerations is used. Lubrication from the first viewpoint is explained by the hydrodynamic theory, which is briefly outlined. The chem. viewpoint considers compn. and reaction with  $O$ , also catalytic influences. From the 3rd viewpoint lubricants are represented by the structural formulas of naphthene, asphalt and paraffin, with which other materials are mixed. By denoting the quality of a lubricating oil with 1 as good and 3 as bad the following schedule was derived for naphthene, asphalt and paraffin, resp.: resistance against  $O$  1, 2, 3; resistance against heat 2-3, 3-2, 1; flat viscosity curve 2, 3, 1; polar activity 2, 1 and 3. Modern lubricating oils are developed from oils with a polar-active center of a carboxyl group (CO).

M. Hartenhein

**Investigation and judging of lubricating oil for motors.** Michael Freund and Stephan Thamm. *Petroleum Z.* 29, No. 40, 1-14, No. 41, 1-13(1933).—Lubricating oils from various sources (300) including blends of some of them were subjected to comprehensive lab. tests designed to predict the behavior of the oils under operating conditions. The tests included gravity, viscosity at various temps. 30-200°, viscosity-temp. relationships, fractionation under 0.1 mm. pressure, Conradson C (C), asphalt content, thermal stability with and without  $O_2$ , and acid and sapon. nos. The huge mass of data are tabulated and graphed to show principally the effect of increasing gravity for oils of like viscosity at 50° and also for fractions of the same crude oil. The viscosity-temp. relationship is recorded in terms of  $\Delta\eta(\eta_{150} - \eta_{100}^\circ)$ ,  $\Delta\eta'(\eta_{150} - \eta_{100}^\circ)$ ,  $\Delta\eta(\eta_{150} - \eta_{100}^\circ)$ , viscosity index, viscosity-gravity const. (V. G. C.), and as developed by F. and T., the radius of curvature  $\rho$ , at pt. S on the hyperbola obtained by plotting  $\log \eta$  against temp., S being the pt. at which the tangent adjoins the axes at an angle of 45°. It is noted that while  $\Delta\eta$  falls with rise in gravity,  $\Delta\eta'$  rises. This is due to the fact that in the 150-200° interval the hyperbola approaches the temp. axis more slowly the smaller the value of  $\rho$ , or the higher the naphthenicity of the oil. The thermostability test without  $O_2$  consisted of heating of the oil for 60 hrs. at 325° subsequent to replacing the air with  $N_2$  and evacuating to a pressure of 0.1 mm. The results from this test were those attributable to cracking, for the oil became darker but still retained its clearness, and the gravity and viscosity were lowered to a degree independent of the constitution of the oil. The effect was greater with increase in original viscosity

Sludge was formed in traces or not at all. C was increased only in the highly naphthenic oils. The other thermostability test was conducted at 200° for 5 or 10 hrs. with O<sub>2</sub> bubbling through the oil, resulting in darkening, opacity, increased viscosity and formation of sludge. Conclusion: (1) The viscosity-gravity relationship is the most characteristic property, for it signifies the constitution of the oil. For oils of like viscosity at 50°, rise in gravity denotes increasing naphthenicity, volatility, slope of the viscosity-temp. curve, amt. of sludge formed and increase in C upon oxidation. Thus the essential tests are viscosity, say at 50°, d<sub>4</sub><sup>20</sup>, pour pt. and C. (2) For oils of the same viscosity at 50° C falls with increase in gravity; for fractions from the same crude, C rises with gravity rise. (3) Increase in acid and sapon. nos. upon oxidation is independent of the constitution of the oil. (4) The asphalt and asphalt-forming substances have some influence on the increase in C upon oxidation. (5) For oils of like gravity and viscosity there is a parallelism among C, hard asphalt content and color depth. (6) For fractions from a given crude oil, the V. G. C. among all of the viscosity-temp. relationships is the only value that remains const. regardless of the gravity. A large no. of literature references are given. I. M. Levine

**New distillation unit increases yield of lubricating oils.** Paul Truesdell. *Chem. Met. Eng.* 40, 517-9 (1933).

Lubricating oil of low C content and high flash point is produced by a plant designed with mild heating in the pipe still, short time of contact in the fractionating column, and provision for removal of salt water from the crude oil before processing. L. W. T. Cummings

**Insoluble and infusible lubricating and packing material.** Franz Josef. *Petroleum Z.* 29, No. 40, *Motoren-betrieb und Maschinen-Schmierung* 6, No. 10, 4 (1933).—Addn. of a C<sub>10</sub>H<sub>8</sub>-inorg. compd. of unknown constitution to several of the higher alcs. caused the latter to become insol. in org. substances without affecting their lubricating or packing properties. This compd. has the consistency of vaseline and does not change even when heated to 250°.

I. M. Levine

**Lubrication of ring-oiled-bearing steam turbines.** James I. Clower. *Power Plant Eng.* 37, 466-7 (1933).—Selection and care of oil are both of importance. Five factors, each of which is discussed, which a proper oil must meet are temp., water, solid impurities, air and rust. In other words, oils must be both chemically and mechanically stable. General specifications are included.

D. K. French

**Fiber formation test as a technical method of examination in the bitumen industry.** W. Rodiger. *Kolloid-Z.* 65, 11 20 (1933).—By use of the Ubbelohde app., fiber lengths to which bitumens could be drawn were detd. The lengths vary between 5 and 30 cm. Those bitumens incapable of forming fibers are useless for road building. Bitumens should be tested by the usual examn. with the greatest care if the length of fiber is below 10 cm. Those above 20 cm. are excellent, while the suitable type averages about 18 cm. The effect of paraffin and relations between various properties, such as ductility, are discussed (cf. Manheimer, C. A. 26, 4708; Klinkmann, C. A. 26, 4150; Macht, C. A. 26, 200, 3087, 5409; Walther, C. A. 25, 3800; Lucr, C. A. 23, 3324; Schlapfer, C. A. 24, 494).

Arthur Fleischer

**Matitza asphalt.** C. Otin and S. Savenco. *Petroleum Z.* 29, No. 42, 1 5, No. 45, 13-17 (1933).—The substance, a bitumen-impregnated marl with 68.58% ash, was extd. twice with tetralin at 250° for 2 hrs. in an autoclave under its self-imposed pressure, to yield 23.55% of extd. tar, d<sub>4</sub><sup>20</sup> 1.0682, Saybolt viscosity at 100°, 687 sec., percentage C, H, S, N, O 87.38, 10.77, 0.43, 0.43 and 0.99, resp. Its elementary analysis differentiates the ext. from that obtained with other solvents. Upon distn. of the ext. there were obtained 57% distillate (acid), 37% pitchy residue (alk.) and 6% gas. The distillate in 4 fractions was also subjected to detailed phys. and chem. examn. and all of the results were tabulated. I. M. L.

**(French) colonial forest products.** Georges Dupont. *Bull. inst. pen* 1933, 169-75, 193-9.—A review of the

forest-product resources of the French colonies.

**Constituents of the volatile oil from the wood of Cham-aecyparis formosensis Matsum.** Kinzo Kafuku and Nobutoshi Ichikawa. *J. Chem. Soc. Japan* 54, 1011-25 (1933).—Steam distn. of the wood gives a reddish, viscous oil which increases in color and viscosity on standing. Yield, 1.10%. Consts. of oil: d<sub>4</sub><sup>20</sup> 0.9685, n<sub>D</sub><sup>20</sup> 1.5020, [α]<sub>D</sub><sup>20</sup> +4.76°, acid value 6.13, sapon. no. 24.00 (after acetylation 196.4). In comparison with the oil obtained from the leaves (cf. C. A. 25, 3774), it contains less terpenes and more alcs.; these are *d*-α-pinene, *d*-camphene, α-terpineol and allylpyrocatechol. The new primary terpene alcs. isolated from the oil are *benihol* (I), C<sub>10</sub>H<sub>18</sub>O, and *benihinol* (II), C<sub>10</sub>H<sub>16</sub>O. I is satd. and gives *benihol* (III), C<sub>10</sub>H<sub>16</sub>O, on oxidation with CrO<sub>3</sub>; the *semicarbazone* of III m. 167°; oxidation of III gives *benihic acid*, m. 110°. II is unsatd. and gives *benihinal*, C<sub>10</sub>H<sub>14</sub>O (IV), on oxidation with CrO<sub>3</sub>; *semicarbazone* of IV m. 216°. The other new substances isolated are *sesquibenehene*, C<sub>15</sub>H<sub>24</sub>, b<sub>10</sub> 127-31°, d<sub>4</sub><sup>20</sup> 0.9162, n<sub>D</sub><sup>20</sup> 1.5058, [α]<sub>D</sub><sup>20</sup> +35.7°, M. R. 66.45; V-2HCl (VI) m. 103-4°; a *sesquiterpene* obtained from VI gives [α]<sub>D</sub><sup>20</sup> -10.32°; a *tertiary alc.* C<sub>15</sub>H<sub>26</sub>O; a *primary alc.* C<sub>15</sub>H<sub>26</sub>O, a *phenol* m. 127-8° and a *liquid substance* C<sub>10</sub>H<sub>16</sub>O<sub>2</sub>.

**Refining crude heavy petroleum hydrocarbons containing sulfur.** Wilhelm Gaus and Mathias Pier (to I. G. Farbenind. A.-G.). U. S. 1,932,174, Oct. 24. Material such as a topped oil or middle oil is subjected to the action of a gas contg. H in the presence of a catalyst immune to S poisoning at a temp. within the usual range of liquid-phase cracking temps. and under a pressure of over 20 atm. for only such a period of time that no substantial decompn. of the hydrocarbons into other of lower b. p. is effected, to remove S as H<sub>2</sub>S and produce purified oils of substantially the same b. p. and viscosity range as the crude starting materials. An arrangement of app. is described.

**Petroleum refining apparatus suitable for mixing oil with acid, alkali or sodium plumbite solution, etc.** Cyril L. Erickson (to Standard Oil Co. of Ind.). U. S. 1,932,655, Oct. 31. Various details are described of an app. including a conduit formed in attachable sections and contg. perforated conical baffles.

**Refining petroleum distillates containing sulfur** Mathias Pier, Friedrich Ringer and Walter Simon (to Standard Oil Co.) U S 1,932,186, Oct 21. A crude oil contg distillate such as gasoline, kerosene or lubricating oil is subjected to the action of a gas contg H at a temp. of 300-420° and a pressure of at least 10 atm in the presence of a catalyst immune to S poisoning comprising metallic sulfides, difficultly reducible metal oxides or metal from group 6 of the periodic system, for only such a period of time that no substantial decompn of hydrocarbons of the crude distillate into hydrocarbons of lower b p ensues, to remove S as H<sub>2</sub>S and produce a refined product of about the same b p and viscosity range as the initial material. App is described.

**Treating alkaline wash liquors from petroleum oil refining** Sidney M Blair, Francis L Melvill, Arthur G V Berry and Bernard G Banks (to Trinidad Caschold, Ltd.) U S 1,933,110, Oct 31. Alkali wash liquors such as those which have been used in treated cracked petroleum oils are acidified and the oily layer formed contg acidic substances is sep'd and a fraction is obtained by distn, b 180-270°, this fraction is caused to react with a reducing agent such as Fe and H<sub>2</sub>SO<sub>4</sub> to convert disulfides present into corresponding mercaptans, and the fraction is thereafter fractionally dist'd, the several fractions thus produced are oxidized (suitably by air) to convert the mercaptans into disulfides, and the fractions contg the oxidized products are subjected to fractional distn to obtain, on the one hand, phenolic products relatively free from disulfides, and, on the other hand, disulfides relatively free from phenolic compds.

**Distillation column and associated apparatus suitable for vacuum distillation of crude petroleum bottoms, etc** Frank I Lichtenthaler (to Immus Co.) U S 1,934,041, Nov 7. Structural details.

**Electrical dehydration apparatus suitable for treating natural petroleum emulsions** Wm I Van Loenen (to Petroleum Rectifying Co of Calif.) U S 1,932,713, Oct 31. Various structural and operative details are illustrated.

**Still and furnace setting for continuous coking of petroleum residues, etc** Joseph B Weaver U S 1,934,091, Oct 24. Various details are described of a unit, including a tubular retort, set in a generally vertical inclined direction, which may be heated by oil or gas burners the waste heat from which may be utilized for preheating steam for use in the app.

**Utilizing by product gas from petroleum cracking for ammonia synthesis** Carlton Ellis (to Ellis-Foster Co.) U S 1,935,469, Nov 14. H<sub>2</sub> is sep'd from gases of petroleum cracking stills, and the H<sub>2</sub> is maintained under pressure and used in catalytic hydrogenation under pressure as in NH<sub>3</sub> synthesis.

**Cracking petroleum oil** Frank A Howard (to Standard Oil Development Co.) U S 1,934,067, Nov 7. A stream of oil is heated to a cracking temp in an elongated narrow heating zone such as a heating tube system and the oil is then passed into a heat insulated enlarged heating zone where cracking occurs. A stream of oil is continuously conducted from one part of the digestion zone to another part, out of direct contact with the main body of the oil undergoing cracking, and all the fluid is continuously withdrawn from the digestion zone in a single stream. App is described.

**Cracking hydrocarbon oils** Gustav Igloff (to Universal Oil Products Co.) U S 1,931,757, Oct 21. For producing gasoline of high "anti-knock" value, heavy hydrocarbon oil is subjected to cracking conditions of temp and pressure and evolved vapors are sep'd from unvaporized oil, the vapors are dephlegmated to condense and sep' insufficiently cracked fractions from the gasoline vapors. resultant reflux condensate is retreated under cracking conditions of temp and pressure, the dephlegmated gasoline vapors are heated independently of the heavy oil and reflux condensate to a temp adequate to form substantial amounts of condensable unsat'd hydrocarbons in the material, and the resulting product is

condensed as a product of the process. An arrangement of app is described. Cf C A 28, 309.

**Cracking hydrocarbon oils** Stewart P Coleman (to Standard Oil Development Co.) U S 1,933,048, Oct 31. A mixt of hot non-oxidizing gas and steam is introduced together with the hydrocarbon oil into a vaporizing zone to effect vaporization of a substantial part of the oil, unvaporized oil and the vapor and gas mixt formed are separately removed, and the vapor-gas mixt is passed into a sep cracking zone into which another portion of the original non oxidizing gas and steam mixt is also introduced at a temp sufficient to effect substantial cracking of the vaporized oil. A substantially uniform temp is maintained throughout the cracking zone and low b p material is recovered from the cracked products. App is described.

**Cracking hydrocarbon oils** Edward B Peck (to Standard Oil Development Co.) U S 1,933,507, Oct 31. Oil is passed in a continuous stream through a heating zone such as a heated pipe coil and thence into an enlarged cracking zone where the temp and pressure are regulated to maintain the oil in a homogeneous gaseous state. A pressure is maintained in the heating zone equal to that in the cracking zone plus the frictional pressure drop due to the passage of the oil through the heating zone, and the pressure in the cracking zone and the rate of heating in the heating zone are sufficiently high to insure a homogeneous state of the oil at any cross section of the heating and cracking zone, and the resulting cracked oil is fractionated. App is described. Cf C A 27, 3067.

**Cracking hydrocarbon oils** Claude W Watson (to Texas Co.) U S 1,933,574, Nov 7. Vapors from oil cracking under pressure are cooled to effect partial condensation and the resulting cooled fluids (still at an elevated temp) are passed to a sep polymerizing chamber in which they are digested under superatm pressure while hot to effect polymerization and stabilization, resulting products are expanded into a fractionating tower in which fractionation is conducted under reduced pressure to form a vapor fraction and a reflux condensate, heat is supplied to reboil the reflux condensate and the vapor fraction is condensed to form a final stabilized distillate. App is described. Cf C A 27, 5180.

**Cracking hydrocarbon oils** Frank H Edson (to Standard Oil Development Co.) U S 1,934,049, Nov 7. Oil is subjected to optimum temp and pressure conditions for cracking in an elongated narrow heating zone such as a heating coil and is digested in an enlarged digesting zone to produce efficient cracking. The digested oil is discharged into a vapor sep' zone and sep'd into liquid and vapor fractions, the vapor is sep'd into a plurality of condensate fractions in a fractionating zone, and the sep'd condensate fractions, while isolated from each other and from the charging oil, are subjected to optimum conditions of temp under pressure in independent narrow heating zones such as heating coils and the heated fractions are discharged into the enlarged digesting zone in such manner as to digest a lighter fraction for a longer time than a heavier fraction, and the digested fractions are discharged into the sep' zone. App is described.

**Cracking hydrocarbon oils** Edwin F Nelson (to Universal Oil Products Co.) U S 1,934,873, Nov 14. Oil is heated to a cracking temp in an elongated heating coil and is thence delivered to the upper portion of a vertically elongated reaction chamber from the lower end of which liquid and vapors are removed at such a rate that no substantial accumulation of liquid occurs, thence passed to a low-pressure distn zone where vaporization of unvaporized oil occurs, vapors are liberated from the oil in the upper portion of the chamber and the downward flow of liquid oil through the chamber is confined to an area sufficiently small as to provide a velocity preventing coke formation. App is described.

**Cracking hydrocarbon liquids and solids** Gustav Igloff (to Universal Oil Products Co.) U S 1,934,847,

Nov. 14. For producing liquid products of low b. p., a mass of hydrocarbon solids such as coal is maintained in an enlarged zone; a body of hydrocarbon liquids such as gas oil or fuel oil is maintained under cracking conditions of temp. and pressure in an independent enlarged zone and vapors from the latter are passed through the hydrocarbon solids, to distil certain portions and dissolve other portions; resulting commingled vapors are condensed, with reflux of heavier fractions which are united with dissolved material and subjected to further cracking in the second-mentioned enlarged zone. App. is described.

**Cracking hydrocarbons.** Soc. des carburants synthétiques. Fr. 41,616, Feb. 15, 1933. Addn. to 607,156. Heavy hydrocarbons and stable org. residues are transformed to light hydrocarbons by heating them in the presence of H at 400–500° and at a pressure above 50 kg. per sq. cm. and using as catalysts Se, Te or their derivs., either alone or associated with hydrogenating catalysts.

**Cracking oils.** Texaco Development Corp. Brit. 396,517, Aug. 10, 1933. Crude oils are converted into oils of low b. p. by cracking a condensate formed as reflux in a fractionating tower by passing it through pipes and the inner coil of a furnace to reaction towers maintained under pressure from which the liquid products are led off without accumulation while the vapors pass through a line to the outer coil of the furnace where they are heated to 1000°F. and then passed through a line to a sec. reaction zone from which also the liquid products are removed as quickly as they are formed and where the cracked products are mixed with the crude stock. The vapors formed pass through a pipe to the fractionating tower where they are fractionated to give a final product, which is passed through coolers to a receiver, and a condensate which collects at the bottom of the tower and is used as the cracking stock. Part of this condensate may be supplied to the sec. reaction zone (a tower). The liquid products from the reaction towers and the sec. reaction zone are flashed into a tower and the vapors produced are passed through a cooler and pipe into the fractionating tower. Cf. C. A. 27, 1500.

**Oil cracking.** Norman H. Ranstead (to Jenkins Petroleum Process Co.). U. S. 1,934,004, Nov. 7. In cracking a heavier oil such as a petroleum oil for the production of gasoline, etc., by a process in which a portion of the heavier hydrocarbon oil undergoing cracking in an enlarged cracking zone is normally withdrawn through one of a plurality of outlets, a portion of the heavier hydrocarbon oil is also withdrawn through another outlet, as the flow diminishes in the first-mentioned outlet because of clogging; subsequently, the normal withdrawal of oil through the first-mentioned outlet is interrupted, and, during the interruption, hydrocarbon oil is forced through the first-mentioned outlet in reverse flow, to remove accumulated deposits. App. is described. Cf. C. A. 28, 308.

**Pressure cylinders suitable for use in oil cracking apparatus, etc.** Sune Hermanson and Orrin E. Andrus (to A. O. Smith Corp.). U. S. 1,934,064, Nov. 7. Various details are described relating to the manuf. of cylinders from a thick metal plate such as ferrous metal with a liner such as a Cr alloy and with deposition of corrosion resistant alloy metal by an elec. arc at the edges of the liner and seam of the plate edges. U. S. 1,934,065 relates to a somewhat similar process of making lined nozzles suitable for use in oil-cracking app.

**Hydrocarbon oil production by condensation of unsaturated cyclic hydrocarbons together with gaseous olefins.** Fritz Hofmann and Carl Wulff (to I. G. Farbenind. A.-G.). U. S. 1,933,134, Oct. 31. Condensation of materials such as naphthalene and C<sub>2</sub>H<sub>4</sub> is effected in the presence of a H halide such as HCl and of a B halide such as B chloride at a temp. of 300° or lower. An arrangement of app. is described, and numerous examples are given.

**Hydrocarbon oil conversion.** Wm. L. Gomory (to Standard Oil Development Co.). U. S. 1,933,108, Oct. 31. Oil is subjected to conversion temps. in a heating and conversion zone such as a pipe system under at least 50

atm. pressure in the presence of H; resulting hot products are transferred directly to a vaporizing and fractionating zone, reflux condensate from which is separately withdrawn and distd. to remove light fractions from it. The residue from this distn. is then returned directly to the heating and converting zone. Numerous details of app. arrangement are described.

**Hydrocarbon oil conversion.** Wm. L. Gomory (to Standard Oil Development Co.). U. S. 1,934,056, Nov. 7. Oil is subjected to distn. in a sep. distg. zone without substantial decompn.; the vapors are discharged into a vaporizing zone, and the distn. residue is subjected to cracking conditions of temp. and time in a heating and conversion zone in the presence of H under over 50 atm. pressure; resulting products are discharged into the vaporizing zone and lower-boiling fractions are sep'd. App. is described.

**Desulfurizing hydrocarbon oils.** Jacque C. Morrill (to Universal Oil Products Co.). U. S. 1,933,748, Nov. 7. Oils such as "cracked distillates" contg. unsatd. hydrocarbons and S are treated at an elevated temp. with a gaseous N oxide dild. with an inert gas such as N or C<sub>2</sub>H<sub>6</sub> and the oil is subsequently treated with H<sub>2</sub>SO<sub>4</sub>. Cf. C. A. 28, 312.

**Hydrogen treatment of hydrocarbon oils.** Edwin J. Gohr (to Standard-I. G. Co.). U. S. 1,933,107, Oct. 31. Oil such as heavy naphtha is passed through a reaction zone such as a heated coil at a temp. of about 370–440° while under a H pressure of at least 20 atm., with an oil supply rate below about 1.5 volumes per hr. of reaction space contg. a sulfactive catalyst such as ZnO, MgO, CaO or Al<sub>2</sub>O<sub>3</sub> and with use of a H volume of at least 5000 cu. ft. per bbl. of oil. Part of the oil is thus converted into an oil suitable for illuminating purposes, and part is unsuitable for such use. The 2 parts are sep'd. (suitably by use of a bubble plate tower) and the part unsuitable for illuminating purposes is passed through a second reaction zone contg. a second sulfactive catalyst under H pressure above 20 atm. at a temp. above 480°, the oil rate being above 1.5 volumes per hr. per volume of reaction space and the volume of H being approx. 1000–4000 cu. ft. per bbl. of oil, thus producing a product of low b. p. and good anti detonation properties. App. is described.

**Exothermic hydrogenation of hydrocarbon oils.** Marion W. Boyer (to Standard-I. G. Co.). U. S. 1,934,061, Nov. 7. In the catalytic hydrogenation of oils such as gas oil or kerosene, a stream of preheated oil and H is passed continuously longitudinally through one portion of a catalytic mass in one direction and then through an adjacent portion of the catalyst in the opposite direction. The entire mass of catalyst is maintained at a reaction temp. solely by the exothermic heat of the reaction and rapid interchange of heat is effected between the adjacent streams flowing in opposite directions. App. is described.

**Fractionating hydrocarbon vapors.** Daniel E. Stines (to Standard Oil Development Co.). U. S. 1,934,101, Nov. 7. Hydrocarbon vapors are passed through a zone in which heavier constituents of the vapors are condensed, uncondensed vapors are withdrawn from the upper portion of the zone (which may be in the form of a bubble tower) and accumulated condensate is withdrawn from an intermediate portion of the zone, reheated to a const. temp. and returned to the lower portion of the zone at a const. rate. The withdrawn vapors are condensed and a portion of such condensed vapor is returned to the fractionating zone as reflux under control in accord with accumulated condensate. App. is described.

**Refining hydrocarbon vapors.** Arthur G. Connolly (to Universal Oil Products Co.). U. S. 1,934,967, Nov. 14. Various details of app. and operation are described for treating vapors such as those of cracked distillates with a solid filtering material such as fuller's earth which is also contacted with a washing liquid such as a hydrocarbon distillate. U. S. 1,934,968 also describes app. and procedure for contacting hydrocarbon vapors such as those of cracked motor fuel with a polymerizing agent such as fuller's earth.

**Fractionating tower and associated apparatus for treating hydrocarbon oils.** Edward C. D'Yarmett (to Fractionator Co.). U. S. 1,932,514, Oct. 31. Structural and mech. details are described, of an app. provided with a rotating shaft on which centrifuging blades and disks are mounted.

**Destructive hydrogenation of hydrocarbon oils.** James M. Jennings (to Standard-I. G. Co.). U. S. 1,933,503, Oct. 31. In hydrogenating oils under pressure above 20 atm. and at temps. above 400° in the presence of a sulfidic catalyst, the reaction products are maintained in contact with a packed mass of catalytic material (such as one contg. oxides of Cr, Mg and Zn) which promotes hydrogenation, during substantially the entire time until the temp. of the products is below that at which decompn. would occur in the absence of a hydrogenating catalytic material. App. is described.

**Destructive hydrogenation of hydrocarbon oils to produce lubricating oil.** Edgar M. Clark (to Standard-I. G. Co.). U. S. 1,934,037, Nov. 7. From a lower-grade oil there is sepd. a fraction having a Saybolt viscosity at 99° not more than 30 sec. greater than the viscosity of the desired product, and this fraction is subjected to the action of H at a temp. of about 370-450° under over 20 atm. pressure until at least 5%, but not more than 20% of the fraction is converted into hydrocarbons of low b. p.; a lubricating fraction of the desired viscosity is recovered from the product. App. is described.

**Destructive hydrogenation of oil.** Robert P. Russell (to Standard-I. G. Co.). U. S. 1,931,093, Nov. 7. In the destructive hydrogenation of oil such as gas oil or kerosene at temps. above 480° and under pressures above 20 atm., a mixt. of oil and gas rich in free H is passed through a bed of solid catalyst arranged in a relatively short path of flow and with a relatively extended sectional area at right angles to the direction of flow (the introduction of the oil and gas into the catalytic material being effected through a large no. of inlets substantially uniformly spaced, and products being educted through a large no. of exits uniformly spaced). Various details of app. and operation are described.

**Destructive hydrogenation.** Tide Water Oil Co. Brit. 9,345, July 11, 1933. Gas oil or other petroleum fractions are treated at above 500° under about 50 atm. pressure with gases contg. H, e. g., coke-oven gas, for such a time, e. g., 0.5 hr., that a large yield of gas oil suitable for enriching blue water gas is obtained while the liquid products consist mainly of aromatic hydrocarbons. The process may be conducted in a closed vessel or pipe still and in the presence of a hydrogenating catalyst.

**Destructive hydrogenation.** Processco Ltd. Brit. 9,065, July 17, 1933. Carbonaceous residues obtained in the destructive hydrogenation of oils are treated with superheated steam at high temps. with the formation of gases contg. H<sub>2</sub> and CO<sub>2</sub> which are used as the hydrogenating gases for the destructive hydrogenation reaction. The latter comprises a multi-stage cyclic process under varying conditions of temp. and pressure, the vapors and gases from 1 stage being recycled to another stage. App. is described.

**Light hydrocarbon products by destructive hydrogenation of heavier hydrocarbon oils.** Robert T. Haslam (to Standard-I. G. Co.). U. S. 1,934,062, Nov. 7. Light hydrocarbon products of good antidetonation properties suitable for use as motor fuels are prepd. from heavier oil such as gas oil or kerosene by preheating the oil in the absence of hydrogenation catalysts, to a temp. of about 125-480° and then bringing the preheated oil into contact with an active hydrogenation catalyst in the presence of free H and under over 20 atm. pressure, thus completing vaporization of the oil and raising the temp. of the vapors to a temp. of above 480° for a sufficient reaction time solely by the exothermic heat of reaction. App. is described.

**Non cracking catalytic hydrogenation of hydrocarbon material.** Hans Kaffer. U. S. 1,933,435, Oct. 31. In hydrogenating materials such as crude naphthalene or low temp. tar benzene with H under at least 20 atm.

pressure and at temps. of about 350-425°, there is used, as a catalyst, the undistillable residue, insol. in org. solvents and not attackable by H, which remains when coal is subjected to splitting hydrogenation in the presence of H under pressure.

**Apparatus for distilling hydrocarbon or other liquids.** Earnest F. Skinner. U. S. 1,932,712, Oct. 31. Various structural details are described of an app. suitable for cracking hydrocarbons.

**Apparatus for producing a hydrocarbon and metallic sol.** James C. Arnold. U. S. 1,933,836, Nov. 7. Various details are described of an app. for use of a high-frequency elec. current for dispersing Pb in hydrocarbon fuels in order to form a non-detonating product.

**Liquefiable aromatic hydrocarbons from hydrocarbon gases such as cracked still gas or coke-oven gas.** Gustav Egloff (to Universal Oil Products Co.). U. S. 1,933,845, No. 7. The gas is subjected to conversion conditions of temp. and pressure in a heating zone such as a heating coil and the conversion reaction is then immediately checked by introducing a cooling oil into direct and intimate contact with the heated gas; the resultant mixt. is passed to a stabilizing zone such as a vertical drum in which a temp. gradient is maintained from top to bottom to produce a rectifying effect on the gases and vapors; condensable reaction products are sepd. from those which are incondensable in this zone and the gases and liquids are withdrawn, resp., from the top and bottom of the stabilizing zone. App. is described.

**Rotary drill for taking samples of materials such as of formations in drilling oil wells.** Redus D. Dodds (to George J. Barrett and S. Robichaux). U. S. reissue 18,975, Oct. 24. A reissue of original pat. No. 1,295,134. Mech. details.

**Furnace setting, etc., for heat treatment of mineral oils in pipe systems, etc.** Wm. G. Leamon. U. S. 1,933,020, Oct. 31. Various structural and operative details are described.

**Continuous distillation system for mineral oils, etc.** I. G. Farbenund. A.-G. (Martin Muller-Cunradi, Wilhelm Sinnat and Erhard Willig, inventors). Ger. 586,436, Oct. 21, 1933.

**Apparatus for distillation of oils such as in vacuum distillation.** John E. Schulze (to Red River Refining Co.). U. S. 1,934,150, Nov. 7. Various structural and operative details are described of an app. adapted for use with steam and vacuum.

**Apparatus for the catalytic treatment of "cracked" distillate vapors.** The Gray Processes Corp. Ger. 577,926, June 7, 1933.

**Use of activated carbon for selective separation of hydrogen from hydrocarbons.** Warren K. Lewis (to Standard Oil Development Co.). U. S. 1,934,075, Nov. 7. For increasing the selective absorbent capacity of the activated C used, a mixed gas under treatment is contacted with the activated C under a pressure substantially greater than atm. pressure and a gas rich in H is obtained. App. is described.

**Tube and shell heat-exchange apparatus suitable for use with oil stills, etc.** Ralph M. Swartz and Carl S. Reed (Swartz to Superheater Co.). U. S. 1,935,066, Nov. 14. Structural features.

**Treating acid sludge from oil refining.** Stanislaw Pilat and Jaroslaw Sereda. U. S. 1,933,070, Oct. 31. A treatment of acid sludge such as is obtained as a waste product in the refining, with H<sub>2</sub>SO<sub>4</sub>, of mineral, vegetable or animal oils or distn. products of coal and bituminous slate, for obtaining sulfonic acids and sulfonates from the sludge, involves neutralizing of the crude acid sludge by introducing it into a sludge consisting of derivs. of alk. earth metals and water (such as an aq. lime sludge) capable of reacting to form alk. earth metal sulfonates from the sulfonic acids in the acid sludge, followed by treatment of the resulting pptd. sulfonates, together with resinous and asphaltic components of the acid sludge and mineral salts, with an aq. soln. of an alkali metal carbonate to form an aq. soln. of alkali metal sulfonates from which the latter can be isolated.

**Coking heavy oil stocks.** Arnold C. Vobach and Horace K. Rogers (to Sinclair Refining Co.). U. S. 1,935,067, Nov. 14. The interior of the coking receptacle is covered with a frangible material such as a fireclay and water glass mixt. and after the material undergoing coking has been coked by contacting it with a hot gaseous material the frangible lining of the receptacle is fractured to permit removal of the coke en bloc from the receptacle. App. is described.

**Motor fuel.** I. G. Farbenind. A.-G. Fr. 749,843, July 29, 1933. Fuels contg. unsatd. hydrocarbons or org. S or O compds. are submitted to a refining hydrogenation under pressure and then to a thermal dehydrogenation treatment at 450-600°. A product with good anti-knock properties is obtained.

**Diesel fuel.** James E. Southcombe and Germ Lubricants Ltd. Brit. 396,427, Aug. 2, 1933. Fuel for Diesel-type engines consists of a light Diesel oil with up to 2% of an org. acid contg. at least 14 C atoms added to obtain improved lubrication of the pistons and cylinders. Naphthenic acids and higher fatty acids are specified, e. g., 3 kg. of a 30:70 mixt. of oleic acid and lubricating oil or 1 kg. of oleic acid to 500 kg. of 0.8 petroleum Diesel oil.

**Gasoline-like products from gases of the ethylene series.** Cary R. Wagner (to Pure Oil Co.). U. S. 1,934,806, Nov. 14. Gases such as those from vapor phase-oil conversion and which may comprise  $C_2H_4$ ,  $C_2H_6$  and  $C_3H_8$  are passed over a catalyst comprising a metallic halide such as chloride of Al, Ni, Fe or Ti or  $AlBr_3$  at temps. of about 175-375° and under a pressure of 600-1500 lb. per sq. in. Cf. C. A. 27, 4390.

**Utilizing heavy fuels such as petroleum in automobile engines.** Rene Oppenheim (to Société anon. Le Carbone). U. S. 1,931,875, Oct. 21. An auxiliary charge of the heavy fuel is contacted with a heated catalyzing substance such as activated carbon so that it may be decomposed to form an easily starting mixt. Exhaust gases are led from the burned starting mixt. around a second mass of catalyzing substance to heat the latter and the main charge of heavy fuel is decompd. by this second heated catalyst and the decompn. products are mixed with air for operation of the engine. App. is described.

**Removing traces of halides from synthetic oils.** Edward M. Jolly and Charles C. Swoope (to Standard Oil Development Co.). U. S. 1,931,068, Nov. 7. Liquid oil such as is produced by the condensation of "chloroparaffin" with  $AlCl_3$  and which contains a halide is treated with a reactive metal such as Na in a liquid or molten condition at a temp. (suitably about 160°) below the decompn. temp. of the oil.

**Removal of sulfur compounds from crude aliphatic saturated hydrocarbon materials such as crude oil, gas oil, or gasoline.** Friedrich W. Guthke (to I. G. Farbenind. A.-G.). U. S. 1,932,369, Oct. 24. Crude material, particularly that having a b. p. up to 180°, is treated with H under 1-10 atm. pressure and at a temp. of about 200-300° in the presence of a catalyst contg. an added sulfide of a metal of groups 6 to 8 of the periodic system (under conditions such as to avoid cracking, polymerization and hydrogenation of the hydrocarbon material itself).

**Absorption apparatus suitable for use in determination of sulfur and halogens in combustible substances such as naphtha products, etc.** Wolfgang Grote and Heinz Kreckler (to Jenaer Glaswerk Schott & Gen.). U. S. 1,931,895, Oct. 24. Structural details.

**Lining vessels for holding oil.** Gustav Egloff and Charles D. Lowry, Jr. (to Universal Oil Products Co.). U. S. 1,932,726, Oct. 31. A layer of Al is attached to the inner surface of a vessel such as a retort or still which may be formed of steel, by a plastic material such as pitch and an inner lining of cementitious corrosion-resisting material such as a ganister lining mixt. is placed over the Al.

**Removing wax from wax-bearing oils.** John F. Mitchell-Roberts (to Texas Co.). U. S. 1,933,868, Nov. 7. A hydrocarbon flocculating or seeding agent such as a small proportion of "filter aid" is added to the oil; the treated oil is chilled to congeal the wax; a diatomaceous

"filter aid" is then added in a larger proportion and the wax and the filter aid are sepd. from the oil.

**Lubricating oil.** Wm. O. Stevens (to Anti Hot Box Co.). U. S. reissue 18,988, Nov. 7. A reissue of original pat. No. 1,798,310 (C. A. 25, 2559).

**Lubricating oil.** Benjamin Gallsworthy (to Texas Co.). U. S. 1,932,381, Oct. 24. For producing a lubricating oil having an acid value of less than 0.5%, oxidized paraffin wax is treated with fuller's earth while maintaining it at a temp. sufficient to keep it in the liquid state, to reduce its acid value, and the treated wax is mixed with lubricating-oil stock in the proportion of 1-5%. Cf. C. A. 27, 5531.

**Lubricating oils.** Robert T. Haslam (to Standard-I. G. Co.). U. S. 1,934,063, Nov. 7. Heavy hydrocarbon oils are subjected to the action of a gas rich in free H at temps. of 400-430° under over 50 atm. pressure for a limited time so that an appreciable but restricted quantity of low-boiling hydrocarbons is formed. The treatment with H is conducted in 2 sep. zones, heavier lubricating fractions are removed from the products of the first zone, and only the lighter lubricating fractions are passed to the second zone. App. is described.

**Lubricating oils.** Jean Grosso and Daniel Perrier. Fr. 749,731, July 28, 1933. Impurities are eliminated from used or fresh oils by bringing the viscosity of the oil to so low a value that the mol. attraction between the oil and the impurities falls below the attraction between an adsorbent of suitable nature and the impurities, the adsorbent being added after the viscosity is lowered.

**Petroleum lubricating oils.** Edgar M. Clark (to Standard-I. G. Co.). U. S. 1,933,047, Oct. 31. For producing higher grade lubricating oils of increased viscosity index in relatively large yields from lower grade petroleum, the oil is subjected to the action of H in the presence of S insensitive catalysts at temps. of about 370-450° under a pressure above 25 atm. (the duration of the operation being limited so that a substantial quantity of naphtha, less than 20% of the oil fed, is produced). App. is described.

**Lubricating oil treatment.** Garland H. B. Davis (to Standard Oil Development Co.). U. S. 1,934,043, Nov. 7. An activated material prepd. from petrolatum and  $AlCl_3$  is mixed and heated with lubricating oil for a prolonged period (suitably about 3 hrs.), and, after cooling, excess petrolatum and the aluminous sludge are sepd. This treatment serves to improve the "viscosity index" of the oil.

**Lubricant of good penetrating properties.** Samuel Cabot (to Polygon Products Co.). U. S. 1,935,588, Nov. 11. See Brit. 369,197 (C. A. 27, 2295).

**Lubricants.** Yacco S. A. F. Brit. 395,867, July 27, 1933. Addn. to 371,643 (C. A. 27, 3813). Fluid lubricants of increased thermal cond. and especially suited for the cylinders of internal-combustion engines are prepd. by dissolving a metal soap and an  $NH_4$  soap in 1 or more vegetable oils and combining the soln. with 1 or more mineral oils. Thus  $NH_4$  oleate 1,  $NH_4$  stearate 1, Cu oleate 0.25, a vegetable oil mixt., e. g., of equal wts. of olive, peanut and soy-bean oils, 7.75% and mineral oil 90 lb. are used. Cf. C. A. 27, 4391.

**Lubricants.** George M. Maverick (to Standard Oil Development Co.). Brit. 396,147, Aug. 3, 1933. Heavy lubricants for transmission and differential gears, etc., comprise a heavy hydrocarbon oil having a Saybolt viscosity above 95 sec. at 210°F. and a minor proportion of a heavy unctuous synthetic product prepd. by condensing with themselves or other substances aliphatic hydrocarbons of mol. wt. 170 or more and contg. 13.5-15.0 parts of H for each 100 pf C. Less than 1 to more than 20% of condensation product may be used and the oils may contain metallic soaps, e. g., Pb, Na and Al stearates or oleates. Suitable synthetics are obtained by condensing  $C_{10}H_{18}$  or  $C_{12}H_{26}$  or aromatic gas oil on chlorinated paraffin wax or by polymerizing dehydrogenated paraffin wax in the presence of  $AlCl_3$ .

**Lubricants.** I. G. Farbenind. A.-G. Fr. 749,942, Aug. 1, 1933. Lubricants or products to be used as addns.

to lubricants are made by submitting soft or hard paraffin or a mixt. thereof or substances contg. appreciable amts. of such waxes to a treatment with dark elec. discharges, preferably elec. discharges of high frequency, taking care that a final product exempt from or poor in soft and hard paraffin and middle oil is obtained. As starting materials compds. composed for the greater part of waxy paraffin hydrocarbons having an average mol. wt. above 300, preferably 350, or derivs. of these hydrocarbons may be used.

**Filters for lubricating systems.** S. F. Bowser & Co., Inc. Brit. 396,257, Aug. 3, 1933. Oil is drawn from the sump of an engine-lubricating system by a pump and part passed through a fine filter and returned direct to the sump while the rest is passed through a coarse filter and hence to the parts to be lubricated from which it returns to the sump. The filters are described:—

**Asphalt emulsion.** Kenneth Taylor (to Standard Oil Co. of Ind.). U. S. 1,932,648, Oct. 31. An aq. concd. asphalt emulsion which can be dild. with hard water without sepn. and which is not broken by wide temp. variations comprises asphalt dispersed in a small amount of water by means of an emulsifier such as green acid soap together with a farinaceous protein material such as corn-gluten meal or soy-bean meal.

**Asphalt and fatty acids from mineral-oil-still bottoms.** Harry F. Angstadt (to Sun Oil Co.). U. S. 1,931,880, Oct. 24. Impure soap-contg. asphaltic material, re-

maining as a residue after the distn. of lubricating oils in a lubricating oil distn. process adapted to form soaps, is heated with added water under sufficient pressure to prevent boiling and to sep. the asphalt from impurities associated with it, without destroying the Na soaps contained in the impurities; cooling is effected under sufficient pressure to prevent boiling with resultant re-entry of the sepd. constituents into emulsion, soln. or dispersion stage, and the asphalt and sepd. impurities contg. soaps adapted to yield water-insol. org. acids are segregated.

**Blending wood pitch with fatty acid pitch.** Louis J. Figg, Jr. (to Eastman Kodak Co.). U. S. 1,933,790, Nov. 7. A stable, viscous, homogeneous mixt. suitable for blending with gilsonite is prepd. by heating a wood pitch with a fatty acid pitch of approx. the same flow point.

**Separating oxygenated components from pine oil.** Irvin W. Humphrey (to Hercules Powder Co.). U. S. 1,932,183, Oct. 24. For the sepn. of components such as borneol and fenchyl alc., pine oil is subjected to the action of a non-acidic substance such as iodine, fuller's earth or activated carbon which will selectively chemically dehydrate the tertiary alcs. present; products of dehydration are removed and the residual pine oil is then fractionated. Cf. C. A. 27, 5755.

**Oven and associated apparatus for making charcoal sticks or pencils.** Irving A. Hultberg (to American Art-Char, Inc.). U. S. 1,933,141, Oct. 31.

## 23—CELLULOSE AND PAPER

CARLETON F. CURRAN

**Cellulose acetate or viscose sheets?** Johann Eggert. *Nitrocellulose* 4, 162 4(1933); cf. C. A. 27, 5184.—A cost study.

**Delignification of wood with gaseous chlorine.** F. Komarov. *Bumazhnyaya Prom.* 12, No. 5, 9 24(1933).—Lab. expts. in the sepn. of cellulose by delignification of wood with gaseous Cl led to the following conclusions: The degree of delignification depends to a certain extent on the quantity of Cl used. A complete delignification can be accomplished only by intermittent chlorination and removal of chlorinated lignin by washing. The resinous matter retards the chlorination very little, and is removed together with chlorinated lignin by washing with alkalis. Chlorination of deresinified samples showed no advantage. The effect of wood swelling on chlorination varies with different kinds of trees. The yield of cellulose is decreased by delignification of wood previously treated with aq. NaOH at 90°, and is practically unaffected by such a treatment with sulfite. Aspen, poplar, willow (66% yield of cellulose) and spruce (60%) are more easily and completely delignified. Birch, beech and especially pine are less easily delignified. In the delignification, 11–13.6% of other constituents of wood, mostly carbohydrates (pentosans), is removed from leafy trees and 5.5–7% from conifers. Thirteen references.

Chas. Blanc

**The bleaching of kraft pulp.** J. O. Murto. *Finnish Paper and Timber J.* 1933, 757 62.—Raw cellulose is sepd. from lignin by direct chlorination, the chlorinated lignin being dissolved in water and dil. alkali prior to the bleaching process. In the Bergström-Zennström kraft pulp-bleaching process a method has been developed in which the total Cl consumption has been reduced to 4–5% of active Cl.

S. A. Karjala

**Pitchy substances in the edge runner screws and at drainage outlets of sulfate pulp plants.** Hilding Bergström and Karl Cederquist. *Iva* 1933, No. 4, 94–6.—The pitchy masses consist of Ca salts of the acids in liquid resin, and CaCO<sub>3</sub>. They are formed from the sulfate soaps and the Ca in the water, and can cause spots in the paper.

E. M. Symmes

**A printing ink and method for discharging from paper.** Sidney D. Wells. *Am. Inst. Chem. Eng., Roanoke Meeting*, Dec., 1933(preprint) 10 pp.—The increasing

demand for paper-making fiber has frequently directed the attention of paper makers to printed paper as a source of supply. Numerous processes for the liberation and removal of the C black pigment are known and some paper-making plants have for a long time secured a large portion of their fibrous raw materials from paper stock recovered from discarded books, periodicals and other publications printed on paper composed of cellulose fibers free from lignin. The use of dischargeable printing ink based upon a pigment consisting of the Fe lake of hematein has now been continuous throughout a period of 2 years. The recovery of the groundwood paper printed with this ink has been taking place in large quantities throughout the past year. A new paper-making material has been made available, which forms an important item in our national inventory of fibrous stock and the supply of such new material can be greatly increased should it become important further to increase our national inventory of paper-making stocks.

C. L. Mantell

**Hydrolysis and fermentation of sawdust** (Schoen, Béraud) 16. **Structure of thin celluloid films** (Jones) 3. **Esters [for softening agents for plastics contg. cellulose derivs.]** (Brit. pat. 395,340) 10. **Resin [for making glaze for paper]** (Ger. pat. 577,723) 26. **Ceramic nozzles for spinning rayon** (Ger. pat. 577,562) 19. **Moisture-preventing compn. [for paper, Cellophane]** (Fr. pat. 740,013) 18.

**Cellulose.** Louisa Elektrizitätswerke und chemische Fabriken A.-G. (Gampel). Swiss 162,143, Aug. 16, 1933. A cellulose ester with a high affinity for dyes, particularly direct dyes, is obtained by treating cellulose with an acetylating agent such as Ac<sub>2</sub>O, in the presence of CH<sub>3</sub>CNCO<sub>2</sub>H. A catalyst may be present.

**Cellulose.** Henry Dreyfus. Fr. 749,536, July 25, 1933. Noncellulosic substances are sepd. from wood, straw, etc., by treating the latter with a liquid composed of or contg. an alc. of relatively high b. p., preferably above 120°. The liquid may be composed of a 30–80% aq. soln. of a glycol, glycerol or other di- or polyhydric alc.

**High  $\alpha$ -cellulose from vegetable fiber such as sugarcane fiber, etc.** Joaquín J. de la Roza. U. S. 1,931,575, Oct. 24. For producing a high-quality, low-ash product

of high  $\alpha$ -cellulose content, material such as sugar-cane fiber is treated with a concd. aq. soln. of  $\text{SO}_2$  contg. at least 12 lb.  $\text{SO}_2$  per each 100 lb. of bone-dry fiber, and, subsequently, the fiber is treated with alkali. Cf. C. A. 27, 4926.

**Cellulosic compositions.** Henry Dreyfus. Brit. 395,664, July 17, 1933. The solvent medium of a cellulosic compn. comprises 1 or more org. liquids,  $\text{H}_2\text{O}$  forming at least 7% of the total org. liquid and a basic org. substance, which may be an aliphatic, aromatic or alicyclic amine. The amine may contain a substituent group, e. g., a  $\text{HSO}_3$ , phosphinic or OH group, rendering it more sol. in  $\text{H}_2\text{O}$  or the org. liquid than is the simple amine. The no. of amino groups should be such as to overcome the acidity of any acidic groups or, alternatively, such groups may be present as salts.  $\text{Me}_2\text{CO}$  or  $\text{Me Et}$  ketone are suitable solvents and they may be mixed with non-solvents, e. g.,  $\text{MeOH}$ ,  $\text{EtOH}$ . The cellulose deriv. may be the acetate or nitrate, ethylcellulose or other ester or ether. Examples of amines are  $\text{PrNH}_2$ ,  $\text{iso-BuNH}_2$ ,  $\text{AmNH}_2$ , hexylamine,  $\text{Et}_3\text{NH}$ ,  $\text{Et}_2\text{N}$ , ethanolamines, diaminopropanols, dihydroxypropylamines, hydroxy-amines obtained by reduction of aldehydes, ketones or alkylene oxides with  $\text{HCN}$ , substituted amines such as the alkali salts of taurine,  $\text{PhNH}_2$ ,  $\text{PhNHMe}$ , hydroxyethylaniline, alkali salts of sulfanilic acid, quinoline, cyclohexylamine, benzylamine, ethylenediamide of oleic, palmitic or stearic acid, etc. The basic substance is preferably sol. in the compn. Its presence reduces the corrosive action of the compn. on app. used in the production of artificial filaments, films, etc., and in the application of lacquers and varnishes. They may be removed from the filaments, etc., or left in to reduce the tendency of the dyed products to fade.

**Cellulose esters.** C. F. Boehringer & Soehne G. m. b. H. Brit. 396,309, Aug. 3, 1933; Fr. 749,657, July 27, 1933. Cellulose is esterified in the presence of a catalyst comprising an aliphatic sulfonic acid which contains at least 1 further acidic group or atom derived from an inorg. acid, e. g.,  $\text{NO}_2$ ,  $\text{Cl}$  or another  $\text{HSO}_3$ . These catalysts do not combine with the cellulose and are completely removed by washing, stable primary or secondary esters being obtained. Among examples (1) cotton linters are pretreated in  $\text{AcOH}$  and acetylated in a mixt. of  $\text{Ac}_2\text{O}$ , methylene chloride and methanesulfonic acid and (2) wood pulp is pretreated with  $\text{AcOH}$  and caused to react with a mixt. of  $\text{Ac}_2\text{O}$ ,  $\text{SO}_2$ ,  $\text{C}_6\text{H}_6$  and trichloromethanesulfonic acid.

**Cellulose esters.** C. F. Boehringer & Soehne G. m. b. H. Brit. 396,575, Aug. 10, 1933. Addn. to 387,533 (C. A. 27, 4671). The process of 387,533 is extended to the prepn. of esters of acids other than  $\text{AcOH}$ , esters of substituted acids and mixed esters. Among examples (1) cotton linters are pretreated and esterified by means of a mixt. of  $\text{Ac}_2\text{O}$ ,  $\text{C}_6\text{H}_6$ , butyric acid,  $\text{SO}_2$  and  $\text{HClO}_4$ , part of the  $\text{SO}_2$  being evapd. as in the process of Brit. 312,242 (C. A. 24, 903), and (2) cotton linters are pretreated with propionic acid and acidulated with a mixt. of propionic anhydride, ligroin,  $\text{SO}_2$  and  $\text{HClO}_4$ . In 396,657, Aug. 10, 1933, addn. to 387,533, the process of 387,533 is modified by avoiding the use of the non-solvent and the limitation of the temp. to below  $40^\circ$ . The esterification soln., after neutralization of the catalyst and, if desired, addn. of further quantities of solvent, may be used directly for the production of rayon, films, plastic masses, etc. In an example cotton linters, pretreated in  $\text{AcOH}$ , are treated with a mixt. of  $\text{Ac}_2\text{O}$ ,  $\text{AcOH}$ ,  $\text{SO}_2$  and  $\text{HClO}_4$ , the catalyst is neutralized and the product pptd. with  $\text{H}_2\text{O}$  or cyclohexanol acetate.

**Cellulose esters.** Kodak-Pathé. Fr. 749,974, Aug. 2, 1933. Esters are obtained in the fibrous state by esterifying cellulose in a bath contg. a sufficient amt. of an ether of high b. p., e. g.,  $\text{Pr}_2\text{O}$ ,  $\text{Bu}_2\text{O}$  or  $\text{Am}_2\text{O}$ , to prevent soln. of the ester formed. The bath may also contain a catalyst such as perchloric acid. Cf. C. A. 27, 1753.

**Mixed cellulose esters.** Carl J. Malm and Charles E. Waring (to Eastman Kodak Co.). U. S. 1,933,815, Nov. 7. A partially de-esterified cellulose acylate of a std. acid such as partially de-esterified cellulose acetate is

1 treated with an anhydride of an aliphatic acid (such as stearic or propionic anhydride) different from that corresponding to the acyl group already present in the cellulose deriv. in the presence of a catalyst such as  $\text{H}_2\text{SO}_4$  or  $p$ -toluenesulfonyl chloride and an org. liquid such as toluene or  $\text{CCl}_4$  in which the anhydride and catalyst are sol. and the cellulose esters in the bath are insol.

**Cellulose organic ester compositions.** Henry B. Smith (to Eastman Kodak Co.). U. S. 1,933,826, Nov. 7. Compns. suitable for films, molded articles, etc., are formed of a cellulose org. ester such as cellulose acetate together with a plasticizer comprising the ethyl ether of ethylene glycol mono-glycolate or the ethyl ether of ethylene glycol  $\alpha$ -hydroxyisobutyrate. U. S. 1,933,827 relates to the use of a compd. such as ethyl  $\gamma$ -phenoxybutyrate as a plasticizer with cellulose org. esters such as cellulose acetate.

**Cellulose esters of lauric acid.** Max Hagedorn and Georg Hingst (to I. G. Farbenind. A.-G.). U. S. 1,931,844, Oct. 24. The solubility of cellulose esters such as those of lauric acid is increased by heating the esters at a temp. below  $200^\circ$  (suitably about  $145^\circ$ ) in a liquid acid medium such as one contg. pyridine- $\text{HCl}$ .

**Purifying organic esters of cellulose.** Camille Dreyfus and Geo. Schneider (to Celanese Corp. of America). U. S. 1,933,720, Nov. 7. By sepg. finer from coarser particles of materials such as cellulose acetate the coarser particles are freed from a substantial part of objectionable constituents such as insol. impurities.

**Decorating cellulose ester material.** Wm. O. Kenyon and Cyril J. Staud (to Eastman Kodak Co.). U. S. 1,933,810, Nov. 7. Cellulose ester material such as cellulose acetate contg. an org. indicator such as bromothymol is subjected to the action of an electrostatic field set up by an a. c. of high potential, in order to produce color changes, as in developing designs or markings.

**Printing fountain pen casings, etc. of cellulose ester material.** Emery G. Desnoyers and Herbert E. Nims (to Fiberloid Corp.). U. S. 1,934,047, Nov. 7. The outer surface of a core of material such as cellulose acetate or nitrate compn. is printed with a design, treated with a softening agent and then united with a shrunk-on covering of transparent material such as a thin cellulose ester compn. which is heated on the core.

**Cellulose esters and ethers.** British Celanese Ltd., John E. Jones and David R. Johnston. Brit. 395,707, July 18, 1933. Cellulose org. derivs., e. g., the acetate, methylcellulose, other esters and ethers, mixed esters and ethers and ether-esters, are pptd. by incorporating with the soln. a precipitant in an amt. in substantial proportion to that required to effect permanent pptn. but insufficient to cause such pptn. and then mechanically mixing the soln. with a further quantity of precipitant so as to ppt. the deriv. in finely divided form. The deriv. may be pptd. from its esterification or etherification soln. Esters may be ripened before pptn. To insure efficient distribution of the precipitant and avoid local pptn. during the first stage spraying and stirring devices are used. In an example cellulose acetate in its esterification soln. contg.  $\text{Ac}_2\text{O}$ ,  $\text{AcOH}$  and  $\text{H}_2\text{SO}_4$  is ripened and, after neutralizing the  $\text{H}_2\text{SO}_4$ , a large quantity of aq.  $\text{AcOH}$  is added with const. agitation. The soln. is then mixed with excess of aq.  $\text{AcOH}$ , with stirring, to ppt. the cellulose acetate. The products may be used for the manuf. of rayon, plastic and other compns.

**Cellulose ethers.** Henry Dreyfus. Fr. 749,401, July 24, 1933. Mixed ethers of cellulose are prepd. by treating cellulose with alkylating and (or) aralkylating agents and by alkylene oxides, the reaction with alkylene oxides being carried out in the presence of  $\text{NH}_3$  or an org. base, such as  $\text{MeNH}_2$ ,  $\text{Me}_2\text{NH}$  or  $\text{Et}_3\text{NH}$ .

**Cellulose ethers.** Henry Dreyfus. Fr. 749,534, July 25, 1933. Hydroxy ethers of cellulose are made by causing hydroxy alkylating agents such as ethylene oxide or propylene oxide to react on cellulose or cellulose derivs. in the presence of primary or secondary org. bases, e. g.,  $\text{Me}_2\text{NH}$ . The reaction is carried out under pressure and at  $80$ – $120^\circ$ .

**Cellulose derivative.** Soc. pour l'ind. chim. à Bâle. Swiss 160,852, May 16, 1933. Addn. to 142,175 (C. A. 25, 2288). Acetylcellulose sol. in acetone is treated with cyanuric chloride, an aromatic tertiary base being present as an acid-binding agent. The product is used for making films, fibers, insulators, etc.

**Cellulose derivatives.** Henry Dreyfus. Fr. 749,568, July 26, 1933. Cellulose derivs. contg. ester groups and hydroxyalkyl groups, particularly acetate groups and hydroxyethyl groups are prepd. by causing a hydroxy-alkylating agent such as ethylene oxide to act on a cellulose ester.

**Cellulose-derivative solutions and compositions.** British Celanese Ltd. Brit. 396,344, Aug. 3, 1933. Solid, liquid or plastic compns. comprise a cellulose deriv. and a sulfonamide of a phenol ether. The compn. may be molded or solns. may be evapd. or pptd. to form artificial filaments, threads, yarns and other textile materials or films which may be used in photography or the manuf. of laminated glass. Solns. in appropriate solvent mixts. may form the basis of lacquers and other coating compns. and compatible resins may be added. Mixts. of the phenol ether sulfonamides with each other or with other plasticizers may be used. Pigments, fillers or dyes may be incorporated. In examples a coating compn. consists of cellulose acetate, anisolesulfonamide and Me<sub>2</sub>CO and a lacquer contains in addn. a resin of the diphenylol-CH<sub>2</sub>O type, alc., C<sub>2</sub>H<sub>5</sub> and diacetone alc.

**Solvents for cellulose derivatives, etc.** Henry Dreyfus. Fr. 749,788, July 29, 1933. Cyclic compds. contg. 2 O atoms and 2 methylene groups, simple or substituted, e. g., dimethylene dioxide and dimethyldimethylene dioxide, are used as solvents and softening agents for cellulose esters and ethers and natural and synthetic resins, in the prepn. of threads, films, varnishes, lacquers, etc. The compds. may be made by the process of Fr. 729,416 (C. A. 26, 5961).

**Cellulose acetate, etc.** James W. McKiuney (to Brown Co.). U. S. 1,933,676, Nov. 7. Wood pulp such as an alkali-refined pulp having an  $\alpha$ -cellulose content of about 94% or more is pretreated with lactic acid before acetylation or the like, to "activate" the material.

**Cellulose acetate preparation.** Samuel E. Sheppard and Leon W. Eberlin (to Eastman Kodak Co.). U. S. 1,931,150, Nov. 7. Cellulose acetate or the like in powder form has its particles provided with an oleaginous film such as castor oil which prevents dusting and retains electrostatic charges.

**Transparent cellulose acetate film.** James P. Walsh (to Celluloid Corp.). U. S. 1,931,518, Oct. 24. A "glass substitute" comprises a reticular film such as wire cloth covered with a transparent film permeable to ultraviolet light and comprising cellulose acetate 100, an aromatic phosphate such as triphenyl phosphate 10-20 and an ester of tartaric acid such as dibutyl tartrate 10-20 parts.

**Cellulose nitroacetate higher aliphatic acid esters.** Cyril J. Staud and Charles R. Waring (to Eastman Kodak Co.). U. S. 1,933,828, Nov. 7. Mixed esters are produced by acylating partially acetylated cellulose with a higher aliphatic acid such as stearic acid in the presence of an "impelling agent" such as chloroacetic anhydride and then initiating the resultant product.

**Use of benzyl ethers of trihydroxybenzene containing a free hydroxyl group as plasticizers with cellulose acetate or the like.** Leon W. Eberlin and John J. Schmitt (to Eastman Kodak Co.). U. S. 1,933,794, Nov. 7. A compd. such as a mono- or di-benzyl ether of hydroquinone or the like may be used with cellulose acetate in the proportion of about 10% or more for making films, etc.

**Cellulose acyl nitrates.** Cyril J. Staud and James T. Bassett (to Eastman Kodak Co.). U. S. 1,933,829, Nov. 7. A product which is suitable for films, lacquers, etc., is produced by acylating (suitably by use of acetic or butyric anhydride) a cellulose nitrate which has been partially de-nitrated so that there are less than 3 nitrate groups to very C<sub>6</sub> cellulose unit.

**Cellulose xanthate.** George A. Richter (to Brown Co.). U. S. 1,932,751, Oct. 31. Cellulose pulp is treated with

1 excess NaOH soln. of about 18% strength and contg. an oxidant such as a hypochlorite or peroxide at temps. above about 40°; excess soln. is removed, and the soda cellulose so prepd. is cooled to a temp. at which mercerization is effected, and the cooled mercerized product is xanthated.

**Use of *p*-biphenyl benzoate as a crystallizing agent with cellulose organic esters such as cellulose acetate.** Thomas F. Murray, Jr. and Cyril J. Staud (to Eastman Kodak Co.). U. S. 1,933,823, Nov. 7.

2 **Modified castor-oil product suitable for use as a softening agent with nitrocellulose.** Harold J. Barrett (to E. I. du Pont de Nemours & Co.). U. S. 1,933,697, Nov. 7. By the action of heat (suitably at a temp. of about 220°) the OH groups of one equiv. of castor oil are esterified with 0.3-1.0 equiv. of a "polybasic" org. acid such as maleic acid or phthalic anhydride which is stable under the reaction conditions, until a viscous oil having a viscosity of 65-1000 poises is produced. The heating is discontinued 3 before gelation occurs.

**Plastic compositions.** Lonza Elektrizitätswerke und chemische Fabriken A.-G. (Campel). Swiss 161,620, Aug. 1, 1933. Objects are made by heating thermoplastic cellulose derivs. to a high temp. and pressing while hot. Cellulose acetate is preferred. Softening agents may be added.

**Films.** Kenneth S. Low. Brit. 395,864, July 27, 1933.

4 **Multi-colored films, bands or sheets are obtained by heterogeneous coloration of aq. cellulosic solns., e. g., viscose or a soln. of cellulose in cuprammonium, thiocyanate or ZnCl<sub>2</sub> soln., followed by regeneration or coagulation in known manner. Examples are given.**

**Film suitable for covering caps over bottle corks.** Joseph C. Ford and Einar Olson. U. S. 1,932,617, Oct. 31. A film is formed of a cellulose compd. such as viscose rendered opaque and glossy by the pptn. in it of S (which may be effected by reaction of Na polysulfide with H<sub>2</sub>SO<sub>4</sub>).

**Regenerated cellulose films.** Kalle & Co. A.-G. (Maximilian P. Schmidt and Julius Voss, inventors). Ger. 586,021, Oct. 14, 1933. Films having a surface pattern are made by forcing the spinning soln. into the coagulating bath through a nozzle of a shape corresponding to the desired pattern.

6 **Films or sheets.** Spicers Ltd. Fr. 41,709, Mar. 29, 1933. Addn. to 615,912 (C. A. 23, 2293). Sheets or films made from compns. contg. cellulose esters or ethers are rolled, immediately after ripening, in a space maintained at a temp. considerably below the ripening temp. The reduction of temp. may be in 2 steps, by rolling first at a temp. 8° below and then rerolling at 22° below ripening temp.

**Apparatus for the manufacture of foils and films by wet or dry methods.** British Celanese Ltd. and Edward Kinsella. Brit. 396,424, July 21, 1933, and 396,723, July 31, 1933, divided on 396,424.

**Apparatus for the manufacture of foils and films, particularly from cellulose derivatives.** British Celanese Ltd. and Edward Kinsella. Brit. 396,398, Aug. 10, 1933.

**Device for producing endless bands of cellulosic materials, gelatin, etc.** Folien- u. Flitterfabrik A.-G. Brit. 395,816, July 27, 1933.

8 **Polypeptide preparations.** Soc. pour l'ind. chim. à Bâle. Swiss 160,144, May 1, 1933. Polypeptide substances are dissolved in a liquid quaternary NH<sub>4</sub> salt. Thus, powd. casein is dissolved in a mixt. of pyridine and benzylpyridinium chloride. The preps. give the biuret reaction and are used in the making of films, fibers, etc.

**Denitrating spun nitrocellulose products.** Harry P. Bassett. U. S. 1,933,204, Oct. 31. NH<sub>4</sub> sulfide and 9 NH<sub>4</sub>OH are used together for denitration.

**Recovering plasticizers such as camphor from scrap celluloid, etc.** Harry P. Bassett. U. S. 1,933,205, Oct. 31. The material is intimately contacted with a solvent for the plasticizer (such as CHCl<sub>3</sub> for recovery of camphor) and alc. is conjointly used as a solvent-recovery agent. CHCl<sub>3</sub> and alc. when used together may be sep'd. by fractional distn. Various details and modifications of procedure are described.

**Esters of polymeric carbohydrates such as cellulose.** Albrecht Schmidt, Gerhard Balle and Hans Lange (to I. G. Farbenind. A.-G.). U. S. 1,931,832, Oct. 24. A carbohydrate deriv. such as diethylcellulose or hydroxypropyl starch is esterified by reaction with an aliphatic carboxylic acid such as formic or acetic acid in the presence of liquid  $\text{SO}_2$ . Cf. C. A. 27, 5976.

**Carbohydrates.** Lonza Elektrizitätswerke und chemische Fabriken A.-G. (Gampel). Swiss 160,753, June 1, 1933. Carbohydrates are pptd. from their solus. by intimate mixture with a liquid pptg. agent in the form of a soln. or dispersion. Thus, a soln. of cellulose acetate is pptd. by addn. of water or aq. salt soln. The rate of pptn. is regulated by the proportions of the mixt.

**Saccharification of cellulosic materials.** Heinrich Scholler. Ger. 577,850, June 6, 1933. App. in which sawdust, etc., is treated with dil. acids under high pressure and temp. is described. Cf. C. A. 27, 1754.

**Polysaccharides.** I. G. Farbenind. A.-G. (Karl Fredenhagen, Burkhardt Helferich and Ernst Koch, inventors). Ger. 577,764, June 3, 1933. Addn. to 560,535 (C. A. 27, 1169). The method of 560,535 for converting polysaccharides to water-sol. form by treatment with liquid or gaseous anhyd.  $\text{HF}$  is modified by using  $\text{HF}$  gas diluted with inert gas such as air.

**Cuprammonium silk.** Bemberg S. A. Ger. 577,726, June 3, 1933; Swiss 162,112, Aug. 16, 1933. App. for spinning cuprammonium silk is described, the pptg. bath being a 1.4% soln. of  $\text{Na}_2\text{SO}_4$ . After use, this is freed from  $\text{NH}_3$  by heating to  $40-70^\circ$  in *vacuo*, and from Cu compds. by filtration; it is then returned for further use.

**Rayon.** N. V. Fabriek van chem. Producten. Ger. 586,228, Oct. 19, 1933. A nitrocellulose of low N content, e. g., 2.4%, is treated with  $\text{Ac}_2\text{O}$  in the presence of  $\text{H}_2\text{SO}_4$  until the degree of esterification of the cellulose is at least 91%, complete conversion into triester being regarded as 100% esterification. Excess of  $\text{Ac}_2\text{O}$  is then decompd. by addn. of water or alc., and the mixt. is left to stand until the  $\text{H}_2\text{SO}_4$  residues in the cellulose ester have been replaced by Ac groups. The soln. is then filtered and spun into a pptg. bath, either directly or after neutralization of free  $\text{H}_2\text{SO}_4$ . Rayon of high resistance to water is obtained.

**Rayon.** Soc. chimique des usines du Rhône. Fr. 41,645, Feb. 15, 1933. Addn. to 638,448 (C. A. 23, 278). A mat surface is obtained by forming  $\text{TiO}_2$  or other white mineral oxide by chem. action in the soln. of cellulose acetate used. The secondary products of the reaction are removed by washing.

**Rayon.** La soie de Valenciennes, Maurice A. Starink and Pierre Koets. Fr. 750,101, Aug. 5, 1933. The strands of rayon are held together after spinning without sizing, by reducing the acidity of the coagulating bath, reducing its temp. or reducing the ratio of cellulose to soda in the viscose soln.

**Rayon, etc.** Henry Dreyfus. Fr. 41,759, Apr. 13, 1933. Addn. to 683,463 (C. A. 24, 4632). The coagulation of solns. of org. derivs. of cellulose is obtained by baths contg. lower aliphatic acids of a relatively high degree of concn. and also solvents of the cellulose deriv. of a relatively high b. p. The bath may also contain sol. salts or other substances capable of reducing the solv. of the aliphatic acid in the water of the bath. Examples are given of baths contg.  $\text{AcOH}$ , l-t lactate and  $\text{NaOAc}$ . Cf. C. A. 28, 323.

**Rayon, etc.** Henry Dreyfus. Fr. 749,709, July 28, 1933. The filaments are extruded into an evapg. medium and at least 2 currents of evapg. agent are directed toward the filament from different sides. An app. is described.

**Rayon, etc.** Henry Dreyfus. Fr. 749,789, July 29, 1933. In dry-spinning processes, the evapg. agent is introduced at a pt. intermediate between the ends of the spinning chamber and at least a part of the current moves in the same direction as the extruded products. Various forms are described. Fr. 749,790. The evapn. of the solvent is retarded in the first stages of the spinning by protecting the filaments when freshly extruded from the evapg. agent and the filaments are afterward drawn in

1 such a manner that the drawing does not wholly extend to the spinning nozzles.

**Rayon, etc.** Henry Dreyfus. Fr. 749,913, Aug. 1, 1933. In dry spinning, the filaments are carried aside from the spinning nozzle and submitted to a tension at points in their course, which points get nearer to one another as the distance from the extruding point increases. The filaments are lubricated before coming in contact with the tensioning means and the tension is preferably applied while the filaments contain at least 50% of solvent.

**Centrifugal spinning apparatus for rayon.** Barney Maschinenfabrik A.-G. Brit. 395,650, July 20, 1933.

**Spinning centrifuge for rayon.** N. V. Intern. Spinpot Exploitatie Maatschappij (I. S. E. M.). Ger. 586,185, Oct. 17, 1933.

**Device for imparting an irregular oscillation to the filament guide in winding rayon in bobbin-spinning machines.** Algemeene Kunstrijde Unie N. V. Brit. 395,954, July 27, 1933.

**Apparatus for washing and other liquid treatments of cakes of rayon.** Walter Schieber and Frich Friedemann (to I. G. Farbenind. A.-G.). U. S. 1,932,913, Oct. 31. Structural details of an app. with spraying nozzles.

**Apparatus with a spinning nozzle and precipitating bath for manufacture of artificial threads from viscose solutions.** Hugo Pfannenstiel and Harry Meyer (to I. G. Farbenind. A.-G.). U. S. 1,933,999, Nov. 7. Various structural and operative details are described.

**Spinning cell for production of artificial filaments from cellulose acetate or the like by the evaporative process.** Henry Dreyfus, Edward Kinsella, Joshua Bower and Wm. I. Taylor (to Celanese Corp. of America). U. S. 1,933,587, Nov. 7. Various structural and operative details are described.

**Apparatus for production of artificial filaments from cellulose acetate or the like.** Wm. I. Taylor (to Celanese Corp. of America). U. S. 1,933,607, Nov. 7. A plurality of filaments are extruded into a setting medium and at some distance from the point of extrusion a fluid such as compressed air is projected onto the filaments to unite them into a single filament while the material is still in a sticky condition.

**Artificial filament manufacture from solutions such as those of cellulose acetate.** John F. Briggs and Robert P. Roberts (to Celanese Corp. of America). U. S. 1,934,618, Nov. 7. Various details of app. and operation are described for the production of filaments by the dry or evaporative method.

**Artificial filaments.** British Celanese Ltd., Edward Kinsella and Reginald H. J. Riley. Brit. 396,792, Aug. 10, 1933. In the dry spinning of artificial filaments 2 or more streams of air, etc., are directed against the filaments near their point of extrusion from different sides at different distances from the spinning nozzle. App. is described.

**Artificial filaments and threads.** Henry Dreyfus. Brit. 395,353, June 30, 1933. Cyclic 1,3-diethers contg. at least 5 atoms in the ring, except methylene ethylene oxide, are used in the manuf. and treatment of filaments, etc., of cellulose esters, ethers and ether-esters as solvents in the spinning soln. or coagulating bath or for swelling the threads for dyeing, printing, stenciling, discharging, delustering, relustering, improving or stretching. Diethers, or their ethers or esters, obtained by condensation of an aldehyde or ketone with an aliphatic alc. contg. 3 or more OH groups are excluded. Examples of diethers are 2-methyl-1,3-cyclotrimethylene dioxide, 2,4-dimethyl-1,3-cyclotrimethylene dioxide, 2-methyl-1,3-cyclotetramethylene dioxide, 4-chloromethyl-1,3-cyclotrimethylene dioxide, 2,2-diethyl-1,3-cyclotrimethylene dioxide, 2-phenyl-1,3-cyclotetramethylene dioxide (obtained from Bzl and 1,3-propylene glycol), 2-benzyl-1,3-cyclotrimethylene dioxide, the diether obtained from cyclohexanone with glycerol monochlorohydrin and the compds. obtained by condensation of  $\text{CH}_2\text{O}$ , or its polymers, with diethylene or other polyolefin glycols. Etherification catalysts may be used in the condensation of the aldehydes or ketones with the aliphatic dihydroxy compds. The lower diethers are suitable as the sole or principal solvent in spinning solns.

and the higher di-ethers for stretching or other treatment. Examples of spinning and various treatments are given. Cf. C. A. 27, 5200.

**Artificial threads and films.** Jan C. de Nooij and Dirk J. Gerritsen. Brit. 395,947, July 27, 1933. Solns. of cellulose suitable for use in the production of rayon threads, films, bands, etc., are obtained by dissolving cellulose in  $\text{H}_2\text{SO}_4$  of concn. above 60% and then dilg. with  $\text{H}_2\text{O}$ , alcs.,  $\text{Me}_2\text{CO}$ , dil. salt solns. or other substance or mixt. of substances which is sol. in the acid until the concn. of the  $\text{H}_2\text{SO}_4$  is less than 60%. The soln., which is then in a metastable condition, coagulates on standing. When making filaments or films the concn. of the soln. and the temp. are adjusted so that the soln. may be subjected to the de-aerating, filtering and ripening processes without coagulating. The soln. is spun into  $\text{H}_2\text{O}$ , alc. or aq. alc. and the coagulating liquid may contain dissolved acids, alkalis and salts.

**Threads.** Henry Dreyfus. Fr. 749,448, July 24, 1933. Filaments made from cellulose acetate, etc., are submitted in the softened state to a stretching or drawing so as to cause rupture of the individual filaments, whereby threads resembling those made by spinning operations are obtained.

**Artificial hollow threads, artificial straw, etc., from cellulose esters and ethers.** Otto Laubi (to Lonza Elektrizitätswerke und chemische Fabriken A.-G.). U. S. 1,933,019, Oct. 31. In operating according to the "dry method," highly concd. dough-like solns. or masses flowing only with difficulty or not at all at ordinary temp. and contg. at least about 30% of a cellulose ester or ether are forced through nozzles with annular orifices under high pressure while simultaneously jointly introducing at least one thread-like inlay and a gas stream into the body undergoing formation. App. is described.

**Cellulose acetate artificial threads.** Société pour la fabrication de la soie "Rhodiaseta." Brit. 395,440, July 20, 1933. The threads are made by downward dry spinning in a mild evaporative atm., the usual spinning solns. being preheated before issuing from the die at such a temp. that their viscosity does not exceed 100 C. G. S. units and the filaments being only subjected during the spinning operations to a stretching not exceeding the ratio 2. The threads produced have an elongation at breaking greater than 30% and a breaking load similar to that of the usual cellulose acetate threads. In the production of crepe fabrics therefrom swelling without peptization may be reduced to a min. or, in some cases, dispensed with. The threads can also be used in the manuf. of horsehair or straws.

**Thin sheets having a basis of viscose, cellulose derivatives, etc.** Henry Dreyfus. Fr. 748,500, July 5, 1933. The drum on which the soln. for making thin sheets is deposited has a surface made of a tenacious and inoxidizable metal, such as stainless steel or Ni worked in the cold.

**Thin sheets having a basis of viscose, cellulose derivatives, etc.** Henry Dreyfus. Fr. 748,539, July 5, 1933. Solns. for making sheets suitable as packing paper are deposited on flexible bands made of stainless steel, or Ni worked in the cold or other highly polished metal.

**Purifying copper salt solutions.** Bemberg S. A. Swiss 161,503, July 17, 1933. Fe is removed from Cu salt solns. by heating with an O-yielding agent in the presence of an alkali. Thus, a soln. contg. 7% Cu and 0.07% Fe is heated with KOH and  $\text{K}_2\text{Mn}_2\text{O}_8$ . The Fe content is reduced to 0.005%. The process is useful for removing Fe from the waste lye of cupranonium silk processes.

**Bleaching pulp, etc.** Carl B. Thorne. Brit. 395,512, July 20, 1933. See Fr. 739,909 (C. A. 27, 2297). In 395,513, July 20, 1933, pulp, or the like, of low d. is bleached while passing in a shallow layer along a conduit having a downwardly inclined floor. App. is described. Cf. C. A. 27, 5977.

**Utilizing "black liquor" from sulfate or soda pulp manufacture.** Edward G. Goodell. U. S. 1,931,536, Oct. 24. For recovering alkali metal values and heat of combustion from black liquor, concd. black liquor and black liquor powder are introduced into a smelting furnace

together with inert gases to retard combustion of org. materials present. App. is described.

**Production of bisulfite liquor and cooling of carbon dioxide.** Sigmund Wang. U. S. 1,935,381, Nov. 14. \* In the production of bisulfite liquor and cooling of  $\text{CO}_2$  preliminary to its liquefaction or solidification, an aq. limestone slurry is decompd. by the action of  $\text{SO}_2$  gas, and liquid  $\text{SO}_2$  is evapd. by heat exchange with the  $\text{CO}_2$  produced from the limestone slurry treatment; the gaseous  $\text{SO}_2$  thus obtained is then caused to react with slurry. An arrangement of app. is described.

**Cooking cellulosic material for fiber liberation.** Geo. A. Richter (to Brown Co.). U. S. 1,935,579, Nov. 14. Material such as wood chips is cooked short of fiber liberation in an alk. Na base liquor such as one contg. NaOH and Na sulfide and, after sepn. of this liquor, is further cooked, to effect complete fiber liberation, in a substantially neutral soln. contg. a sulfite. U. S. 1,935,580 relates to a process in which preliberated cellulosic pulp is digested at temps. above  $150^\circ$  in a soln. of a sol. borate, aluminate or silicate, to improve its properties for manuf. of paper, nitrocellulose, etc.

**Cellulose pulp.** Oscar V. E. Jansa and Erik G. Planck. U. S. 1,933,017, Oct. 31. In the continuous digestion of vegetable fibrous material such as wood chips by treatment with a lixivation liquor in a digester under pressure and while heated, the raw material is introduced into the digester in admixture with an excess of liquor and the excess liquor is then sepd. and withdrawn from the digester. App. is described.

**Cellulose pulp.** A.-G. für Halbzellstoff-Industrie. Swiss 100,451, May 16, 1933. Pulp for the paper industries, capable of storage or transportation, is made by mechanically disintegrating the crude fiber, softening it by treatment with hot water, washing, dehydrating and pressing.

**High  $\alpha$ -cellulose pulp.** Wm. D. Nicoll (to E. I. du Pont de Nemours & Co.). U. S. 1,931,933, Oct. 24. Raw gramineous fiber such as that of bagasse substantially free from pith is countercurrently digested in alk. liquor such as NaOH soln. maintained at  $130$ – $60^\circ$ . The pulp is then washed and countercurrent digestion is continued until a pulp is obtained contg. at least 95% alpha cellulose on the dry basis.

**Multiple-stage washer for treating cellulosic pulp.** Charles L. Wagner (to J. O. Ross Engineering Corp.). U. S. 1,933,609, Nov. 7. Structural and mech. features.

**Treating black liquor from cellulose pulp manufacture.** Edward G. Goodell. U. S. 1,933,254, Oct. 31. For recovery of alkali metal values and utilization of the heat content, the solids of black liquor, in substantially dry condition, are introduced into a smelting furnace and burned under reducing conditions; alkali metal values are fused off, and addnl. air is supplied to the combustion gases directly above the fuel bed and the gases are burned under a boiler. App. is described. U. S. 1,933,255 relates to app. for generally similar use, including a steam generator and spray drier.

**Apparatus for pulping wood.** James H. Ross. Fr. 750,119, Aug. 5, 1933.

**Grinding apparatus for making wood pulp.** A.-G. der Maschinenfabriken Escher Wyss & Cie. Ger. 586,129, Oct. 18, 1933.

**Apparatus for removing bleaching, etc., liquids from wood pulp and like fibrous masses.** Zellstofffabrik Waldhof and Walter Leupold. Ger. 586,205, Oct. 21, 1933.

**Apparatus for straining wood pulp, etc.** Walter Voith, Hermann Voith and Hanns Voith (trading as J. M. Voith). Brit. 395,897, July 27, 1933.

**Paper pulp.** Ralph H. McKee. U. S. 1,932,904, Oct. 31. Alkali-treated fibrous vegetable material (such as straw or stalks) is subjected to the action of a mixt. of Cl gas and air.

**Paper pulp.** Sidney D. Wells (to Lewis L. Alsted). U. S. 1,934,957, Nov. 14. In the manuf. of pulp from wood contg. foam-producing substances, the wood is digested in a cooking liquor maintained at such a d. as to be separable from suspended foam-producing substances

by centrifuging; after cooking of the wood and removal of the liquor from the digested material, such centrifugal sepn. is effected.

**Refining paper pulp.** Lemuel V. Reese and George W. Johnson (to American Laundry Machinery Co.). U. S. 1,931,508, Oct. 24. Pulp is centrifuged to sep. the pulp and impurities into strata so that pulp free from impurities may be obtained; impurities are sepd. and trapped, liquid is extd. from the impurities, and the liquid is delivered to the purified pulp. App. is described.

**Screening paper-making pulp.** Anton J. Haug. U. S. 1,932,603, Oct. 31. Various details of app. and operation are described.

**Pulp from waste paper.** Francis H. Snyder and Stanley P. M. Maclaren (to Industrial Research Ltd.). U. S. 1,933,227, Oct. 31. Waste paper is subjected to the action of a solvent for linseed oil varnish such as  $C_6H_6$  or  $CCl_4$  and a dil. aq. suspension of the treated paper is subsequently subjected to beating in the presence of Na silicate. U. S. 1,933,228 relates to a process in which a dil. suspension of the waste paper is beaten in the presence of a sol. salt of an amphoteric metal acid such as an alkali metal aluminate or titanate.

**Cellulose digester.** Rinar Morterud. Ger. 577,985, June 8, 1933.

**Continuously operated cellulose digester.** Felix Gohl and Sixten Magnus Hjelte. Ger. 586,302, Oct. 19, 1933. Pressure rolls for dewatering cellulose coming from the digester are described.

**Use of carbon bricks for lining digesters such as those used for cooking material for paper pulp.** James L. Green (to National Carbon Co.). U. S. 1,932,457, Oct. 31.

**Digesting wood chips with sulfite liquor.** Thomas L. Dunbar. U. S. 1,932,885, Oct. 31. Hot preconditioned sulfite liquor is flowed from an elevated pressure accumulator, under the pressure and static head existing in the accumulator, directly into a digester (the liquor being of such concn. that it can be used immediately for the digesting operation). App. is described.

**Treating sulfide solutions such as residual solutions from cooking wood.** Linn Bradley and Edward P. McKeefe (to Bradley-McKeefe Corp.). U. S. 1,934,655, Nov. 7. A residual soln. contg.  $Na_2S$  is mixed with  $NH_4$ , Ca and Mg sulfites and Mg sulfate and heated to remove  $H_2S$ .

**Apparatus for recovering fibers from waste waters of cellulose or paper manufacture.** Carl B. Thorne. Ger. 580,494, Oct. 21, 1933. See Brit. 343,327 (C. A. 25, 4338).

**Paper.** James J. O'Connor and Donald F. Morris (to Mead Corp.). U. S. 1,935,482, Nov. 14. See Brit. 341,733 (C. A. 27, 597).

**Paper.** Papeteries Navarre (Soc. anon.). Fr. 750,032, Aug. 3, 1933. The cellulose is sized before its use for the manuf. of paper. The sizing agents, e. g., an emulsion of paraffin, may be applied to the cellulose in suspension in water or while the sheet of cellulose is in process of formation or completely formed. Fr. 750,036, describes an app. for dispersing paraffin, etc., on paper, etc.

**Vacuum apparatus for stock consistency control in paper making.** Darcy E. Lewellen and Emmons F. Lewellen. U. S. 1,933,814, Nov. 7. Various structural and operative details are described.

**Press for paper-making apparatus, including a screen-faced press roll.** Carl H. R. Johnson (to Downingtown Mfg. Co.). U. S. 1,934,543, Nov. 7. Mech. features.

**Doctor blades for paper-making apparatus.** Oliver P. Arnold (to W. F. Greene Corp.). U. S. 1,933,837, Nov. 7. Mech. features.

**Apparatus for manufacture of paper reinforced with woven fabric or threads.** Wm. H. Cannard. U. S. 1,934,580, Nov. 7. Mech. and structural features.

**Homogenizing suspensions of solids such as pigments or fillers for paper manufacture.** Harold R. Rafton (to Raffold Process Corp.). U. S. 1,934,637, Nov. 7. Various details of operation are described by which oversize solid particles may be reduced in size by passing them in liquid suspension under high pressure through a restricted orifice. U. S. 1,934,638-9 relate to mech. details in the prepn. and use of an alk. filler in making paper. U. S. 1,934,640-1 (Harold R. Rafton to Rafton Engineering Corp.) relate to prepn. and use of satin white in the manuf. of coated paper, the material being prppd. in particles of regulated and desired size.

**Preparation and use of a clay filler in paper manufacture.** Harold R. Rafton (to Rafton Engineering Corp.). U. S. 1,934,642, Nov. 7. Various details of operation are described for the prepn. and use of material of desired particle size.

**Resin soap for sizing paper.** Cyprien Gillet. Ger. 577,887, June 6, 1933. Resin is heated with an aq. soln. of alkali carbonate and ammonia in two stages. App. is indicated.

**Sizing paper.** I. G. Farbenind. A.-G. (Eduard Schnitzler and Georg Hingst, inventors). Ger. 584,490, Oct. 25, 1933. Resin, wax or other usual paper size having, either naturally or as the result of treatment, an acid no. between 2 and 40 is emulsified in water with the aid of a monocarboxylic ester of polyglycerol. The emulsion is mixed with paper stuff, and the size then pptd. on to the fiber with  $Al_2(SO_4)_3$ . Cf. C. A. 27, 2035.

**Carbonate-filled sized paper.** Harold R. Rafton (to Raffold Process Corp.). U. S. reissue 18,983, Oct. 31. A reissue of original pat. No. 1,803,647 (C. A. 25, 3837).

**Waterproofing or sizing paper.** Papeteries Navarre (Soc. anon.). Fr. 749,722, July 28, 1933. The application of paraffin, pure or in admixt. with products favoring sizing or waterproofing, is carried out in the normal manuf. of paper or cardboard, preferably before the last drying cylinders.

**Coating paper, etc., sheets.** Cyril A. Chester and Raymakers Syndicate Ltd. Brit. 390,810, Aug. 14, 1933.

**Waxed paper or sheet material such as textile material** manufd. by depositing wax in a liquid film upon the surface of a flotation medium at such temp. as to maintain the wax film in liquid form and applying the paper, etc., to the surface of the medium so as to remove the wax film therefrom. The wax, e. g., white wax, may be dissolved, e. g., in gasoline, and used at normal temp. or the process may be conducted at higher temps., e. g., 90°F., when using paraffin wax dissolved in gasoline.

**Coating paper with aqueous mineral coating compositions.** Donald B. Bradner (to Champion Coated Paper Co.). U. S. 1,933,003, Nov. 7. Various details of app. and operation are described.

**Apparatus for water-marking paper during manufacture.** Howard Brown (to Southworth Co.). U. S. 1,933,006, Oct. 31. Mech. features.

**Machine for opening or cleaning and simultaneously disinfecting waste paper, esparto grass, rags, etc.** Reynald Brown. Brit. 395,824, July 27, 1933.

**Tracing material.** Waldemar Schwable and Otto Schnecko (to Du Pont Cellophane Co.). U. S. 1,934,824, Nov. 14. A tracing sheet comprises cellulose hydrate coated with a material such as a nitrocellulose lacquer which is resistant to the action of writing fluids and which contains a finely divided filler such as chalk, starch or talc which is capable of retaining writing fluid lines.

## 24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROK AND C. G. STORM

**Alfred Nobel. P. Martel. Z. ges. Schiess-Sprengstoffw.** 28, 305-6(1933).—In commemoration of the 100th anniversary of Nobel's birth. C. G. Storm

**Determination of mononitrotoluene.** K. Lesničenko *Chimie & Industrie Special No.*, 945-51 (June, 1933).—See C. A. 27, 2113. A. Papineau-Couture

**Modern explosives.** Guido Guastalla and Giovanni Raccui. *Industria chimica* 8, 1231-41 (1933); cf. C. A. 27, 5541, 5979.—The prepn. and properties of tetryl are reviewed; a bibliography is appended. A. W. Contieri

**The limiting charge of fulminate of mercury.** J. Barcikowsky and J. Kleczewski. *Chimie & industrie Special No.*, 939-44 (June, 1933).—Detonator charges can be made considerably smaller than they are at present, by suitably shaping them. A 0.1-g. of  $\text{Hg}(\text{CNO})_2$  detonator can be used for firing TNT charges in mines by shaping the detonator as 2 co-axial cylinders, the base of the larger being in contact with the main charge of explosive into which it may be pressed. A. Papineau-Couture

**Purification of trinitrotoluene by sodium sulfite: its effect on  $\alpha$ -trinitrotoluene.** Jean McElf. *Chimie & industrie Special No.*, 952-9 (June, 1933).—A study of the action of  $\text{Na}_2\text{SO}_3$  on sym.  $\text{C}_7\text{H}_5(\text{NO}_2)_3$  (I), on the impurities which accompany it in crude com.  $\text{C}_7\text{H}_5(\text{NO}_2)_3$  (2, 3, 4- and 3,4,6-trinitrotoluene, dinitrotoluenes) and on mixts. of I with the impurities (including  $\text{C}(\text{NO}_2)_4$  and trinitrobenzoic acid) in approx. the proportions in which they are present in the crude com. product. At atm. temp. I reacts but slightly with  $\text{Na}_2\text{SO}_3$ ; 2,3,4- and 3,4,6-trinitrotoluene combine fairly rapidly; increasing the temp. reduces the time necessary for completion of the reaction, but increases the loss of I. Removal of 2,3-, 3,4- and 2,5-dinitrotoluene requires a temp. of about 50°, but at the expense of a quite appreciable loss of I; but the 2,4-deriv. is practically unacted upon at this temp. In the presence, however, of both I and asym.  $\text{C}_7\text{H}_5(\text{NO}_2)_3$ , dinitrotoluenes are removed, provided they are present in amts. not exceeding 3%; up to 0.4% of the 2,4-deriv. remains, and the purified I m. 80.5°. The small amts. of  $\text{C}(\text{NO}_2)_4$  (0.3%) and trinitrobenzoic acid (0.2%) normally present in the crude product are readily removed by this treatment when carried out at 35° for 45 min., the loss of I being about 4%, which is due to the formation (through a series of intermediate reactions) of hexanitrodikuzvl. Treatment is best carried out when the crude oil is in small crystals, readily obtained by pouring the melted mass in an equal wt. of water at 90° and cooling at the rate of 1° per 3 min. A. Papineau-Couture

**Formation of nitrodiazotoluenesulfonic acid from the waste waters of the purification of trinitrotoluene by sodium sulfite.** Bedlich Batik. *Chimie & industrie Special No.*, 960-3 (June, 1933).—On acidification of the waste waters from the purification of trinitrotoluene by  $\text{Na}_2\text{SO}_3$ , there ppts. 6-nitro-4-diazotoluene-3-sulfonic acid (I) (constitution proved), which easily explodes on heating (as low as 75°). These waste waters should therefore be discharged in such a manner as not to become acidified. Formation of I may be used as a test for detecting the presence of asym.  $\text{C}_7\text{H}_5(\text{NO}_2)_3$  in the com. product. On boiling with  $\text{NaHSO}_3$ ,  $\text{C}_7\text{H}_5(\text{NO}_2)_3$  gives amino derivs. which, on acidification, give with  $\text{NaNO}_2$  diazo and diazo-amino derivs. which ignite very easily; aminosulfonic acids are also probably formed to a slight extent. A. Papineau-Couture

**High brisance in the service of commercial and military technic.** Stettbacher. *Schweizerische Bauzeitung* 101, No. 17, 4 (1933); *Nitrocellulose* 4, 166 (1933).

E. M. S.

**Theory of detonation of safety explosives.** Karl Fisher. *Z. ges. Schuss-Sprengstoffw.* 28, 316-17 (1933).—An explanation, contrary to the theory offered by Audibert (*Chronik der Unfallverhütung* 8, 131), is advanced to explain the presence of portions of the original explosive

charge in the products of explosion of certain coal-mining explosives. C. G. Storm

**A new azide detonator.** Fr. Blechta. *Chimie & industrie Special No.*, 921-5 (June, 1933).—The advantages of  $\text{AgN}_3$  as a detonator, even in coal mines, are discussed. The fact that it ppts. in the colloidal form has prevented its adoption because of tech. difficulties in the manuf. of detonators. This has now been overcome by mixing the  $\text{NaN}_3$  with substances (either inert, or, preferably, explosive such as tetryl, penthrite,  $\text{Hg}$  fulminate, etc., suitable as detonators) which remain granular and mobile when dried, so that the  $\text{AgN}_3$  forms a thin film over the added substances. The efficiency of such detonators, wt. for wt., is practically the same as that of pure  $\text{AgN}_3$ , and the cost appreciably lower. A. Papineau-Couture

**The explosion of carbon disulfide-nitrous oxide and carbon disulfide, nitrous oxide-nitric oxide mixtures.** J. A. M. van Liempt and J. A. de Vriend. *Rec. trav. chim.* 52, 862-8 (1933); cf. C. A. 27, 5180.—The explosion limits for mixts. of  $\text{CS}_2$  and  $\text{N}_2\text{O}$  at pressures from 1 to 35 cm. were detd. and the intensity of light evolved by the explosion flames was measured, the max. being obtained with the ratio of 1:3.5. Intensity is proportional to the sq. of the pressure. Ignition temp. is 1800-1900°. Explosion limits for mixts. of  $\text{CS}_2$ ,  $\text{NO}$  and  $\text{N}_2\text{O}$  were also detd. C. G. Storm

**Influence of thermal cond. of metals on their utilization in the manuf. of explosives.** (Stefan) 9. Ignition temps. of mixts. of  $\text{H}_2\text{S}$ ,  $\text{CS}_2$  and air (Leicester) 2.

**Explosives.** Charles P. Spach (to E. I. du Pont de Nemours & Co.). U. S. 1,932,050, Oct. 24. Explosives such as  $\text{NH}_4\text{NO}_3$  or a smokeless powder mixt. are coated with trimethylethylmethane trinitrate, which serves as a waterproofing and auxiliary explosive agent. Cf. C. A. 27, 845.

**Pentaerythritol tetranitrate.** Thomas R. Paterson (to Imperial Chemical Industries Ltd.). U. S. 1,933,754, Nov. 7. Purification of pentaerythritol tetranitrate is effected by crystg. from  $\text{PhNO}_2$ . Cf. C. A. 27, 3950.

**Smokeless powder.** Sereno G. Norton (to Hercules Powder Co.). U. S. reissue 18,989, Nov. 7. A reissue of original pat. No. 1,788,438 (C. A. 25, 1086).

**Slow match composition suitable for igniting smokeless powder, etc.** Aubrey A. Young (to Atlas Powder Co.). U. S. 1,935,495, Nov. 14. An "elec. match" comprises a body of a sensitive initiating compd. such as cuprous acetylide and a body of deflagrating and more slowly burning material such as  $\text{NH}_4$  picrate and  $\text{K}_2\text{Cr}_2\text{O}_7$ . Various details and examples are given.

**Pyrotechnic product suitable for coloring open fires.** Althea T. Berry. U. S. 1,932,722, Oct. 31. An assemblage is formed of elongated combustible shreds such as excelsior which are each coated with material including a flame-coloring ingredient, a combustible binding ingredient such as gelatin or glue and a comminuted refractory combustion-retarding ingredient such as talc, gypsum or  $\text{CaCO}_3$ . The shreds are sufficiently flexible and the coating of such frangible character that by flexure of the shreds the coatings may be ruptured to permit simultaneous combustion of the shreds and of the combustible ingredients of the coating compn.

**Miners', etc., safety lamps.** The Concordia Electric Safety Lamp Co. Ltd. and Theodore Stretton. Brit. 396,886, Aug. 17, 1933.

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

**Studies on Japanese dyeing tannins. XI. Discussion of the mechanism of tannin mordanting (Preliminary Report III).** The absorption of tannin by cellulose (Supplementary Report). Yoshisuke Uyeda and Kikuo Ishinada. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 574 5(1933); cf. *C. A.* 26, 6142.—Some improvements on the exptl. procedure are reported. K. K.

**Influence of treatment with hyposulfite on the dyeing ability of pine extract.** A. N. Mikhailov. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Koshevennoi Prom. Tsentral. Nauch.-Issledovatel. Inst. Koshevennoi Prom.* 1932, No. 4, 21.—The expts. were carried out in an alk. medium because of the decompn. of the hyposulfite in an acid medium, thus causing a lower viscosity. Conclusion: Although the hyposulfite treatment causes some changes in the colloidal properties of the pine ext., these changes do not improve the tanning properties of the ext. to any noticeable extent. A. A. Boehlingk

**Effect of sunlight and other factors on the strength and color of cotton fabrics.** Mary Anna Grimes. *Tex. Agr. Expt. Sta., Bull.* 474, 5 56(1933).—Unnecessary exposure of cotton fabrics to direct sunshine should be avoided. To lose the least strength upon exposure to sunlight, a cotton fabric should be composed of unbleached, mercerized, coarse, hard twisted yarns. If dyed, a vat dye with protective characteristics and in a high concn. should be used. The fastness of the dye is not dependent upon the color. C. R. Fellers

**The use of unoxidizable or stainless steels in the dyeing industry.** Andre Michel. *Rev. gen. mat. color.* 37, 417 23(1933). The unoxidizable or stainless steels which contain Cr, Ni and other metals in varying proportions are quite satisfactory in the various operations of bleaching and dyeing but a selection should be made of the one best suited for the chem. baths used. Halsey E. Silliman

**The use of aluminum in the construction materials in the bleaching industry.** H. Tatu. *Rev. gen. mat. color.* 37, 427 36(1933). There are no serious objections to the use of Al for materials of construction in contact with bleaching baths, particularly  $H_2O_2$ . Large constructions are now in use. The merits lie in no serious corrosion, no catalytic decompn. of the baths as with Cu, Fe and their alloys, also its lightness. Halsey E. Silliman

**Overcoming the bad effect of sodium alkalis on vegetable textile fibers.** Raymond Vidal. *Rev. gen. mat. color.* 37, 137 8(1933). To overcome the bad effect of alkali treatment in bleaching operations, it is proposed to use a bath of about 1% of Liposels for 5-10 min. followed by a cold bath of alk. hypochlorite contg. 0.3% active Cl. Repetition of this treatment even 3 or 4 times does not show formation of oxycellulose by the Turnbull blue test. The merits of this process are the cold treatment, omission of 2 washings and 2 acid treatments, reduction of time of bleaching, in so far as concerning cotton, from 2 or 3 days to 3 or 4 hours, and a better conservation of the fiber and its weight. Halsey E. Silliman

**The influence of light on cotton and wool.** Emil J. Simola. *Teknillinen Aikakauslehti* 23, 326 9(1933). Comparative tests were made on cotton and worsted yarns which were exposed to sunlight through a double glass window. The results showed that exposure for 5 summer months reduced the tensile strength of cotton 17.8% and of wool 7.3%, but the stretching properties were simultaneously reduced an av. of 12% for cotton yarn and 37.7% for worsted yarn. Mercerized cotton yarn had the smallest loss in tensile strength (13.7%) but the greatest loss (27.3%) in elasticity. Fine fiber wool suffered more from the light than coarse fiber. S. A. Karjala

**Use of aqueous chlorine and bromine solutions in the manufacture of knitted unshrinkable wool fabrics.** S. R. Trotman. *Rev. gen. mat. color.* 37, 388 92(1933); cf. *C. A.* 27, 4085.—When wool is treated with Cl in the presence of acid, the amine group is lost. Structural alteration is not necessarily accompanied by unshrinkability. It is proposed to employ Br water in place of the

usual NaClO and HCl methods. Much less alteration of structure is obtained in using Br than in an equiv. quantity of Cl. Cl with NaOAc, Br and HBr, and Br alone permit good dyeings although bromination does not augment the affinity of wool for dyestuffs as much as chlorination. Halsey E. Silliman

**Direct sulfonation of natural substances containing higher alcohols.** Mario Gallotti and Alberto Moggi. *Industria chimica* 8, 1226(1933).—Natural products, such as oils, waxes, may be sulfonated directly to obtain products useful in treating textile yarns. Treat spermaceti oil by dissolving in trichloroethylene, cool to  $-2^\circ$ , and treat with sulfuryl chloride. After 48 hrs., pour in ice, neutralize with  $Ca(OH)_2$ , distill to recover solvent, and filter. Treat the filtrate contg. the cetylsulfonate with  $Na_2CO_3$  to give the sol. Na cetylsulfonate. This product is used in textiles without further purification. A. W. C.

**Impregnating pig skins and dyeing them with a black permanent dye (Baidan, et al.)** 29. Dyeing chrome sheep skins black (Vinogradova) 29. Dyeing light box leather into brown color resistant toward wet and dry friction (Metlitzkaya) 29. Prepn. of the hyposulfite-formaldehyde of soda (Zundel) 18. Metallic soaps [products used in mordanting, dry cleaning] (Brit. pat. 395,406) 27. Polyvinyl compds. [products for use in the textile industry] (Brit. pat. 306,186) 10. Indophenols—S dyes (Brit. pat. 396,393) 10. Hydrazine-sulfonates of the diarylamine series (U. S. pat. 1,932,152) 10.

**Dyes.** I. G. Farbenind. A.-G. Brit. 395,968, July 27, 1933. Complex Cr compds. of *o*-hydroxyazo dyes are made by treating *o*-alkoxyazo dyes with a Cr sulfate under such conditions that the alkyl radical is split off. In examples the dyes 4-chloro-2-anisidine  $\rightarrow$  2-naphthol-6,8-disulfonic acid or 1-naphthol-3,8-disulfonic acid and 5-nitro-4-methyl-2-aminoanisole  $\rightarrow$  1-naphthol-4,8-disulfonic acid are heated in a Pb-lined autoclave with a  $H_2SO_4$  soln. of  $Cr_2O_3$ .

**Dyes.** I. G. Farbenind. A.-G. Brit. 396,077, July 28, 1933. 1,4-Diamino-2,3-dihaloanthraquinones are sulfonated, advantageously in the presence of  $H_2BO_3$ , to give  $HSO_3$  derivs. without splitting off either halogen atom. The products dye wool in fast clear shades which are not changed by after-chroming. In examples 1,4-diamino-2,3-dichloroanthraquinone is heated with  $ClSO_3H$ , fuming  $H_2SO_4$  and  $H_2BO_3$  at  $145-50^\circ$ ; the product dyes wool violet shades. Fuming  $H_2SO_4$  and  $H_2BO_3$  may be used alternatively at about  $120-25^\circ$ .

**Dyes.** Chemische Fabrik vorm. Sandoz. Swiss 160,757, June 1, 1933. A dye sol. in water is prepd. by treating 1-benzoylamino-2-methyl-4- $\beta$ -naphthylaminoanthraquinone with  $H_2SO_4$ . It gives fast brown shades to wool.

**Dyes.** Soc. pour l'ind. chim. à Bâle! Swiss 161,051, June 16, 1933. The dye 1-methylamino-4-aminoanthraquinone is prepd. by heating 1-methoxy-4-aminoanthraquinone with alcoholic  $MeNiI_2$  soln. The dye gives blue-violet shades to acetate silk.

**Dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 162,635 to 162,638, Sept. 1, 1933. Addns. to 159,942 (*C. A.* 27, 4680). New dyes are prepd. by chroming the azo dyes from 1-amino-2-naphthol-4,6-disulfonic acid and the following,  $\beta$ -naphthol (162,635), 1-phenyl-3-methyl-5-pyrazolone-(162,636), 1-(3 $\beta$ -sulfo)-phenyl-3-methyl-5-pyrazolone (162,637), and 4-methyl-1,3-phenylenediamine (162,638).

**Dyes.** I. G. Farbenind. A.-G. (Max A. Kunz, Karl Koberle and Erich Berthold, inventors). Ger. 577,963, June 8, 1933. Dyes are produced by replacing the  $NO_2$  group of mono-nitro-3,4,8,9-dibenzopyrene-5,10-quinone by other residues. Thus, the above compd. is treated with  $BzCl$  to give the monochloro deriv. which colors

cotton from a blue-red vat in yellow shades. Other examples are given.

**Dyes; dyeing.** I. G. Farbenind. A.-G. (Fritz Lange and Richard Stüsser, inventors). Ger. 588,180, Oct. 18, 1933. Cr compds. of azo dyes contg. a sulfo group are treated in substance or on the fiber with dyes of the triarylmethane or xanthene series which contain a sulfo and an amino group but no chromable group. Dyes giving fast shades of various colors on animal fibers are obtained. Examples are given.

**Anthracene or anthraquinone dyes.** Imperial Chemical Industries Ltd. Fr. 749,569, July 26, 1933. Dyes of the formula

(X and Y are Cl, Br, NO<sub>2</sub>, SO<sub>2</sub>H, COOH, OH, substituted OH, NH<sub>2</sub> or substituted NH<sub>2</sub>, and Z is H or O) are prepd. by treating anthracene or anthraquinone acids contg. the group -SCH<sub>2</sub>COOH in the 1-position, with ClSO<sub>2</sub>H or a mixt. of ClSO<sub>2</sub>H and H<sub>2</sub>SO<sub>4</sub>. Several examples are given.

**Azo dyes.** Franz Henle and Herbert Kracker (to General Aniline Works). U. S. 1,933,431, Oct. 31. Disazo dyes dyeing fast yellow to red shades are formed from components such as an aminomethoxynitrobenzene and terephthaloylbisaceto-*o*-toluide or the like. Numerous examples are given. Cf. C. A. 27, 5194.

**Azo dyes.** Rainald Brightman and Wm. L. B. Wellcott (to Imperial Chemical Industries Ltd.). U. S. 1,933,585, Nov. 7. Disazo dyes suitable for dyeing regenerated cellulose various even level shades are formed from components such as 3,3'-diaminodiphenylurea and salicylic acid and 2-amino-8-naphthol-6-sulfonic acid or the like. Various examples are given.

**Azo dyes.** Albert Schmelzer, Fritz Ballauf and Heinrich Helmer (to General Aniline Works). U. S. 1,934,009, Nov. 7. Azo dyes generally producing brown or black dyes are formed by coupling hydroxynaphthocarbazolecarboxylic acid arylamides with unsulfonated and uncoupled diazotized aromatic amines. Numerous examples are given and the dyes have the general formula C<sub>6</sub>H<sub>4</sub>.NX.K(OH)(CONHR)(N:NR'), where K stands

for a naphthalene nucleus which is bound to the carbazole in an  $\alpha$ , $\beta$ -position, R stands for the residue of an amine of the benzene or naphthalene series, R' stands for the residue of an amine of the benzene, azobenzene, naphthalene, anthraquinone or carbazole series, the groupings -CONHR and -OH stand in ortho position to each other, the groupings -CONHR, -OH and -N=N-R' stand in that benzene nucleus of the naphthalene nucleus K which is not neighbored to the carbazole ring, X stands for hydrogen or alkyl, and where all nuclei may be further substituted by alkyl, alkoxy and nitro groups or halogen.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 160,342, May 1, 1933. The dye from diazotized 4-chloro-2-amino-1-phenol-5-sulfonic acid and 1-hydroxynaphthalene-5-sulfonic acid is treated with a Cr-yielding agent to give a product which gives wool from a H<sub>2</sub>SO<sub>4</sub> bath fast blue-violet shades.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 161,050, June 16, 1933. The dye obtained by coupling diazotized 1-amino-2-naphthol-4-sulfonic acid with  $\beta$ -naphthol in a medium with a  $\mu_{11}$  value of below 7 is chromed in an alk. medium. The dye gives wool from a H<sub>2</sub>SO<sub>4</sub> bath fast marine blue shades. Examples are given.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 161,841, Aug. 1, 1933. A new dye is produced by coupling 2-diazo-4,4'-dimethoxy-5-acetylaminol-1,1'-diphenyl ether with the anilide of 2,3-hydroxynaphthoic acid. The dye colors cotton, wool and rayon in fast violet shades.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 161,842, Aug. 1, 1933. A new dye is produced by coupling 2-diazo-4-carboxy-4'-chloro-1,1'-diphenyl ether with the  $\alpha$ -naphthylamide of 2,3-hydroxynaphthoic acid. The dye colors cotton, wool and silk in fast red shades.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 162,464, Sept. 1, 1933. A red dye is prepd. by chroming the azo dye from diazotized 4-chloro-2-amino-1-phenol-6-sulfonic acid and 1-(3'-sulfo)phenyl-3-methyl-5-pyrazolone.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 162,465, Sept. 1, 1933. A new dye is produced by coupling diazotized PhNH<sub>2</sub> with diacetyl-1,4-diamino-8-hydroxynaphthalene-6-sulfonic acid. The dye colors wool from an acid bath in red shades.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 41,589, Feb. 7, 1933. Addn. to 734,021 (C. A. 27, 1180). Azo dyes are prepd. by coupling a diazotized aminoarylide of an aliphatic acid contg. at least 10 C atoms with a sulfonated ketone, e. g., sulfonic acids of phenylmethylpyrazolones, carboxylated phenylpyrazolones and arylides of acetoacetic acid.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 41,731, Mar. 29, 1933. Addn. to 735,365 (C. A. 27, 1186). Azo dyes are prepd. by impregnating the fiber in an alk. medium with hydrazinesulfonic acids of 4-amino- or 4,4'-diaminodiamines in which the hydrazinesulfonic acid is in the *p*-position to the imino group, in the presence of azo compds. capable of forming *o*-hydroxyazo dyes and contg. no other solubilizing groups. The fiber is then steamed. Examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 749,926, Aug. 1, 1933. Dyes going from yellowish red to Bordeaux-red and insol. in water are prepd. by coupling arylamides of 2,3-hydroxynaphthoic acid with 2- or 3-aminobenzanilides, the NH<sub>2</sub> group attached to the CO being substituted by aryl or aralkyl groups and the benzoyl group may also contain substituents. These amides are prepd. by the reaction of *m*- or *p*-nitrobenzoyl chlorides with appropriate amines and subsequent reduction. The following are referred to, 3-aminobenzoylphenyl- $\alpha$ - (m. 157°), 3-amino-4-methylbenzoylphenyl- $\beta$ - (m. 154-5°), and 4-aminobenzoylphenyl- $\beta$ -naphthylamine (m. 222°), 3-amino-4-phenoxybenzoyl- (m. 172-3°), 3-amino-6-methoxybenzoyl- (m. 165°), 3-amino-4-chlorobenzoyl- (m. 175°), 4-aminobenzoyl(*p,p'*-dimethoxy) (m. 193°), and 4-amino-6-methylbenzoyldiphenylamine (m. 181-2°) and 4-aminobenzoylbenzylamine, m. 118°. Dyes prepd. from these compds. are described.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 749,971, Aug. 2, 1933. Metal complexes of 4-amino-1-hydroxybenzene-2-carboxylic acid or its derivs. are linked with coupling components. Thus, refluxing the above acid in water with pyridine and an aq. soln. of Cr chloride gives a complex compd. contg. Cr and pyridine, which may be diazotized and coupled. Pyridine may be omitted or replaced by PhNMe<sub>2</sub> or triethanolamine. Examples are given.

**Azo dyes; dyeing.** British Celanese Ltd., George H. Ellis and Ernest W. Kirk. Brit. 396,412, July 26, 1933.

**Azo dyes** are made in substance by coupling any component with a diazo compd. obtained by diazotizing an anthraquinone compd. contg. an external diazotizable amino group. Diazo components specified are aminoaryl or aminoaracyl derivs. of 1-amino- or 1,5- or 1,8-diaminoanthraquinone, e. g., 1,5-di(*p*-aminophenylamino)anthraquinone, 1-(*p*-aminophenylamino)anthraquinone, 1-amino-5-(*p*-aminophenylamino)anthraquinone; 1-hydroxy-1-amino- or 1-aliphatically-substituted-amino-4-arylaminoanthraquinones contg. an amino group in the aryl residue, e. g., 1-amino, 1-methylamino-, 1-dimethylamino-, 1-(hydroxyalkylamino)-4-(aminoarylamino)-anthraquinone. Coupling components of relatively low mol. wt., e. g., PhOH, *o*- or *m*-cresol, *m*-phenylenediamine, *m*-aminophenol, dimethylaniline, *m*-hydroxydiphenylamine, 1-phenyl-3-methyl-5-pyrazolone, gives dyes suitable for cellulose esters and ethers. In the case of 1-amino-4-(aminoaryl-

amino)anthraquinones 1 or both amino groups may be diazotized and coupled. The dyes may be applied to cellulose esters and ethers as suspensions or dispersions. In an example the dye 1-methylamino-4-*p*-aminophenylaminoanthraquinone  $\rightarrow$  PhOH is described. Anthraquinone derivs. having the 1,4-aminohydroxy grouping and also contg. an external diazotizable amino group are used for producing azo dyes on the fiber. The arylamides of aromatic hydroxy carboxylic acids and the di- $\beta$ -ketosacyl diamines are specially suitable as coupling components. Swelling agents may be used when dyeing cellulose ester and ether materials. In examples the following dyes are produced on acetate silk: 1-hydroxy-4-*p*-aminophenylaminoanthraquinone  $\rightarrow$  diacetoacetyl-*o*-toluidine (green) or 2,3-hydroxynaphthyl-*o*-toluidine (blue). In 396,430, July 26, 1933, divided on 396,412, azo dyes are made on the fiber by coupling thereon an azo coupling component with a diazo compd. obtained by diazotizing an anthraquinone compd. contg. an external diazotizable amino group, excluding 1,4-aminohydroxyanthraquinones contg. external amino groups. The use of (substituted) amides of aromatic hydroxycarboxylic acids and the dyeing of cellulose textiles by combining on the fiber a diazotized 1-alkyl- or dialkyl-amino-4-*p*-aminoanilinoanthraquinone with a bis-acetylaldiamine is also excluded.

**Dyeing.** British Celanese Ltd., George H. Ellis and Ernest W. Kirk. Brit. 396,431, July 26, 1933. Divided on 396,412 (preceding abstract). Azo dyes are made on the fiber by coupling a diazo compd. of an anthraquinone of formula  $1-H_2N-4-R'R''NC_6H_4(CO)_2C_6H_4$ , where R' is alkyl, aryl or aralkyl and R'' is H, alkyl, aryl or aralkyl and which may be further substituted in the anthraquinone nucleus but which contains no diazotizable external amino groups, with a coupling component. Specified components are 1-amino-4-*p*-tolyl- or -anisyl-aminoanthraquinone, 1-amino-4-phenylaminoanthraquinone, 1-amino-4-phenylamino-5-hydroxyanthraquinone, 1,5-diamino-4-phenyl- or -4,8-diphenyl-aminoanthraquinone and 1-amino-4-*p*-tolylamino-5-hydroxyanthraquinone. Coupling components specified are amines, phenols, pyrazolones and  $\beta$ -keto acid derivs. and (substituted) amides of hydroxycarboxylic acids, e. g., salicylic acid and 2,3- or 1,4-hydroxynaphthoic acids, di-2,3-hydroxynaphthoyl-bianisidine, diacetoacetylaldiamines. Swelling agents may be used.

**Azo dyes; intermediates.** I. G. Farbenind. A.-G. Brit. 396,741, Aug. 9, 1933. 2-(3'-Hydroxynaphthyl-2')-4-hydroxy-6,7-benzopseudoazaminobenzene is made by coupling a diazotized 2-amino-3-naphthol in which the OH group is protected with a similar compd., converting the *o*-aminoazo dye thus obtained into the pseudoazimine and splitting off the radicals linked to the O of the original OH groups. In examples (1) the dye obtained by coupling diazotized 2-amino-3-(4'-methylbenzenesulfonylhydroxy)naphthalene with itself is treated with thionyl chloride in xylene and the product hydrolyzed, (2) the *o*-aminoazo dye from diazotized 2-amino-3-methoxynaphthalene is oxidized by air in presence of pyridine and CuSO<sub>4</sub> and the dimethoxyazimine compd. is treated with HBr in glacial AcOH to split up the alkoxy groups and (3) 2-(3'-hydroxy-7'-methoxynaphthyl-2')-4-hydroxy-*Bz*-4'-methoxy-6,7-benzopseudoazaminobenzene is made by treating the *o*-aminoazo dye from 2-(carboxybenzenesulfonylhydroxy)-6-methoxy-3-aminonaphthalene as in (1), oxidizing to the pseudoazimine as in (2) and hydrolyzing to remove the benzenesulfonyl group. They have good affinity for vegetable fibers. Azo dyes, insol. in H<sub>2</sub>O, are made in substance, on a substratum or on the fiber, e. g., cotton, viscose or animal fibers, by coupling the above azimine compds. with suitable diazo components. In examples (1) cotton is impregnated with 2-(3'-hydroxynaphthyl-2')-4-hydroxy-6,7-benzopseudoazaminobenzene and developed with diazotized 2,5-dichloroaniline (orange) and (2) the azimine compd. of (1) is coupled in substance with diazotized *o*-nitroaniline.

**Water-soluble azo dyes.** Rudolf Bauer (to General Aniline Works). U. S. 1,931,836, Oct. 24. See Ger. 562,644 (C. A. 27, 1186).

**Monoazo dyes.** I. G. Farbenind. A.-G. Brit. 395,882, July 27, 1933. Monoazo dyes are made by coupling 2-amino-4,6-dinitrophenol with a *m*-diamine of the C<sub>6</sub>H<sub>4</sub> series which is substituted in 1 or both of the amino groups by hydroxyalkyl or dihydroxyalkyl group(s), or with a nuclear substitution product of such an amine (e. g., halogen, alkyl, alkoxy). In examples 1-amino-3-hydroxyethylaminobenzene, 4-chloro-3-amino-1-hydroxyethylaminobenzene, 1-amino-3-( $\beta$ , $\gamma$ -dihydroxypropyl)aminobenzene, 1-( $\beta$ , $\gamma$ -dihydroxypropyl)amino-3-( $\beta$ , $\gamma$ -dihydroxypropyl)aminobenzene, 1-amino-3-di(hydroxyethyl)aminobenzene, etc., are specified as coupling components.

**Monoazo dyes.** Durand & Huguenin A.-G. Brit. 395,951, July 27, 1933. See Fr. 748,840 (C. A. 27, 5548).

**Water-insoluble disazo dyes.** Hefnz Eichwede and Adolph Koch (to General Aniline Works). U. S. 1,932,577, Oct. 31. Dyes suitable for forming lakes and for coloring natural or synthetic rubber (yellow shades in examples given) are formed by tetrazotizing a dihalo-dialkoxydiaminobiphenyl such as 2,2'-dichloro-5,5'-dimethoxy-4,4'-diaminobiphenyl and coupling with an acrylactic acid arylide such as acetoacetic acid anilide, *o*-chloroanilide, *m*-xylide or the like or benzoylactic acid anilide. Several examples with details of procedure are given. Cf. C. A. 27, 5548.

**Hydroxyazo dyes.** I. G. Farbenind. A.-G. Brit. 396,895, Aug. 17, 1933. Diazotized *o*-aminophenolmonosulfonic acid or a nuclear substitution product thereof not contg. a further HSO<sub>3</sub> group is combined with a benzo-2,4-dihydroxyquinoline or a deriv. thereof. Wool is dyed red to violet with the aid of a Cr mordant by the single bath process. In examples the following dyes are described: (1) 4-chloro-2-amino-1-phenol-5- or -6-sulfonic acid (I) or 4-nitro-2-amino-1-phenol-6-sulfonic acid (II)  $\rightarrow$  7,8-benzo-2,4-dihydroxyquinoline, (2) I  $\rightarrow$  5,6-benzo-2,4-dihydroxyquinoline and (3) II  $\rightarrow$  6,7-benzo-2,4-dihydroxyquinoline.

**Vat dyes.** I. G. Farbenind. A.-G. (Heinrich Nere-sheimer, Willy Eichholz and Georg Böhrner, inventors). Ger. 576,131, May 8, 1933. Addn. to 553,000. Vat dyes are produced by treating *Bz*-1, *Bz*-1'-di(1,2-benzanthraquinonyl), unsubstituted by halogen in the *Bz*-1-positions as in the prior patent, with acid condensing agents. Reduction products, ethers or esters of the starting substance may be used. The condensation product may be further substituted. In an example *Bz*-1-*Bz*-1'-di(1,2-benzanthraquinonyl) is treated with Cu powder and 96% H<sub>2</sub>SO<sub>4</sub> to give a dye which colors cotton from a red-violet vat in violet shades. Other examples are given.

**Vat dyes.** I. G. Farbenind. A.-G. (Wilhelm Eckert, Ernst J. scher, II and Otto Braunsdorf, inventors). Ger. 576,132, May 9, 1933. Addn. to 538,314 (C. A. 26, 3384). Isomers of 1,4,5,8-naphthoylencdiarylimidazoles are converted into salts of org. acids in the presence of solvent or suspending agent and sepd. by taking advantage of their differing soly. Thus, the dye obtained by condensing 1,4,5,8-naphthalenetetracarboxylic acid and 1,2-diaminobenzene is heated with *p*-toluenesulfonic acid and glacial AcOH. On filtering, the residue contains an orange colored salt of *p*-toluenesulfonic acid and the filtrate a blue-red isomeric salt of the same acid. Several other examples are given.

**Basic dyes.** I. G. Farbenind. A.-G. Brit. 396,177, Aug. 3, 1933. See Fr. 736,079 (C. A. 27, 1519).

**Dyes of the anthanthrone series.** Rudolf M. Heidenreich (to General Aniline Works). U. S. 1,931,821, Oct. 24. By causing ring closing agents (such as concd. H<sub>2</sub>SO<sub>4</sub>, chlorosulfonic acid, a mixt. of anhyd. AlCl<sub>3</sub> and NaCl or a mixt. of KOH and alc.) to react upon the compds. obtainable by condensing halogenated anthanthrones or their derivs. with aminoanthraquinones or their derivs. (these compds. probably being anthanthrone-anthrimides), vat dyes are obtained which dye cotton from the hyposulfite vat various khaki-brown to gray shades of good fastness. Several examples with details of procedure are given.

**Carboyanine dyes.** Leslie G. S. Brooker (to Eastman Kodak Co.). U. S. 1,934,687, Nov. 7. Dyes having

good photo-sensitizing properties may be prepd. by the treatment of a 1-methylbenzothiazole alkyl quaternary salt with an ester of an aliphatic orthocarboxylic acid, the acid corresponding to which contains more than 2 C atoms in the mol. The reaction may be carried out in boiling dry pyridine. The esters of the orthocarboxylic acids which are suitable include tri-Me orthopropionate, Me di-Et orthocaproate, Me di-Et orthoisocaproate, and tri-Me orthovalerate. Several examples with details of procedure are given. U. S. 1,934,658 relates to the production of dyes having good photo-sensitizing properties prepd. by the treatment of a 1-methylbenzothiazole alkyl quaternary salt with an ester of an orthocarboxylic acid, the acid corresponding to which contains a substituted alkyl group directly linked to the carbon atom of the carboxyl group. U. S. 1,934,659 relates to dyes having good photo-sensitizing properties prepd. by the treatment of a 1-methylbenzothiazole alkyl quaternary salt with an ester of an aromatic orthocarboxylic acid, such as tri-Me orthobenzoate or tri-Me ortho-*p*-toluate. Various examples are given.

**Naphthophenazine dyes.** I. G. Farbenind. A.-G. Br. 750,016, Aug. 3, 1933. Dyes are prepd. by causing oxidizing agents to act in the presence of diluents or solvents on a mixt. of 1,3-diarylamino-naphthalene-8-sulfonic acid, and a monosulfonic acid of 4,4'-diaminodiphenylamine or its alkyl substitution products. The dyes obtained have the formula

where X represents a  $\text{SO}_3\text{H}$  group and the others H or alkyl groups).

**Reserve dye.** Soc. pour l'ind. chim. à Bâle. Swiss 160,439, May 1, 1933. A product for use in reserve dyeing is obtained by condensing 1 mol. of benzoin with 1 mol. of 2-hydroxynaphthalene-3,6-disulfonic acid. The product has a strong affinity for animal fibers and is used in reserve dyeing wool.

**Isatins, thioindigo dyes.** I. G. Farbenind. A.-G. Brit. 396,636, Aug. 10, 1933. Thioindigo dyes are prepd. by condensing hydroxythionaphthenes with dimethylalkoxyamines or their reactive  $\alpha$ -derivs. Both the isatins and the dyes may be halogenated. The isatins may be prepd. from the corresponding dimethylalkoxyaminobenzenes by the Sandmeyer synthesis. Among examples (1) 1,3-dimethyl-4-hydroxy-5-nitrobenzene, is methylated and reduced and then converted into the isonitrosoacetanilide by warming with hydroxylaminesulfonic acid and chloral hydrate; the 4,6-dimethyl-7-methoxyisatin obtained by treatment with  $\text{H}_2\text{SO}_4$  may be chlorinated to 5-chloro-4,6-dimethyl-7-methoxyisatin or brominated to give the corresponding bromo compd.; dyes are obtained by condensing 5-chloro-4,6-dimethyl-7-methoxy (and ethoxy) isatin- $\alpha$ -chloride with 4,7-dimethyl-5-chloro-3-hydroxy-naphthalene and (2) 1-amino-2,5-dimethyl-3-methoxy-1-chlorobenzene, prepd. from 1-amino-2,5-di-methoxy-1-methoxybenzene by chlorination of the corresponding amine and subsequent sapon., is converted into 4,7-dimethyl-5-chloro-6-methoxyisatin by condensation with an oxalic ester (Martinet's method); the isatin may be condensed with 5,6,7-trichloro-3-hydroxythionaphthene.

**Water-soluble derivatives of indigoid dyes.** Walter Metz and Rudolf M. Heidebreich (to General Aniline Works) U. S. 1,933,993, Nov. 7. Indigoid dyes such as indigo, monohaloindigos, alkyl indigos or the like are treated with a benzoic acid sulfohalide in the presence of a cyclic tertiary org. base such as pyridine or its homologs, at temps. between about  $80^\circ$  and the b. p. of the reaction mixt. Several examples are given.

**Condensation product.** I. G. Farbenind. A.-G. (Heinz Scheyer, inventor). Ger. 577,560, June 1, 1933. The condensation product obtained as in 575,948, is further condensed by treatment with an alk. condensing agent such as a soln. of KOH in EtOH. The product is a dye fast to sunlight.

**Condensation products.** Soc. pour l'ind. chim. à Bâle. Swiss 161,739 to 161,743, July 17, 1933. Addns. to 159,665 (C. A. 27, 4688). Products useful as dye intermediates are obtained by condensing 2 mols. of 1-(4'-carboxyphenyl)-3-methyl-5-pyrazolone with 1 mol. of benzidine (161,739), or 1 mol. of *o*-tolidine (161,740), or 1 mol. of *o*-biansidine (161,742), or 2 mols. of 1-(3'-carboxyphenyl)-3-methyl-5-pyrazolone with 1 mol. of *o*-tolidine (161,741), or 1 mol. of *o*-tolidine (161,741), or 1 mol. of *o*-biansidine (161,743).

**1-Methylamino-4-aminoanthraquinone.** Soc. pour l'ind. chim. à Bâle. Brit. 390,662, Aug. 10, 1933. 1-Methoxy-4-aminoanthraquinone is treated with alc.  $\text{MeNH}_2$ , the MeO group being exchanged without substantial disturbance of the  $\text{NH}_2$  group. In an example the reaction is performed with periodic testing of samples until the product is obtained. It dyes acetate rayon blue-violet shades.

**Amino compounds.** I. G. Farbenind. A.-G. Br. 750,065, Aug. 3, 1933. Compds. of the formula  $\text{HN}(\text{R}^1)\text{R}^2$ .  $\text{CH}_2\text{R}^1$  (R is a hydrocarbon group contg. at least 7 C atoms,  $\text{R}^1$  is alkyl, aralkyl, aryl or a hydrogenated aryl group and  $\text{R}^2$  is H, alkyl, aralkyl, aryl or hydrogenated aryl) are prepd. by transforming to ketones carboxylic acids capable of forming soaps and which contain at least 8 C atoms, if desired with the addn. of other carboxylic acids, and transforming the ketones to amino compds. by hydrogenation in the presence of  $\text{NH}_3$  or a primary amino compd. which contains an aliphatic, cyclic, alicyclic or heterocyclic group. The products are used as intermediates for making auxiliary agents in the textile industry and for dispersing agents, etc. Examples are given of the prepn. of 2-phenylaminononadecane, b.p.  $200^\circ$ , 1-phenyl-2-aminoheptadecane and others of unspecified compn.

**Arylides of 2,3-hydroxynaphthoic acid.** Ernest F. Grether and Lindley E. Mills (to Dow Chemical Co.). U. S. 1,935,551, Nov. 14. 2,3-Hydroxynaphthoic acid is condensed with a substituted aniline such as monochloro-dimethoxyaniline, monochlorodimethoxyaniline or monochlorodiphenoxyaniline to form arylides suitable for use as dye intermediates. Various details of procedure are given. Cf. C. A. 27, 5340.

**Hydroxy compounds of phenazone.** I. G. Farbenind. A.-G. (Otto Goll, inventor). Ger. 577,631, June 2, 1933. These are prepd. by the action of fused alkali on phenazone-2-mono- or -2,7-disulfonic acid. Thus, Na phenazone-2-sulfonate is fused with KOH to give 2-hydroxyphenazone, m.  $275^\circ$ . The prepn. of 2,7-dihydroxyphenazone, m.  $300^\circ$ , 2,7-diacetylphenazone, m.  $239^\circ$ , and 2-hydroxyphenazone-7-sulfonic acid is also described. The substances are used as intermediates for dyes and medicines.

**Porphins.** Chemische Fabrik vorm. Sandoz. Swiss 162,355 to 162,359, Aug. 10, 1933. Addns. to 158,834 (C. A. 27, 4686). Strongly basic porphins useful for dyeing and in pharmacy, are prepd. by treating protoporphyrin dimethyl ester, phylloporphyrin monomethyl ester, or pyroporphyrin monomethyl ester with diethylaminoethylenediamine; similarly, strongly basic porphins are prepd. by treating a complex Cu salt of methyl pheophorbide with asym. diethylaminoethylenediamine, or by treating a complex Fe salt of phylloporphyrin with diethylaminoethanol.

**Basic porphins.** Chemische Fabrik vorm. Sandoz. Swiss 161,232 to 161,237, July 1, 1933. Addns. to 158,834 (C. A. 27, 4686). Strongly basic porphins are prepd. by (a) treating methylpheophorbide with diethylaminoethanol, (b) with ethylenediamine, (c) pheophorbide with diethylaminoethylenediamine, (d) hematoporphyrin with diethylaminoethanol, (e) phylloporphyrin with diethylaminoethanol, and (f) pyroporphyrin with diethylaminoethanol. The products are used in dyeing.

**Naphthalene derivatives.** Chemische Fabrik vorm. Sandoz. Swiss 162,350, and 162,351, Aug. 16, 1933. Addns. to 159,408 (C. A. 27, 4685). The compds. 1-iodo-8-hydroxynaphthalene-4,6- and -3,6-disulfonic acid are prep'd. by treating 1-diazo-8-hydroxynaphthalene-4,6- or -3,6-disulfonic acid with Cu bronze in the presence of HCl. The substances are used as *intermediates in the production of dyes or drugs*.

**2,7-Dihydroxynaphthalene-3,6-dicarboxylic acid.** I. G. Farbenind. A.-G. Brit. 395,365, July 12, 1933. The acid, which is a *dye intermediate*, is obtained by treating 2,7-dihydroxynaphthalene alkali salts, 2,7-naphthol mixed with alkali carbonate, or a 2,7-dihydroxynaphthalene-3-carboxylic acid alkali salt or mixt. with alkali carbonate with CO<sub>2</sub> under increased pressure at above 250°.

**Dye intermediates.** I. G. Farbenind. A.-G. Brit. 396,320, Aug. 3, 1933. Addn. to 382,449 (C. A. 27, 4249). Arylamino-1-hydroxynaphthalene-3-carboxylic acids are prep'd. by heating with CO<sub>2</sub> at a raised pressure, an alkali metal salt of a 1-hydroxynaphthalene contg. an arylamino group in 5-, 6-, 7- or 8-position, the COOH group apparently entering the 2-position. In an example 1-hydroxy-7-phenylaminonaphthalene is treated in aq. KOH in an autoclave with CO<sub>2</sub> at about 200°.

**Dye intermediate.** Soc. pour l'ind. chim. à Bâle. Swiss 160,170, Apr. 17, 1933. A new intermediate is prep'd. by introducing an acetyl group into both NH<sub>2</sub> groups of 1,4-diamino-5-hydroxynaphthalene-7-sulfonic acid by treatment with an acetylating agent.

**Dyeing.** H. Th. Bohme A.-G. Brit. 395,853, July 27, 1933. Impregnating baths and printing colors contg. arylides of 2,3-hydroxynaphthoic acid are made by using as dispersing agents sulfonated or phosphatized compds. of the fatty series of high mol. wt. which contain at least 9 C atoms and still contain free alc. OH groups. In examples (1) 2,3-hydroxynaphthoic acid bianiside or  $\alpha$ -naphthalide is dispersed with sulfonated oleic alc. which still contains a free alc. OH group and (2) 2,3-hydroxynaphthoic acid *o*-toluide is dispersed with ricinoleic alc. sulfuric ester which still contains a free alc. OH group (monosulfuric acid ester of octadecanetriol). Sulfonated alics. that still contain free alc. OH groups are made by sulfonating unsat'd. alics. contg. at least 9 C atoms at about 0°, sulfonation taking place at the double bonds. Sulfonated partially esterified polyhydric alics. contg. more than 9 C atoms are made by esterifying the alics. obtained by reducing sugars with fatty acids and sulfonating the esters so that 1 or more OH groups remain free. In an example mannitol is treated with concd. H<sub>2</sub>SO<sub>4</sub> and oleic acid. Phosphatized compds. are made as follows: (a) mannitol is treated with anhyd. H<sub>3</sub>PO<sub>4</sub> and P<sub>2</sub>O<sub>5</sub> and then with oleic acid, (b) hydroxystearic alc. (1,12-octadecanediol) is treated with chlorinated acetylphosphorous acid (from PCl<sub>3</sub> and AcOH), (c) ricinoleic alc. is treated with AcCl and H<sub>3</sub>PO<sub>4</sub> and (d) oleic acid is treated with acetylphosphoric acid (from H<sub>3</sub>PO<sub>4</sub> and Ac<sub>2</sub>O).

**Dyeing.** Soc. pour l'ind. chim. à Bâle. Brit. 396,859, Aug. 17, 1933. Wool is grounded with an unsulfonated arylide of 2,3-hydroxynaphthoic acid, contg. no SO<sub>2</sub>NHR group, under specified conditions and developed by means of a diazotized amine of the general formula H<sub>2</sub>NC:CH.CX:CH:CH:CY, where 1 X is —NHCOR

(R is alkyl, aralkyl, aryloxyalkyl, aryl) and the other X and also Y is H, halogen, alkyl or alkoxy. The grounding conditions are (a) the liquor ratio is from 6:1 to 50:1, (b) not more than 5% of the arylide on the wt. of the wool, (c) the NaOH used is 1.5-2.5 times the amt. of arylide but should not exceed 4 g. per l. of grounding liquor and (d) the grounding bath should be exhausted. An electrolyte may be present in the bath. In examples the following dyes are made on wool (1) 1-amino-4-benzoylamino-2,5-dimethoxybenzene  $\rightarrow$  *p*-chloroaniline, (2) 1-amino-4-benzoylamino-2,5-diethoxybenzene  $\rightarrow$   $\alpha$ -naphthylamide and (3) 1-amino-4-benzoylamino-2-methoxy-5-methylbenzene  $\rightarrow$  aniline.

**Dyeing.** Société pour l'ind. chim. à Bâle. Brit. 396,883, Aug. 17, 1933. Textile materials contg. cellulose

esters and ethers are dyed or printed with products obtained by condensing a compd. contg. a reactive CH<sub>2</sub> or CH<sub>3</sub> group with an aromatic aldehyde or nitroso compd., especially 1 contg. an NH<sub>2</sub> group which is unsubstituted or substituted by alkyl, aryl or aralkyl. In examples acetate silk is dyed with (1) products obtained by condensing *p*-dimethylaminobenzaldehyde with 1-(2'-chloro)phenyl-3-methyl-5-pyrazolone, Et cyanoacetate and the corresponding Me, iso-Pr and Bu esters, (2) products obtained by sapon. said esters after condensation and (3) products obtained by condensing *p*-nitrosodimethylaniline with 1-phenyl-3-methyl-5-pyrazolone.

**Dyeing compositions.** Joseph Nusslein (to General Aniline Works). U. S. 1,933,068, Oct. 31. Aq. preps. suitable for dyeing wool or cotton, etc., comprise a vat dye such as one of the indanthrene series and an aromatic sulfonic acid contg. an alkyl radical with more than 2 C atoms such as a propylated naphthalenesulfonic acid which serves as a wetting agent.

**Dyeing level tints on cotton goods or the like.** Justin F. Wait. U. S. 1,934,936, Nov. 14. In dyeing a light level tint on cotton, the goods are suspended in water held at a temp. of about 75° for a short time while flowing ozonized air in contact with the water and the goods, and there is subsequently applied a dye, such as a diphenylmethane dye not normally considered as having affinity for cotton goods so treated, which produces a light tinting. App. is described.

**Dyeing wool.** Soc. pour l'ind. chim. à Bâle. Fr. 41,688, Mar. 10, 1933. Addn. to 734,189 (C. A. 27, 1205). The diazo derivs. of *p*-aminodiphenylamines are replaced by diazo derivs. of compds. of the general formula H<sub>2</sub>NC:CH.CX:CH:CH:CY, in which one X is —NHCOR

(R is alkyl, aralkyl, aryloxyalkyl or aryl) and the other X and Y are H, a halogen or an alkyl or alkoxy group, e. g., 4-benzoylamino-1-amino-2,5-diethoxybenzene.

**Dyeing furs, hairs and feathers.** Erich Lehmann (to General Aniline Works). U. S. 1,932,901, Oct. 31. For producing variously colored dyeings, the material is treated in a bath contg. an oxidizing agent such as H<sub>2</sub>O<sub>2</sub> and a benzene compd. contg. as a substituent an amino group substituted by an aliphatic alc., such as a condensation product of 1-methoxy-2,5-diaminobenzene and 1,2-dihydroxy-3-chloropropane or the like. Mordants are used.

**Dyeing and printing textiles.** Durand & Huguenin S. A. Fr. 749,461, July 25, 1933. Esters of leuco derivs. of vat dyes which are easily sol. in water are prep'd. by transforming the H<sub>2</sub>SO<sub>4</sub> esters of leuco derivs. of vat dyes into their Li salts.

**Printing.** Durand & Huguenin A.-G. Brit. 395,949, July 27, 1933. See Fr. 748,403 (C. A. 27, 5551).

**Sizing textile fibers.** I. G. Farbenind. A.-G. Fr. 41,788, Apr. 13, 1933. Addn. to 687,155 (C. A. 25, 828). Instead of a polyvinyl alc., a mixt. of at least 2 polyvinyl alics. having different viscosities is used, or a mixt. in which one or more of the constituents are replaced by a sol. deriv. in water of a polyvinyl alc., the viscosities of the various constituents being different.

**Printing textiles.** Henry Giesler. Brit. 396,219, Aug. 3, 1933. Knitted fabrics with ornamental effects are obtained by re-knitting yarn obtained by de-knitting a printed knitted fabric, the re-knitted fabric being preferably of a width different from that of the original fabric. Among examples woolen yarn dyed with Cloth fast brilliant red 4B is knitted into strips which are printed with Neolan black WA (1st roller) and a hyposulfite discharge (2nd roller); the strips are then de-knitted and re-knitted to obtain a fabric with black-white effects on a red ground.

**Printing wool.** A. Holtmann & Co. G. m. b. H. (Mark Frankfurt, inventor). Ger. 577,832, June 6, 1933. A paste contg. wool dyes, thickening and the usual addn. of urea or glycerol is used. Thus, a paste for wool printing contains the dye obtained by coupling 2-hydroxynaphthalene and diazotized 2-aminonaphthalenesulfonic acid, urea, British gum, (CO<sub>2</sub>H)<sub>2</sub> and water.

**Reserve-printing fabrics.** Soc. pour l'ind. chim. à Bâle. Ger. 577,702, June 3, 1933. Fabric impregnated with coupling components is printed with xanthogenates and developed with diazo compds. Thus, fabric impregnated with a soln. of 2,3-hydroxynaphthoic acid anilide in NaOH, Turkey-red oil and hot water is printed with a paste contg. K xanthogenate, water and gum. The dried fabric is then developed with a soln. of the diazo salt of 4-chloro-2-aminodiphenyl ether. Other examples are given.

**Discharge printing.** British Celanese Ltd., Henry C. (Opin and George H. Ellis. Brit. 396,730, Aug. 9, 1933. Discharge effects on textile and other materials are obtained by the action of discharging agents, having an acid reaction or liberating acid during the discharge process, in the presence of an org. base which restricts acidity and minimizes the tendering of the material. The base may be incorporated in the discharge compn. or applied separately, e. g., by padding before or after application of the compn. and before steaming, aging or like moist heat treatment. Any other desired substances may be present in the discharge compn., e. g., swelling agents (in printing cellulose deriv. materials), dyes resistant to the discharging agent, basic coloring matters of the di- and tri-aryl-methane, azine, oxazine and thiazine series. In examples (1) a silk fabric colored with a dye dischargeable by  $\text{SnCl}_2$  is printed with a compn. contg.  $\text{SnCl}_2$ , methylated spirits (1) urea, NaSCN, citric acid, gum arabic (1:1) or gum tragacanth (10%) and  $\text{H}_2\text{O}$  and then dried, aged and steamed to give a white discharge on a colored ground and (2) a fabric contg. silk and cellulose acetate and dyed with dyes dischargeable with  $\text{SnCl}_2$  is printed with a compn. contg.  $\text{SnCl}_2$ , I, sym-dimethylurea, NaSCN and gum arabic thickening and then dried, steamed, washed off and again dried.

**Coloring bone articles.** Soc. pour l'ind. chim. à Bâle. Swiss 162,206, Aug. 16, 1933. Buttons, buckles, spoons, etc., are colored by dyeing them with dyes comprising complex metal compds., such as chromed dyes.

**Apparatus for dyeing yarn locally.** Eclipse Textile Devices Inc. Ger. 577,937, June 7, 1933. Addn. to 511,731 (C. A. 25, 1391).

**Dyeing apparatus for hanks of thread and cloth in the piece.** Smith, Drum & Co. Fr. 749,833, July 29, 1933.

**Dye-grinding mill.** Johann Aebi. Ger. 577,904, June 7, 1933.

**Fibers.** Comptoir des textiles artificiels (Soc. anon.). Fr. 749,734, July 28, 1933. Natural or artificial fibers are transformed to a light flocculent state by passage through a rotor having pivoted arms rotating at a high speed.

**Vegetable fibers.** Emil Schwabe. Ger. 577,889, June 6, 1933. These are obtained by treating straw, etc., with a soln. of alkali, alk. earth or  $\text{NH}_4$  salts of complex org.  $\text{H}_3\text{BO}_3$  compds. Thus, ramie bast is treated with a soln. contg. NaOH,  $\text{H}_3\text{BO}_3$  and glacial AcOH.

**Fibers and fillers for plastic compositions from kapok, etc., cores.** Marcel Dupret. Brit. 396,243, Aug. 3, 1933. Fibers for mattresses and a filler for use with rubber to form a plastic compn. are obtained from the seed cores of kapok and like pods of the Bombacaceae by disintegrating, by beating, crushing, grinding or passing through a hard waste opener to form "ground centers" which is used as a filler or further sepd. to obtain the fibers and the powd. meal. The finer filler thus obtained may be substituted for cork as a filling material, e. g., mixed with rubber latex to obtain a tough elastic sheet like soft bukkum.

**Apparatus for wet-treating textile fibers.** Eclipse Textile Devices Inc. Ger. 577,939, June 7, 1933.

**Sizing textile fibers.** Auguste F. Galvin. Brit. 396,952, Aug. 17, 1933. Silk or rayon fibers are sized at 35-80 with a soln. of linseed oil in 0.25-2 times its vol. of  $\text{C}_6\text{H}_6$ , PhMe or like solvent or with an emulsion of the oil in 2-7 times its vol. of  $\text{H}_2\text{O}$ .

**Delustering filaments.** Franz Hoelkeskamp (to American Bemberg Corp.). U. S. 1,932,734, Oct. 31. The filaments are successively treated with a soln. contg.

baryta and a soln. contg.  $\text{Al}_2(\text{SO}_4)_3$ , then rinsed with water and treated with a wax-soap emulsion.

**Treating artificial threads, horsehair, ribbons, etc.** British Celanese Ltd. Brit. 395,380, July 14, 1933. The luster of artificial yarns, etc., contg. cellulose acetate or other org. esters or ethers of cellulose is modified or reduced by treatment in the form of hanks or fabrics with aq. suspensions or dispersions of  $\text{H}_2\text{O}$ -insol. soaps, e. g., Zn, Mg and alk. earth stearates, oleates, palmitates, cerotates, elaidates or carnaubates. The treatment is preferably in the presence of a swelling agent for the cellulose deriv. The delustered threads, etc., do not cut the guides, etc., and they possess improved textile properties, e. g., they knit closer and the fabrics are free from defects and the packages are less liable to collapse.

**Apparatus for wet-treating wound yarn.** Vereinigte Glanzstoff-Fabriken A.-G. Ger. 577,940, June 7, 1933.

**Treating textiles.** Bleachers' Association Ltd. and George D. Sutton. Brit. 395,722, July 21, 1933. Fibers or fabrics consisting of or contg. cellulose acetate are made resistant to delustering by subjection to the action of dil. aq. AcOH under conditions of concn., temp., etc., such that substantially no swelling occurs and then washing free from the acid. Instead of or in addn. to AcOH HCOOH, propionic, HCl,  $\text{HNO}_3$  or chloroacetic acid may be used. The treated goods may again be made susceptible to delustering by treatment with dil. aq. succinic, lactic or  $\text{H}_2\text{SO}_4$ .

**Treating textiles.** Wm. M. Theobald. Brit. 396,434, Aug. 4, 1933. In dry-cleaning or dyeing fabrics, etc., the fabric is treated with a soln. of an animal, vegetable or mineral oil, wax or fat in an org. solvent; evapn. of the solvent causes impregnation with the wax, etc. The soln. may be applied simultaneously with the dry-cleaning solvent or the cleaned or dried dyed fabric may be immersed in or sprayed with the soln., excess of the latter removed and the treated fabric dried. The process restores the original appearance and texture.

**Treating textiles.** Ignacy Rassalski and Roman Vogel. Brit. 396,750, Aug. 9, 1933. Slivers of hard fibrous material, e. g., sisal, manilla hemp, are treated with a mixt. of lanolin, glycerol, mineral oil, soda lye and talc and are then spun. The resulting string is treated with a mixt. of casein, glycerol, stearin and soda lye and is preferably smoothed, dried and treated with formalin in a single operation.

**Apparatus for liquid treatments of textile materials as in treating silk with oil emulsions.** Albert J. Pfeiffer and Thayer P. Gates. U. S. 1,934,208, Nov. 7. Various details of a closed container and liquid circulation system are described.

**Preparation for textile treatment baths.** I. G. Farbenind. A.-G. Brit. 396,050, July 19, 1933. Wool, silk, fur and other animal fibers are protected against the detrimental action of alk. and acid liquors by adding thereto a prepn. consisting of a salt, oxide or hydroxide of Mg, Zn or Cd and a natural or waste org. substance of high mol. wt., e. g., sugars, sol. starch or other carbohydrates, albuminous compds. and the degradation products thereof, waste liquors from sulfite cellulose and molasses, the metal compd. being present in the prepn. in ams. up to about 5% (calcd. as oxide) such that no metallic ions are detectable therein or in aq. solns. thereof. The org. compds. form sol. or colloidal dispersed complex compds. with the metallic compd. or act as protective colloids and prevent the sepn. of the metallic oxides in alk. soln. Aminocetic acid may be added to facilitate dispersion of the metallic compd.

**Sizing textiles.** A. Th. Böhme Chem. Fabrik (Richard Böhme, inventor). Ger. 577,831, June 6, 1933. Textiles, especially rayon yarns, are sized by treatment with finely dispersed solns. of metal salts of sulfonated aliphatic or cyclic fatty acids, e. g., naphthenic acids, or their esters. Thus, a sizing soln. may be made up from commercial water-sol. casein, Turkey-red oil, a conserving agent such as salicylic acid and  $\text{BaCl}_2$  soln. Sulfonated peanut oil and  $\text{SrCl}_2$  are used instead of Turkey-red oil and  $\text{BaCl}_2$  in another example.

**Apparatus for wet-treating textile pieces.** Maschinen-fabrik Benninger A.-G. Ger. 577,938, June 7, 1933.

**Apparatus for cooling cloth and conditioning it by treatment with water.** Ernest Farrell. U. S. 1,935,022, Nov. 14. Structural and mech. features.

**Apparatus for treating fabrics with viscose, etc.** Arthur H. Kilner. Ger. 588,061 and 588,062, Oct. 10, 1933. See U. S. 1,892,579 (C. A. 27, 2314).

**Viscose fabrics.** Feldmühle A.-G. vormalis Loeb, Schoenfeld & Co., Rorschach. Swiss 161,018, June 16, 1933. Textile fabrics with a mat sheen are produced by using viscose in which are suspended metal salts capable of pptn. in the presence of a protective colloid. Thus, Ba salts may be suspended and starch used as the protective colloid.

**Rayon.** Benuo Borzykowski. Fr. 750,014, Aug. 3, 1933. Instead of the various washing, desulfurizing and bleaching baths generally used, a single bath is used which will accomplish all these operations. E. g., viscose silk is treated with a 2%  $\text{Na}_2\text{SO}_3$  soln. at 60–5°. The sulfite neutralizes the acid, eliminates the salt and the  $\text{SO}_2$  liberated bleaches the silk.

**Rayon from fibroin.** Gustavus J. Esselen (to Corticelli Silk Co.). U. S. 1,931,413, Nov. 7. Fibroin is dissolved in a cuprammonium solvent contg. a sugar or glycerol and free from acid radicals; the soln. is filtered, extruded into a bath contg.  $\text{NaHSO}_4$  and  $\text{Al}_2(\text{SO}_4)_3$ ; the fibers formed are wound on a bobbin, and are treated (as by a soap soln.) to prevent their adherence together on the bobbin. App. is described.

**Desulfurizing rayon in package form.** Hayden B. Kline (to Industrial Rayon Corp.). U. S. 1,932,789, Oct. 31. For desulfurizing rayon in package form with min effect upon or contamination by the material of either the device on which the rayon is held or the app. in which it is desulfurized, where such material includes one substance such as iron affected less as the soln. is made more alk. and another substance such as Al affected less as the soln. is made more acid, the rayon in package form is treated in such app. in a soln. of  $\text{NH}_4$  sulfide contg.  $\text{NH}_4\text{OH}$  in such quantity that the OH ion concn. of the soln. is such that effect upon and contamination by both of such substances is minimized.

**Incandescent mantles.** Deutsche Gasglühlicht-Auer G. m. b. H. Brit. 395,975, July 27, 1933. The mantles are made from plaited rayon and provided with reinforcing ribs composed of staple fiber. In 396,010, July 27, 1933, the longitudinal ribs are composed of a yarn that will shrink to a higher degree during the manuf. of the mantle than the yarn used for the rest of the mantle. The body may be of artificial silk or ramie and the ribs of cotton.

**Silk.** Francesco S. Rossi. Swiss 161,539, July 17, 1933. A concd. soln. of natural silk in  $\text{HCO}_2\text{H}$  is obtained

by adding a little mineral salt such as  $\text{CaCl}_2$  to facilitate dispersion.

**Regenerated silk yarn.** Samuro Yamamoto. Brit. 396,901, Aug. 17, 1933. A regenerated silk filament is subjected, during coagulation, by deflection to a frictional drag increasing progressively or by graduated stages. App. is described.

**Dust trunks for cotton or other fiber-opening and cleaning machines.** Howard & Bullough Ltd. and Arthur NeuKirchner. Brit. 396,885, Aug. 17, 1933.

**Machines for opening cotton or other fibers.** Richard Greenhalgh and Josiah Greenhalgh. Brit. 396,176, Aug. 3, 1933.

**Openers or scutchers for cotton, etc.** Harold Andrew. Brit. 396,918, Aug. 17, 1933.

**Rendering clothing or other fibrous material impervious to tetraalkyl lead compounds.** Wm. S. Calcott and Howell V. Bricka (to E. I. du Pont de Nemours & Co.). U. S. 1,933,704, Nov. 7. The material is impregnated with a compn. comprising a Na soap, glycerol and  $\text{EtOH}$ .

**Coating apparatus for making waterproof and washable linen, e. g., collars.** Aktiebolaget Reno-Kragar. Brit. 396,653, Aug. 10, 1933.

**Woven fabric suitable for lining shoe uppers.** Henry Kahlmeyer (to United Shoe Machinery Corp.). U. S. 1,931,612, Oct. 24. A woven fabric is formed of individual fibers which carry minute discrete particles of dry adhesive such as paracumaronic resin adhering to them (the remainder of the length of the fibers being uncoated) which serve to secure the fabric to assocd. material. Cf. C. A. 27, 5201.

**Apparatus and method for drying or conditioning materials in long lengths, e. g., cloth or warp.** Wm. W. Spooner. Brit. 388,167, Feb. 23, 1933, and 396,106, July 31, 1933, divided on 388,167.

**Tank and associated apparatus for treating lengths of fabric with washing or other liquids.** Florent Hinneken. U. S. 1,932,105, Oct. 24. Structural and mech. details.

**Apparatus for coating lengths of fabrics with various materials.** James W. Faulkner. U. S. 1,932,727, Oct. 31. Structural and mech. features.

**Furs.** Georges Romanc. Fr. 750,111, Aug. 5, 1933. Furs are made fuller by shrinking and softening the skin and then drying. These operations may be repeated several times.

**Tentering machine with a steaming unit, provided with a steam separator.** Maurice M. Kasanof. Brit. 396,350, Aug. 3, 1933.

**Dry cleaning.** Alexander Wacker Gesellschaft für elektrisch-chemische Industrie G. m. b. H. Brit. 395,517, July 20, 1933. See Fr. 739,141 (C. A. 27, 2047).

**Filter suitable for use with dry-cleaning apparatus.** James A. Bell. U. S. 1,932,569, Oct. 31. Structural details.

## 26 PAINTS, VARNISHES AND RESINS

A. H. SABIN

**Case of lead poisoning by sprayed paint.** W. Stoldt. Pharm. Zentralhalle 74, 545-6(1933). W. O. E.

**Artificial vermilion in the Middle Ages.** Daniel V. Thompson, Jr. Tech. Studies Field of Fine Arts 2, 62-70 (1933). E. H.

**New notes on the reconstitution of the pictorial technic of Jan van Eyck.** Jacques Maroger and Geo. Mourier-Malouf. Compl. rend. 197, 766 7(1933); cf. C. A. 26, 3938.—The medium used by van Eyck is transparent when dry and consists of microscopical superposed oleoresinous droplets agglomerated in the stabilizing material, which also is transparent. It is thus composed of 2 different optical systems, one continuous and the other discontinuous, with different  $n$ s. The distribution of the pigment throughout the medium is governed by a definite law for each pigment; the oleoresinous droplets exhibit selective affinity for the pigments, which prevents contact of the particles of the different pigments. This results in an

extremely high chromatic value with a min. amt. of pigment, which cannot be obtained with present-day practice, and at the same time eliminates the possibility of ultimate chem. reaction between different pigments, which explains the perfect state of preservation of the paintings. From its very nature, van Eyck's medium dries throughout the mass (and not from the surface inward as with present-day paints), which accounts for the total absence of cracking or blistering of the paintings. A. P.-C.

**The specifications of China wood oil.** M. Th. François. (Chimie & Industrie Special No., 1051-5(June, 1933). cf. C. A. 27, 5202. Analysis of 4 samples of tung oil (*Aleurites fordii*) of known purity gave the following results: acid no. (as % oleic acid) 0.53-0.84, sapon. no. 192-5, I no. (Hanus) 144-173, I no. (Wijz) 159-179, d<sub>4</sub> 0.9422-0.9489,  $n_D^{20}$  1.51875-1.51992; 2 samples of oil of *A. montana* of known purity gave: acid no. 1.3 15, sapon. no. 191-192, I no. (Hanus) 137 170, I no. (Wijz)

155-168,  $d_4^{20}$  0.9340-0.9390,  $n_D^{20}$  1.51019-1.51194; 1 sample of oil of *A. moluccana* of known purity gave: acid no. 12, sapon. no. 192, I no. (Hanus) 140-159, I no. (Wije) 150-173,  $d_4^{20}$  0.9286,  $n_D^{20}$  1.47449. Some of the values fall appreciably outside the limits set in the generally accepted specifications in the U. S., Gt. Britain, Australia, China, Germany and France, presumably because the specifications were in most cases based on the examn. of com. samples which may not have been pure. The I no. is considered to be of little value because of lack of proper duplication of results; 7 days are required to obtain the true value. The most promising single test, from the triple standpoint of rapidity, accuracy and specificity, seems to be the  $\pi$ , or possibly better still the refractive dispersion, which distinguishes between tung oil and oil of *A. montana*.

A. Papineau-Couture

Selection of nitrocellulose varnishes for covering imitation leather. V. P. Malign. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Koshevennoi Prom.* 1932, No. 3, 5.—This imitation leather consists of a no. of paper layers held together by a mixt. of animal glue and glycerol. The finished plates are treated in a formalin bath and dried. This substitute is used for making trunks; however, it has the disadvantage of losing its shape and its dark gray color is another undesirable feature. It was attempted to eliminate these disadvantages by covering the substitute with a base varnish composed of a mixt. of one part (by weight) of nitrocellulose contg. 10.5-11.5% N and 2 pts. of acetone-alc. mixt. and with the addn. of the necessary amt. of Am acetate and pigments; the whole is thoroughly ground with castor oil and a layer placed on the imitation plate. The latter was then dried at 25-30°. The face was covered 2-3 times with that compn. and once with varnish. The results were satisfactory.

A. A. Boehlingk

Benzylcellulose lacquers. L. Meunier and M. Goufard. *Chem. Tech.* 22, 200-3 (1933); cf. C. A. 27, 1593.—Benzyl groups may be detd. either by acetylation or by forming benzyl iodide. Three specimens of high-, medium- and low-viscosity all contained about 52% benzyl groups, corresponding closely to 2 benzyl groups per  $C_{12}H_{10}O_2$  group. Tests showed that benzylcellulose is superior to acetate cellulose and nitrocellulose in decompn. temp., non-hygroscopicity, resistance to acids and alkalis, adhesion, toughness and dielec. strength. Benzylcellulose contg. 56% benzyl groups is sol. in  $C_6H_6$ ; that contg. 52% requires addn. of 10-20%  $PrOH$ . Benzylcellulose films swell about 3% in  $H_2O$ ; swelling increases progressively with concn. on addn. of  $KtOH$ , acetone (partial sol. in 40% soln.), pyridine, phenol and aniline. The partition coeffs. of the last 2 compds. between  $H_2O$  and benzylcellulose are const. Viscosity measurements on benzylcellulose solns. indicate no appreciable internal mobility; viscosity declines on aging. The properties of benzylcellulose indicate that it may be used in making leather or artificial leather.

The development, characteristics and future of urea-formaldehyde resins and molding powders. James Taylor. *Australian Plastics & Allied Trades Rev.* 2, No. 2, 8-11 (1933).

E. H.

Printing ink (Wells) 23. Detn. of mol. wt. of linseed oil and its polymerides (Gay) 2. Aromatic bases [use in prepn. of artificial resins] (Fr. pat. 749,964) 10. Metallic soaps [products used in the paint, varnish and lacquer industries] (Brit. pat. 395,406) 27. Esters [for plasticizing and softening agents for lacquers] (Brit. pat. 395,240) 10. Polyvinyl compds. [products used for making lacquers] (Brit. pat. 396,186) 10. Polymerization product for coatings (U. S. pat. 1,933,052) 18. Cellulose acyl nitrates for lacquers (U. S. pat. 1,933,296) 23.

1. Polymerized vinyl esters and fatty oils [products for lacquers] (U. S. pat. 1,934,297) 10.

Siccatives for paints, etc. Herman A. Bruson\* (to Resinose Products & Chemical Co.). U. S. 1,933,520, Oct. 31. Compns. are described comprising Co, Mn and Pb salts such as those of *p*-isopropylphenolcarboxylic acid, *p*-isopropylsalicylic acid, *p*-sec-octylsalicylic acid, *p*-sec-butyl- or amyl-salicylic acid and the like. U. S. 1,933,521 relates to the similar use of compds. such as salts of *p*-cymyl-*o*-benzoic acid.

Storage tank and mixing device suitable for preparing paints, etc. Fred F. Schwentker (to General Elec. Co.). U. S. 1,933,346, Oct. 31. Structural and mech. features.

Titanium dioxide. Herbert L. Rhodes (to Glidden Co.). U. S. 1,931,682, Oct. 24.  $TiO_2$  is calcined with 0.1-2.5% of a titanate of the alkali metal group such as Na titanate which will remain white or light colored after calcination and serves to give the product lower oil absorption, higher opacity and improved mixing properties.

Zinc white. Joseph M. H. Cornillat. Fr. 41,712, Mar. 29, 1933. Addn. to 632,235 (C. A. 22, 3498). Zn is heated indirectly by the combustion flame to a temp. near its f. p., and then directly by this flame which provokes instant fusion and volatilization in the current of  $CO_2$  from the flame.

Permanent quick drying writing fluid. Carl S. Miner and Galen H. Sayler (to Parker Pen Co.). U. S. 1,932,248, Oct. 24. A direct dye such as Schultz No. 424 is used with flake NaOH,  $NH_4$  metavanadate, amyl xanthate, corn starch, bentonite and water.

Ink suitable for printing on materials such as cellulose acetate plastics. Americo F. Caprio and William Bowker (to Celluloid Corp.). U. S. 1,931,485, Oct. 24. An ink is formed contg. low-viscosity cellulose acetate or nitrate 100, dimethyl phthalate 200 and a pigment 75-200 parts.

Varnishes, etc. Albert J. Ducamp and Marie E. A. Baule. Fr. 41,711, Mar. 29, 1933. Addn. to 729,547 (C. A. 27, 434). Surfaces of metals, more or less oxidized, are coated with fatty substances capable of resinifying and contg. one or more fatty acids. The oxide is dissolved in the coating by the action of heat and the whole is transformed by catalytic action to a solid layer.

Coating copper or other metals to prevent corrosion. Albert J. Ducamp and Marie E. A. Baule. U. S. 1,932,156, Oct. 24. Dist. castor oil, free from heptylic aldehyde, is mixed with undecylenic acid and a metal oxide such as Cu oxide, and the mixt. is heated so that the castor oil is resinified and oxidized and the product is used as an insulating-resistant varnish. The material is heated after application, and other ingredients such as naphthenic acids, gums, gasoline, alc., pigments, etc. may be added. Cf. C. A. 27, 4427.

"Wrinkle finish" varnish. Glen H. Burgman (to G. J. Liebhich Co.). U. S. 1,934,034, Nov. 7. A base for a wrinkle finish varnish comprises raw China wood oil and a hard fusible resin in a proportion of 5-10% the wt. of the oil, the compn. being heated to 175-285° for 4-8 hrs.

Lacquers; putty compositions. Deutsche Hydrierwerke A.-G. Brit. 396,924, Aug. 17, 1933. Esters of fatty acids contg. not more than 6 C atoms with alcs. corresponding to soap-forming carboxylic acids, e. g., alcs. corresponding to coconut oil, naphthenic and resin acids and oleic, cetyl, myristic and lauryl alcs., are used as constituents of oil lacquers and varnishes and putty compns. Free alcs. corresponding to soap-forming carboxylic acids may also be included. In examples (1) a lacquer is prepd. from linseed oil, cetyl acetate, oleic alc., varnish benzene and a pigment and (2) a putty is prepd. from linseed oil varnish, turpentine oil, cetyl acetate, myristic alc., slate dust and white lead.

Lacquer. J. R. Geigy A.-G. Ger. 577,724, June 3, 1933. A light-fast yellow lacquer is prepd. by coloring nitro- or acetylcellulose lacquer with the azo dye obtained from *o*-nitrodiazonium compds. of benzene derivs. without free  $COOH$  or  $HSO_3$  groups, and acetoacetic esters. Thus, the lacquer is colored by the azo dye from 1-methyl-3-

nitro-6-aminobenzene and the ethyl ester of acetoacetic acid.

**Synthetic gum lacquers.** Charles T. Ellis (to Sherwin-Williams Co.). U. S. 1,934,261, Nov. 7. A base for use in pyroxylin coating compns. consists of 50 parts of a "destructively-distd. castor-oil condensation product" mixed with a hardening agent such as ester gum, fused Kauri copal or fused Congo copal, together with BuOAc 15, AmOAc 10, BuOH 5 and toluene 20 parts.

**Compounds of the aroyl-o-benzoic acid series.** Herman A. Bruson (to Resinous Products & Chemical Co.). U. S. 1,934,033, Nov. 7. Siccatives suitable for dissolving in linseed oil, China wood oil, soy-bean oil, etc., in making *varnishes, enamels, paints*, etc., comprise metal salts such as the Al, Ba, Ca, Pb, Ce, Mg, Sr, Zn, Cr, Co, Cu, Fe or V salts of synthetic acids (prepn of some of which is described) such as *n*-butylbenzoyl-o-benzoic acid, *n*-amylbenzoyl-o-benzoic acid, *sec*-amylbenzoyl-o-benzoic acid, *di sec*-amylbenzoyl-o-benzoic acid, *sec*-hexylbenzoyl-o-benzoic acid, *sec*-octylbenzoyl-o-benzoic acid, *sec*-amyltoluyl-o-benzoic acid, *sec*-octyltoluyl-o-benzoic acid, *sec*-amylxyloyl-o-benzoic acid, *sec*-octylxyloyl-o-benzoic acid, *sec*-amyl-naphthoyl-o-benzoic acid, *sec*-amyl-tetrahydronaphthoyl-o-benzoic acid, *sec*-octyl-naphthoyl-o-benzoic acid, and the like (which acids may also be employed in the crude state or admixed with each other).

**Coating compositions.** E. I. du Pont de Nemours & Co. Brit. 396,081, July 28, 1933. A vehicle which promotes *leafing of flake pigments*, e. g., flake Al, graphite, mica and flake sulfide pigments, consists of an oil-modified polyhydric alc.-polybasic acid resin having an acid value of 15 or less and driers dissolved in mineral spirits or other solvent to give a soln. having a viscosity between A and F on the Gardner-Holdt scales. The flake pigment may be first coated with substances, e. g., stearic acid, that enhance the *leafing properties*. The resins may be formed by condensing in presence of PhO phthalic anhydride, glycerol (which may be replaced in part by ethylene glycol) and 45-70% of linseed, China wood, perilla or menhaden oils, or acids derived from these oils.

**Rust-preventing coatings.** I. G. Farbenind. A.-G. (Hermann Schladebach and Herbert Hahle, inventors). Ger. 576,210, May 9, 1933. Addn. to 570,738 (C. A. 27, 4427). The protective coating of cellulose ether lacquer of 570,738 is applied over a layer of drying fatty oil.

**Preventing oxidation of metal objects.** Sigg A. G. Swiss 159,677, Aug. 16, 1933. Oxidation of metal bodies, especially of Al, is prevented by cleaning off grease and applying a layer of paraffin, ceresin or other wax-like substance; a second layer consisting of a soln. of synthetic resin in a primary state of condensation is then applied and the object heated to 250-400° so that the first layer is volatilized and the second layer burned on to the object.

**Composition for making molded articles.** Frazier Groff (to Bakelite Corp.). U. S. 1,931,958, Oct. 24. A compn. suitable for making molded articles comprises a resin of the hexamethylenetetramine triphenol type, a water-repellant org. substance of low vapor pressure such as rosin or carnauba wax and a filling material such as mica.

**Inlaid linoleum.** Emerson R. Newell (to Sloane-Blahon Corp.). U. S. 1,932,419, Oct. 31. Mech. features.

**Resin.** Hercules Powder Co. Ger. 577,723, June 3, 1933. Resin is purified by dissolving it in an org. solvent and treating it with PhOH, chlorohydrin, 2-furancarbinol SO<sub>2</sub> or PhNH<sub>2</sub>. The purified resin may be used for making *glaze for paper*.

**Resin esters.** I. G. Farbenind. A.-G. (Arthur Voss, inventor). Ger. 577,691, June 2, 1933. In prepg. resin esters, a low-mol., difficultly volatile org. acid or synthetic resin acid is added before or during the esterification. Thus, colophony is fused with glycerol, with addn. of diglycolic acid. The products are used in the *paint and varnish industry*.

**Vinyl resin.** Ernest W. Reid (to Carbide & Carbon Chemicals Corp.). U. S. 1,935,577, Nov. 14. An arti-

ficial resin which may be used for lacquers or plastics is obtained by conjointly polymerizing vinyl chloride and a vinyl ester of a lower aliphatic acid such as vinyl acetate.

**Condensation products of polyvinyl alcohol with cyclic ketones.** Georg Kranzlein, Arthur Voss and Werner Starck (to I. G. Farbenind. A.-G.). U. S. 1,933,986, Nov. 7. Condensation products suitable for use in making *lacquers, molding compns.*, etc., are obtained by causing a cyclic ketone such as  $\alpha$ -methylcyclohexanone, cyclohexanone or *p*-chlorocyclohexanone to act upon a polyvinyl alc., in the presence of a condensation catalyst of acid reaction such as H<sub>2</sub>SO<sub>4</sub>, HCl, H<sub>3</sub>PO<sub>4</sub>, monochloroacetic acid, dichloroacetic acid, borofluoroacetic acid, oxalic acid, formic acid, lactic acid, an aromatic sulfonic acid, ZnCl<sub>2</sub> or AlCl<sub>3</sub>. Various examples with details of procedure are given.

**Resinous condensation products from phenols and ketonic "monobasic" acids such as benzoyl-o-benzoic acid.** Herman A. Bruson (to Resinous Products & Chemical Co.). U. S. 1,934,032, Nov. 7. Condensation products substantially free from esterified phenol and suitable for use with nitrocellulose in lacquers, etc., are produced by reaction of a phenol such as PhOH, *o*-cresol or a naphthol with a ketonic "monobasic" acid such as benzoyl-o-benzoic acid (suitably by heating and use of H<sub>2</sub>SO<sub>4</sub>). (CH<sub>3</sub>)<sub>2</sub>N<sub>4</sub>, etc., may be added.

**Resinous ester-aldehyde condensation products.** Fritz Seebach (to Bakelite G. m. b. H.). U. S. 1,933,124, Oct. 31. An aromatic ester of an aliphatic acid such as phenyl carbonate is condensed with a reactive methylene-contg. reagent such as (CH<sub>2</sub>)<sub>6</sub>N<sub>4</sub> and polymerized formaldehyde to form a product which is suitable for *varnishes, etc.*

**Forming plates or the like from artificial phenol-formaldehyde resins.** Kurt Raschig and Max Koeber (to F. Raschig G. m. b. H.). U. S. 1,934,817, Nov. 14. Various details of operation are described suitable for forming a block or plate of phenolic resin firmly united with a layer of wood or the like.

**Resinous compositions.** Moyer M. Safford (to The British Thomson-Houston Co. Ltd.). Brit. 396,354, Aug. 3, 1933. A molding compn., particularly suitable for extrusion processes, comprises a mixt. of uncured, e. g., 20-40%, and cured, e. g., 60-80%, flexible alkyd resin with, if desired, a basic substance such as ZnO, BaO, PbO, etc., to accelerate curing. Fillers and other accelerators may also be added. The resins are described in Brit. 365,140 (C. A. 27, 1775). Armature coils may be molded in the solid bar by covering the wire with the compn. curing it, then extruding a second coating thereon, winding, pressing in a mold and, after removing, curing. The compns. are resistant to corona, oil and H<sub>2</sub>O. Wide sheets, tape, oil-proof gaskets, wire coverings, tubes, etc., may be molded, extruded or calendered. Cf. C. A. 28, 352.

**Synthetic resin.** Merlin M. Reubaker (to E. I. du Pont de Nemours & Co.). U. S. 1,932,688, Oct. 31. A non-drying fatty oil or a semi-drying fatty oil having an I no. of at least 70 or acids derived from such oils by saponification are converted from the  $\alpha$ - to the  $\beta$ -form (suitably by use of HNO<sub>3</sub>). The  $\beta$ -product is *sepd. from unconverted  $\alpha$ -material* and is caused to react with a "polybasic" acid such as with phthalic anhydride and glycerol. Various details and examples are given.

**Synthetic resins.** Roland B. Day (to Universal Oil Products Co.). U. S. 1,933,715, Nov. 7. Cracked hydrocarbon oil distillates contg. unsatd. material are oxidized and subjected to the action of a solvent such as liquid SO<sub>2</sub> to sep. the unsatd. hydrocarbons and the solvent is removed from the dissolved unsatd. compds. and the latter are caused to react with *furfural*. Products are obtained which may be used for molding, etc. U. S. 1,933,716 relates to a generally similar process in which an aldehyde may be used instead of furfural.

**Synthetic resins.** Richard Weithoner and Glasurit-Werke M. Winkelmann A.-G. Brit. 395,894, July 27, 1933. Resins are prepd. by condensing polybasic carboxylic acids, e. g., succinic, citric, malic, camphoric or their anhydrides, with mixts. of polyhydric alcs., e. g., glycerol,

glycol, polyals. and incompletely esterified polyals. and their esters with volatile monobasic aliphatic acids contg. not more than 5 C atoms, with or without addns. such as monobasic acids, e. g., BzOH, lactic, salicylic, glycollic, chloroacetic, chlorobenzoic, oleic and resin acids or fatty oils. In examples phthalic anhydride is heated with (1) a mixt. of glycerol and glycerol mono-, di- and tri-acetates, with or without linseed oil and (2) a mixt. of glycerol and glycerol formates, propionates, butyrates or valerates, with or without linseed oil.

**Synthetic resins.** American Cyanamid Co. and Theodore F. Bradlev. Brit. 395,899, July 27, 1933. The fatty acids of walnut oil, with or without walnut oil and other oils and fatty acids, e. g., linseed or tung oils, heat treated if desired, are condensed with a polybasic acid or anhydride, e. g., phthalic anhydride, and a polyhydric alc., e. g., glycerol, to give a resinous product.

**Synthetic resins.** Edward H. Jackson and Hugh J. Cameron (to The British Thomson-Houston Co. Ltd.). Brit. 396,071, July 26, 1933. See U. S. 1,919,163 (C. A. 27, 4943).

**Synthetic resins.** Soc. pour l'ind. chim. à Bâle. Fr. 749,962, Aug. 2, 1933. Infusible masses are obtained by submitting fusible condensation products (obtained from

primary aromatic amines and  $\text{CH}_2\text{O}$  in the absence of acid or in the presence of less than  $1/4$  mol. of acid for 1 mol. of amine) to the action of fresh amts. of aldehydes or agents liberating aldehydes at temps. not above  $140^\circ$ , with or without the use of acid condensing agents, and causing the final hardening at higher temps., if necessary under pressure.

**Synthetic resins.** Soc. pour l'ind. chim. à Bâle. Fr. 750,025, Aug. 3, 1933. Products which may be molded and hardened are made by condensing amino or hydroxy-amino aromatic di- or poly-nuclear bases, the rings of which are joined directly or indirectly in the mol. ratio of less than 2 methylenic groups, substituted or not, for 2 aromatic radicals and which contain, as a min., as many amidogen or amidogen and hydroxyl groups as joined rings, with aldehydes or agents yielding aldehydes. The products may be submitted to a preliminary hardening at a moderate temp. Suitable bases include amidobenzyl-aniline and its homologs and analogs of higher mol. wt. (cf. Fr. 749,964 (C. A. 28, 481)), *p*-diaminophenylmethane and its derivs., hydroxybenzylarylamines (by condensing mono- and poly-methylolphenols with aromatic bases) as well as products obtained by replacing  $\text{CH}_2\text{O}$  by other aldehydes in the syntheses of the products mentioned.

## 27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

**Determination of the unsaponifiable matter of fats.** V. Veselý and L. K. Chudožilov. *Chimie & industrie Special No.*, 1048 50 (June, 1933).—If the unsaponifiable matter consists of higher als., the Spitz-Honig method using petr. ether gives low results, because of the solv. of the higher als. in the 50% alc. used for washing the petr. ether to remove the last traces of soap. If the unsaponifiable matter consists mainly of hydrocarbons, the use of petr. ether gives accurate results. A. P.-C.

**Estimation of fats, oils and fatty acids by fusion with wax or ceresin.** C. A. Rojahn and Josef Haugg. *Apoth. Ze* 48, 1117 20 (1933). The method, simple in execution and for all practical purposes sufficiently exact, consists in the case of soaps in pptn. of the fatty acids by addn. of acid to the soap soln., followed by heating the resulting mixt. with 3-6 g. of wax, ceresin or a mixt. of equal parts of the latter, removal of the supernatant cake, drying on paper and weighing, the increase in wt. representing the fatty acids. The entire operation requires only a few min. Emulsions, liniments, salves, suppositories, creams and spirituous preps. are treated in much the same way. *Ibid.* 1236-7.—An amplification of the recent paper by the authors. W. O. E.

**Composition of fatty acid mixtures. I. Relation of composition to Dalcian's curve.** Robert N. Wenzel. *Ind. Eng. Chem., Anal. Ed.* 5, 393-6 (1933).—It has been shown that the Dalcian curve is at best only an approximation which must be handled with considerable caution even in its proper application, which is the estn. of yields of chem. products. It can contribute no evidence of an exact quant. nature regarding the actual content of satd. fatty acids in any tech. mixt. R. Scherubel

**Accelerating effect of metals on the development of peroxides in oils and fats.** A. E. King, H. L. Roschen and W. H. Irwin. *Oil and Soap* 10, 204-7 (1933).—Sols. of the acetates of Cu, Fe, Mn, V, Ni, Al, Pb, Zn, Sn and Cr in  $\text{CHCl}_3$  were made; and 2-cc. portions in 20 cc. lard were aerated at a uniform rate at  $208^\circ\text{F}$ . until a peroxide concn. was produced which coincided with the rancid point of the fat as detd. organoleptically. Results are tabulated. Cu showed the greatest effectiveness as an accelerator of rancidity while Sn showed the least. The same test was made with strips of some of the metals immersed in lard. The results classify the metals in a different order from that given by the tests made with the dissolved metals. Cu was found to be active in both forms. Fe is inactive in solid form, but Sn in solid form is active. No loss in wt. of the metals took place except

with Pb. Insufficient work has been done to draw many conclusions, but Cu should be avoided in fat-handling and processing equipment.

E. Scherubel

**Analytical classification of the fish-liver oils.** Norman Evers and Wilfred Smith. *Quart. J. Pharm. Pharmacol.* 6, 329 37 (1933); cf. C. A. 27, 617. In the first part of this paper an attempt was made to correlate the chem. characters of the fish-liver oils with the zoological classification of the fish, more particularly in regard to the nature of the unsaponifiable matter. In the present paper further samples of fish-liver oils have been examd. by the methods previously followed. A no. of oils were examd. for vitamin A by the spectrographic method of measuring the intensity of absorption at a wave length of  $328 \mu$ . The results obtained have been compared with the blue values yielded by the  $\text{ShCl}_3$  color test on the same oils. It is shown that for none of these oils is the "blue value" detd. directly on the oil more than an approx. measure of the vitamin A content. W. O. E.

**Relationship between the antimony trichloride blue value of cod-liver oils and that of their unsaponifiable fractions.** F. J. Dyer. *Quart. J. Pharm. Pharmacol.* 6, 338-46 (1933).—Thirty-nine samples of liver oil were tested by  $\text{ShCl}_3$  reagent both for the blue value of the oil ( $x$ ) and of the unsaponifiable fraction ( $y$ ). For this series it has been shown that the blue value of the unsaponifiable fraction is 161.5% of that of the blue value of the oil itself. By math. analysis, the curve of distribution of the values of  $\log y - \log x$  has been shown to be almost normal, to possess only a slight degree of "skewness" and to be of normal height. In practice this means that the likelihood of the blue value of the unsaponifiable matter prepd. by the rapid method of Smith and Hazley, being 161.5% of that of the blue value of the oil, is equal for oils of high and low blue values. A simple calcn. has been made of the degree of inaccuracy that is unavoidable in making a detn. of the blue value of an oil direct, rather than on the unsaponifiable matter. A worker must decide whether this degree of inaccuracy is so great as to make it worth while to carry out the test on the unsaponifiable matter. W. O. E.

**Notes on extraction plants for oil seeds.** Herrmann Meyer. *Chem. App.* 20, 94-5, 103-5 (1933). The flow sheet and details of construction for extn. plants are discussed. Summarized data for properties of oils and suitable solvents are presented. Karl Kammermeyer

**Calculation of a refining plant for seed oils.** Herrmann Meyer. *Chem. App.* 20, 113-17 (1933); cf. preceding

abstr.—Calens. for the various steps in a refining plant processing 3000 kg. cottonseed oil per 12 hrs. are carried out for heat and material requirements. A table is presented which gives values for the mean temp. difference as functions of the terminal differences, in heating equipment.

Karl Kammermeyer

The seeds of *Euphorbia oxigua* L. Paul Gillot. *Bull. sci. pharmacol.* 40, 449-53(1933).—The compn. of the seed was detd. as follows:  $H_2O$  7.04, fat 34.35, protein 19.77, sugars 1.80, inorg. matter 7.64, cellulose 29.40. The oil obtained by pressing is of pale yellow color and has the following characteristics:  $[\alpha] = +50'$  ( $d = 2$ );  $d_{20} 0.9368$ ;  $n_D^{20} 1.4858$ ;  $n_D^{25} 1.4832$ ; Crismer's index (alc. d = 0.7967) 64.5°; m. p. -25°; free fatty acids as oleic acid per 100 g. 0.35; sol. fatty acids, as butyric acid 0.07%; Hehner value 95.79%; volatile fatty acids (Reichert-Wolny) sol. 0.3, insol. 0.2 (in cc. 0.1 N KOH); sapon. value 191.5; I value 212.5; Ac value (André) 7.0; un-saponifiable matter 0.94%; Hehner-Mitchell value 99.60%; oxidation degree (Bishop) 21.85. It gives immediately a ppt. in the Br reaction of Halphen; Bellier's resorcinol reaction produces a violet oil and yellow acid. The fatty acids have  $n_D^{20} 1.4735$ , I value 220.8 and neutralization value 198.5. The constn. obtained with oil prepd. by extn. vary slightly from the above figures. The oil has a purgative action.

A. E. Meyer

Impregnating viscose plates with emulsions of sulfonated and non-sulfonated linseed and hempseed oils followed by fixing the emulsions on the plates. A. P. Pisarenko. *Izvestiya Tsentral' Nauch-Issledovatel' Ins. Koshvennoi Prom.* 1932, No. 3, 4.—In an attempt to prep. sulfonated oils suitable for impregnating viscose plates it was found that a good product is obtained when linseed oil is sulfonated with 30% of  $H_2SO_4$ ; it is added gradually and the temp. kept below 30°. If these conditions are disregarded, polymerization occurs and 2 layers form. The  $H_2SO_4$  is sep'd from the sulfonated oil by treatment with a 20% soln. of NaCl followed by neutralization with an 18% soln. of NaOH. The obtained product is dissolved with difficulty in cold but easier in hot water; a perfectly clear soln. is obtained on adding 1 drop of  $NH_4OH$ . Hempseed oil is sulfonated without forming 2 layers. The product obtained on using more than 30% of  $H_2SO_4$  is too viscous and difficultly sol. in water, while 20% of  $H_2SO_4$  produces an oil which dissolves in water and yields a clear soln. upon the addn. of 1 drop of  $NH_4OH$ . The sulfonation temp. should also be kept below 30°. The sep'n. of  $H_2SO_4$  is carried out in the usual manner.

Recovering protein from press cake. V. N. Rozanov and N. V. Smirnova. *Schriften zentral. biochem. Forschungsinst. Nahr.-Genussmittelind.* (U. S. S. R.) 1, 301-8 (1932).—The  $NH_4OH$  method of extg. protein from oil seed press cake is not economical because of the difficulty and expense of  $NH_3$  recovery. Use of KOH or NaOH causes no greater protein degradation and is more efficient. Details vary according to conditions, but in general good results are obtained by extn. with 0.5-1.5% KOH (or NaOH) and pptn. with dil. HCl.

J. F. S.

Reesterification. Ryohei Oda. *Sci. Papers Inst. Phys. Chem. Research* 22, 15-46(1933).—Reesterification of olive oil in a 1-l. shaking autoclave at 200° with EtOH takes place readily and easier if excess of EtOH is used as a solvent; with glycerol the reaction is slower. The amt. of reesterification is detd. by sapon., acid and acetyl nos. Olive, coconut and linseed oils, resp., react similarly with  $(CH_3OH)_2$  to give probably the mono acid glycol of the oil. EtOH and  $C_2H_5$  are ineffective as solvents but  $C_2H_5N$  accelerates the reaction probably because of its alkyl. The use of CaO or  $K_2CO_3$  has an accelerating effect, while fuller's earth,  $Na_2B_4O_7$ ,  $SiO_2$ ,  $ZnCl_2$ , and activated C have practically no effect. Excess pressure has no effect. Castor oil, hardened fat or fish oil reacts with  $(CH_3OH)_2$ , while spermaceti does not react with  $(CH_3OH)_2$ , EtOH or glycerol. Olive oil does not reesterify with  $C_2H_5OH$ ,  $PhCH_2OH$  and *o*-, *m*- or *p*- $C_6H_4(OH)_2$ . The oils can similarly be reesterified with org. acids. Olive oil and  $ClCH_2CO_2H$  react easily. Traces of  $H_2O$  accelerate the reaction, as does higher temp.; with  $Ac_2O$ ,  $CH_3(CH_2)_2$ ,

$CO_2H$  or  $(CO_2H)_2$ , the reaction is slower; with lactic, citric or tartaric acid there is very little action; with  $C_6H_5CO_2H$  a small amt. which is accelerated by  $H_2SO_4$ . Coconut oil and oleic acid are reesterified as well as linseed oil and stearic acid. Castor oil reacts similarly with oleic acid and  $(CH_3OH)_2$ . Linseed oil and coconut oil are about 30% reesterified. Ethers react with alcs. in an analogous manner.  $ClCH_2CO_2H$  and  $Cl_3CCO_2H$  react with castor oil without a catalyst very easily. Castor oil reacts with  $(CO_2H)_2$ , citric or phthalic acid under reduced pressure to give resins called *oxalestolid*, *citronestolid* and *phthalestolid*. No resins are obtained with malonic, succinic or tartaric acid. Citric acid with glycerol and  $(CH_3OH)_2$  gives resins.

Julius White

Investigations on reesterification. \*VIII. Reaction between castor oil and some polycarbonic acids, particularly oxalic acid. Ryohei Oda. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 571-4(1933); cf. C. A. 27, 5719.—The reactions of castor oil with oxalic, malonic, succinic, citric and tartaric acids were investigated, and it was found that (1) oxalic acid reacts easily but excess acid is ineffective; (2) malonic and citric acids react easily; (3) succinic and tartaric acids react only with difficulty. Exptl. data are presented.

Karl Kammermeyer

Quantitative estimation of detergency. O. M. Morgan. *Oil and Soap* 10, 223-7(1933).—A standard soiled cloth in lab. expts. showed that it was sufficiently sensitive to show up differences in washing procedure. In a comparison of the detergent efficiencies of laundry soap builders it was shown that  $Na_2SiO_3$  was the most efficient followed by NaOH,  $Na_2PO_4$  and  $Na_2CO_3$ . On a plant scale the same order of efficiency was obtained. The  $pH$  values at which max. detergent effects were noted varied considerably. For  $Na_2CO_3$ ,  $Na_2PO_4$  and modified soda the max.  $pH$  values found during treatment with suds were 10.1 and 10.2;  $Na_2SiO_3$  gave opt. results at a  $pH$  value of 10.8 and NaOH at 10.6. No trouble was experienced in rinsing out any of the alkalies used.

E. Scherubel

Detn. of volatile oils (Perlova) 17. System of lipoids (Halden) 11A. Coloring butter, etc. [oils] (Swiss pat 162,130) 12. Aralkyl ethers [wetting agents] (Fr. pat 749,402) 10. Polymerized vinyl esters and fatty oils (U. S. pat. 1,934,297) 10.

Purifying and splitting fats, etc. I. G. Farbeund A.-G. Brit. 396,769, Aug. 8, 1933. Fats, oils, waxes, oxidation products of non-aromatic hydrocarbons and other mixts. contg. fatty acids are freed from unsaponifiable substances of high mol. wt by heating the crude alkali metal soaps prepd. from the raw material in a closed vessel under pressure, removing  $H_2O$  therefrom by releasing the pressure and then distg. off the volatile substances from the anhyd. molten soap. Thus bleached montan wax, wool grease, spermaceti or hydrogenated soy bean oil is heated to 200-300° with aq. NaOH or KOH or  $Na_2CO_3$  in an autoclave under 10-30 atm. pressure. Pressure is then released to allow steam to escape and the residue is heated to 310°, if desired *in vacuo* or in a current of steam or inert gas, e. g.,  $CO_2$ , N or waste gases, whereby unsaponifiable products, e. g., alcs., aldehydes, ketones and hydrocarbons, are distd. off and condensed. The residu. may be dissolved in  $H_2O$  and fatty acids recovered by addn. of mineral acid, the acids being purified by distn. *in vacuo* or in steam and used in the manuf. of soap.

Fats and oils. Donald P. Grettie (to Swift & Co.). Brit. 395,971, July 27, 1933. Lard, beef fat, hydrogenized or unhydrogenized cottonseed oil and other shortening agents are stabilized against rancidity by adding a small amt., e. g., 5-10%, of hydrogenized sesame oil, which may be partially deodorized before use and hydrogenated to the consistency of the material being treated.

Distilling fatty acids, glycerol, etc. Nicolaas H. S. van Recsema. Brit. 396,095, July 31, 1933. In the distn. of fatty acids, etc., with steam under vacuum, a high vacuum is maintained by freezing out the steam in solid

form after first condensing the distd. vapor and then withdrawing the residual gases by means of a vacuum pump. App. is described.

**Fatty acid recovery from soaps derived from asphaltic residuum of mineral oil stills.** Gellert Alleman (to Sun (il Co.). U. S. 1,931,855, Oct. 24. The soaps, in aq. soln., are acidified and xylene is added to the fatty acids and water; the xylene and water are then distd. off, leaving all the fatty acids in the residue, and they may then be extd. with anhyd. EtOH. App. is described.

**Purifying oils.** I. G. Farbenind. A.-G. Fr. 41,676, Mar. 10, 1933. Addn. to 888,370 (C. A. 25, 837). Lecithins, phosphatides, etc., are removed from crude oils, particularly soy-bean oil, by dispersing a small proportion of water or steam in the oil at about 60-70° and cooling rapidly to normal or lower, and removing the products which are pptd.

**Purifying hydrogenated fatty oils.** Dietrich Hildisch. Brit. 397,039, Aug. 17, 1933. The oils are freed from objectionable taste and odor by treating the hot oil with substances which split off gases or vapors such as O, NH<sub>3</sub>, CO<sub>2</sub>, etc., e. g., NH<sub>4</sub> carbamate, (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub>, NH<sub>4</sub>NO<sub>3</sub>, mixts. of NH<sub>4</sub>Cl and NaNO<sub>3</sub>, urea, di- or tri-ethanolamine, inorg. or org. peroxides, e. g., Bz peroxide, or bicarbonates alone or mixed with acids. During evolution of the gas a current of steam, NH<sub>3</sub> or CO<sub>2</sub> may be passed into the oil, or the latter may be submitted to steam treatment *in vacuo* after deodorization.

**Catalytic hydrogenation.** Deutsche Hydrierwerke A.-G. Brit. 396,311, Aug. 3, 1933. Metallic salts of high mol. org acids are used as catalysts for the reduction of fats, oils, waxes, fatty acids, etc., to high mol. alcs. Such salts are the Cu, Zn, Pb, Mn, Co, Ni and Hg salts of palmitic, stearic, linseed oil, rosin and naphthenic acids. They may be formed within the substance to be reduced, e. g., CuCO<sub>3</sub> and oleic acid may be added to coconut fat and the mixt. heated in an autoclave to 280-300° under 100-200 atm. of H pressure.

**Wax-like emulsifiable materials suitable for various uses.** Walther Schrauth (to Unichem Chemikalien Handels A.-G.). U. S. 1,932,643, Oct. 31. A wax-like material capable of combining with 5 times its quantity of water contg. 2% Na<sub>2</sub>CO<sub>3</sub> to form a colloidal mass may be formed of spermaceti 65, cetyl alc. 25 and stearic acid 10%. Similar mixts. also may be formed contg. wool fat alcs., palmitic acid, colophony, etc.

**Soap.** Nguyễn-Ngọc-Thai dñ Nguyễn-Van-Thai. Fr. 749,751, July 29, 1933. The soap contains water 280.1, coco oil 550, soda 100 and talc 5 parts.

**Apparatus for the continuous preparation of soap and glycerol.** John B. E. Johnson. Ger. 577,886, June 6, 1933.

**Metallic soaps.** Titanium Pigment Co., Inc. Brit. 375,406, July 17, 1933. Soaps of tetravalent elements of group IV A are obtained by adding a compd. of the element, e. g., org. or inorg. salts of Ti, Zr and Th, to a soln. of a salt of a fatty or resin acid, the soln. being at 40-70° and being constantly agitated during the addn. Mixed soaps, e. g., Ti Co linolate tungstate or Pb Ti tungstate resinate, may also be obtained by co-pptn. or by mixing the separately prepd. soaps. The products may be used in *waterproofing, mordanting, the prepn. of emulsions, lubricants, floor waxes, polishing compds., in dry-cleaning and in the paint, varnish and lacquer industries*. Cf. C. A. 27, 1215.

**Wetting, etc., agents.** Karl Marx, Karl Brodersen and Matthias Quaedvlieg (to I. G. Farbenind. A.-G.). U. S. 1,931,902, Oct. 24. Aminosulfonic acid or a deriv. such as phenyl- or tolyl- or 4-methylphenylsulfamic acid is used for reaction with the higher aliphatic alcs. such as dodecyl alc., hexadecyl alc., octadecyl alc., polyhydric alcs. with more than 10 C atoms, fatty alcs. contg. a phenyl group or a cyclohexyl group, alcs. corresponding to the general formula R-CO-NHR'-OH (R meaning a higher aliphatic radical and R' an aliphatic radical) such as lauroylhydroxyethylamide, the hydroxyethyl- or propylamide of coconut oil acid, stearylhydroxypropylamide,

monocarboxylic acids, esters of the higher fatty acids, such as esters of coconut oil acid, oleic acid, stearic acid, palmitic acid with polyhydric alcs. such as glycerol, sorbitol and polyglycerol and mono ethers of polyhydric alcs., such as stearyl glycerol ether, palmitylglycerol ether. Numerous examples with details of procedure are given. The products are wetting, emulsifying and softening agents.

**Wetting, etc., agent.** Chemische Fabrik vorm. Sandoz. Swiss 160,755 June 1, 1933. An agent for wetting, washing, dispersing or emulsifying is prepd. by treating a mixt. of isomeric monoxylene glycol ethers, obtained by the action of CH<sub>3</sub>OHCH<sub>2</sub>Cl on a tech. mixt. of isomeric xylenes, with *n*-butanol and a sulfonating agent. The product is used in the paper, leather and textile industries.

**Wetting, etc., agent.** Chemische Fabrik vorm. Sandoz. Swiss 160,937 and 160,938, June 16, 1933. Addns. to 151,958 (C. A. 26, 4926). An agent for wetting, cleaning, and emulsifying is prepd. by sulfonating the propylglycol ester of ricinoleic acid (160,937), or the CH<sub>3</sub>ClCH<sub>2</sub>OH ester of oleic acid (160,938).

**Wetting, etc., agent.** Chemische Fabrik vorm. Sandoz. Swiss 162,347, Aug. 16, 1933. Addn. to 151,958 (C. A. 26, 4926). An agent for wetting, washing, emulsifying, etc., is prepd. by treating a mixt. of coconut oil and the monoxylene ether of glycerol with H<sub>2</sub>SO<sub>4</sub>.H<sub>2</sub>O at 30-5°, the sulfonation and esterification proceeding simultaneously. The resulting sulfonic acid is isolated and neutralized with NH<sub>4</sub>OH.

**Wetting, etc., agents.** I. G. Farbenind. A.-G. Fr. 41,542, Jan. 28, 1933. Addn. to 728,415 (C. A. 26, 5713). Wetting, cleaning and dispersing agents are prepd. by treating with sulfonating agents urethanes to the N atoms of which are fixed atoms of H or aliphatic, cycloaliphatic, aromatic or heterocyclic radicals, or the alc. radical of which contains one or more double or triple bonds or aromatic or heterocyclic rings.

**Wetting, dispersing and softening agents, etc.** Heinrich Ulrich and Paul Koerding (to I. G. Farbenind. A.-G.). U. S. 1,931,806, Oct. 24. Products suitable for use in the textile industries, etc., are obtained by the action of a sulfuric ester of a hydroxyalkyl amine contg. at least one H atom attached to a N atom (such as monoethanolamine sulfuric ester, *n*-butylaminoethanol sulfuric ester or secondary aminobutanol sulfuric ester) with an org. halogen compd. corresponding to the general formula R-COX in which X is a halogen atom and R represents alkyl, aryl, alkoxy, halogen alkoxy, halogen alkyl or hydroxyalkyl (such as stearic chloride, coconut oil fatty acid chloride or chloroformic *n*-butyl ester), in the presence of water and of a metal compd. having an alk. reaction such as NaOH or Na<sub>2</sub>CO<sub>3</sub>. Various examples are given with details of procedure.

**Esters of sulfoacetic acid.** J. R. Geigy A.-G. Swiss 160,079-80-1, May 1, 1933. Addns. to 157,337. New high mol. esters of sulfoacetic acid are prepd. by treating the myristyl, cetyl or oleyl esters of ClCH<sub>2</sub>CO<sub>2</sub>H resp. with neutral or acid sulfites. The products are useful as *wetting, dispersing, emulsifying or foam-producing agents*.

**Sulfo carboxylic acid amides.** Winfrid Hentrich and Helmut Keppler (to I. G. Farbenind. A.-G.). U. S. 1,931,540, Oct. 24. Colorless or but slightly colored compds. sol. in water and with alkalis and suitable for use as *softening, purifying, frothing, wetting and dispersing agents in dyeing or other textile treatments*, etc., correspond to the probable general formula: R<sub>1</sub>R<sub>2</sub>NCORSO<sub>2</sub>X, where R stands for a substituted or unsubstituted alkylene or aralkylene or arylene, such as ethylene, propylene, CH<sub>2</sub>CH(OH)CH<sub>2</sub>, C<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>, C<sub>6</sub>H<sub>3</sub>ClCH<sub>2</sub>, C<sub>6</sub>H<sub>4</sub>NO<sub>2</sub>, X means hydrogen, ammonium (NH<sub>4</sub>) or a metallic equivalent, R<sub>1</sub> represents a satd. or unsatd. aliphatic radical contg. at least 8 carbon atoms, R<sub>2</sub> means hydrogen, alkyl, for instance, a lower alkyl group or the above-mentioned saturated or unsaturated aliphatic radical containing at least 8 carbon atoms, aralkyl, aryl or cycloalkyl. The manuf. of these compds. is carried out by

causing a primary or secondary amine contg. at least one higher unsubstituted or substituted aliphatic radical to react with a carboxylic acid contg. at least one sulfonic acid group, or an appropriate functional deriv. thereof, for example, ester salts. Details are given of the production of a deriv. from heptadecylamine and the Na salt of the ethyl ester of sulfoacetic acid, corresponding to the formula  $C_{17}H_{35}NHCOCH_2SO_3Na$ , forming short white felted needles and stable to acids and to hard water.

**Sulfuric acid derivatives of amides.** Fritz Guenther, Ferdinand Munz and Hans Haussmann (to I. G. Farbenind. A.-G.). U. S. 1,932,176, Oct. 21. *Wetting, cleansing and dispersing agents* are obtained by the action of sulfonating agents on reaction products of nitrogenous bases such as  $NH_3$ , primary or secondary amines or heterocyclic bases such as morpholine or piperidine and carboxylic acids or their derivs. such as are obtainable from vegetable or animal oils or fats or by the oxidation of paraffin or from resinic or naphthenic acids or from lower aliphatic carboxylic acids provided the amides derived from them contain at least 8 C atoms. Numerous examples with details of procedure are given. U. S. 1,932,177 (Fritz Guenther and Hans Haussmann, to I. G. Farbenind. A.-G.) relates to the production of products of similar utility by reaction of a carboxylic halide or anhydride, such as chlorides of the acids of coconut oil or palmityl chloride, on an ammonomethanesulfonic acid contg. at least one H atom connected to the N atom, such as methylammonomethanesulfonic acid, in the presence of an alk. diluent (the reacting materials together supplying at least 6 C atoms). Several examples with details of procedure are given. U. S. 1,932,178 (Fritz Guenther, Hermann Holsten and Karl Saffert, to I. G. Farbenind. A.-G.) relates to products also having like uses obtained by reaction of an alkali sulfite such as  $Na_2SO_3$  with an inorg. acid ester such as the octadecylamide of chloroacetic acid in a vehicle such as 30% aq. alc. soln. Several examples with details of procedure are given. U. S. 1,932,179 (Fritz Guenther, Hans Haussmann and Ferdinand Munz, to I. G. Farbenind. A.-G.) relates to products also of like utility produced by reaction of an aliphatic satd. compd. contg. the grouping  $RCOX$  in which X is

either halogen,  $OR_1$ ,  $-OH$ ,  $-OCOR_1$ , R being an aliphatic saturated radical contg. from 5 to 15 carbon atoms and  $R_1$  being an aliphatic satd. radical, which radicals may possess sulfuric ester or sulfonic acid groups, with an aromatic amine free from aliphatic alc. and chromophorous groups, but contg. at least one H atom connected to a N atom which amine may contain sulfuric deriv. groups; if the above initial reacting components do not contain sulfuric ester or sulfonic acid groups, the resulting arylide is caused to react with a sulfonating agent. An anilide of  $\alpha$ -hydroxylauric acid, or of satd. aliphatic acids contg. 12 to 15 C atoms and derived from oxidation of paraffin or coconut oil fatty acids may be used as initial material.

**Sulfuric acid derivatives of amides.** Fritz Guenther, Ferdinand Munz and Hans Haussmann (to I. G. Farbenind. A.-G.). U. S. 1,932,180, Oct. 24. Products suitable for use in the textile and related industries as *wetting, cleansing and dispersing agents* are obtained from an aliphatic compd. contg. the grouping  $RCOX$  in which X is either halogen,  $-OH$ ,  $-OR$ , or  $-OCOR$ , R being an aliphatic radical which radical may contain sulfuric deriv. groups, in the absence of a metal halide having a condensing action, by reaction with an ammonia base corresponding to the formula  $HNX'X''$ , in which  $X'$  denotes hydrogen or an aliphatic open-chain, an isocyclic aliphatic, or an aliphatic aromatic radical which radicals are free from aliphatic alc. groups, and  $X''$  denotes H or a radical as denoted by  $X'$  or an aromatic radical free from chromophorous groups provided  $X'$  is one of the aforementioned org. radicals, or  $X'$  and  $X''$  denote a conjoint aliphatic chain, all of which radicals may contain sulfuric deriv. groups (if the above initial reacting components do not contain sulfuric deriv. groups the resulting amide is caused to react with a sulfonating agent), the C-contg. reacting components being so selected that the total C atoms in the resulting amide is at least 8. Products such as the carboxylic amide of hydroxystearic sulfuric ester and *N*-ethylaniline, oleic *N*-methyltaurine products, etc., are claimed as being new compds., and a very large number of detailed examples with statements of procedure are given.

## 28—SUGAR, STARCH AND GUMS

J. K. DALL

**Modern control in the sugar factory.** G. Gollnow. *Chem.-Ztg.* 57, 825-6 (1933). E. H.

**$pH$  measurements in the refinery.** Ippolito Sorgato. *Ind. saccar. ital.* 26, 511-17 (1933).—A discussion with bibliography. I. Cusachs

**Study of the deterioration of cut cane, topped vs. not topped.** Alejandro S. Alvarez. *Rev. ind. agr. Tucuman* 23, 53-59 (1933).—Tests on P. O. J. 213 and P. O. J. 36 show little difference in deterioration after cutting, whether topped or untopped. In either case, the purity decreases 13-30% during 10 days' storage. The storage conditions are not described. It is inferred from the data that *invertase* is formed in the stalks of these varieties after cutting. Nelson McKaig, Jr.

**A mutation of P. O. J. 36 of greater sucrose content.** William E. Cross. *Rev. ind. agr. Tucuman* 23, 47-52 (1933).—Comparative tests over a 5-year period show that the cultivation of P. O. J. 36-M (I) is preferable to P. O. J. 36 (II). The data show that (I) has more stalks per hectare, each of less weight, but of better sucrose, glucose and purity contents, and gives slightly more sugar per hectare than (II). (I) also matures earlier as inferred from early purity analyses. N. McKaig, Jr.

**Beet and cane sugar.** H. C. S. de Whalley. *Food* 3, 26 (1933).—A recently published statement to the effect that the best British beet sugar contains 2% raffinose is refuted by showing that it contains  $H_2O$  0.02, ash not more than 0.01, org. non-sugars 0.02, and sucrose 99.95%.

A. Papineau-Couture

**The oxidation of sucrose by oxygen in the presence of**

lime. M. I. Nakhmanovich, S. L. Berman, M. S. Plachotnik and I. I. Pletnik. *Z. Ver. deut. Zuckerrind.* 83, 235-61 (1933).—By treating a 15% sucrose soln heated to various temps., 40-100°, for varying times, 2-24 hrs., and limed to varying lime concns., 0.2-1.0% alk., it was found that the presence of air promotes the decompn. of sucrose solns. contg.  $CaO$ , decrpn. increasing with increase in temp.,  $CaO$  concn., and time of heating, but decreasing when the  $CO_2$  of the air was not removed, because of the effect of the  $CO_2$  in decreasing the alk. Control expts. as well as expts. with pure  $O_2$  confirmed these findings. Increase in the sucrose concn. varying from 5 to 80% showed that there is an increase of the percentage of sucrose decompd. up to a sugar concn. around 30%, while for greater concns. the effect decreases.  $HCHO$  and  $CH_3CHO$  were identified in the volatile decompn. product, while evidence indicates the presence of equiv. anits. of Ca salts of glycolic and oxalic acids in the ppt. in addn. to some  $CaCO_3$  from the  $CO_2$ .

F. Camps-Campins

**Crystallization.** A. Schweitzer. *Intern. Sugar J.* 35, 385-7 (1933).—Up to the present time advances in the knowledge of crystn. were obtained largely through empirical methods. In expts. on the initiation of crystn. in supersatd. solns., it was found that in the absence of crystal nuclei, the formation of crystals does not take place spontaneously. Crystn. can be induced, however, by the introduction of "crystallones" or mol. complexes arranged according to the crystal lattice. These substances can pass through hardened filter paper, but are

retained by an ultra-filter. An insight is thus obtained into the sizes of these "molecular complexes" which induce spontaneous crystn. in supersatd. solns.

W. L. Owen

**Recent practice with the Lafeuille rotary crystallizer pan.** Fernand Lafeuille and G. C. Kaar. *Intern. Sugar J.* 35, 387-8(1933).—The use of these crystallizers in the Philippine Islands has resulted in a lower purity of final molasses, a decrease in the total molasses produced per ton of cane, and an increase in house capacity. The massecuites produced with these crystallizers have shown a much improved curing quality. The recent improvements in the construction of the crystallizers are enumerated.

W. L. Owen

**Crystallization and its control in the sugar house.** Mario Lupo. *Ind. saccar. ital.* 26, 518-27(1933).—The principles are reviewed with a description of the recording device of Teatini, and illustrations of records and sugar crystals obtained.

L. Cusachs

**A method to prevent crystallization of sugar-cane sirup.** Wm. E. Cross. *Rev. ind. agr. Tucuman* 23, 66-7(1933).—Leaving cut sugar cane in the field several days before grinding permits the invertase content to increase to the point that crystn. of sucrose in the final sirup will be prevented. The method is particularly applicable to P. O. J. 36, P. O. J. 213, P. O. J. 234 and Zwinga varieties. The flavor of the resulting sirup is adversely affected.

Nelson McKaig, Jr.

**Studies of the cause of molasses formation. IV. The equilibrium of the ternary system sucrose water sodium sulfate or potassium sulfate at 30° and the viscosity of the coexisting liquid phase.** Kyōsuke Nishizawa and Masataka Amagasa. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 535-7(1933); cf. *C. A.* 28, 300.—The equil. diagrams for the ternary mixts.  $H_2O-C_{12}H_{22}O_{11}-Na_2SO_4$  and  $K_2SO_4$  on a wt. percentage basis and a diagram for the solubilities in 100 g. of  $H_2O$  are presented. By the addn. of  $Na_2SO_4$  the soly. of sucrose was diminished to a lar extent and at the invariant pt. the content of sucrose was about 20% lower than that in pure  $H_2O$ . The addn. of  $K_2SO_4$  did not show any marked effect on the soly. of sucrose. In the ternary system,  $Na_2SO_4 \cdot 10H_2O$  existed as a stable solid phase for small amts. of sucrose added. For greater addns. this stable solid phase disappeared until at the invariant pt. both  $Na_2SO_4$  and sucrose existed as stable solid phases. The soly. of  $K_2SO_4$  was not notably affected by the addn. of sucrose. A diagram of the relative viscosity, relative satn. and salt content in g. per 100 g.  $H_2O$  is given. In comparison with the system of acetates or carbonates the addn. of  $Na_2SO_4$  and  $K_2SO_4$  has much less effect on the viscosity of the liquid phase. The systems  $CaSO_4$  and  $CaCO_3 \cdot C_{12}H_{22}O_{11} \cdot H_2O$  were studied, but in these cases no remarkable phenomena related to molasses formation were observed. K. K.

**A new design of the compensator box for polarimeters.** Noel Deerr and G. F. Stanley. *Intern. Sugar J.* 35, 432-3(1933).—In a previous communication (*C. A.* 27, 3105), D. reported a new design of polarimeter for use in the microscopical rather than in a horizontal position, having as its essential features the greater accessibility of its optical parts, comfort in observation and facility of adjustment. Similar modifications with respect to facility of adjustment and accessibility have now been applied to the compensator box. Two drawings of the modified compensating system are shown. W. L. O.

**Efficiency of carbon dioxide during saturation.** V. Konn. *Chimie & industrie Special No.*, 1151-4(June, 1933).—See *C. A.* 26, 3133. A. Papineau-Couture

**Physical and chemical activity of lime during technical saturation.** V. Konn. *Chimie & industrie Special No.*, 1155-6(June, 1933).—See *C. A.* 25, 4732-3. A. P.-C.

**Foaming of defecated juices by fractional addition of lime during saturation.** Jaroslav Brzek. *Chimie & industrie Special No.*, 1157-9(June, 1933).—See *C. A.* 27, 2328. A. Papineau-Couture

**The control of sugar boiling by electrical conductivity.** O. Spengler, F. Tödt and J. Wigand. *Z. Ver. deut.*

*Zuckerind.* 83, 822-32(1933); cf. *C. A.* 27, 4118.—A review is given of the various sources of error due to leakage of current (a) on the pan wall, (b) from one pan through the framework to another. The need for having electrodes of suitable area and close together so as to avoid these troubles as well as oxidation is discussed. Two elec. hook-ups are described. Methods for calibrating the electrodes are given so as to obtain comparable results. F. Camps-Campins

**Conductometric control of the boiling process.** S. Stare. *Z. Ver. deut. Zuckerind.* 83, 807-21(1933).—The work of Honig is reviewed. For the control of the boiling of refinery liquors of 98-100 purity, S. found Honig's method unsatisfactory because of the low and fluctuating readings of the milliammeter at high concn., as well as because of the dependence of cond. on temp., Bx., ash quotient, etc. However, by gold plating the electrodes to obviate oxidation, by using larger electrodes to reduce the c. d., and by adjusting the reading of the milliammeter to 100 at the start (say the graining point) of the process by varying the voltage, the method proved satisfactory for control purposes. Care should be taken that if a sirup of different ash quotients is introduced, a correction is made. The temp. correction at 80° Bx. is about 3.5% per degree centigrade. F. C.-C.

**Automatic device for the detection of sugar in boiler feed water.** S. Lange. *Sucr belge* 52, 390-8(1932-3).—A detailed drawing is given of an automatic app. for adding  $H_2SO_4$  and  $\alpha$ -naphthol soln. to a continuous water-sampling device. A photoelec. hook-up sets off the alarm when the coloration due to the presence of sugar occurs. F. Camps-Campins

**The composition of waste waters from sugar houses.** Jiří Vondrák. *Chimie & industrie Special No.*, 1141-2(June, 1933).—See *C. A.* 27, 3845. A. P.-C.

**The colorimetric determination of pectins.** P. M. Silin and Z. A. Silina. *Z. Ver. deut. Zuckerind.* 83, 390-7(1933).—A new method is given, based on the comparison by a Duboseq colorimeter of the coloration produced by the addn. of 4 cc. of AcOH and 0.5 cc. of aniline to (1) 5 cc. of a furfural soln. prepd. by dilg. a standard stock soln. contg. 0.1 g./100 cc., so that its furfural concn. is approx. equal to that of (2) the distillate obtained by distg. slowly so as to collect 30 cc. over 3 hrs. from 40 cc. of a parent mixt. made up of 5 cc. of sample plus 2.5 cc. of concd. HCl and the remainder of HCl of sp. gr. 1.06, 10% NaOH being added to the distillate to phenolphthalein neutrality. The following are the advantages of the method over that of Tollens: (1) 4 instead of 48 hrs. are required; (2) little HCl and no phloroglucinol are used; (3) it yields more accurate results for the detn. of small amts. of furfural-forming substances. Expts. have been worked out for the calcn. of the pectin from the amt. of furfural formed on HCl digestion for raw and purified beet juices. The resp. coeffs. to convert the furfural values into "pectins" are 3.8 and 5.5. The coeffs. to convert furfural values in arabinose and xylose are 1.894 and 1.732, resp., as based on exptl. detns. F. Camps-Campins

**Starches of commerce.** T. E. Wallis. *Pharm. J.* 131, 396-7(1933).—The microscopic appearance of the 10 principal com. starches is sketched, and their phys. properties are tabulated and discussed. S. W.

**Starch. III. Swelling of potato starch in pyridine-water.** K. Hess, R. Pfeiffer and C. Trogus. *Ber.* 66B, 1505-12(1933); cf. *C. A.* 23, 302.—Potato starch which has been dried at 95-100° over  $P_2O_5$  shows marked swelling in mixts. of pyridine and water, with maxima at 30% and 85% pyridine. The extent of swelling is const. after 3 days, and the swollen granules lose their double refraction. The second swelling max. at 85% pyridine is assocd. with the appearance of a new kind of x-ray diagram and is therefore ascribed to the formation of a pyridine-starch compd. Untreated potato starch shows the same maxima, but to a much less extent, and exhibits the same x-ray diagram in 85% pyridine. At the first swelling max. only the normal B-diagram can be

observed and this max. is therefore probably due to ionic adsorption followed by hydration. K. V. T.

Physical chemistry of starch and bread making. XIII. Comparison of the agglutination of various sorts of native starches with much water. J. R. Katz and Th. B. van Itallie. *Z. physik. Chem.* A166, 27-42(1933); cf. C. A. 27, 5213.—The agglutination phenomena investigated are mostly the same for different kinds of starches, but there are certain minor differences that characterize the starch. G. M. Murphy

Colloid chemistry of rice starch (Sakurada, Futino) 2. Inheritance of sugar content and wt. in hybrids of sugar and fodder beets (Stehlík) 11D. Effect of soil acidity on the yield of sugar cane (Croucher) 15. Mucilage of fenugreek (Iyer, Sastri) 17. Centrifugal sepn. of starch and gluten (U. S. pat. 1,933,119) 1. Detg. moisture [in beet pulp] (Brit. pat. 396,098) 13. Drying [sugar] in molds (Brit. pat. 395,903) 13.

Purifying sugar juices. Adrien Leduc. Brit. 396,136,

Aug. 3, 1933. The satn. of lime-contg. or lime-treated sugar juices or sirups with  $\text{SO}_2$  or  $\text{CO}_2$  is effected by introducing the gas into the liquid in a closed boiler kept under pressure. The pressure may be 1 atm. for the treatment of beet-root juices. App. is described.

Apparatus (with an inclined rotary drum) for drying and granulating materials such as sugar. Robert S. Kent. U. S. 1,934,930, Nov. 14. Structural and mech. details.

Centrifugal separation of materials such as in drying sugar or salt, etc. Edward N. Trump. U. S. 1,933,644, Nov. 7. Various details of app. and operation are described.

Stirring and temperature-regulating device suitable for treating "massesclutes." Wm. A. Rolston. U. S. 1,934,008, Nov. 7. Structural and mech. features.

Starch. Hugo Kühl and Gustav Soltau. Ger. 577,540, June 1, 1933. Starch is prepd. by mixing fine ground rice with water at  $45^\circ\text{f}$  introducing whey cultures of yoghurt bacteria at  $40-45^\circ$  to set up lactic acid fermentation, and sepg. the starch by usual methods.

## 29—LEATHER AND GLUE

ALLEN ROGERS

Influence of the composition, the state and the origin of salt on the preservation processes of skins. A. G. Dauman, A. I. Zhdanovich and M. A. Reizman. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1931, No. 1, 24 30.—A literature review covering the following items: (1) Influence of chem. admixts. generally found in NaCl on process of preservation; (a) chem. phys. investigations, (b) bacteriol. control, (c) histological control, (d) treating exptl. batches down to the stage of finished leather. (2) Dependence of the preservation process on the size of grain for different types of raw material. (3) Detg. the max. of  $\text{H}_2\text{O}$  permissible for NaCl. (4) Expts. with rock salt.

A. A. Bochtlingk  
Enzymes of vegetable and fungus origins and their application in unhairing and in preserving wool. E. K. Kaverzneva and E. M. Oleinikova. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 2, 24.—Proteases were obtained from exts. of sprouting soy beans. They contain some of the proteases of the pepsin and trypsin type which are active at  $p_{\text{H}}$  4-8. The optimum for trypsin acting on gelatin lies at  $p_{\text{H}}$  7.4 and on peptone at  $p_{\text{H}}$  7.0. Cyanic acid depresses the activity of the trypsin. The pepsinase penetrates into the adsorbing medium when subjected to adsorption by kaolin. Hide powder is energetically dissolved by soy exts. in an alk. medium ( $p_{\text{H}}$  = 8.0), less in a neutral medium and quite insignificantly in an acid medium. The skins are first kept for 1-2 days in a 0.1-0.2% soln. of NaOH at ordinary temp., immersed for 5 hrs. in 0.1% soln. of  $\text{NaHCO}_3$  to lower the  $p_{\text{H}}$ . The fermentation vat soln. consisted of 1%  $\text{NaHCO}_3$  and 10-30% of soy-bean fermentation ext.; the temp. was  $30^\circ$  and the duration 1-3 days, toluene or phenol also being added. From mold cultures, exts. and dry preps. were prepd. The activity of the proteases is lowered through storage, this being particularly noticeable with exts. The proteases easily dissolve the collagen from the albumin of the hides; they have almost no effect on elastin and do not dissolve keratin even after treatment with 0.2% of NaOH. A slight activation of the proteases is observed if the soln. contains 0.05-0.1%  $\text{Na}_2\text{SO}_4$  and  $(\text{NH}_4)_2\text{SO}_4$ . High concns. depress the action of the enzyme and  $(\text{NH}_4)_2\text{SO}_4$  is even harmful. Trypsin is only slightly adsorbed by kaolin and the soln. is activated if sawdust is introduced. Sawdust preps. are good unhairing agents. A. A. B.

Investigating the adsorption ability of various hide powders. E. S. Ovechkis and I. Dukarskaya. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 3, 5-8.—Conversion factors for tannides

tested with German, British, Russian untanned and Russian chrome-tanned hide powders were derived experimentally. These factors were based on the assumption that the tannides detd. by the German hide powder in the tanning substance amounted to 100. Thus the relationship between the 4 powders was found to be German 1, British 0.95, Russian tanned 0.96 and Russian untanned 0.95 when the tanning substances in various parts of oak and oak ext. were detd. The procedure is described and numerical data are tabulated.

A. A. Bochtlingk  
Relation of the fat content of hides to the conditions of curing. P. White and F. G. Caughley. *New Zealand J. Sci. Tech.* 15, 163-8(1933).—Excess fat in greasy hides differs from natural skin fat in having a higher I value and lower m. p.; it resembles the oil pressed out from fatty tissues. When uncured hide is cured in contact with fat under pressure, fatty oil is absorbed by the hide. The presence of fat retards penetration of salt, resulting in bacterial damage and loosening of structure with increased absorption capacity for fatty oil. H. B. M.

Treating hides with sulfur-vegetable tanning substances with a preliminary fat liquoring. G. K. Baidan and A. I. Zhemochkin. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 2, 24.—The hides were unhaird, pickled and treated with hypsulfit to ppt. S on the leather tissue and fat liquored in a drum with a mixt. of lard and seal oil. They were then dried in a no. of stages. The calking was carried out for a no. of days and the leather was then placed in drums to be tanned with willow ext.; the tanned leather was then made up into black Russia leather in the usual manner. Thus when this method is used the mfg. cycle is shortened to 22 days, the consumption of tannides lowered by 30%, while the obtained leather is characterized by its high qualities. A. A. Bochtlingk

Changes in the saturation with water of raw skins on vat tanning with pine. A. N. Mikhailov. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1931, No. 1, 20-3.—The hydration of leather treated in various ways was studied and the following conclusions were derived. The decrease in the content of water is smaller and it proceeds more slowly when the diffusion of the tannides is not uniform. Changes in the water content in leather after centrifuging show an increase of combined water calcd. on the hide substance, the curves having their max. in the middle of the tanning process. In prolonged tanning the dehydration tends to increase which is also true when the tanning is carried out at high temps. The hydration increases after hydrating a leather which was already dried and tanned. A raw material

which was subjected to a preliminary chrome treatment shows a greater dehydration and the amt. of absorbed substance is lowered. The following explanation is given: In comparing the conditions existing in gelatin with those in hides when both are exposed to the influence of tanning substances, it is said that they are quite different because of the fact that tanning substances act only on the surface of the gelatin. Some authors assume that the same conditions may exist with leather; this is, however, incorrect because gelatin can be accepted as having a micellar structure, while the structure of leather is similar to elements occupying an intermediate position between the intermicellar spaces and the macro-capillary spaces of the gelatin. If it is assumed that the original interaction between the raw hide and the tanning substance is due to the charges carried by the tannides and the collagen, overtanning, whereby the tannides do not penetrate the top layer, is explained. An interaction of the tannides and the collagen occurs when the former pass on the surface of the microcapillary. In case the tannides carry a high charge the amt. of particles is not sufficient for neutralizing the particles with a different index carried by the collagen and there is no clogging of the capillaries. However, if the charge carried by the tannides is smaller the amt. of the particles which would participate in the action would be greater and the vol. of the particles of the tannides may interfere with a further diffusion through the microcapillaries. The same is true if some of the substances which accompany the tannin penetrate at a higher speed than the tannin, thus affecting the charge of the collagen. A. A. B.

**Purification and clarification of tanning extracts.** P. S. Konovalenko. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 4, 203.—A bibliography on various clarification and purification methods is given. According to the method of du Perua, ox blood expd. from fibrin and diluted to 2°Bé. is added in small portions to the cooled diffusion ext., the mixt. is then heated to 70–75°, whereby the blood is coagulated and the insol. substances and part of the pigments are thus taken out. According to expts. an increase in the amt. of blood used leads to an increase in the loss of tanning substances which may be as high as 5–18%. This is due to the coagulation of the albumin of the blood which carries off some of the tanning substances. When cellulose is used as a purifier, it is softened in water with the addn. of 3.5% HCl for 2–3 hrs., and the mass is then added at 70–75° to the tanning liquid. The latter had a sp. gr. of 8°Bé.; the settling required 24–48 hrs. It was found that the application of cellulose for coagulation does not accelerate the settling. A. A. Bochtlingk

**Tannin diffusion through gelatin gel.** Z. V. Zolotareva. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 3, 20–9.—In the diffusion process of tannin into gelatin the latter is subjected to deformation because of the compression and increase in the density of the layer which is in direct contact with the tanning substance. This fact, as well as the fact that the color of the tannin in the gelatin changes with time (probably because of oxidation), makes the operation of measuring the diffusion coeff. more difficult and causes the measurement to become only very approx. However, according to the theory of Westgren the data obtained accurately reproduce the actual procedure. Accordingly it may be concluded that only a small amt. of the tanning substance, namely a mol. dispersive amt., penetrates into the gelatin. This amt. does not enter into a reaction with the gelatin and has therefore no direct effect on tanning, and it is assumed that on tanning the leather the most important part played during the process belongs to the processes which occur in the structural element of the leather and not on its surface. It was also found that skins were formed on the boundary of the gelatin and the soln. of the tanning substance, these skins differing in structure, depending upon the exptl. conditions. They were either turbid and friable or transparent and dense. The latter kind was obtained

when the  $p_H$  of the soln. amounted to 4 or on repeated diffusions through the gelatin gel. It appears that the nature of the skin depends on the hydration of the tannin-gelatin complex, and that the transparent skin is formed by a stronger action of the tannin on the gelatin. In applying this theory to leather, the formation of a dense layer on the micella or the gel of collagen prevents the penetration of colloidal tannin particles causing osmosis, i. e., penetration of water from the outside, from the micella. A. A. Bochtlingk

**Changes in the color measurement of tannin infusions at analytical strength as a function of time.** G. H. W. Humphreys. *J. Intern. Soc. Leather Trades Chem.* 17, 685–8 (1933).—Filtered exts. contg. 0.5% tannin were exposed to north light in beakers and color measurements were made with the Lovibond tintometer at intervals for 24 hrs. With sulfited quebracho and mimosa, both the red and yellow values increased markedly with time; appreciable changes were observed in 1 hr. No change was noted with valonia, chestnut, myrobolam, and pine bark. Conclusion: Color measurement should be made promptly after filtering. H. B. Merrill

**Action of tannase on pine tanning extracts.** D. M. Mikhlina and G. L. Gutkina. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 1, 8.—Tannase was grown by the authors in pine tanning ext. (process not disclosed) and it was found that its activity is not inferior to other enzymes. Its basic properties are: it is neutral; it does not reduce Fehling soln., decomposes tannin with sepn. of gallic acid. The max. reaction temp is 60°. Tannase, judged by its action on tannin, has esterification properties; its glucosidic properties belong to those of corresponding enzymes, since *Aspergillus niger* is very high in various enzymes and the existing methods of sepg. the enzymes do not assure the purity of the latter. The detns. of the products of hydrolysis of tannin by tannase, i. e., sugar and gallic acid, are stoichiometrically in agreement with data by B. Fischer for the compn. of tannin, i. e., pentadigalloylglucose. However, the obtained ratios of sugar and gallic acid in the tannin justify the assumption that digalloyl combines with glucose in the tannin via an ester bond and that the presence of the glucoside bond only is highly improbable. It was found that after the action of the tannase prepn. the amt. of nontannides and of sugar increased in the tanning soln. while that of tannides decreased. The reaction was not investigated quantitatively because of the absence of suitable methods. A. A. Bochtlingk

**Acid and fermentative method of hydrolyzing pine tanning extract.** A. M. Simskaya. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 1, 9.—Vat tanning with pine exts. causes overtanning which prevents tannides from entering the hide. The low diffusion of pine ext. tannides is probably due to the large mols. of these tannides. If the large size of the mol. is due to the presence of carbohydrates in the tannin mol. then a decrease of the amt. of combined carbohydrates would lead to a decrease of the size of this mol. The bond of the tannin with the carbohydrate may be of the nature of an ester or a glucoside, both being hydrolyzed with acids and specific enzymes. The hydrolysis of pine ext. tannides was undertaken with HCl of varying  $p_H$  concns., as well as with enzymes of the  $\alpha$ - and  $\beta$ -type glucosidases. The effect of the hydrolysis was ascertained by the increase of free reducing sugar, while changes in the diffusion properties of the ext. were tested by the penetration of color into the raw hide. It was found that the mol. of pine ext. tannide contains carbohydrates which are split off through the hydrolysis with dil. HCl. A moderate hydrolysis with HCl did not improve the diffusion of the tannides present in pine ext. The same is true when the sugar is removed by fermentation. A. A. Bochtlingk

**Influence of tanning and non-tanning substances from pine on the diffusion properties of tannides.** N. N.

Tarasenko and G. A. Arbuzov. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 2, 8-9.—Expts. carried out with mixts. of pine and quebracho-willow exts. showed that overtanning characteristic of pine ext. can be eliminated by using a mixt. of non-tanning substances derived from pine together with quebracho-chestnut exts. It is stated that overtanning with pine ext. is due to the low charge carried by the tannin from pine ext.

A. A. Bochtlingk

The use of sulfite cellulose extract No. 1 together with oak extract in tanning sole leather. G. K. Baidan and A. I. Zhemochkin. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 2, 25.—In tanning carried out with this mixt. the thoroughly limed leather is tanned in vats where it stays up to 28 days depending on the amt. of tanning required. It is then tanned in drums for 48-60 hrs., left for 24 hrs., washed, pressed in a press, fat liquored in a drum and dried as usual at a temp. not in excess of 30°.

A. A. B.

Oxidation of fish oils by chromic acid and by dichromate in the presence of acid. A. Dohogne and G. Rezahek. *J. Intern. Soc. Leather Trades Chem.* 17, 413-23, (608-12) (1933).—The oxidation theory of oil tannage implies that tannage would be facilitated by the presence of a suitable oxidizing agent. As a preliminary to tanning expts., the oxidation of cod-liver oil by  $\text{CrO}_3$  in the presence of  $\text{H}_2\text{O}$  is studied as a function of time, ratio of oil to  $\text{CrO}_3$ , ratio of  $\text{H}_2\text{O}$  to  $\text{CrO}_3$ , and temp. The extent of oxidation is detd. by titration of excess  $\text{CrO}_3$  after shaking the oil with  $\text{CrO}_3$  soln. for a definite time. When the ratio oil: $\text{CrO}_3$  is low, oil: $\text{H}_2\text{O}$  is high, and temp. = about 20°, an exponential oxidation-time curve is obtained. Rate of oxidation is very greatly increased by increasing the ratio of  $\text{CrO}_3$  to oil, by decreasing the ratio of  $\text{H}_2\text{O}$  to oil and  $\text{CrO}_3$ , and by increasing the temp. The oxidation appears to take place in 3 stages, during the first of which the oil is emulsified without visible change, during the second of which oxidized products sep., and during the third of which products are formed that are sol. or easily emulsifiable in  $\text{H}_2\text{O}$ .

H. B. M.

The influence of the volume of the precipitate on the accuracy of the  $p_H$  determinations in tanning extracts. Ya. P. Berkman. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 1, 9-10.—In all indirect methods used in the detn. of  $p_H$  (by the difference of the dry residues before and after their sepn.) there is always an inaccuracy caused by not taking into account the vol. occupied by the residue. This inaccuracy increases rapidly with increased concn. of the soln. and it can be calcd. by the introduction of the following factor:  $d/(d-a)$ , where  $d$  = sp. gr. of the insol. and  $a$  = the dry residue of sol. substances in 1 cc. The deviations observed for oak ext. increase from 5 to 27% for analytical concns. up to 20°Bé. The inaccuracy is still higher when the gravimetric method is used and the correction factor to be used in this case is  $d/(d-a)$ , where  $d$  = the sp. gr. of the soln. after the removal of the ppt. and  $a$  = the dry residue of sol. substances in 1 cc. The exptl. procedure is described.

A. A. Bochtlingk

Investigation of the ratio of the  $p_H$  of tanning solutions and of the  $p_H$  of hides during diffusion. G. A. Arbuzov. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 2, 18-22; No. 3, 13-20.—The Sb electrode can be used in the detn. of  $p_H$  of vegetable tanning solns. and of horizontally split leather and hides; the acid fractions penetrate the hides more rapidly than the tannides in diffusion, thus prepg. the hide and binding the tannides. The  $p_H$  of dyed layers of hides is lower than that of undyed and it is lower toward the end of the tanning operation than that of tanning solns. When tanning with pine ext. the  $p_H$  of the dyed top layer is lower than that of the flesh side; they are identical for willow tanning and occupy an intermediate position for oak; these data are analyzed in accordance with the scheme for tanning proposed by Procter and Wilson and give a theoretical explanation of practical results obtained.

A. A. Bochtlingk

Determination of  $p_H$  of lime liquors. W. R. Atkin, L. Goldman and F. C. Thompson. *J. Intern. Soc. Leather Trades Chem.* 17, 568-75 (1933).—In the presence of more than traces of  $\text{Na}_2\text{S}$  measurements of  $p_H$  with the H electrode, glass electrode or indicators are unreliable. A method is given for calcg.  $p_H$  from the concn. of  $\text{Ca}^{++}$  and soly. product. The constancy of the soly. product was demonstrated by adding  $\text{NaOH}$  to  $\text{Ca}(\text{OH})_2$  soln. and detg.  $\text{Ca}^{++}$  analytically and  $\text{OH}^-$  by the H electrode.  $pS (= 1/\log S)$ , where  $S = [\text{Ca}^{++}] [\text{OH}^-]^2$  was found to be const. up to a concn. of added  $\text{NaOH}$  of 0.12  $N$ , which exceeds any probable concn. of  $\text{OH}^-$  arising in practice from hydrolyzed  $\text{Na}_2\text{S}$ . The value of  $pS (= 4.5)$  is unaffected by large addns. of non-hydrolyzed protein (gelatin), but is lowered somewhat by amino acid (glycine). To det. the  $p_H$  of a lime liquor, det.  $\text{Ca}^{++}$  at 25°, and apply the equation:  $p_H = 0.5 pCa + pK_w - 0.5 pS = 0.5 pCa + 11.65$ . Calcd. values for  $\text{Ca}(\text{OH})_2$  solns. contrg. increasing amts. of  $\text{Na}_2\text{S}$  are rational and self-consistent. The use of  $p_{OH}$  instead of  $p_H$  for alk. liquors is advocated because, on account of the change in  $K_w$  with temp., a given value of  $p_H$  does not always correspond to the same value of  $p_{OH}$ .

H. B. Merrill

Impregnating pig skins for boxes and dyeing them with a black permanent dye. G. K. Baidan, A. A. Pchelina and G. S. Rabkina. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 2, 27.—The dyed leather was treated with tannides of pine, etc., followed by a treatment with salts of metals which form with vegetable tanning substances dark brownish water-insol. varnishes, the best results being obtained with Na and K chromates. The impregnation was affected with machine and spindle oil, paraffin, Al soap, Al naphthenate, light petroleum bottom oils, paraffinic fuel oil, an alk. soln. of albuminous substances and vegetable tannides and with Al naphthenate produced on the leather.

A. A. B.

Dyeing chrome sheep skins black. A. S. Vinogradova. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 2, 29.—After a no. of mixts. were tried the following formulas were accepted: (1) Wool-black AT4B 25 g. per l., orange PB 3% of the weight of AT4B, 50% com. AcOH (80%) from the weight of the dye. (2) Wool-black AT4B 20 g., cyanine sulfone AT2B 4 g., acid brown 5G 2 g. and 50% com. AcOH (80%) of the weight of the dye. Formic acid may be used instead of AcOH. The dye soln. is applied with a brush on the soaked sheep skin 2 times in succession with a 3 hrs. drying period in between. It is finally dried for 8-10 hrs., washed with ordinary water, dried and finished.

A. A. B.

Dyeing light box leather a brown color resistant toward wet and dry friction. R. L. Metlitzkaya. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 2, 25-6.—Three methods were investigated: (1) The leather is dyed in the usual manner in the drum or by brushing with acid anthracene-brown ATR, followed by treatment with an acidified soln. of  $\text{NaNO}_2$  and  $m$ -tolylene- or  $m$ -phenylenediamine. The following diazotizing soln. produced the best results: 2 g.  $\text{NaNO}_2$ , 5 cc.  $\text{HCl}$  (18°Bé.), one l. water, temp. 15° and duration of treatment 15 min. The treated leather was subjected to a no. of tests (described in detail) and was found to be satisfactory. (2) Mordant dyes do not produce such bright colors, probably on account of the low temp. used in the processing. The following substances were investigated: Chrome brown RO, olive-brown metachrome, and some vegetable tanning substances. (3) According to the literature the color of leather dyed with vegetable tanning substances is a function of  $p_H$ , i. e., the color darkens with an increase of the  $p_H$  value up to 8-9. The expts. revealed that dyeing with tanning solns. produces colors of low intensity of brownish yellow tint which have higher intensities with increase in  $p_H$  value. The color acquires a higher intensity on treating the leather with K Ti oxalate.

A. A. Bochtlingk

Method for determining the oxidation-reduction coefficient in liming solutions. E. L. Gutkina. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.*

1932, No. 3, 8-13.—The oxidation-reduction potential is measured preferably by means of a platinized Pt electrode and in a stream of  $N_2$ . The size of the electrode should be const. and it should be completely immersed in the soln. under investigation. The oxidation-reduction potential of liming liquids changes and depends on the concn. of  $Na_2S$ ; it is higher with increase in the amt. of  $Na_2S$ . In the detn. of the active reaction of the liming liquid a palladized electrode is best. The latter is satd. with  $H_2$  above the liquid and is then immersed in the soln. only when measuring its  $p_H$ . The Pt electrode is unsuitable in the detn. of liming solns. contg.  $Na_2S$ . The expts. are described in detail and are illustrated by plots and tabulated data. A. A. B.

Determining sulfur and fat in leather. L. Ya. Ginzburg. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 2, 27-8.—Various methods used in detg. S and fat in leather are discussed and the following procedure is recommended: Ext. 5 g. of leather as usual in a Soxhlet app. with freshly distd.  $CS_2$  in a tared and dried flask. Distil off the  $CS_2$  and dry the flask contg. the extn. products (S and fats) in an oven at 102-105°. If sulfated oil is present, treat the extn. products in the same flask with 30 cc.  $HCl$  (1:5) and boil under a reflux condenser until the fatty and aq. layers brighten. Sep. the fat layer from the aq. layer by shaking in a separatory funnel with ether and wash the ether layer a no. of times with distd.  $H_2O$  and pour back in the same flask. Oxidize the mixt. with strong  $HNO_3$  (1.40 sp. gr.), heating gently; after evapg. the ether, pour the contents into a beaker, neutralize with  $NH_4OH$ , boil until ammonia is removed, filter and ppt. with  $BaCl_2$ . Recalc. the results on the leather and calc. the amt. of fat by subtracting from the total weight of S and fat. A. A. Bochtlingk

The application of *p*-dichlorobenzene in preserving pig skins. I. M. Baronov. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 2, 13.—The deterioration of skins is prevented by the addn. of *p*-dichlorobenzene to salt lyes. A. A. Bochtlingk

Impregnating leather with synthetic resins. A. P. Pisarenko. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 1, 18-19.—Red-tanned leather was impregnated with phenol-formaldehyde resins for various periods and at a temp. of 45-50°. It was found that there is a max. for the duration of impregnation. An excessive duration causes brittleness. The resistance to water was much greater for impregnated than for non-impregnated leather which is also true for swelling when the leather is immersed in water. A. A. B.

Impregnation of stiff varieties of leather with mixtures of albuminous substances containing sulfite-cellulose and vegetable tannides. A. A. Pchelina and E. P. Lotova. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 2, 26-7.—Leather was impregnated with a glue obtained after detanning leather waste, the viscosity of the chrome glue being lowered to 1.1-1.3° Engler by a special treatment. The soln. of this glue together with sulfite cellulose ext. was kept below  $p_H$  6.0-8.0 during the reaction to avoid coagulation. The leather was then treated with acid to effect coagulation in the leather. The latter acquires elasticity when fat emulsions are used. This treatment lowered the water adsorption of pig sole leather 40-50% and its air permeability 25-30%. The appearance of the leather was that of good-quality sole leather. A. A. B.

Hydrolysis of leather. The system leather + water at 100° and its dependence on  $p_H$  during tanning. G. A. Abuzov. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 2, 18.—Hide powders which were vat tanned with willow and pine exts. at  $p_H$  = 5-7.5 were investigated. It was found that the amt. of solid products of the hydrolysis combined with the tannide proteins is lower than the total of combined tannides in the tanned powders and higher than the amt. of irreversibly combined substances in the latter. The influence of the  $p_H$  of the tanning on the ratio between

the tannides and proteins in the solid products of hydrolysis is similar to that in the tanned powders; it is higher for willow than for pine. The amt. of tannides which is combined with the protein in the  $p_H$  zones is on the left side of the isoelec. point of collagen and it increases with decrease of  $p_H$ . On comparing the compn. of the solid products of hydrolysis and that of the tanned powder it is concluded that an addnl. tanning takes place in the zone close to the isoelec. point of collagen when heat is applied. The resistance of hide powders to water is at a max. when tanning with solns. having a  $p_H$  close to the isoelec. point of collagen. A. A. Bochtlingk

The influence of relative humidity and air temperature on the physico-mechanical properties of chrome leather. N. A. Bogdanov. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 1, 20-3.—All conditions which differ from normal affect the quality of leather. Thus the air humidity should not exceed 50-60%, and the temp. should not be above 20°. The worst effect on leather is a temp. in excess of 40°, a humidity of 80-100% and a drying temp. exceeding 40°. Air with 20-35% humidity and a temp. of normal to 40°, as well as repeated soaking and drying, are less harmful. Temps. below 0° do not affect the leather to any appreciable extent; they lower its breaking strength slightly. The expts. are described and data are plotted. A. A. Bochtlingk

Effect of mineral acidity on vegetable-tanned sole leather. Committee report. Thomas Blackadder. *J. Am. Leather Chem. Assoc.* 28, 532-41 (1933).—Substitution of a method based on the detn. of the  $p_H$  value of an aq. ext. of leather for the Procter-Searle method is advocated. Cf. C. A. 27, 2334. H. B. Merrill

Vegetable-tanned sole leather: studies of physical and chemical data. A. T. McKay. *J. Intern. Soc. Leather Trades Chem.* 17, 583-607 (1933).—Statistical. H. B. Merrill

Apparatus for drying leather in the laboratory. T. F. G. Hepburn. *J. Intern. Soc. Leather Trades Chem.* 17, 688-91 (1933).—Humidity control is effected by a strip of goldbeater's skin whose contraction actuates an immersion heater in a small  $H_2O$  reservoir, the steam so generated being injected into the cabinet. H. B. M.

Spots on red tanned leather. V. G. Babakina. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 2, 27.—Two types of spots were investigated: (1) spots of dark brownish and black color with a white aureole and a diam. of 0.25-2 mm., and (2) white spots with veins. The following cultures were sep'd. from the infected spots: two varieties of yeast, a dry and a fat culture of *Aspergillus fumigatus*, *Aspergillus glaucus* and *B. mesentericus*. Expts. with the above cultures were successful and spots with the characteristics of the original spots were reproduced on non-infected leather, which was infected by contact with infected pieces of leather. A. A. Bochtlingk

Influence of fat emulsions on the quality of the inner skin of chrome-tanned sheep skins. K. L. Krasnov. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 2, 30.—The inner skin is softened after fat liquoring. The operation is carried out after neutralization, washing and proper pressing. Hides which are naturally fat should have the fat removed in the wet state. A. A. Bochtlingk

Developing standards for inspection for chrome- and red-tanned sheep skins. V. A. Abramukhev. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 2, 31-2.—Various tentative standards are discussed and tests are described. A. A. Bochtlingk

Preparing inner soles by the viscose method. A. S. Kryukova. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932, No. 3, 3-4.—Viscose inner soles are usually prep'd. as a plate by the method developed by the Central Inst. of Leather Research in Moscow; 50% of pulp cellulose and 50% "linter" are used. The plates are then treated with rubber and polymerized oils. The rubber is introduced in the viscose in a benzene soln. and water and  $CaO$  and  $ZnO$  or casein are added as emulsi-

fiers. The plates are elastic but become brittle after some time. The polymerized oils are also introduced in a benzene soln. These plates have a higher elasticity (without plasticizers) than hollow ones and have a lower swelling and water-adsorbing factor. The oils were polymerized as follows: 100 parts of linseed or hemp-seed oil + 50 pts. rosin were heated for 4-5 days to 300°. A mixt. of polymerized oils and rubber on being introduced in a benzene soln. into rubber yielded brittle plates.

A. A. Boehtlingk

Artificial leather prepared from sulfite cellulose extract and rubber. A. A. Nikolskii. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevnoi Prom.* 1932, No. 2, 7.—The following compn. was used in prepg. sole-leather substitute: tar 61, rubber 12.75, formolite 25, lampblack 5.1, S 2.5, S ore 2.5 and stearic acid 1.0% (by weight). The tar was prepd. from 50% sulfite cellulose ext. and 50% petroleum residues, the mixt. being heated to 260-300°. The above mixt. was vulcanized with open steam in an autoclave for 3 hrs. and at 3 atms. The plates were brittle and would not hold the nails. It is stated that the properties can be improved by use of more rubber and rags.

A. A. Boehtlingk

Artificial leather prepared from naphthenates and fillers. A. A. Minerv. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevnoi Prom.* 1932, No. 4, 16-19.—The following unsuccessful attempts were made to prep. a leather substitute from Al naphthenate. Al naphthenates from petroleum were mixed with S, litharge, rubber, C black, talc, leather fiber, and cow hair in various proportions with all or some of the substances in the mixts. The attempts carried out with various synthetic resins were of no avail. Vulcanization of the mass did not yield satisfactory results. The plates were either brittle or too soft. The expts. are described in detail and proportions used in making the mass are given.

A. A. B.

Utilizing red-tanned sole-leather waste for making glue. A. A. Pchelin and G. S. Perelman. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevnoi Prom.* 1932, No. 2, 32-3.—The raw material used for glue extn. had the following properties: moisture 18, ash 0.72, fatty substances 0.35, extractable org. substances 11.80, non-leather substance 69.13, hide substance 40.86 and combined tannides 28.27%. The finely cut leather was de-tanned with  $\text{Ca}(\text{OH})_2$ ,  $\text{Na}_2\text{CO}_3$ , NaOH,  $\text{NaHSO}_3$ ,  $\text{Na}_2\text{SO}_3$  and  $\text{Ca}(\text{OH})_2$  +  $\text{Na}_2\text{S}$ . The expts. are described.

1 The best results were obtained when de-tanning in a slightly alk. or acid medium with 1.5% NaOH at 18-20°. The glue obtained by the application of some of the chemicals had low solubilities in water and an unsatisfactory color. The boiling of the de-tanned material was carried out with 2-4 vol. of water for 5-6 hrs. and at a temp. of 85-90°; 7-8 water extns. were made and the exts. concd. to 10-12°Bé. A liquid glue was obtained on heating the undissolved material to 85-90° with 1 1/2-2% NaOH, whereby the substance was completely dissolved. This glue was, however, of a low viscosity.

Dyeing pelts. Soc. pour l'ind. chim. à Bâle. Swiss 161,814, Aug. 1, 1933. Pelts are colored by dyes contg. complex metal compds. such as chromed dyes. Examples are given.

Chamber for treating leather, etc., in bulk with hot air or other gas for drying purposes. Walter Bridges. Brit. 396,824, Aug. 17, 1933.

Substitute for neat's-foot oil for treating leather, etc. Carl Stiepel (to Unichem Chemikalien Handels A.-G.). U. S. 1,934,100, Nov. 7. An oil having a turbidity point of about -5° or lower consists of triglycerides of that fraction of a mixt. of fatty acids derived from sperm oil, hog fat, palm oil or olive oil which has a turbidity point approx. 5° or lower. Cf. C. A. 27, 4945.

Artificial leather. Koch & Co. G. m. b. H. Ger. 586,383, Oct. 20, 1933. Fibrous material such as rags is digested with dil. NaOH soln., and comminuted leather waste is afterward added to the hot mixt. The dissolved leather is then pptd. on to the fibers by addn. of a tanning agent, and the mixt. is worked up on a paper-making machine.

### 30— RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

Post nubila, Phoebus. A new rubber era. Philip Schidrowitz. *India Rubber J.* 86, 589-91 (1933).—A discussion of present trends and future desiderata in the chem. engineering of rubber manuf.

C. C. Davis

The chlorination of rubber. Andreas Nielsen. *Kautschuk* 9, 167-70 (1933). A review and discussion of the various methods of prepg. chlorinated rubbers, the chemistry involved, their phys. and chem. properties and present and potential applications.

C. C. Davis

The stress-strain relationship in ebonite. B. L. Davies. *Trans. Inst. Rubber Ind.* 9, 130-49 (1933).—The extensometer which is described and illustrated is an attachment to a standard tensile testing machine, and will give stress-strain curves of low elongations of hard rubber. Various expts. were carried out with this instrument to det. the behavior of hard rubber under stress and the influence of various factors. Hard rubber does not deform in exact agreement with Hooke's law, for it exhibits plastic flow. The deviations from this law depend upon the rate of extension, and moreover the faster this rate the higher the tensile strength. Prolonged mastication of the rubber and the addn. of neutral softeners both result in a weaker vulcanizate. Curves representing the transition from overcured soft rubber to hard rubber indicate that hard rubber curves may be related to the initial portions of soft rubber curves. The plasticity of overcured rubber,

as judged by deviations from Hooke's law, increase with the time of cure up to the "semi-hard rubber" stage. Leather-like semi-hard rubbers differ from soft or hard rubbers in that they are extremely sensitive to small changes in the time of cure, and in that the velocity of plastic flow is approx. equal to the rate of extension. The best tech. cure of hard rubber for mech. service is that at the max. tensile strength and where at a temp. commensurate with service there is considerable plastic flow (e. g., 50%) at the const. max. load. Hard rubbers cured with org. accelerators are particularly sensitive to the time of vulcanization, and prevulcanization is detrimental to the mech. properties of vulcanizates, even where it is almost inappreciable. "Mineral rubber" accelerates the rate of vulcanization, as judged by the stress-strain curve. Gas black gives weak and brittle vulcanizates, and its effect on stiffness is similar to that of further vulcanization. Stress-strain curves offer a reliable means for comparing vulcanizates at the same state of cure contg. different ingredients.

C. C. Davis

Viscometric investigations of solns. of natural compds. of high mol. wt. 1. Rubber in toluene (Reiner, Schoenfeld-Reiner) 2. Aromatic bases [use in the rubber industry] (Fr. pat. 749,904) 10. Machine for continuously extruding vulcanized rubber on a series of wires (Brit. pat.

396,069) 13. Disulfides [as vulcanization accelerators] (Brit. pat. 395,726) 10. Water-insoluble disazo dyes [for coloring rubber] (U. S. pat. 1,932,577) 25.

**Treating latex.** Alexander A. Nikitin (to Naugatuck Chemical Co.). U. S. 1,931,678, Oct. 24. Milk is mixed with alkaline preserved latex and the treated latex is then mixed with an acidic material such as formaldehyde and HOAc in order to produce a stable material (suitably having a  $pH$  of 5.5).

**Forming gloves, caps or other rubber articles by dipping forms into liquid latex.** Abraham N. Spanel, Roger D. Weston and Walter Bitner (to International Latex Corp.). U. S. 1,933,397, Oct. 31. Various details of app. and operation are described.

**Rubber.** Rubber Growers' Association, Inc. and Geo. Martin. Brit. 395,774, July 27, 1933. A soft rubber is obtained by adding a nitrite, *e. g.*,  $NaNO_2$ , to latex and then coagulating with an acid. Insufficient acid to react with all the nitrite produces a harder rubber. The longer the coagulum remains in the serum before machining the softer the product. In 395,775, July 27, 1933, rubber in powd. or crumb form is made by lightly pressing the coagulum obtained as in 395,774 and disintegrating. 10%  $NaNO_2$  may be added and the amt. of acid added should be sufficient to coagulate the rubber, react with the nitrite and neutralize any  $NH_3$ , etc., present. If the latex is preserved with  $NH_3$  it is desirable to add a protective colloid, *e. g.*, casein, to insure gradual coagulation.

**Rubber.** The Goodyear Tire & Rubber Co. Fr. 749,642, July 27, 1933. The surface characteristics of vulcanized rubber are improved by a treatment with ultra-violet rays.

**Rubber.** I. G. Farbenind. A.-G. (Wilhelm Breuers, inventor). Ger. 576,349, May 10, 1933. Addn. to 563,406 (C. A. 27, 1233). The method of 563,506 for producing rubber products by heating rubber in the presence of org. solvent to temps. between 200° and 300° is varied by confining the temp. to the limits 180–300°. Examples are given.

**Rubber.** I. G. Farbenind. A.-G. (Hans Tochtermann and Claus Heuck, inventors). Ger. 577,731, June 3, 1933. Rubber-like masses are prepd. by treating a latex of butadiene hydrocarbon polymerization products with an emulsified anti-ageing compd. and coagulating.

**Rubber.** I. G. Farbenind. A.-G. (Otto Schmidt, inventor). Ger. 577,732, June 3, 1933. Addn. to 568,906 (C. A. 27, 2845). The process of 568,906 for treating films, fibers, etc., of synthetic rubber with sulfurizing agents to obtain a product of desired elasticity is applied to mixts. of natural and polymerized butadiene rubber.

**Rubber.** Chem. Fabrik Ludwig Meyer. Ger. 586,382, Oct. 20, 1933. A product resembling smoked crude rubber is obtained by coagulating fresh or preserved latex or concd. latex by addn. of beechwood-tar oil. Alternatively, crude rubber may be mixed with beechwood-tar oil.

**Microporous rubber.** Zellkautschuk G. m. b. H. Ger. 586,283, Oct. 19, 1933. A rubber compn. contg.  $NaHCO_3$  and  $PbSe$  is vulcanized in the usual way. It is stated that the  $PbSe$  strengthens the walls of the cells formed by the evolution of gas from the  $NaHCO_3$ , and thus restricts the size of the cells. The proportions taken may be  $NaHCO_3$ , 10–20 and  $PbSe$  1–2%, calcd. on the rubber.

**Porous rubber compositions.** Dunlop Rubber Co. Ltd., The Anode Rubber Co. Ltd., Edward A. Murphy and Evelyn W. Madge. Brit. 396,158, Aug. 3, 1933. Porous or microporous goods of rubber and the like, contg. fibers, are produced by forming granular ppts. of rubber, mixing with fibrous materials, *e. g.*, cellulose fiber or asbestos, compacting the mixt. by filtration and vulcanizing so that evapn. of the contained  $H_2O$  is prevented. The filtration may be conducted in conjunction with molding, spreading, impregnating or dipping operations, *e. g.*, a porous former may be dipped and suction applied to produce cylindrical articles. Pressure may be used in addn. to suction for filtering and the filter cake may be treated with a rubber solvent, *e. g.*,  $CCl_4$ , mixed with a

mutual solvent for  $H_2O$  and the rubber solvent used, *e. g.*, alc.

**Rubber compositions.** Dunlop Rubber Co. Ltd., The Anode Rubber Co. Ltd., Edward A. Murphy and Alfred Niven. Brit. 396,159, Aug. 3, 1933. Dough-like or paste-like aq. compns. of rubber and the like and asbestos are prepd. by mixing asbestos fiber, preferably dry, with a q. compns. of flocculent or granular ppts. prepd. from aq. dispersions of rubber and the like. The compn. may be compacted by filtration, *e. g.*, through ceramic material, cotton fabric or fine-mesh wire gauze. Concentrates, such as obtained in Brit. 219,635 and 290,313 to which may be added any known vulcanizing or compounding ingredients, may be used subsequent to diln. Cf. C. A. 27, 3854.

**Rubber composition or artificial leather.** Helsingborgs Gummitfabriks Aktiebolag. Ger. 586,282, Oct. 19, 1933. See Swed. 71,981 (C. A. 27, 3110).

**Preserving rubber.** Max Hagemann, Curt Kreuter and Theodor Weigel (to I. G. Farbenind. A.-G.). U. S. 1,933,962, Nov. 7. See Ger. 557,138 (C. A. 27, 1233).

**Sulfonating rubber.** I. G. Farbenind. A.-G. (Erich Konrad and Helmut Kleiner, inventors). Ger. 582,565, Aug. 17, 1933. Addn. to 550,243 (C. A. 26, 4067). Rubber is treated with oleum,  $HSO_4Cl$ , or other reagent yielding  $SO_3$ , in the presence of an ether or ester of low mol. wt. Partly isomerized or partly degraded rubber may also be treated. Water-sol. sulfonic acids stable to boiling  $HCl$  are obtained. Details are given.

**Conversion products of rubber.** Frederick S. Shadholt. Brit. 396,154, Aug. 3, 1933. A conversion product of rubber is obtained by treating a soln. thereof with a compd. of P, O and Cl or Br in which the proportion of () is greater than that in the corresponding oxyhalide. The compd. may be prepd. by the partial hydrolysis of  $PCl_5$  and (or)  $POCl_3$  or it may be the residue obtained by distg. a mixt. of  $PCl_5$  or  $POCl_3$  and a phosphoric acid. As the conversion proceeds the soln. becomes less viscous and reddish brown in color. The solvent may be removed by any suitable means or the product pptd., *e. g.*, with alc. Mineral acids may be removed with  $H_2O$  or alkali. The products are hard at room temp., become plastic at 100°, are sol. in most solvents, yielding a less viscous soln. than raw or milled rubber, and, with the plasticizers commonly used with nitrocellulose, are suitable for the production of films, etc. Solns. thereof can be halogenated at ordinary or raised temps., the final product being more sol. than ordinary chlorinated rubber. Plasticizers may be mixed also with the halogenated products; vegetable oils are incompatible. Numerous examples are given.

**Dispersion of rubber and like materials.** Ralph T. Halstead (to Dispersions Process, Inc.). U. S. 1,932,661, Oct. 31. Artificial dispersions of rubber or rubber-like material in an aq. medium are formed with the use of Na abietate, Na rosinate or Na oleate and either Na palmitate or Na stearate.

**Evaporators and method for concentrating aqueous dispersions of rubber, etc., preferably with simultaneous compounding.** Dunlop Rubber Co. Ltd., The Anode Rubber Co. Ltd., Wm. McCowan, Eric W. B. Owen and Douglas F. Twiss. Brit. 396,919, Aug. 17, 1933.

**Apparatus (with rolls and scrapers) for working rubber, etc.** Raymond W. Allen (to Firestone Tire & Rubber Co.). U. S. 1,932,200, Oct. 24. Mech. features.

**Molds, etc., for rubber.** Accumulatoren-Fabrik A.-G. Brit. 395,941, July 27, 1933. Molds or traveling bands for the shaping and vulcanizing of microporous rubber are made of Al (alloys), the contact surfaces being oxidized previous to use to render them incorrodible when the rubber is vulcanized in the presence of aq. media. Oxidation is effected in known manner, *e. g.*, by electrolysis.

**Bands of cellular rubber with closed cells (such as those of large size.** Maurice P. H. L. Raepsaet (to Société belge du caoutchouc mousse). U. S. 1,931,964, Oct. 24. Various mech. and manipulative details of manuf. are described.

**Rubber sheets.** Marcel Dupret. Brit. 396,503, Aug. 10, 1933. A sheet of rubber obtained by spreading latex

upon a sheet of glass, etc., and allowing to dry is attached to 1 or both surfaces of a reinforcing layer of porous, fibrous or granular structure, *e. g.*, paper, fabric, etc., or cork dust or rice husks agglomerated with latex, using liquid latex as the adhesive. Ornamental surfaces can be obtained by using plates having impressed patterns for forming the rubber sheets.

**Substituted sulfenamides.** I. G. Farbenind. A.-G. (Ewald Zaucker, inventor). Ger. 586,351, Oct. 20, 1933. Sulfenamides of the formula  $\text{RSNR}'\text{R}''$ , where R is an org. radical and R' and R'' are alkyl or aralkyl radicals, or together form an alicyclic or heterocyclic radical, are prepd. by treating mercaptan salts with *N*-halo derivs. of secondary amines. Thus, Na *p*-thiocresolate, treated in MeOH soln. in the cold with *N*-chloropiperidine, yields *p*-tolylsulfenpiperidide ( $\text{MeC}_6\text{H}_4\text{SNC}_4\text{H}_9$ ). Examples are given also of the prepn. of benzothiazolyl-2-sulfenpiperidide, m.  $80^\circ$ , -morpholide, m.  $85^\circ$ , -dimethylamide, m.  $36^\circ$ , -dibutylamide and -thylcyclohexylamide (from a salt of 2-mercaptobenzothiazole and the corresponding *N*-chloro amine); another example describes the prepn. of 4-phenyl-1,3,4-thiadiazole-5-thione-2-sulfenpiperidide

( $\text{S.CS.NPh.N:CSNC}_4\text{H}_9$ ), m.  $80^\circ$ . Benzoxazolyl-2-sulfenpiperidide, m.  $51^\circ$ , has also been obtained. The products are useful in the rubber industry.

**Adhesive from latex, etc.** John McGavack and Alexander A. Nikitin (to Naugatuck Chemical Co.). U. S. 1,932,632, Oct. 31. Adhesives which are suitable for uniting rubber to metals are formed from concd. acidified latex and various other ingredients such as acidified and creamed latexes, casein, glue, gelatin, corn gluten, egg albumin, powd. silica gel, Fe oxide and MgO.

**Adhesive containing rubber, etc.** Douglas F. Twiss, Frederick A. Jones and James H. Anderson (to Dunlop Rubber Co. Ltd.). U. S. 1,931,879, Oct. 24. An adhesive which is suitable for bonding rubber to metals, etc., is prepd. by the reaction of a reactive polymerized or polymerizable unsatd hydrocarbon such as isoprene or butadiene with resins such as those of balata, gutta-percha or rubber in the presence of  $\text{H}_2\text{SO}_4$  or a sulfonic acid or  $\text{SnCl}_4$  or  $\text{H}_3\text{PO}_4$ .

**Apparatus for plasticizing rubber compositions in successive stages of treatment.** Wm. A. Gordon (to Farrel-Birmingham Co.). U. S. 1,935,050, Nov. 14. Mech. features.

**Adhesives for bonding rubber to metal.** Dunlop Rubber Co. Ltd., Douglas F. Twiss, Frederick A. Jones and James H. Anderson. Brit. 395,430, July 20, 1933. An adhesive for bonding rubber to metal, etc., surfaces is made by heating a polymerizable unsatd. hydrocarbon with balata-, gutta-percha- or rubber-resins and a condensing agent, *e. g.*,  $\text{H}_2\text{SO}_4$ ,  $\text{H}_3\text{PO}_4$ ,  $\text{SnCl}_4$  or a sulfonic acid. Examples are given. The solid adhesive or a soln. may be dispersed in  $\text{H}_2\text{O}$  by stirring with the addn. of emulsifying agents, *e. g.*, casein, oleic acid,  $\text{NH}_3$ . Treatment of the hot reaction products with solid  $\text{Ca}(\text{OH})_2$  or MgO or with  $\alpha$ -naphthylamine or a mixt. of aldol,  $\alpha$ - and  $\beta$ -naphthylamines enhances the keeping properties of the adhesive.  $\text{SiO}_2$ , kieselguhr and vulcanizing agents also may be added.

**Coating metal objects with rubber.** Vereinigte Stahlwerke A.-G. (Heinrich Klas and Gustav Tichy, inventors). Ger. 577,803, June 6, 1933. The metal object is coated with a soln. of rubber in a non-volatile solvent such as tar oil or mineral oil distillate. The layer is then vulcanized at a temp. at which the solvent is partly evapd.

**Coating glass, etc., with rubber, etc.** Dunlop Rubber Co. Ltd. Ger. 577,802, June 6, 1933. One or more layers of the product obtained by treating resins, such as balata or gutta-percha resins with  $\text{CH}_2\text{O}$  or its polymers in the presence of a condensing agent is used as the binding agent for the rubber coating, or as the coating itself.

**Gutta-percha insulation.** Archie R. Kemp and John H. Ingmanson (to Bell Telephone Laboratories, Inc.). U. S.

1,935,321, Nov. 14. -Albane is used as a plasticizing agent with resin-poor gutta-percha.

**Vulcanization accelerators.** Imperial Chemical Industries Ltd., Maldwyn Jones and Wm. J. S. Naunton. Brit. 395,705, July 18, 1933. A vulcanization accelerator which shows substantially no tendency to scorch at milling temps. and behaves as a superaccelerator at vulcanization temps. comprises a mixt. of not less than 40% dibenzothiazyl disulfide and not more than 60% tetraethylthiuram disulfide. The 2 accelerators may be added to the rubber separately.

**Vulcanizing molds for the production of rubber toys.** Magyar Rugsyantaárugyár R. T. Brit. 396,610, Aug. 10, 1933.

**Rubber tire manufacture.** Adrian O. Abbott, Jr. (to Morgan and Wright). U. S. 1,931,638, Oct. 24. Mech. features.

**Apparatus for vulcanizing rubber tires.** Harold A. Denmire (to General Tire & Rubber Co.). U. S. 1,931,923, Oct. 24. Mech. features.

**Apparatus for vulcanizing rubber tires.** Roy W. Brown and George P. Bowmworth (to Firestone Tire & Rubber Co.). U. S. 1,932,063, Oct. 24. Mech. features.

**Vulcanizing rubber tires.** Edward Fetter. U. S. 1,932,092, Oct. 31. Mech. features.

**Vulcanizing rubber to leather.** Leon B. Conant. U. S. 1,934,038, Nov. 7. In hot-vulcanizing rubber compn. with pressure to cement cured leather, a hot fibrous blanket is applied before and during vulcanization, in order to prepare the leather for uniting with the rubber compn.

**Apparatus for the continuous vulcanization of rubber-covered wire.** Bell Telephone Laboratories, Inc. Brit. 396,061, July 26, 1933.

**Age-resisting vulcanized rubber.** Robert L. Sibley (to Rubber Service Laboratories Co.). U. S. 1,932,562, Oct. 31. In prepg. a S-vulcanized rubber product, an antioxidant is used comprising a reaction product of a dihydroxynaphthylmethane and a phenylamine or naphthylamine contg. 7-13 C atoms such as the reaction product of  $\beta,\beta$ -dihydroxydinaphthylmethane and *p*-toluidine. Cf. C. A. 27, 4133.

**Vulcanizing rubber.** I. G. Farbenind. A.-G. Fr. 749,413, July 24, 1933. Pastes contg. colloidal S in intimate mixt. with plastic or very viscous substances are used for vulcanizing rubber.

**Vulcanizing rubber.** The Goodyear Tire & Rubber Co. Fr. 749,716, July 28, 1933. Comps. of the formula  $[(\text{YCS})_n \text{RCOO}]_m \text{M}$  (Y is  $-\text{N}(\text{R}')\text{R}''$ , R is C or Cand H, R' and R'' are alkyl, aryl or aralkyl or a heterocyclic radical contg. N,  $\pi$  and  $\pi'$  are 1 or higher and M is a metal, an alkyl, aryl or aralkyl radical or a radical giving rise to salts, such as  $\text{NH}_4$  and substituted  $\text{NH}_4$  groups, *e. g.*, carboxymethyl(or ethyl)di(dimethyl(or ethyl)dithiocarbamate) or carboxymethyl(di(pentamethylenedithiocarbamate)).

**Vulcanizing rubber.** The Goodyear Tire & Rubber Co. Fr. 749,928, Aug. 1, 1933. Rubber is vulcanized in the presence of a mixt. of a nitrophenyl ether of a mercapto-benzothiazole, *e. g.*, 2,4-dinitrophenyl-6'-ethoxybenzothiazyl-2'-mercaptide, and a reaction product of an aldehyde and an amine, *e. g.*, crotonylideneaniline.

**Vulcanizing rubber.** Imperial Chemical Industries Ltd. Fr. 749,953, Aug. 2, 1933. The "burning" of rubber during vulcanization is prevented or reduced by using as accelerator dibenzothiazyl disulfide and tetraethylthiuram disulfide mixed in such proportions that there is not less than 40 of dibenzothiazyl disulfide and not more than 60% of tetraethylthiuram disulfide in the total accelerator.

**Hard rubber-like products.** Waldemar Zieser (to I. G. Farbenind. A.-G.). U. S. 1,932,390, Oct. 31. A material which has good resistance to heat and to chem. reagents comprises a product obtained by polymerizing 1,3-butadiene in the presence of an alkali metal, together with natural rubber 40-80% and a large proportion of S.

# CHEMICAL ABSTRACTS

Vol. 28

FEBRUARY 10, 1934

No. 3

## 1-APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

**Apparatus for facilitating melting-point reading.** G. Speroni. *Ann. chim. applicata* 23, 432-4 (1933).—To make it possible to watch the melting substance constantly, and also follow the temp. in m.-p. detns., a sliding clamp is placed on the thermometer, with a mirror set at 45° to reflect the reading down to another mirror, half of which is silvered to reflect the reading to the eyepiece; the other half is clear glass so that the melted substance can be viewed directly. A. W. Contieri

**A simple apparatus for the determination of melting points, boiling points, transition points, ignition temperatures, etc., specially convenient for use with a small quantity of sample.** Satoshi Watanabe. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 22, 264-8 (1933).—An elec. recording device is described, with 1 cut and 4 graphs, with which the b. p. of H<sub>2</sub>O may be detd. with less than 0.01 cc., or the ignition temp. of S with 0.05 g.

**A non-isothermal, adiabatic microcalorimeter for studying the thermal effects of radioactive substances.** Alexandre Sanielevici. *J. chim. phys.* 30, 513-27 (1933).—A non-isothermal, adiabatic microcalorimeter designed for weak thermal effects is described, and its sensibility and precision are discussed. The measured heat effects of a radioactive salt checked with those calcd. from the energy of radiation. L. B. Steiner

**A simple apparatus for exact gas analysis, especially for the determination of carbon dioxide and water vapor at low concentrations.** Paul Schulten. *Chem. Fabrik* 1933, 113-15.—An improved Riedel app. (cf. *C. A.* 26, 2849) is described with 2 cuts, and comparative results are shown.

**A new high-frequency calorimeter for investigation of the dielectric losses of liquids.** L. Pungs and H. Rieche. *Z. tech. Physik* 14, 483-5 (1933).—A description of a calorimeter for measuring dielec. losses of liquids at frequencies from 0 to  $5 \times 10^6$  and temps. from -40° to +80°

**A quartz glass plunger pump without packing gland.** Theo Frantz. *Chem. Fabrik* 1933, 508.—A glass-lined pump is described.

**Rotary compressors for Anilob'edinenie plants.** B. I. Entikhtikov. *Aminokrasnochnaya Prom.* 3, 208-72 (1933). The performance of various types of rotary air compressors is discussed.

**General properties of photoelectric cathodes.** Geo. Daurin. *Rev. gen. elec.* 34, 515-26, 535-66, 591-607, 629-37 (1933).—Modern development of photoelec. cells, their different types, characteristics and performances, sensitivity to white light and to spectral colors are discussed theoretically and in respect to their practical applications. Of great importance for practical purposes is proportionality of current produced to illumination. The various fields in which these appliances are now used are described and curves and tables of performance and sensitivity of different light-sensitive devices given. One hundred and twenty-four references. M. H.

**High capacity of rotary furnaces, their calculation and suggestions for further uses of this furnace system.** J. Lainort. *Feuerfest Ofenbau* 9, 137-40 (1933).—The dimensions and heat efficiencies of rotary kilns and stationary furnaces are calcd. and compared; the superiority of the former is shown. The indirect heat transfer (re-

generative effect) from preheated wall to charge is especially pointed out. The active heating surface of a rotary kiln is 1.46 times the diam. times the length as compared with the mere bath surface of an open hearth. The use of rotary kilns for the glass industry is advocated.

**Possible set-ups of the Ostwald decade rheostats for the purposes of potentiometric titrations.** Edmund Erbacher. *Chem.-Ztg.* 57, 904-5 (1933).—A wiring diagram is shown and the method of carrying out titrations with the new set up is explained in detail.

**Color tests in metallurgical labs. equipped with the Leitz colorimeter (Kropf) 7.**

**Felgentraeger, W.:** Feine Waagen Wagungen und Gewichte. 2nd enlarged ed. of "Theorie, Konstruktion und Gebrauch der feineren Hebelwaage." Berlin: J. Springer. 308 pp. M. 26. Reviewed in *Nature* 132, 730 (1933).

**Temperature indicators.** Henry Dreyfus. *Fr.* 750,240, Aug. 7, 1933. A solid mass for indicating the temp. of a surface consists of a fusible substance and (or) a sublimable substance and a filling material, e. g., a mixt. of C<sub>12</sub>H<sub>10</sub>, C<sub>10</sub>H<sub>8</sub> and chalk.

**Columns or towers for holding materials for chemical treatment.** Garvenswerke, Maschinen-, Pumpen- und Waagenfabrik W. Garvens. *Ger.* 578,650, June 16, 1933.

**Hydrometer.** Charles O. Fairchild and Robert M. Willhelm (to Charles J. Tagliabue Mfg. Co.). U. S. 1,935,703, Nov. 21. Structural details.

**Portable thermocouple pyrometer suitable for use with molten metals.** John A. Obermaier. U. S. 1,936,140, Nov. 21.

**Viscometer of the compound pendulum type.** Howard C. Rule, Jr. U. S. 1,934,739, Nov. 14. Various structural and operative details are described.

**Apparatus for distillation and fractionation of materials or for effecting various reactions.** Adolph Placek. U. S. 1,936,523, Nov. 21. Various structural and operative details are described of an app. comprising a casing in which is mounted a rotatable drum with a closed convolute spiral channel through which material is fed from the inner to the outer portion of the drum. U. S. 1,936,524 relates to structural and operative details of a similar app.

**Apparatus for feeding catalyst to pressure reaction vessels such as used for converting acetylene to acetaldehyde.** Philip H. Falter (to American Cyanamid Co.). U. S. 1,935,627, Nov. 21. Various structural and operative details are described.

**Disk valve closure, particularly applicable for use with purifiers and scrubbers.** Wm. Blakeley. *Brit.* 397,542, Aug. 28, 1933.

**Air filter.** Anselme Neveu (to Westinghouse Air Brake Co.). U. S. 1,935,813, Nov. 21.

**Filter for liquids.** The Dorr-Co. *Ger.* 582,503, Aug. 16, 1933.

**Filter for liquids.** Giacinto Ravinetti. *Fr.* 751,730, Sept. 8, 1933.

**Filters for liquids.** Auto-Klean Strainers Ltd. *Fr.* 753,010, Oct. 5, 1933.

**Funnel-shaped filter.** Firma Mellita-Werke A.-G.<sup>1</sup> Fr. 751,732, Sept. 8, 1933.

**Rotary filter with pump for cleaning liquid.** Auto-Klean Strainers Ltd. and Wm. R. Beldam. Fr. 751,739, Sept. 8, 1933.

**Filter presses.** Georges Perrin. Fr. 753,190, Oct. 9, 1933. Construction of plates.

**Spray cooler or washer for gases required to be kept above or below atmospheric temperature.** Thyssen'sche Gas- und Wasserwerke G. m. b. H. Ger. 587,064, Oct. 28, 1933.

**Centrifugal apparatus for removing dust from gases.** Deutsche Babcock & Wilcox Dampfkessel-Werke A.-G. Ger. 587,168, Oct. 31, 1933.

**Apparatus for scrubbing gases.** London Power Co. Ltd. and Stauden L. Pearce. Fr. 752,321, Sept. 20, 1933.

**Apparatus for contact of gases with liquids as in ammonium sulfate production, etc.** Wilhelm Mueller. U. S. 1,936,308, Nov. 21. Structural details.

**Gas-pressure regulators.** Karl Wolinski. Brit. 396,308, Aug. 3, 1933.

**Reaction column for distilling or concentrating liquids.** Harry Pauling. Ger. 578,565, June 15, 1933.

**Apparatus for evaporating liquids.** I. G. Farbenind. A.-G. (Adolf v. Friedolsheim and Konrad Pratzel, inventors). Ger. 578,790, June 17, 1933.

**Apparatus for measuring the wetting power of liquids.** Firma Louis Schopper. Ger. 578,880, June 17, 1933.

**Treating liquids with gases as in "phosgenating" amino compounds.** Albert H. Munro (to National Aniline and Chemical Co.). U. S. 1,935,190, Nov. 14. Various details of app. and operation are described relating to a method in which gas is introduced into a downwardly moving stream of liquid which is recirculated in the app.

**Apparatus for distilling liquids such as dry-cleaner solvent.** Cyrus H. Haggood (to De Laval Separator Co.). U. S. 1,935,183, Nov. 14. Various structural and operative details are described.

**Device for indicating when the level of a liquid in a container falls below a predetermined level, particularly for use with oil-filled electrical bushings and transformers.** The Ohio Brass Co. Brit. 397,958, Sept. 7, 1933.

**Mixer for dissolving, mixing or emulsifying liquid, viscous or powdered masses.** J. S. Petzholdt, Maschinenfabrik und Heinrich Horn. Ger. 582,863, Aug. 21, 1933.

**Apparatus for concentrating solutions by circulation.** Soc. anon. des ateliers de constructions mécaniques Escher Wyss. Fr. 750,295, Aug. 8, 1933.

**Apparatus for treating liquids with gases as in aerating sewage.** Ralph R. Lefler. U. S. 1,936,305, Nov. 21. Various structural and operative details are described.

**Steam-heated tubular drier.** Maschinenfabrik Buckau R. Wolf A.-G. Ger. 584,678, Sept. 22, 1933. Addn. to 583,043 (C. A. 28, 5<sup>o</sup>).

**Rotary mill for drying, grinding and burning goods of all kinds.** Bruno Faber. Ger. 578,980, June 19, 1933.

**Apparatus for drying bands, films, etc.** Ernst Bleibler. Ger. 582,721, Aug. 21, 1933.

**Apparatus for utilizing the waste heat from lignite driers, etc., for heating water, etc.** Metallgesellschaft A.-G. Ger. 578,823, June 17, 1933.

**Water-tube boiler and superheater.** Charles A. Hulsart (to Babcock & Wilcox Co.). U. S. 1,934,714, Nov. 14.

**Superheater installation for boilers.** Richard P. Wagner (to Superheater Co.). U. S. 1,935,068, Nov. 14. Structural features.

**Apparatus for feeding treating chemicals to boilers.** Edward W. Butzler (to John M. Hopwood). U. S. 1,934,791, Nov. 14. Structural and mech. features.

**Lids for sealing pressure-resisting vessels.** Cecil S. Hall and Imperial Chemical Industries Ltd. Brit. 397,890, Sept. 4, 1933.

**Thermally-actuated device for operating valves, dampers, etc.** Bernard T. Wingfield. Brit. 397,239, Aug. 24, 1933.

**Apparatus for the detection, measurement or recording of suspended particles, e. g., smoke or thin fogs.** Eric B. Moss and Cambridge Instrument Co. Ltd. Brit. 396,300, Aug. 1, 1933.

**Jigging conveyors.** Alfred Bickhoff (trading as Gebr. Bickhoff Maschinenfabrik und Eisengiesserei). Brit. 396,332, Aug. 3, 1933.

**Apparatus for classifying and dewatering fine solid materials.** James M. Mitchell. U. S. 1,934,812, Nov. 14. Structural and mech. features.

**Hydraulic by-pass valves for use with gas-holders, washers, purifiers, etc.** R & J. Dempster Ltd. and Wm. A. Hulme. Brit. 396,307, Aug. 3, 1933.

**Shaking mechanism for sifting and conveying apparatus.** George E. Smith. Brit. 397,241, Aug. 24, 1933.

**Centrifugal mixer and sprayer for heavy viscous fluids and powders such as molasses, etc.** Hermann H. Schmidt (to Missouri Holding and Investment Co.). U. S. 1,936,120, Nov. 21. Various structural, mech. and operative details are described.

**Apparatus for lixiviating solid materials.** Egon Bohm. Ger. 578,704, June 16, 1933.

**Crystallizing apparatus.** Compagnie de produits chimiques et électrometallurgiques Alais, Froges et Camargue. Ger. 578,840, June 22, 1933.

**Surface condenser suitable for steam, etc.** Townsend Timber and Harold M. Graham (to Ross Heater & Mfg. Co.). U. S. 1,935,864, Nov. 21.

**High-capacity surface condenser suitable for steam.** John H. Smith. U. S. 1,935,822, Nov. 21. Structural features.

**Apparatus for rectifying volatile products.** Jean B. Segura. Fr. 751,931, Sept. 12, 1933.

**Apparatus for examining substances by ultra-violet light.** Griffin & Tatlock Ltd. and Joseph C. O. Turfery. Brit. 397,059, Aug. 17, 1933.

**Röntgen-ray apparatus.** Oscar H. Pieper. Brit. 397,483, Aug. 14, 1933.

**Röntgen-ray-tube anodes.** C. H. F. Muller A. G. Ger. 582,751, Aug. 22, 1933. Details of construction are given.

**Selenium cell.** Byron Decker and Elmer Blume. U. S. 1,935,698, Nov. 21. Structural details.

**Selenium cells.** Elise Haerdtl nee Bartschneider and Frieda Kirsch. Fr. 752,241, Sept. 19, 1933. Construction of electrodes is given.

**Operating luminous tubes.** Zoltan Bay. U. S. 1,936,005, Nov. 21. For producing, in a luminous tube such as one contg. Ne and Hg, colors or tints other than the fundamental color, the tube is subjected to the action of current impulses sep'd. from one another by intervals the lengths of which are much greater than the duration of the impulse (the intensity of the impulses being many times the effective strength of the current).

**Vacuum tube.** Hendrik Lems (to General Elec. Co.). U. S. 1,935,723, Nov. 21. A tube is described which has a wall portion of refractory material such as quartz which is sealed by means of a graded seal to the basal portion of the tube, the seal being coated on the outside with an opaque opalescent glass layer.

**Thermionic cathodes.** Westinghouse Electric & Manufacturing Co. Fr. 753,113, Oct. 7, 1933. The emitting substance is prep'd. by mixing BaNa<sub>2</sub> with compds. of Ba and Sr, such as BaCO<sub>3</sub> and SrCO<sub>3</sub> and a binder such as a nitrocellulose binder. The mixt. is applied to a conductor, dried at a low temp. and the BaNa<sub>2</sub> is reduced in the vacuum to liberate metallic Ba in the coating.

**Photoelectric cell.** N. V. Philips' Gloeilampenfabriek. Ken. Fr. 42,669, Sept. 1, 1933. Addn. to 603,016 (C. A. 25, 1415).

**Photoelectric tube.** Theodore W. Case (to Case Research Laboratory, Inc.). U. S. 1,935,939, Nov. 21. A portion of the interior surface of the bulb is coated with a metallic substance such as Ag and there is inserted within the bulb a heatable electrode such as Pt having a coating of material such as a Ba comp'd. adapted to be photo-active; the heatable electrode is heated to throw off the coating in

vaporized form, and the vaporized material is condensed upon the interior of the metallic coating on the bulb; the metallic coating on the bulb is connected in circuit with the heatable electrode, and H is admitted to the bulb until a condition is reached at which a glow discharge takes place between the electrodes; H is removed from the bulb, the electrodes are connected in circuit with a source of potential and the connection is maintained until the tube obtains a maximum sensitivity; then H is admitted to the bulb until a pressure is reached which gives the desired sensitivity.

**Photoelectric tube.** Soichiro Asao and Motomatsu Suzuki (to General Elec. Co.). U. S. 1,936,419, Nov. 21. In the production of the tube, there are evapd. and condensed on the envelope a superposed coating of alk. material such as Cs or K and a layer comprising Ni, Au, Ag or Pt. Cf. C. A. 27, 3120.

**Photoelectric battery.** Horst Kottas. Austrian 134,913, Oct. 10, 1933.

**Discharge tubes.** Compagnie générale de télégraphie sans fil. Fr. 751,867, Sept. 11, 1933.

**Electric discharge apparatus.** Walter Lehmann. Fr. 753,017, Oct. 5, 1933. Means for controlling the discharge is described.

**Electric discharge devices such as discharge lamps containing gases.** Hans Ewest, Kurt Wiegand and Martin Roger (to General Elec. Co.). U. S. 1,935,702, Nov. 21. Structural and elec. features.

**Gas-filled electric discharge device.** Leonard J. Davies and Henry de B. Knight (to General Elec. Co.). U. S. 1,935,697, Nov. 21. Structural features.

**Electric discharge tube.** Hans von Hartel. Fr. 753,002, Oct. 5, 1933. The metal to form the screen is placed in a part of the tube which may be sepd. from the rest by fusion. This part is heated to vaporize the metal and to sep. it by fusion.

**Electric discharge tube for the emission of ultra-violet rays.** Jan H. de Boer (to General Elec. Co.). U. S. 1,935,699, Nov. 21. A device having at least 2 cooperating electrodes one of which is a thermionic cathode contains a substance such as I in the vapor of which the discharge takes place and the spectrum of which is emitted by

the tube, and a material such as carbon,  $\text{CaF}_2$  or  $\text{ZrO}_2$  capable of adsorbing the said substance and liberating it again on being heated (various structural and operative details being described). Cf. C. A. 27, 3363.

**High-tension electron-discharge tubes.** Compagnie française pour l'exploitation des procédés Thomson-Houston. Fr. 753,300, Oct. 12, 1933.

**Electron-discharge amplifier.** Radio Research Laboratories Inc. Fr. 751,631, Sept. 7, 1933.

**Chamber furnace.** C. Otto & Co. G. m. b. H. Ger. 578,993, June 19, 1933. Addn. to 569,688 (C. A. 27, 3807).

**Gas-fired industrial furnace.** Wilhelm Ruppmann. Ger. 578,233, June 12, 1933.

**Tunnel furnace.** Alfred P. Denus. Fr. 752,087, Sept. 15, 1933.

**Apparatus for determining the composition of the atmosphere of furnaces.** Marie T. J. Lépine née Roussel. Fr. 750,367, Aug. 9, 1933.

**Pre-heating device for furnaces for roasting or sintering materials.** Lepol Internationale Patentverwertungs-G. m. b. H. and N. V. Solopol Ingenieursbureau tot Exploitatie van het systeem Polysius. Ger. 578,935, June 19, 1933.

**Apparatus for heating or cooling iron ore, cement, or other granular materials.** Nikolai Ahlmann. Ger. 578,652, June 16, 1933.

**Rotary tubular heat-exchange apparatus suitable for use with naphthalene vapor for heating various substances.** Ernst Daub. U. S. 1,936,293, Nov. 21. Various structural and operative details are described.

**Heater suitable for vaporizing liquids.** Walter M. Cross (to Babcock & Wilcox Co.). U. S. 1,935,617, Nov. 21.

**Oil burner.** Walter W. Williams. U. S. 1,934,755, Nov. 14.

**Apparatus for generating acetylene.** Marius L. G. Toussaint. Fr. 751,930, Sept. 12, 1933.

**Thermostatic valve suitable for controlling the flow of gas and air to furnaces.** Anthony J. Donohue (to Simplex Gas Products Corp.). U. S. 1,936,502, Nov. 21.

## 2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

**Edward Theodore Brewis.** E. Hinks. *Analyst* 58, 732 (1933).—(Obituary. W. T. H.

**John David Roberts.** C. A. Adams. *Analyst* 58, 732 3 (1933).—(Obituary. W. T. H.

**The negative weight of phlogiston.** Charlotte Saechtling. *Angew. Chem.* 46, 754 (1933). A philosophical-historical treatise. Karl Kammermeyer

**Extremely low temperatures.** W. J. de Haas. *Naturwissenschaften* 21, 732 4 (1933).—Adiabatic demagnetization brings about a temp. drop of suitable substances (Debye, also Giauque); these substances are nonferromagnetic and of reasonably high magnetic moment. The effect is most marked at low temp. A short description is given of the exptl. arrangement of the Leyden lab. for these investigations, principally a glass vacuum vessel with  $\text{CeF}_3$  tube between the poles of a large magnet. The vessel is surrounded by He at  $1.26^\circ$  abs.; the substance indicates its own temp. from the force with which it is attracted into the magnetic field. The  $\text{CeF}_3$  temp. obtained was  $0.27^\circ$  abs., for  $\text{Dy Et sulfate}$   $0.14^\circ$  abs., for  $\text{Ce Et sulfate}$   $0.085^\circ$  abs., no definite limit to the possible temp. has been set as yet. A magnetic temp. scale for these extremely low temps. is suggested; the gas-thermometer scale becomes impracticable in this range.

**Hydrogen sulfide water.** A. I. Sheinkman. *Farm. Zhur* 4, 166 7 (1933).— $\text{H}_2\text{S}$  water is suggested in place of  $\text{H}_2\text{S}$  gas for class-room analysis. A convenient arrangement of a series of flasks for satn. is designed.

L. Nasarevich

**Molecular symmetry and the reduction of the secular equation.** Henry Eyring, Arthur A. Frost and John Turkevich. *J. Chem. Physics* 1, 777 83 (1933).—A method is given for expressing a characteristic function of a bond of any multiplicity in terms of a linear independent set. The independent sets for the multiplicities corresponding to one bond and to two bonds for an arbitrary no. of electrons are given. A method recently given for obtaining matrix components for characteristic functions of a singlet bond is generalized to include all multiplicities. Group theory is applied to the characteristic functions of bonds for sym. mols. to reduce the secular equations, and examples are worked out for all multiplicities. The possible reasons for the approx. additivity of bond energies for mols. is examd. in connection with the common custom of ignoring all but the strongest bonds. G. M. Petty

**Ionization potentials and energies of formation of non-polar molecules.** Jean Savard. *Compt. rend.* 197, 1122-4 (1933).—The energy of dissociation of a mol.  $AB_n$  is expressed as the difference in ionization potentials of the mol. and of the atoms. The formula was verified with a precision of 0.1-0.2 v. for  $\text{H}_2$ ,  $\text{N}_2$ ,  $\text{O}_2$ ,  $\text{C}_2$ ,  $\text{Cl}_2$ ,  $\text{Br}_2$ ,  $\text{HCl}$ ,  $\text{HBr}$ ,  $\text{CO}$ ,  $\text{CO}_2$ ,  $\text{SO}_2$ ,  $\text{H}_2\text{O}$ ,  $\text{CH}_4$ ,  $\text{CH}_3\text{CH}_3$ ,  $\text{CH}_3\text{CH}_2\text{CH}_3$ ,  $\text{CH}_3\text{CH}_2\text{CN}$ ,  $\text{CN.CN}$ . Formulas for the energy of the C-C bond are given in terms of the ionization potentials of the mol. The energy of a mol. reaction is calcd. by replacing the ionization potentials of the atoms by those of the mols. Also in *J. phys. radium* 4, 650 64 (1933).

P. S. Roller

The effect of pressure on galvano-magnetic phenomena.

C. Bellia. *Nuovo cimento* 10, 221 9(1933).—The application of hydrostatic pressure increases the Hall coeff. ( $R$ ) in sheet Bi and lowers it in sheet Sb. The values for Bi are as follows, where the first figure is the pressure in atm. and the second is the coeff.: 1, 2.583; 5, 2.731; 25, 2.741; 50, 2.750. The value of the const. magnetic field ( $H$ ) is not given. Variations in  $H$  gave the following data which are, in order, the field strength in c. m. u.,  $R$  at 1 atm. and  $R$  at 25 atm.: (sheet A) 1500, 3.483, 3.510; 2000, 2.915, 2.950; 4080, 2.373, 2.408; 5500, 1.973, 2.015; (sheet B) 1500, 3.122, 3.150; 2000, 2.699, 2.718; 4080, 2.180, 2.220; 5500, 1.887, 1.922. The elec. cond. was also measured in Bi with the following results, which are in order, the pressure in atm., the cond.  $\times 10^6$  without a magnetic field, the cond.  $\times 10^6$  in a field of 1485 c. m. u.: 1, 7.600, 7.488; 5, 7.740, 7.628; 25, 7.773, 7.765; 50, 7.790, 7.681. The no. of free electrons per cc. is calcd. to be  $753.5 \times 10^{16}$ . J. B. Austin

The dielectric constant and absorption of several organic fluids at 1.82 m. W. T. Szymanski. *J. Chem. Physics* 1, 809 16(1933).—Dielec. consts. and absorption of energy at  $\lambda = 1.82$  m. were measured in EtOH, PrOH, iso-PrOH, iso-BuOH, BuOH, AmOH,  $C_6H_5Cl$ ,  $C_6H_5NO_2$  and quinoline. The resonance method for undamped waves was used. The results agree well with Debye's theory of anomalous dispersion and with the results of Mizushima for fluids whose polarization does not change with diln. from normal concn. By use of the Malsch modification of Debye's theory, the dielec. const. for  $C_6H_5NO_2$  and quinoline is in satisfactory agreement with theory; the agreement is improved for energy absorption, but is far from satisfactory. Gerald M. Petty

Dipole moment and solvents. Horst Muller. *Physik. Z.* 34, 680-710(1933); cf. *C. A.* 27, 1248.—An app. of high precision was developed to measure dielec. consts. of liquids, and to show the dependence of mol. polarization of solutes on the solvent. A no. of solutes were measured in the solvents: hexane, cyclohexane, decalin,  $CCl_4$ ,  $C_6H_6$ ,  $C_2Cl_4$  and  $CS_2$ . An empirical equation, valid for many substances, was developed which permits for non-gaseous mols. the calcn. of the dipole moment of free mols. by extrapolation of the results obtained in soln. To explain the results, a "satn. effect" in the elec. field of the dipoles is assumed. L. E. Steiner

Complex formation due to polarization. I. The system krypton and hydrogen chloride. Geo. Glockler, Charles P. Roe and Donald L. Fuller. *J. Chem. Physics* 1, 703 8(1933).—Five lines of evidence are cited for the formation of mol. complexes confg. rare gas atoms and an excited atom or a mol. with a dipole moment. They are (1) Band spectra of complex HgA and HgKr are known. (2) Rare-gas hydrates have been described. (3) Iso-electronic systems similar to the rare gases have proton affinity. (4) Rare gas hydride ions have been found in the mass spectrograph. (5) The  $P$ - $V$ - $T$  relation of gas mixts. shows that interaction between unlike mols. exists. The last type of evidence was established experimentally for Kr HCl mixts. from a study of the second virial coeff. as a function of the compn. of the mixt. II. The system propane and hydrogen chloride. Geo. Glockler, Donald L. Fuller and Charles P. Roe. *Ibid.* 709 13. The similarity in structure between the rare gases and satd. hydrocarbons suggests that the latter should also show complex formation with other mols. or atoms of dipole character. This is verified by an exptl. study of the  $P$ - $V$ - $T$  relations of gaseous mixts. of propane and HCl and an analysis of the second virial coeffs. as a function of the compn. The question of complex formation of satd. hydrocarbons is also discussed on the basis of Bronsted's theory of acids and bases. Morris Muskat

Investigations in the critical region. IV. Critical isotherms and Joule effect of  $N_2O_4$ . K. Bennewitz and J. J. Windisch. *Z. physik. Chem.* A166, 416 27(1933); cf. *C. A.* 23, 5078.—An app. is described for measuring the isothermal Joule effect at high temp. with corrosive substances. The crit. Joule-isotherm was detd. for  $N_2O_4$ . Conclusion: The van der Waals coupling between 2  $NO_2$

mol. and the chem. binding to form  $N_2O_4$  are different and can be sepd. G. M. Murphy

Thermal dissociation of cyanogen into cyanide radicals A correction. G. B. Kistiakowsky and H. Gershinowitz. *J. Chem. Physics* 1, 885(1933).—A correction of *C. A.* 27, 4474. Gerald M. Petty

Meyer micro method for vapor density determination Paul de Ceuster. *Natuurw. Tijdschr.* 15, 180-91(1933).

The liquid (about 15 mg.) in a bulb with capillary 25 mm long is dropped in a tube with lower half surrounded by bath of boiling aniline; the upper half at room temp. is protected by an asbestos shield. The vol. of the content is measured before and after dropping the bulb by means of a volumeter tube (3 mm. diam., 3 cc. contents) with Hg seal. The entire detn. takes less than 2 hrs., the error is less than 1.5%. B. J. C. van der Hoeven

A new method for determining density of corrosive liquids at high pressures, and the critical density of nitrogen tetroxide. K. Bennewitz and J. J. Windisch. *Z. physik. Chem.* A166, 401 15(1933).—A magnetically regulated buoyancy method is described suitable for detg. d. of corrosive liquids at high pressure and temp. The d. temp. curve for  $N_2O_4$  was detd. between 17.60° and 158.20°. The latter is the crit. temp. and the crit. d. is 0.570. G. M. Murphy

Vapor pressure of vinyl acetate. J. Marsden and A. C. Cuthbertson. *Can. J. Research* 9, 419 23(1933).—The vapor pressure of vinyl acetate, from 0° to the normal b. p. 72.5° was measured. The detns. were made on vacuum-distd. samples with an isotenoscope. The mol. heat of evapn. is 8211 calories. The results are represented by  $\log_{10} P_{mm.} = (-0.05223 \times 34433/T) + 8.001$  Trouton's const. and the crit. temp. were calcd. as 23.8° and 228.3°, resp. The crit. temp. was calcd. from Ramsay and Shields' formula as 228.9, from Ramsay and Young's as 233.6, with Et propionate and *n*-PrOAc as the reference liquids and from Sugden's formula as 222.1. J. W. S.

Graphic representation of crystal forms. Helmut Stutzel. *Centr. Mineral. Geol.* 1933A, 52 8.—A method is given for the graphic illustration of crystal forms and their growth in terms of their relative central distances on a triangular net. Victor Hicks

Variation of the principal magnetic susceptibilities of certain paramagnetic crystals with temperature. H. W. Bartlett. *Phys. Rev.* 44, 687(1933); cf. *C. A.* 26, 5463. Errata. L. S. Kassel

A polymorphous transformation of calcium. A. Schulze and H. Schulte-Overberg. *Metallwirtschaft* 12, 633 1(1933).—Logarithmic cooling curves of Ca, which was 95.4% pure, show a change in direction between 430° and 450°. Above and below this range the curves are straight lines corresponding to the different sp. heats of the 2 phases. The thermal expansion curve detd. with a differential dilatometer shows a sudden contraction between 430° and 450° equal to 0.6% change in length. It is reversible with falling temp. The elec. resistance measurements were made on wire 2 mm. in diam. placed in Ni tubes to prevent oxidation. The resistance also shows a change between 430° and 450°, a decrease of 5.8%. It is not completely reversible. A polymorphous transformation of Ca between 430° and 450° is indicated. The heat of transformation, 2.3 calories, was detd. in a small water calorimeter. A sharp kink at 350° in the elec. resistance curve is due to recrystn. of the Ca. Six references. C. E. Macfarlane

X-ray examination of calcium at elevated temperatures I. Graf. *Metallwirtschaft* 12, 649 53(1933). Ca of 95.4% purity was extruded hot into wire and was examined under vacuum in a small specially built x-ray diffraction app. at temps. up to 500°. An allotropic transformation from the face-centered cubic lattice with a const.  $a = 5.50$  to a body-centered cubic lattice with a const.  $a = 4.43$  takes place at 450°. This explains the irregularities at this temp. in cooling, dilatometer, and elec.-resistance curves (see preceding abstr.). The d. of the  $\alpha$ -phase at 450° is 1.48 and of the  $\beta$ -phase at 480° 1.52. The irregularities in the elec. resistance-temp. curve of Ca with

which was extruded at 300° as compared with soft temper wire, which were found by Schulze, are caused by intense lattice disturbances due to the 100% reduction in extruding. These disturbances are not relieved at temps. below 300° but are relieved at 345°, when a very rapid recrystallization takes place, which causes the peculiar kink in the resistance-temp. curve.

C. E. Macfarlane

**X-ray investigation of the system iron-selenium.** Gunnar Hagg and Anna-Lisa Kindstrom. *Z. physik. Chem.* **B22**, 453-64 (1933). In the system Fe-Se at 50 atoms % Se there are 2 intermediate phases. Below a temp. of about 600° the stable form has B-10 structure with a tetragonal elementary cell contg. 2 atoms each of Fe and Se. This phase is not stable with more than 50% Se. Above the transition temp. the stable phase has Ni arsenide structure (B-8). It may dissolve Se and then is stable at lower temp. When this happens considerable deformation of the crystal lattice takes place. Between 5 and 100% Se there are no stable intermediate phases.

G. M. Murphy

**X-ray analysis of the crystal structure of the thallium alloys.** H. J. C. Ireton, J. P. Blewett and J. F. Allen. *Can. J. Research* **9**, 415-18 (1933).—The crystal structure of Tl-Sn alloys was analyzed. The Sn lattice const. had a max. value at the eutectic point (42.5% Tl), while the superconducting curve showed a cusp-shaped min. at this point and a peak at the soly. boundary. When Sn was added to Tl a change from  $\alpha$  to  $\beta$  Tl was observed. This change is similar to that already noted in other alloys of Tl.

J. W. Shipley

**The crystal structure of troilite and pyrrhotite.** Gunnar Hagg and Ingrid Sucksdorff. *Z. physik. Chem.* **B22**, 444-52 (1933). In the compd. FeS a hexagonal superstructure of the NiAs type exists with the longest base diagonal the  $a$ -axis and with a doubled  $c$ -axis. This disappears between 51 and 52° S and the usual NiAs structure exists up to about 55.5° S. Increase of the S content is accompanied by contraction of the crystal lattice and d. detns. show that the S fills empty places in the Fe lattice. This is a new type of solid soln. which the authors call subtraction phases.

G. M. Murphy

**Comparison of x-ray diagram of crystalline-liquid and normal liquid phases of the same substance.** W. Kast. *Naturwissenschaften* **21**, 737 (1933). X-ray diagrams were made (cf. Katz, *C. A.* **23**, 765); Buchwald, *C. A.* **25**, 620) of a 0.5-mm. layer of  $p$ -azoxyanisole in 2 conditions with strictly monochromatic Cu radiation in parallel beam of 0.3 mm. diam. No significant differences are found between the anisotropic and the isotropic melt; the diagram of the former is shifted somewhat because of the higher d. In both cases groups of an approx. equal no. of arranged mols. exist, this seems to be characteristic for the liquid state (Stewart, *C. A.* **25**, 3562). The difference between normal and crvst. liquid must lie in isotropy or anisotropy of the groups themselves.

B. J. C. van der Hoeven

**Structure of chrysene and 1,2,5,6-dibenzanthracene in the crystalline state.** John Iball and J. Monteath Robertson. *Nature* **132**, 750-1 (1933).—Chrysene crystallizes in the monoclinic system with 4 mols. per elementary cell with  $a_0 = 8.34$ ,  $b_0 = 6.18$ ,  $c_0 = 25.0$  A. U.,  $\beta = 115.8^\circ$ . The space group is  $C_{2h}^2$ . 1,2,5,6-Dibenzanthracene crystallizes in the monoclinic system with 2 mols. per elementary cell with  $a_0 = 6.50$ ,  $b_0 = 7.84$ ,  $c_0 = 14.17$  A. U.,  $\beta = 103.5^\circ$ . The space group is  $C_{2h}^2$  or  $C_2^2$ . The mols. of both compds. stand nearly upright on (001). F. D. Bernal. *Ibid.* **751**.—Preliminary optical data confirm the mol. orientation found by x-rays. V. Hicks

**Refractive index of  $H_2O^{18}$  and the complete isotopic analysis of water.** Gilbert N. Lewis and Daniel B. Luten. *J. Am. Chem. Soc.* **55**, 5061-2 (1933).— $\alpha$ , the mole fraction of  $H_2O$ , =  $1.370\Delta s - 190.5\Delta n$ , where  $\Delta s$  is the difference in d. at 25° between a given sample and ordinary  $H_2O$  and  $\Delta n$  is the difference in  $n$  at 25°;  $\gamma$ , the increase in mole fraction of  $H_2O^{18}$ , or the atom fraction of  $O^{18}$  =  $7.602\Delta s + 180.9\Delta n$ .

C. J. West

**Isotopic analysis of water.** R. H. Crist, G. M. Murphy

and Harold C. Urey. *J. Am. Chem. Soc.* **55**, 5060-1 (1933).—Detn. of  $n$  by a Zeiss interferometer is discussed.

C. J. West

**The deuteroammonias.** Hugh S. Taylor and Joseph C. Junger. *J. Am. Chem. Soc.* **55**, 5057-8 (1933).—Passing heavy  $H_2O$  over  $Mg_3N_2$  gave 3 samples of deuteroammonias, d. 1.12, 1.158 and 1.174 (compared with  $NH_3$ ) corresponding to ammonias with 68, 90 and 99% heavy H; the f. p. and b. p. ("abs.") are, resp.: 0° 195.2, 239.75; 68°, 197.9, 241.7; 90° 198.6, 242.1; 99°, 199, 242.3.  $NH_3$  and the 99% deuteroammonia showed vapor pressure at  $T$  ("abs.") as follows: 202.3, 77, 63; 213, 184, 154; 226.1, 304, 313; 232.1, 511, 445; 238.6, 714, 628; the latent heat of vaporization of  $NH_3$  is calcd. as 5900 cal. per mole. The absorption spectra are discussed.

C. J. West

**Volatilization of silicon dioxide and of copper in steam.**

J. Gillis. *Natuurw. Tijdschr.* **15**, 153-4 (1933).—The results on volatility of  $SiO_2$ , etc., of Nieuwenburg and Bloemendaal (*C. A.* **24**, 5553; **25**, 3215) were confirmed contrary to work of Morey (*C. A.* **27**, 3374). A steel Hofer autoclave, 50 cm. deep, was used, the cover provided with a sample tube 50 cm. long. Small metal cylinders contg. the reagents were attached to this tube just below the cover, the water inside the autoclave stood 5-10 cm. high. The willemite synthesis from  $ZnO$  and  $SiO_2$  in containers at 5 cm. distance was evident after 4 hrs. at 300 atm., the  $ZnO$  increased 25 and 16% in wt., the  $SiO_2$  decreased around 50% in wt. Amorphous fine  $SiO_2$  volatilizes faster than sand or quartz. With  $CuO$  and  $SiO_2$  or plancheite ( $Cu$  silicate) reduction to  $Cu$  took place.  $Cu$  volatilizes under these conditions to the extent of 50 mg. from 20 g.  $Cu$  during 3 days in 300 atm. steam, the  $Cu$  settling as a fine, loose deposit on the autoclave walls. Cassiterite and rutile do not lose wt.; pitchblende loses 11% of its wt. during a 3-day period.

B. J. C. van der Hoeven

**The properties of Rochelle salt.** Hans Muller. *Phys. Rev.* **44**, 854-5 (1933); cf. *C. A.* **27**, 4452. Numerous results are listed as derived from an extensive study of the dielec., optical, electro-optical and pyroelec. properties of Rochelle salt in the temp. range from  $-50^\circ$  to  $+50^\circ$ . The results can be explained by generalizing the Weiss theory of ferromagnetism so that the polarization is caused both by an orientation of polar mols. and by a polarization of non-polar mols., and the assumption that the ease of orientation decreases as the temp. decreases.

Morris Muskat

**Recovery of carbon tetrachloride.** W. L. Mendenhall, C. W. McClure and Mildred Huntsinger. *Science* **78**, 482-3 (1933).— $CCl_4$  vapor is led into a shallow dish contg. ice cubes floating on Hg. No fumes escape into the room, and recovery is practically complete.

G. M. Petty

**Adsorption and surface tension of strong electrolytes.** Syōten Oka. *Proc. Phys.-Math. Soc. Japan* **15**, 407 (1933); cf. *C. A.* **27**, 652.—By use of Gibbs' adsorption equation, the same results as were previously deduced (*C. A.* **26**, 4230) are obtained. The theory is extended to concd. solns. by introducing an av. ionic diam.

E. R. Smith

**Oil lenses on water and the nature of monomolecular expanded films.** Irving Langmuir. *J. Chem. Physics* **1**, 756-76 (1933).—Higher hydrocarbons form circular lenses on the surface of water if the spreading coeff.  $F_s = \gamma_1 - \gamma_2$  is neg. As the vol. of the lens increases, the thickness  $l$  at the center approaches a limit  $l_\infty^2 = -2F_{sp}/R_{sp}(\rho_1 - \rho_2)$ .  $F_s$  is detd. from the radii and vol. of large lenses. The linear tension at the lens boundary is calcd.  $C_{14}H_{30}$  on water at 25° gives  $F_s = -0.2$  dynes/cm. and  $\gamma = 26.9$ . Hydrophilic mols. in the interface give a spreading force  $F_{12}$  which causes a decrease in  $F_s$  and  $l$ . When  $l < 0.1$  mm. gravitational effects are negligible and the lens degenerates into a duplex film. Such a film, confined by a piston, exerts a force  $F_h$  per unit length  $F$ . If mols. adsorbed at the interface give a force  $F_{12}$ , the equation of state of the duplex film is  $(F - F_0)(a - a_0) = kT$ , where  $F_0 = F_h$  in the absence of hydrophiles. This

equation applies to expanded oil films on water and these films, even when monomolecular, are duplex films. A kink in the  $F$ - $a$  curves is attributed to the formation of micelles, each contg.  $\beta$ -mols. when  $F_{12}$  rises to a crit. value. For fatty acids on dil. HCl,  $\beta = 13$ ; the low value is due to sepn. of the hydrated mol. heads. The esters show little or no hydration and  $\beta = 60$ . The heat of formation of micelles in the fatty acids is  $5.5 + 0.24n$  kg. cal./mol., where  $n$  in the no. of C atoms. Values of  $F_0$  and  $a_0$  are detd. from data given by Adam (C. A. 16, 4107 8; 20, 3804; 22, 1713, 1296; 24, 2351; 27, 1254).

Gerald M. Petty

A physicochemical reaction modifying itself because of an electrical connection with a sol. F. Vles and M. Gex. *Compt. rend.* 197, 777 9(1933).—When thin sheets of metal (Zn, Al, Cu, Fe, Pt) are inserted into Bredig Ag sols whose  $p_H$  is less than 6.5, the color changes and final coagulation appears in less time, if the sheets are not grounded, than if they are grounded. If condensers are introduced into the connections of those grounded, those connected to the larger condensers coagulate most rapidly. These effects are due to exchanges of atm. electricity.

F. B. Brown

The transverse magneto-optic anisotropy of a few colloid solutions. II. Iron oxide sol. Wilfried Heller and Hans Zocher. *Z. physik. Chem.* A166, 365 81(1933); cf. C. A. 27, 2853. — Although the Majorana phenomenon in  $Fe_2O_3$  sols. is complicated a series of regularities was found.

G. M. Murphy

Surface phenomena on the boundary solid body-solution. Change of the heat of wetting in solutions of substances with active surface upon introduction of electrolytes. Boris V. Il'in, V. Semuchenko and V. Ivanov. *Z. physik. Chem.* A166, 382 92(1933). The heats of wetting of C with aq. sols. of NaCl, of iso-PrOH, of iso-BuOH and of these aces. in the presence of NaCl were measured. The introduction of electrolyte increases the heat of wetting with wide deviations from additivity. A qual. explanation is given.

G. M. M.

Electrokinetic processes in capillaries. II. Reichardt. *Z. physik. Chem.* A166, 433 52(1933); cf. C. A. 25, 5330. — The preceding work was extended to allow for cases where the capillary is so small that the region of the double layer cannot be neglected with respect to the vol. of the liquid.

G. M. Murphy

Preliminary report on the meaning of the gas phase for the formation of emulsions. F. Rogowski and K. Sollner. *Z. physik. Chem.* A166, 428 32(1933). — Emulsions of paraffin oil- $H_2O$ ,  $PhMe-H_2O$ ,  $PhMe$ -ethylene glycol,  $Hg-H_2O$  were prepd. by shaking or with supersonic waves. The emulsions differ according to whether or not a gas is present as a third component. Emulsions contg. gas are much easier to prep. and are more stable.

G. M. M.

Beginning of hydrolysis of agar-agar. A. Korentzvit. *Khim. Farm. Prom.* 1933, 153. — The process is traced by adding alc. soln. of I and observing the colors which range from violet at the beginning to colorless at the end.

L. Nusarevich

Viscosity changes of the cellulose solution with various treatments. T. Nakashima and M. Negishi. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 621 3(1933); cf. C. A. 26, 6124; 27, 1164. — An equation for the change of viscosity with temp. is derived which coincides with a previously detd. empirical equation. Data are presented for the change of viscosity as affected by (1) alkali boil, (2) aging and (3) bleaching. Karl Kammermeyer

Discontinuous diffusion into gelatin Suzanne Veil. *Compt. rend.* 197, 756 8(1933); cf. C. A. 27, 1801 and 4151. — Rings like Liesegang rings form when  $Na_2S$  or  $(NH_4)_2C_2H_4O_4$  diffuses into gelatin, independently of any chem. reaction.

F. B. Brown

Molecular weight of gelatin. W. R. Atkin. *J. Intern. Soc. Leather Trades Chem.* 17, 575-82(1933). — By use of the most recent data on amino acid content and assuming 2 histidine residues per mol., a mol. wt. of 34,500 is calcd.

H. B. Merrill

Solubility of some complex metal thiocyanates. III.

1 The system  $Ba(SCN)_2 - Co(SCN)_2 - H_2O$ . V. Cuvelier. *Natuurw. Tijdschr.* 15, 177-80(1933). — The soln. equil. of the above system was detd. at  $25^\circ$  in a thermostat (cf. C. A. 25, 3551). The SCN was detd. by titration with 0.05 N  $Hg(NO_3)_2$ , with  $NH_4Fe(SO_4)_2$  indicator;  $Ba$  was detd. gravimetrically. A compd.  $BaCo(SCN)_4 \cdot 8H_2O$  appears, identical with julenite (C. A. 27, 2114), of wide stability range: it is formed in a satd. soln. contg. more than 5%  $Co(SCN)_2$  or 20%  $Ba(SCN)_2$ . The existence of  $Ba(SCN)_2 \cdot 3H_2O$  (satd. soln. 62.87 parts  $Ba(SCN)_2$  to 37.13  $H_2O$ ) could not be definitely established. A triangular diagram is given with tabulated soly. data.

B. J. C. van der Hoeven

Theory of the distribution of electrolytes between a solid crystalline and a liquid phase. A. P. Ratner. *J. Chem. Physics* 1, 789 94(1933). — Equations are deduced from the general theory of thermodynamic potential and the activity theory of strong electrolytes, giving the effect of the compn. of the liquid phase on the distribution ratio and the dependence of the partition const. on the properties of the pure components. The relative importance of the various factors in these equations is discussed. The equations agree with exptl. data for the pairs  $Pb(NO_3)_2$ ,  $Ra(NO_3)_2$  at  $25^\circ$ .  $BaBr_2$ - $RaBr_2$  at  $0^\circ$  and  $Ba(NO_3)_2$ - $Ra(NO_3)_2$ .

Gerald M. Petty

The theory of non-stationary processes in electrolytic solutions and some problems for electrolytic investigation H. Falkenhagen and W. Fischer. *Physik. Z.* 34, 786 8(1933). — A brief discussion of the dispersion effect in mixts. of electrolytes is followed by a survey of some problems yet to be solved.

E. R. Smith

The law of Lambert-Beer and the nature of the absorbing particles in solution. E. Darnois. *Compt. rend.* 197, 1120 1(1933). The variation of the sp. absorption coeff. with concn. indicates more than one species in soln. If in plotting the coeff. against wave length a bundle of conc. current lines is obtained, the presence is shown of 2 species only. If concurrence is not obtained, there are more than 2 species.

P. S. Roller

Surface tension and complex formation in non-aqueous salt solutions. P. P. Kozakevich and N. S. Kozakevich. *Z. physik. Chem.* A166, 113 35(1933); cf. C. A. 22, 4297. — The previous measurements were continued with expts. on d. and surface tension of the following salts and solvents:  $LiCl$ ,  $LiBr$ ,  $NaBr$ ,  $CaCl_2$ ,  $CoCl_2$ ,  $CdCl_2$ ,  $HgCl_2$ , picric acid,  $H_3BO_3$ ,  $(CO_2H)_2$ , malic acid, succinic acid,  $BzOH$ ,  $C_6H_6$ ,  $AcNH_2$  in  $MeOH$  soln.;  $LiCl$ ,  $HgCl_2$ ,  $C_6H_6$ ,  $AcNH_2$ ,  $BzOH$  in  $EtOH$ ;  $C_6H_6$ ,  $BzOH$  in  $BuOH$ ,  $BzOH$ ,  $C_6H_6$ , 1,  $H_2O$  in  $i-AmOH$ ;  $LiCl$ ,  $LiI$ ,  $LiBr$ ,  $NaCl$ ,  $NaI$ ,  $NaBr$ ,  $KCl$ ,  $KI$ ,  $KBr$ ,  $CaCl_2$  in  $HCO_2H$ ;  $CaCl_2$ ,  $C_6H_6$  in  $AcOH$ ;  $CaCl_2$ ,  $C_6H_6$  in  $BuCO_2H$ ;  $C_6H_6$  dissolved in  $C_7H_{16}$ ,  $C_6H_6$  and  $PhNH_2$ ;  $LiBr$ ,  $LiI$  in  $AcOMe$ ;  $C_6H_6$ ,  $LiCl$ ,  $LiBr$ ,  $LiI$ ,  $NaI$ ,  $HgI_2$  in  $C_6H_6$ . In concd. soln. the salt raises the surface tension approx. in proportion to the concn. But the effect of the sp. surface tension due to any one component is usually hidden by other factors.

G. M. Murphy

Propagation of supersonic waves through an electrolyte Syöten Oka. *Proc. Phys.-Math. Soc. Japan* 15, 413 19(1933). — The theory of Debye (C. A. 27, 1577) for the detn. of the mass of electrolytic ions from the propagation of supersonic waves through electrolytes is developed further by taking into account the relaxation and electrophoretic forces. An expression for the potential waves due to the sound waves is derived.

E. R. Smith

Some notes on the calomel electrode. Kentaro Nomura. *J. Biochem. (Japan)* 18, 301 9(1933). — If properly satd. with  $HgCl_2$  a freshly prepd. 3.5 N  $KCl$ -calomel electrode attains a const. potential in about 2 days. At different temps. the potential of such an electrode has a value expressed by the formulas:  $\pi_{25} = 0.28382 - 0.0007$  between  $13^\circ$  and  $25^\circ$ , and  $\pi_{25} = 0.30249 - 0.0007$  from  $25^\circ$  to  $43^\circ$ .

S. Morgulis

Cells of liquid ammonia and ammonia solutions. Georges I. Costeanu. *Compt. rend.* 197, 1113-14(1933); cf. C. A. 27, 887. — The e. m. fs. of the cells  $Cd | Cd(NO_3)_2 \cdot 4H_2O ; NH_4NO_3 ; AgNO_3 | Ag$  and  $Zn | Zn(NO_3)_2$ .

$\text{H}_2\text{O}$ ;  $\text{NH}_4\text{NO}_3$ ;  $\text{AgNO}_3/\text{Ag}$  were measured for liquid  $\text{NH}_3$  solns. contg. 0, 20.5, 45.2 and 80%  $\text{H}_2\text{O}$ . The temp. varied from  $-75^\circ$  to  $18^\circ$ . Over the whole range of concn. and temp. the e. m. f. varied by a few hundredths of a v. only.

P. S. Roller

**Studies on the antimony stick electrode. I. The degree of stability of the electrode potential and its effect on the relation between  $p_{\text{H}}$  and e. m. f.** Tetuo Tomiyama. *J. Biochem. (Japan)* 18, 285-99 (1933). An Sb stick electrode is prepd. by dipping it for several days into a soln. of  $p_{\text{H}}$  11.8. On suddenly stirring the soln. in which the electrode is placed the potential against a calomel electrode increases on the acid and diminishes on the alk. side. In unstirred solns. the potential varies according to temp. and duration of immersion, and the longer the latter is the more nearly does the  $p_{\text{H}}$ -e. m. f. curve approach a straight line. After immersion for 30 min. and between 10 and 30, the change in p. d. per  $1^\circ$  is 1.5 mv. for  $p_{\text{H}}$  2-4; 2.0 mv. for  $p_{\text{H}}$  5-7; and 2.5-3.0 mv. for  $p_{\text{H}}$  8-11. The following exptl. formula was obtained:  $E = 0.022 + 0.0567 p_{\text{H}}$  at  $20^\circ$  as compared to a calomel electrode.

S. Morgulis

**Measurement of  $p_{\text{H}}$ .** F. C. Thompson. *J. Internat. Leather Trades Chem.* 17, 680-4 (1933).—An address.

H. B. Merrill

**The theory of passivity. XIX The structure of natural layers of iron oxide in rusting processes.** W. J. Muller and W. Machus. *Z. physik. Chem.* A166, 357-61 (1933), cf. *C. A.* 27, 1468. Fe electrodes were treated in  $\text{Na}_2\text{SO}_4$  soln. under different conditions. The amt. of Fe on the surface can then be detd. either optically or by the curve of initial current strength vs. passivation time. The law of the formation of oxide film is exponential, the half value time is a measure of the different exptl. conditions.

G. M. Murphy

**Effect of fluid velocity on heterogeneous reactions. II Effect of fluid velocity on solution velocity of metallic copper in ammoniacal cupric solutions.** Shun-ichi Uchida and Ichito Nakayama. *J. Soc. Chem. Ind., Japan* 36, suppl. binding 635-42 (1933); cf. *C. A.* 27, 4993. Ammoniacal cupric soln. satd. with  $\text{O}_2$  was passed through Cu tubes of 3 different diams. at 25 and the reaction velocity const.  $k$  was found to be expressed by  $kd = 0.0000225(dup/\mu)^{0.4}$ , where  $d$  is the inside diam. of the Cu tubes,  $u$  the mean fluid velocity,  $p$  its d., and  $\mu$  its viscosity. At  $dup/\mu$  about 4000, the pure chem. reaction seems to play a part and the deviation from the equation is such that  $kd$  becomes independent of  $dup/\mu$ . The number in which  $dup/\mu$  affects the reaction velocity const. is similar to heat transfer processes. The viscous-flow region was not distinct because of probable disturbances.

Karl Kammermeyer

**A method of measuring gaseous reactions.** M. Polanyi. *Nature* 132, 747-8 (1933). Gas A is led through an orifice into sufficient gas B to consume it before it reaches the wall of the reaction vessel. The rate of reaction and the half period are readily calcd.; collision efficiencies from 1 to  $10^{-4}$  should be amenable to measurement.

Gerald M. Petty

**The kinetics of the reaction between potassium persulfate and potassium ferrocyanide in neutral solution.** E. J. Holliba and Walter Herrmann. *Z. physik. Chem.* A166, 453-67 (1933). The reaction between  $\text{K}_2\text{S}_2\text{O}_8$  and  $\text{K}_4\text{Fe}(\text{CN})_6$  was investigated in neutral soln. Second- and third order "const." are not const. with change of the initial concn. of the reactants; this is attributed to the presence of a strong electrostatic ionic field. In concd. K soln the irregularities disappear completely. The reaction is considered 2nd order and a reaction scheme is proposed. Temp. and the effect of light on the rate were investigated.

G. M. Murphy

**Conversion of ammonium cyanate into urea. Mechanism and kinetic salt effect.** J. C. Warner and Fred B. Stitt. *J. Am. Chem. Soc.* 55, 4807-12 (1933).—The effect of the concn. of  $\text{NH}_4\text{OCN}$  and of added salts on the rate of conversion of  $\text{NH}_4\text{OCN}$  into urea was investigated.

A neg. primary salt effect is evidence that the rate of conversion depends upon collisions between  $\text{NH}_4$  and  $\text{CNO}$  ions. The velocity const. of the reaction was detd. by graphic extrapolation to zero ionic strength and also by direct calcn. from the exptl. data and activity coeffs. by taking into account the effect of changing ionic strength during the course of the reaction. The possibility of detg. activity coeffs. from velocity measurements is suggested.

Walter B. Keighton, Jr.

**The velocity of decomposition of diazo compounds in water. XII.** E. Yamamoto, R. Goshima and J. Hashima. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 609-13 (1933); cf. *C. A.* 27, 5620.—Exptl. data for the decompn. velocity of the diazo compds. derived from 1-ammonaphthalene-4-sulfonic acid (I), 1-ammonaphthalene-5-sulfonic acid (II), and Cleve's acid (III) are presented. The following values for the temp. coeff.  $A$  and the const. of the decompn. velocity at  $0^\circ$ ,  $C_0$ , were obtained from the data,  $A_{\text{I}} = 8068$ ,  $A_{\text{II}} = 22$ ,  $306$ ,  $A_{\text{III}} = 14,076$  and  $C_{0\text{I}} \times 10^4 = 2.89$ ,  $C_{0\text{II}} \times 10^4 = 3.10$ ,  $C_{0\text{III}} \times 10^4 = 1.77$ . Decompn.-velocity consts. calcd. at various temps. are given.

Karl Kammermeyer

**The law of displacement of chemical equilibrium.** J. E. Verschaffelt. *Compt. rend.* 197, 753-4 (1933). The law of displacement of chem. equil. can be derived by setting the differential equations which characterize the system.

F. E. Brown

**Thermal decomposition of propyl mercaptan. II.** Austin Taylor and Edwin T. Layng. *J. Chem. Physics* 1, 798-808 (1933).—The thermal decompn. of  $\text{PrSH}$  at temps. of  $405-35^\circ$  and at pressures of 100-300 mm. was studied by static and dynamic methods. There is an induction period with autoaccelerating rate, ending in a pseudoequil. of propylene,  $\text{H}_2\text{S}$  and  $\text{Me}_2\text{CSH}$ . The induction period is reproducible if the glass surface is thoroughly poisoned with the decompn. products of the reaction. The energies of activation of the induction period and of the later reaction are about 40,000 and 39,000 cal., resp. A mechanism is proposed which involves the successive formation of  $\text{PrS}$  and  $\text{PrSSH}$ . The vapor pressure of  $\text{PrSH}$  from 284.6 to  $340.57^\circ\text{K}$ . and from 84.0 to 760 mm. is given by the equation  $\log p = (1647/T) + 7.7190$ .

Gerald M. Petty

**The Cotton-Mouton constant of nitrobenzene at the transition point.** Hans Koenig. *Physik. Z.* 34, 731-4 (1933). The Cotton-Mouton effect for  $\text{PhNO}_2$  shows no discontinuity at  $9.6^\circ$ , and therefore no evidence of the transition point reported by Wolfke and Mazur. The Cotton-Mouton const., at  $20^\circ$  and  $546 \mu\mu$  is  $25.7 \times 10^{-12}$  c.g.s. units.

L. E. Steiner

**Temperature-composition relations of the binary system zinc nitrate-water.** Warren W. Ewing, John J. McGovern and George E. Mathews, Jr. *J. Am. Chem. Soc.* 55, 1827-30 (1933). The f.-p. curve was detd. for the concn. range 56-90%  $\text{Zn}(\text{NO}_3)_2$ . The solid phases found were the hexa-, tetra-, di- and mono-hydrates, melting congruently, resp., at 36.1, 44.7, 55.4 and about  $70.7^\circ$ .

Michael Fleischer

**Solubility relations of the ternary system magnesium nitrate-nitric acid-water at  $25^\circ$ .** Warren W. Ewing and Ernst Klinger. *J. Am. Chem. Soc.* 55, 4825-7 (1933). Solv. detns. were made over the entire concn. range. The solid phases found were the hexa- and di-hydrates and the anhydrous salt.

Michael Fleischer

**Solubility relations of the ternary system zinc nitrate-nitric acid-water at  $25^\circ$ .** Warren W. Ewing, Atwood J. Richards, William J. Taylor, Jr. and David W. Winkler. *J. Am. Chem. Soc.* 55, 4830-2 (1933).—Solv. detns. were made over the entire concn. range. The solid phases found were the hexa-, tetra-, di- and monohydrates.

Michael Fleischer

**Development of the theory of catalysis in the nineteenth century.** A. Mittasch. *Naturwissenschaften* 21, 729-32, 745-9 (1933).—A lecture.

B. J. C. van der Hoeven

**Catalysis and transformation of the alkaline earth cyanides into cyanamides.** A. Perret and R. Perrot.

*Compt. rend.* 197, 704-6(1933).—The equation,  $\text{CaCl}_2 + 2\text{NaCN} \rightarrow \text{CaNCN} + \text{C} + 2\text{NaCl}$ , represents a chem. change which is irreversible because of the change of  $\text{Ca}(\text{CN})_2$  to  $\text{CaNCN}$  and C. Finely divided metals, Fe, Co, Ni and Mn, hasten the decompn. and consequently the primary reaction. F. E. Brown

The free energy of the synthesis of alanine from pyruvic acid and ammonia. René Wurmser and Nelicia Mayer-Reich. *Ann. physiol. physicochim. biol.* 9, 923-8(1933).—The calcd. free energy change is -17,180 cal. The concns. of the reactants are such as to necessitate an intracellular  $r_H$  of approx. 13 if the reaction is to take place. It is interesting to note that this is the value obtained by W. for the potential of aerobic cells. H. E.

### 3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

W. ALBERT NOYES, JR.

Electrostatic deviation and specific charge of the positive electron. Jean Thibaud. *Compt. rend.* 197, 447-8 (1933). See *C. A.* 28, 38<sup>9</sup>. H. E. Messmore

Scattering processes produced by electrons in negative energy states. O. Halpern. *Phys. Rev.* 44, 855-6 (1933). The scattering of radiation by electrons in neg. energy states is briefly discussed. A distinction is made between the case where all the incident quanta have the same direction of propagation and that where they have different directions. In the former case scattering processes can only reduce the frequency, the reduction, if small, being on the av. proportional to the distance traveled by the quantum through vacuum. A possible connection with the Hubble red shift is suggested.

Morris Muskat

The scattering of electrons by nitrogen molecules. H. S. W. Massey and E. C. Bullard. *Proc. Cambridge Phil. Soc.* 29, 511-21(1933).—Exptl. results are given for the scattering of 4- and 2-v. electrons in N and are shown to agree well with Stier's theoretical curves. As Stier's theory applies only to low voltages in which the electron wave lengths are large compared with the nuclear sepn. an approx. method of calcul. is developed for the opposite case of electron wave lengths which are small compared to the nuclear sepn. The results of the new theory agree well, except at small angles, with measured angular distributions in N for voltages from 30 to 780 v. M. Muskat

The inelastic scattering of slow electrons in gases. IV. F. H. Nicoll and C. B. O. Mohr. *Proc. Roy. Soc. A* 142, 647-58(1933); cf. *C. A.* 28, 32<sup>9</sup>.—Previous work on the angular distribution of inelastically scattered electrons has been extended to  $\text{CH}_4$ ,  $\text{N}_2$ ,  $\text{Ne}$  and  $\text{Hg}$  for the angular range of 10-155°. The voltages used extended from a few v. above the excitation potential upward. The particular energy losses studied were those of 9 v. in  $\text{CH}_4$ , 12.8 and 8.5 v. in  $\text{N}_2$ , 16.6 v. in  $\text{Ne}$  and 6.7 v. in  $\text{Hg}$ . The elastic scattering observed at small angles is discussed in relation to Born's theory, and the gradual disappearance of the diffraction effects at large angles at the lower voltages is investigated and discussed. Morris Muskat

Electro-optical Kerr effect in gases. C. W. Bruce. *Phys. Rev.* 44, 682-6(1933).—The Kerr const. for  $\text{CO}_2$  is measured as a function of d. and temp.; the results agree with the Langevin-Born theory. For N, the exptl. value exceeds the calcd. one by an amt. greater than exptl. error. The const. for H was too small to detect, as is expected from theory. L. S. Kessel

The intensity of cathode rays scattered by potassium chloride. Shunji Shirai. *Proc. Phys.-Math. Soc. Japan* 15, 420-7(1933).—Cathode rays from an electron tube

were made homogeneous by spreading into the magnetic spectrum and passing through 3 holes. A thin layer of cryst. KCl, deposited by evapn. in a high vacuum on a thin film of collodion, was mounted behind the last hole with its plane normal to the primary rays. The distance from the specimen to the photographic plate was 16.74 cm. The camera was evacuated. Photographs showed the intensities of the Debye-Scherrer rings to be uniform in all directions. It was found that with KCl there is fair quant. agreement between the exptl. results and the theoretical calcn. of electron scattering, as with Au, Ag and Al (cf. *C. A.* 24, 22, 2948). E. R. Smith

The crystal photoeffect. G. Monch. *Naturwissenschaften* 21, 751-2(1933). A Dember photoeffect (*C. A.* 26, 878) was observed on cuprite, proustite and pyrrargyrite crystals as well as on natural (Almaden) cinnabar, usually the electrode on the side of the light source was neg. Superficially sand-papered proustite and pyrrargyrite crystals gave a charge of the reverse sign. Artificial, clear,  $\text{Cu}_2\text{O}$  monocrystals gave no photoeffect; evidently the explanation of this effect by light pressure or by diffusion potential is erroneous. The explanation by impurity or by non-homogeneity (barrier effect) of mineral  $\text{Cu}_2\text{O}$  is more likely to be correct. At room temp. several substances were examd. as to the sign of the electrode at the side of the irradiated light and the sign of the thermopotential (hot electrode). B. J. C. v. d. H.

The structure of glow discharges. H. Rothe and W. Kleen. *Naturwissenschaften* 21, 772(1933).—In low voltage d.-c. glow discharges in a gas-filled tube with a grid a high-frequency modulation appears, the wave length depending on the potential. The discharge is built up of electron groups at intervals depending on the migration time for the ions. B. J. C. van der Hoeven

Atom ionization by electric fields. Rudolf Schulze. *Naturwissenschaften* 21, 737(1933).—The ionization of a homeopolar substance without free conduction electrons by means of an elec. field was studied. Vacuum-distd. S was condensed on 2 sliding Ni electrodes to give an insulating film of about  $10^{14}$  ohm. On a current-potential curve of this system there are found sudden cond. rises at 45, 101.6, 152 and 205 v., these being in the same ratios as the ionization potentials of S from spectral data: 10.31, 23.3, 34.9 and 47.8 v. Hence it is assumed that the S film consisted of 4 superimposed at. films.

B. J. C. van der Hoeven

The surface ionization of potassium on molybdenum. R. C. Evans. *Proc. Cambridge Phil. Soc.* 29, 522-7 (1933).—Expts. are described in which the efficiency of ionization of K at a hot Mo surface was investigated.

The degree of ionization observed is consistent with the most recent measurements of the electron work function of Mo.

**The structure of atoms.** Arvi Talvitie. *Acta Chem. Fennica* 6A, 100-6(1933).—See C. A. 27, 5630.

**The ground state of the hydrogen molecule.** Hubert M. James and Albert S. Coolidge. *J. Chem. Physics* 1, 825-35(1933); cf. C. A. 27, 2869.—The method used by Hylleraus in treating the He atom was extended to the  $H_2$  mol. The method consists in setting up a wave function as a series in the five variables required, electronic spin being introduced explicitly as one of the variables. The coeffs. are then detd. so as to produce the lowest energy. The energy found is within 0.03 v. of the most probable exptl. value, while the form and location of the potential-energy curve for various internuclear distances agree with those deduced from spectra to within similar limits. The value of the function is computed for several configurations of the electrons, and compared with other approximations. Application of the method to other problems is discussed. A method is given for the numerical soln. of secular equations of high degree.

**Possibility of matter formation by interaction of a photon and an electron.** Francis Perrin. *Compt. rend.* 197, 1100-2(1933).—The conservation of momentum requires that the electrons take on kinetic energy. The total energy required of the photon is double that in a nuclear interaction, half the energy being recovered as kinetic energy of the electrons.

**The equilibrium theory of the abundance of the elements: A statistical investigation of assemblies in equilibrium in which transmutations occur.** T. E. Sterne. *Monthly Notices Roy. Astron. Soc.* 93, 736-67(1933); cf. C. A. 27, 3877. Theoretical.

**A note on the liberation of energy by transmutations of nuclei in the stars.** T. E. Sterne. *Monthly Notices Roy. Astron. Soc.* 93, 767-9(1933).—Theoretical.

**The equilibrium of transmutations in stars in which transmutations are an important source of energy.** T. E. Sterne. *Monthly Notices Roy. Astron. Soc.* 93, 770-7(1933). Theoretical.

**The exponential law of radioactive disintegration.** Arthur E. Ruark. *Phys. Rev.* 44, 654-6(1933). A math. proof is given that ordinary half-life expts. require the disintegration probability of a radioactive atom to be independent of its own age and of the lives of its parents.

**The half-life of actinouranium and the problem of geologic time.** Forrest Western and Arthur E. Ruark. *Phys. Rev.* 44, 675-81(1933); cf. C. A. 27, 2102.—Reasons are given for assuming that the Ac series arises from  $U^{238}$  and that this is the only long-lived U isotope. Equations are then developed for calcg. the decay const. of  $U^{238}$  and  $U^{235}$  and the ages of radioactive minerals. The best value for the half life of  $U^{238}$  is  $(4.58 \pm 0.09)10^9$  years, while that for  $U^{235}$  is 3 or  $4 \times 10^8$  years. The ages calcd. for Karlskruv boggerite and Wilberforce uraninite are 0.81 and  $1.04 \times 10^9$  years, resp. Equations are developed to show the effect of uniform leaching.

**An explanation of  $\beta$ -ray activity.** M. N. Saha and D. S. Kothari. *Nature* 132, 747(1933). Either an internal or an external  $\gamma$ -ray is divided in the at. nucleus into an electron, which escapes as a  $\beta$ -ray, and a positron, which is captured by a nuclear neutron. This partition may occur anywhere within the nucleus, giving a wide range of  $\beta$ -ray energy.  $\beta$ -Ray emission is accordingly a secondary process.

**Artificial atomic disintegration.** Fritz Kirchner. *Physik Z.* 34, 777-86(1933); cf. C. A. 27, 659.—A summary is given of recent work on the artificial disintegration of the light elements by means of high-energy protons and  $H^2$  nuclei. Among the subjects treated in detail are: (1) dependence of the no. of disintegrations on the proton energy; (2) ranges of the  $\alpha$ -particles produced by the

disintegrations by proton bombardment and (3) the mechanisms of the disintegration processes.

**The  $\alpha$ -particles from radium C'.** H. A. Wilson. *Phys. Rev.* 44, 858(1933).—By use of the energies of  $\alpha$ -rays from Ra C' found by Rutherford, Lewis and Bowden, it is shown the energies for disintegration can be arranged in pairs having sums equal to multiples of 3.85 in units of  $10^6$  electron v. The disintegration energies can, therefore, be expressed as  $3.85n + c$ . As Ra C'  $\gamma$ -ray energies are also expressible by the same formula with the same values for  $c$  it is probable that the disintegration energies of the Ra C' nucleus are equal to 3.85 n. M. Muskat

**The disintegration energies of radioactive nuclei.** H. A. Wilson. *Phys. Rev.* 44, 858-9(1933).—It is found that all the disintegration energies of the radioactive nuclei can be represented to 1 part in 4000 by the expression  $3.85n + c$ , in units of  $10^6$  electron v., and that the values of  $c$  are nearly the same as those in the same expression giving the Ra C'  $\gamma$  ray energies. This suggests that there is some process which takes place in all radioactive atoms which releases an energy of  $3.85 \times 10^6$  electron v. The values of  $c$  probably represent energy exchanges with the electrons or a secondary action between the emitted  $\alpha$ -or  $\gamma$ -rays and the rest of the atom.

**$\alpha$ -Rays of long range emitted by an active deposit of actinium.** Mme. Pierre Curie and W. A. Lub. *J. phys. radium* [7], 4, 513-16(1933).—By using active deposits of Act(B + C + C' + C'') having an initial activity corresponding to the emission of  $2 \times 10^6$  to  $3 \times 10^6$   $\alpha$ -rays from Act C per second (as many as from 5 to 8 millicuries of Ra C') the  $\alpha$ -rays of long range were counted by the scintillation method.  $\alpha$ -Rays of about 10 cm. range are emitted in about the proportion of  $3 \times 10^7$  per  $\alpha$ -ray from Act C.

**An application of probabilities to the counting of  $\alpha$ -particles.** Norman I. Adams, Jr. *Phys. Rev.* 44, 651-3(1933). The  $\alpha$ -particles emitted in a simple radioactive change are distributed individually and collectively at random, and hence the probability of any no. of particles in a fixed interval obeys the Poisson law. This is not true in general for the particles from a radioactive series; A. derives the distribution law for the case that the chosen interval is either long or short compared to the half life of each species considered; the results are needed for accurate detn. of the disintegration const. of Th. L. S. Kassel

**The absorption of penetrating  $\gamma$ -radiation.** W. Gentner. *Compt. rend.* 197, 1111-12(1933); cf. C. A. 27, 5242.—The coeff. of absorption for Pb detd. experimentally, less the calcd. coeff. for Al, shows a faint min. at 6.6 A. U. The min. is much less sharp than that found previously by Chao. It is concluded that this wave length has no special significance for Pb. The min. is due to the greater nuclear absorption for Pb with decrease in wave length.

**The isotopic fractionation of water.** Edward W. Washburn, Edgar R. Smith and Mikkell Frandsen. *Bur. Standards J. Research* 11, 453-62(1933); cf. C. A. 27, 3865.—When water is subjected to electrolysis an isotopic fractionation occurs, the evolved H being richer in the  $H^1$  isotope and the evolved O richer in the  $O^{16}$  isotope than is the water from which they are evolved. If the gases resulting from the electrolysis of water are recombined, the water produced has a lower d. than that from which they were evolved. The residual water grows progressively more dense as the electrolysis proceeds, because of the increasing concn. of the  $H^2$  isotope of H and of the  $O^{18}$  isotope of O. Curves illustrating the efficiency of the fractionation process are given. Substantially pure  $H^2$ , pure  $H^1$  and pure  $O^{18}$  can be obtained. The heavy water has a higher f. p., a higher b. p. and a lower n than normal water. Isotopic fractionation of water by distn. and by adsorption has also been accomplished. A differential pycnometer method for detg. d., accurate to 1 p. p. m., is described.

**Theoretical and practical studies of atomic and molecular forms of the hydrogen isotopes.** Hugh S. Taylor and Henry Eyring. *Proc. Am. Phil. Soc.* 72, 255-64

(1933).—In the abstract in *C. A.* 27, 5630, there should have been included a statement that for concg. the heavy H an electrolytic method was used. The explanation of the concn. effect is shown to lie in the relative reaction rates for the 2 isotopes, the rate of desorption of the light and heavy isotopes at the electrodes being the principal reaction. Other modifying factors are discussed. A theoretical explanation of the mechanism is given. It is shown that a compd. with light H will enolize about 7 times and ketonize approx. 12 times as fast as the heavy species at ordinary temps. The authors also have shown that rapid conversion from *ortho*- to *para*-hydrogen at liquid-air temps. with only van der Waals' adsorption involved is assocd. with the paramagnetic properties of the surface. Calvin Brous.

**Isotopes of sodium and cesium.** C. B. Dollins and Edna R. Bishop. *J. Am. Chem. Soc.* 55, 4372-4 (1933). The magneto-optic method indicates that Na has 1 isotope lighter and 1 heavier than 23, the most abundant one, and that Ce has 3 isotopes lighter and 2 heavier than 133, the most abundant one. F. E. Brown.

**Manganese isotopes.** Irene G. Otto and Edna R. Bishop. *J. Am. Chem. Soc.* 55, 4371-2 (1933). Study of solns. of Mn salts by the magneto-optic method indicates that there are 3 isotopes heavier and 3 lighter than 55, the most abundant one. F. E. Brown.

**Decay of luminescence and light absorption in phosphorescent materials.** D. H. Kabakjian. *Phys. Rev.* 44, 618-24 (1933). Various luminescent materials are irradiated by  $\alpha$ -,  $\beta$ - and  $\gamma$ -rays. The luminescence consists of both fluorescence and phosphorescence, which vary with time in different ways. The variation in absorption coeff. with time is also detd. The results are not in agreement with the usual theories of these phenomena. L. S. K.

**New investigations on the radioactivity of the waters of the massif of Ballon d'Alsace.** R. Delaby, R. Charonnat and M. Janot. *Compt. rend.* 197, 1140-2 (1933). The Rn content of the source of the Savoureuse River reached a max. of 106.3 millimicrocuries per l., decreasing to 96.7 after 4 days of rain. The descent of the river causes the disengagement of Rn till at 3 km. from the source the content is practically nil. The subterranean waters near the summit of Ballon de Servance which scarcely touch granite have a content of less than 0.1. The Rn contents at various locations are given. P. S. Roller.

**X-ray satellites of high atomic number elements.** F. K. Richtmyer and Sidney Kaufman. *Phys. Rev.* 44, 605-9 (1933).—The x-ray lines,  $L_{\alpha 1}$  and  $L_{\alpha 2}$ , are examd. for satellites in the range Ta(73) to U(92). Two satellites are found,  $L_{\alpha 1}'$  extending from Au(79) to U(92) and  $L_{\alpha 2}'$  from Os(76) to Bi(83); these are apparently unrelated to the satellites in the range  $36 < Z < 54$ .  $L_{\beta 1}$  is also found to have 2 satellites, one extending from Ta(73) to U(92), the other having a slightly greater range. These also may be new lines. L. S. Kassel.

**X-ray spectra in the region 50-250 Å.** U. Manne Siegbahn and Torsten Magnusson. *Nature* 132, 750 (1933).—The L series have been followed to No. 12 Mg. Nineteen K and 17 Cl show sharp doublets; 14 Si, 13 Al and 12 Mg show broad lines with a sharp limit. V. H.

**Soft x-rays from (100) and (111) faces of copper single crystals.** Morgan L. Williams. *Phys. Rev.* 44, 610-17 (1933). Between 90 and 220 v., 14 identical crit. potentials were found for the (100) and (111) faces of single-cryst. Cu. Most of these can be explained in terms of the Kronig theory (*C. A.* 26, 4247) of forbidden electronic energy zones within the crystal. L. S. Kassel.

**The energy levels of the rare-gas configurations.** Geo. H. Shortley. *Phys. Rev.* 44, 606-74 (1933). A math. study of the  $sp$  and  $pd$  levels, leading to exact specification of the proper states in the  $jj$ -coupling scheme. L. S. Kassel.

**The inversion of doublets in alkali-like spectra.** Melba Phillips. *Phys. Rev.* 44, 644-50 (1933). Math. L. S. Kassel.

**Forbidden lines in the arc spectrum of lead.** Henryk Niewodniczanski. *Phys. Rev.* 44, 854 (1933).—Four

lines corresponding to transitions between the 5 lowest energy states of Pb, which are forbidden by the Laporte-selection rule, were observed in an undamped high-frequency discharge in a mixt. of a rarefied Pb vapor and a noble gas, He or Ar. One of the lines is also forbidden by the quadrupole radiation selection rules and is due to an electrically disturbed dipole radiation while the other lines may be either quadrupole or perturbed dipole radiations. Morris Muskat.

**Sulfur spark lines in the sun's spectrum.** O. Bartelt and L. Eckstein. *Z. Astrophys.* 7, 272-80 (1933).

The existence of singly ionized S atoms in the reversing layer of the sun is established through identification of the lines of several of the strongest S II multiplets with faint solar lines of hitherto unknown origin. C. C. Kiess.

**The calcium ionization temperature of the sun.** R. v. d. R. Woolley. *Monthly Notices Roy. Astron. Soc.* 93, 691-710 (1933).

From measurements of the intensities of the principal lines of neutral and ionized Ca in the sun the ratio of ionized to neutral atoms per cc. at any prescribed optical depth may be found. With this ratio and a value for the electron pressure at the prescribed depth Salpêtré's formula gives a temp. of 6310° for sunlight integrated over the disk. C. C. Kiess.

**The Zeeman effect of infra-red krypton arc lines.** B. Pogany. *Naturwissenschaften* 21, 719 (1933). The magnetic multiplicity of infra-red Kr arc lines was detd., the results are in good agreement with those of Laporte and Ingles (*C. A.* 24, 5223). B. J. C. van der Hoeven.

**The dissociation of molecules in the atmospheres of the stars of the main sequence.** Yvonne Cambresier and L. Rosenfeld. *Monthly Notices Roy. Astron. Soc.* 93, 710-23 (1933). It is shown that the intensity variations of the bands of TiO, ZrO, CH, CO, CN and C<sub>2</sub> in the spectra of the main sequence stars can be satisfactorily explained by the theory of dissociative equil. in stellar atmos. assumed to be of the same chem. compn. and state of ionization. C. C. Kiess.

**The dissociation of molecules in the atmospheres of carbon stars.** L. Rosenfeld. *Monthly Notices Roy. Astron. Soc.* 93, 724-9 (1933).—The intensity variations in the bands of C compds. in the spectra of stars of class R and N (carbon stars) as compared with their variation in the main-sequence stars (cf. preceding abstr.) are accounted for, on the theory of dissociative equil. by the relative abundances of C and O in the 2 sequences. C. C. Kiess.

**The spectra of red stars of types M and N.** G. Piccardi. *Atti accad. Lincei* 17, 952-4 (1933). In order to det. whether spectra from red stars of types M (due to TiO) and N (due to C<sub>2</sub>) can coexist, lab. expts. were made with TiCl<sub>3</sub> in an oxyhydrogen flame. The spectrum shows that the TiO and C<sub>2</sub> lines may be adjacent but not superimposed. A. W. Cotton.

**Magnetic rotation spectrum of the red bands of sodium.** W. R. Fredrickson and Carl R. Stannard. *Phys. Rev.* 44, 632-7 (1933). The red Na bands are due to a  $^2S - ^2P$  transition and should show no magnetic rotation spectrum. Since such a spectrum does exist, it was re-investigated under high dispersion. It is found that the rotational levels in the various initial vibrational states from 0 to 12 which give magnetic rotation doublets are 53, 45, 35, 11, 60, 52, 43, 31, 16, 58, 51, 40, 28, resp. That just these levels give magnetic rotation lines suggests a perturbation, probably by a  $^3H$  state. The vibrational numbering of the initial state is corrected. L. S. Kassel.

**The magnetic extinction of the fluorescence of iodine vapor.** Jean Genard. *Compt. rend.* 197, 1101-7 (1933).

Photometric measurements were made on the first and third members of the resonance series excited by  $\lambda 5461$  Hg I in magnetic fields between 0 and 42,000 gauss. At the highest field, the fluorescence was too feeble to be measured photometrically. The results agree with the theoretical formula of Van Vleck. The existence of an unstable electron level between  $^1\Sigma_g^+$  and  $^3\Pi_{g,2}$  is indicated. P. S. Roller.

**The polarization of the fluorescent bands of mercury**

vapor. Georges Ziclinski. *Compt. rend.* 197, 1109-11 (1933).—The fluorescence was excited by the light from a Zn spark. The first max. is at 2320 Å. U. followed by a series of step-like maxima as far as 2100, 2063 and 2026 Å. U. The excitation gives also broad continuous bands with maxima approx. at 4850 and 3300 Å. U. With the direction of observation perpendicular to the direction of the exciting nonpolarized light, the polarization is equal to  $5.6 \pm 0.4\%$ . Between 235° and 380° corresponding to changes in vapor pressure of 50-1140 mm. Hg, the degree of polarization is unchanged. The polarization persists in spite of many at. collisions. The bands contg. the maxima at 4850 and 3300 Å. U. show no trace of polarization. P. S. Roller

**Fluorescence testing.** Erich Stock. *Farben-Ztg.* 38, 1557 8(1933); cf. *C. A.* 28, 4339.—An app. called the Callophane for examn. of materials in ultra-violet light is described. It consists of a collapsible triangular box one side of which contains glass transmitting ultra-violet light. G. G. Sward

**The discovery of the molecular diffusion of light in a pure liquid.** Albert Turpain. *Compt. rend.* 197, 1107-9 (1933).—It is claimed that Lallemand anticipated the results obtained by Raman 60 years later. P. S. R.

**The spectrum of sulfur dioxide.** Tung-Ching Chow. *Phys. Rev.* 44, 638-43(1933).—The emission and absorption spectra of SO<sub>2</sub> are studied in the region 2000-2600 Å. U. and most of the observed bands fitted into a vibrational-level scheme. L. S. Kassel

**The absorption of light by metals.** A. Smakula. *Physik Z.* 34, 788 90(1933). The absorption for metallic films of Ag, Au, Cu, Al, Sn, Pb, Cr, Mn, Sb and Bi was measured in the region of 186 700 mμ. All the metals show a no. of small maxima and minima superposed on the large-scale variations of the absorption. When the energies of these minima are plotted against the consecutive no. of the minima beginning in the red, they form a set of smooth curves, the mean separation of the minima for each metal showing a correlation with their at. conductivities. Morris Muskat

**Actinometry with uranyl oxalate at 2537, 253 and 208 mμ, including a comparison of periodically intermittent and continuous radiation.** F. Parkhurst Brackett, Jr., and Geo. S. Forbes. *J. Am. Chem. Soc.* 55, 4459 66 (1933). The gross quantum yield at 27° (expressed in mols. of oxalic acid per quantum) in a soln. wherein 1 (O SO<sub>4</sub>) is 0.01 and H<sub>2</sub>C<sub>2</sub>O<sub>4</sub> is 0.05 M  $M/N$  is 0.48  $\pm$  0.01 at 2080 Å. U.; 0.63  $\pm$  0.03 at 2530 Å. U.; 0.59  $\pm$  0.01 at 2780 Å. U. The various absorption coeffs. are given. William E. Vaughan

**Photochemical studies. XVI. A further study of chlorination of benzene.** Homer P. Smith, W. Albert Noyes, Jr., and Edwin J. Hart. *J. Am. Chem. Soc.* 55, 1441 59(1933); cf. *C. A.* 27, 905. In the photochem. chlorination of benzene it is found that both addn. and substitution occur, but the main initial reaction is addn. In the early stages of the reaction the rate of pressure decrease was proportional to the square root of the light intensity, the pressure of Cl<sub>2</sub> and the pressure of benzene. The mechanism of the reaction is discussed. William E. Vaughan

**The absorption spectra of glycine solutions and their interpretation.** Gladys A. Anslow, Mary Louise Foster and Charlotte Klingler. *J. Biol. Chem.* 103, 81 92 (1933). The glycine cation exists in aq. and HCl solns. in the same form, NH<sub>3</sub><sup>+</sup>CH<sub>2</sub>COOH. Total dissoen. occurs at a frequency of 51,894 in H<sub>2</sub>O and 51,813 in HCl and glycine obeys the linear relationship which other amino acids follow indicating that dissoen. consists in the sepn. of the H from the mol. amphoterion. The cation exists in NaOH as NH<sub>3</sub><sup>+</sup>CH<sub>2</sub>COONa. Dissoen. occurs at a frequency of 48,972, differing from the above frequencies by an amt. equal to the difference between the limiting frequency of the Balmer series for H and that for Na, and consists in the sepn. of Na ion from the amphoterion. The energy of dissoen. is in H<sub>2</sub>O 6.413 v., in HCl 6.403 v., in NaOH 6.052 v. The heat of dissoen. is in H<sub>2</sub>O 146,860

cal., in HCl 146,630 cal., in NaOH 138,590 cal. From f.-p. measurements increasing concn. causes increased polymerization as does irradiation with ultra-violet light. R. C. Elderfield

**The production of histamine by irradiation.** P. Holtz. *Klin. Wochschr.* 12, 1613-14(1933).—The irradiation of 1:150 histidine solns. at pH 12 in the absence of O causes the appearance of histamine (7 mg. from 1 g. histidine). The histamine was identified by the m. p. and compn. of the cryst. picrate, chloroaurate and chloroplatinate. A preliminary report. Harry Eagle

**Light sensitivity of 2 benzylpyridine.** Hans Freytag and Adolf Muller. *Naturwissenschaften* 21, 720 1(1933).

Pure colorless 2-benzylpyridine (M. and Krauss, *Monatsh.* 61, 595(1932)), b. 137°, on standing in diffuse daylight, becomes yellow-red to brown and shows weak green fluorescence. The action of ultra-violet rays on the substance was studied (cf. *C. A.* 27, 15, 2440, 2687). Filter paper impregnated with a soln. of the discolored base (2 drops in 10 cc. EtOH or C<sub>6</sub>H<sub>6</sub>) turns yellow or brown after 1/2 min. exposure in daylight, gray-brown or greenish after 1 hr. The yellow-brown product reacts like the corresponding product from pyridine with hot  $\beta$ -naphthylamine-HCl soln., giving a red-purple dye. Light of various  $\lambda$  between 365 and 270 mμ gives green discoloration, of  $\lambda$  between 265 and 248 mμ yellow discoloration of the original substance. Many details of the photoreactions are given. B. J. C. van der Hoeven

**Chemical reactions induced by x-rays and a method for following them.** N. Waterman and H. Limburg. *Biochem. Z.* 266, 329(1933) —A table giving the changes in potential for different concns. of quinone is published which had been omitted from the paper abstracted in *C. A.* 27, 5244. S. Morgulis

**Modifications of chemical reactions under the influence of a forced wave oscillatory circuit.** Antonio de Pereira Forjaz. *Compt. rend.* 197, 1124 5(1933).—The wave length of the circuit was 1.256 m. The amt. of esterification of 20 drops each of alc. and AcOH in 25 cc. H<sub>2</sub>O at 21.5° showed a max. increase over the normal amt. after 2 days. Thereafter, the difference decreased. After 2 days the acidity of olive oil was decreased 37.5%; of wine 15.71%; of vinegar 5%. P. S. Roller

**Spectrochemical investigation of the viscose reaction.** Katsumoto Atsuki and Hiroshi Sobue. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 589 95(1933). The xanthogenation of alkali cellulose was studied spectrochemically by the absorption of the visible and ultra-violet light. The absorption of visible light by viscose increases as the time of xanthogenation increases, and the max. of absorption becomes sharper with a longer time of xanthogenation. The reaction product of NaOH and CS<sub>2</sub> shows a considerable absorption of light after 1 hr. The absorption of light in this case increases also very rapidly with the reaction time except at about 5800 Å. U. The max. absorption of ultra-violet light occurs at about 3000-3100 Å. U. in the viscose reaction, and at about 3300 Å. U. and at a wave length shorter than 2800 Å. U. in the reaction of NaOH and CS<sub>2</sub>. It is considered that the reaction velocity of alkali-cellulose and CS<sub>2</sub> is greater than that of NaOH and CS<sub>2</sub>. Though the xanthogenation velocity is great, the xanthogenated alkali-cellulose is not dissolved in water as fast as its reaction velocity would indicate because the diffusion of CS<sub>2</sub> into the fiber is slow. The xanthogenation can be much accelerated by the disintegration of the fiber. Exptl. data and photographs are presented. Karl Kammermeyer

**Effect of water contg. the isotope of H on fresh-water organisms (Taylor, et al.) 11A.** Action of ultra-violet rays on pyridine (Freytag) 10. Refractive index of H<sub>2</sub>O<sup>19</sup> and the complete isotopic analysis of water (Lewis, Luten) 2. The deuteroammonias (Taylor, Jungers) 2.

Fluorescent screens. Siemens-Reiniger-Weiss Gesell-

schaft für medizinische Technik m. b. H. *Brit.* 396,601, Aug. 10, 1933. Addn. to 372,827 (*C. A.* 27, 2882). To obviate loss of brightness the active layer of the screen of 372,827, or its binding medium, is colored with a coloring matter which selectively absorbs part of the fluorescent light and thus alters the spectral compn. of the emitted light. Zn silicate and Cd tungstate are mentioned as luminescent materials and examples are given of screens made from Cd tungstate with a cellulose ester binding medium colored with brilliant green, fluorescein, quinoline yellow, auramine, chrysoidine or I; also of the use of colored natural or synthetic resins as binding media, alone or mixed with other colored or uncolored binding media, e. g., orange or ruby shellac solns which may be combined with cellulose ester solns.

• The graphite oxidation process. V. Sihvonen. *Acta Chem. Fennica* 6B, 68 70(1933)(in German); cf. *C. A.* 27, 5234. —A discussion of the mechanism of the electrolytic oxidation of graphite anodes in acid and alk. media. S. A. Karjala

The voltage balance of a cell for the electrolysis of sodium chloride solutions. Distribution of voltage drop through the (Vorce) cells with vertical filtering diaphragms. W. W. Stender, P. R. Zivotinsky and M. M. Stroganoff. *Trans. Electrochem. Soc.* 65, 24 pp.(preprint)(1934).—Cl at the graphite anode and H at the Fe cathode are discharged at a considerable overvoltage. The values of this overvoltage depend on the kind and quality of the graphite and Fe used, on the c. d., and on the concn. and temp. of the solns. Electrodes having the least overvoltage are: Acheson graphite anodes and steel cathodes. With increase of c. d., the overvoltage also increases to a great extent. Therefore, the lowest voltage drop requires the largest possible electrode surface. It is shown that elec. conductivity of the Vorce cell anolyte differs but slightly from the cond. of pure brine solns. of the same NaCl concn. It is shown that making a total balance for the whole cell is not possible, because of unequal c. d. at different points of the electrodes. The relation between electrode potentials and voltage drop in the electrolyte will vary for different points of the cell. The voltage may be accurately balanced only for definite electrode surfaces identical as to the distribution of the current over them. C. G. F.

The potential of the cobalt electrode. M. M. Haring and B. B. Westfall. *Trans. Electrochem. Soc.* 65, 12 pp.(preprint)(1934).—Co is closely related to Ni and has possibilities for use instead of the latter in the electroplating and electroforming industries. Its potential has been studied by several investigators but the results are not in agreement and apparently do not have the reliability desired. The standard potential of Co was found to be  $-0.278 \text{ v.} \pm 0.002 \text{ v.}$  at 25°. The normal potential is, therefore, close to  $-0.300 \text{ v.}$  The necessity of using pure metal free from strains prepared by high c. d. electrolysis and of maintaining O-free conditions is reemphasized. C. G. F.

The hydrogen overvoltages of iron-chromium alloys in potassium hydrate solution. M. deKay Thompson and D. M. Fleming. *Trans. Electrochem. Soc.* 65, 5 pp.

(preprint)(1934).—The H overvoltages of the Fe-Cr series of alloys were measured in molal KOH soln. at 25°. No appreciable change in the overvoltage was found between zero and 60% Cr; above 60% the overvoltage rises gradually to that of pure Cr in a curve that is concave upward. In the Fe-Ni alloys, these curves are concave downward. C. G. F.

The electrochemistry of complex cuprohalogen anions. István Nárá-Szabó and Zoltan Szabo. *Z. physik. Chem.* A166, 228-40(1933). Cu was dissolved anodically into solns. (satd. with H<sub>2</sub>) of KCl, NaCl, HCl, CaCl<sub>2</sub>, KBr and KI. The compn. of the soln. was detd. analytically and e. m. f. measurements were made with an auxiliary Cu electrode. In chloride soln. above 0.04 M Cu concn. a complex anion  $\text{CuCl}_4^{+}$  is formed. Activity coeffs. were calcd. from the equil. equation and it is shown that the Debye-Huckel limiting law is valid up to very high concn. G. M. Murphy

Chromium plating literature. XIX. L. H. Decker. *Platers' Guide* 29, Nov. 13 14(1933); cf. *C. A.* 28, 17.

W. H. Boynton

Electrodeposition of cuprous oxide film. Masami Nakajima. *J. Electrochem. Assoc. (Japan)* 1, 230 2 (1933).—The effects of c. d. and time of electrolysis on the deposition of  $\text{Cu}_2\text{O}$  film from Fehling and Wernicke solns. have been worked out. The deposit from the latter is in general more uniform and clearer in the reddish purple color, and the range of c. d. is far wider than that from the former. Electrolysis of the former with c. d. of 1.5 9 ma./sq. dm. gives a beautiful deposit. K. Konda

Anodic oxidation of fluophosphoric acids. Juan M. García Marquina. *Rev. acad. cienc. Madrid* 30, 382 138 (1933).  $(\text{NH}_4)_2\text{FP}_2\text{O}_7$  can be made by heating  $\text{NH}_4\text{F}$  and  $\text{P}_2\text{O}_5$ , but heating  $\text{KF}$  and  $\text{P}_2\text{O}_5$  or  $\text{KHF}_2$  and  $\text{P}_2\text{O}_5$  does not give the K salt.  $\text{K}_2\text{FP}_2\text{O}_7$  can be obtained by decomposition of  $(\text{NH}_4)_2\text{FP}_2\text{O}_7$  with cold KOH. Electrolysis of fluophosphoric acid produced monoperoxo-monofluophosphoric acid,  $\text{O:PF(OH)OOH}$ , and diperoxo-monofluophosphoric acid,  $\text{O:PF(OH)OO(HO)FP:O}$ . Yields are better than 2% during addn. of fluoride to the electrolyte. The best anode c. d. depends upon the electrolyte compn. The best yields were obtained with the K salt, lower yields with the  $\text{NH}_4$  salt, and almost zero with the Na salt. The best electrolyte: 250 g./l.  $\text{K}_2\text{FP}_2\text{O}_7$  and 300 g./l.  $\text{KF}$ ; c. d. 3 amp./sq. cm. Addn. of acid or alkali reduces the yield. Temp. variation between 3° and 16° has little effect. Concns. above 0.36 N were not obtained on adding chromate or increasing coulombs. These peroxo acids decompose in alkalies, one losing O and forming monofluophosphates, the other hydrolyzing to form peroxophosphates. E. M. S.

The electrolysis of solutions of metallic salts with a rarefied gas cathode. N. Thon. *Compt. rend.* 197, 1114-17(1933).—The electrolysis was made in a U-tube with side bulbs and with movable electrodes for adjusting the thickness of the evacuated gas space. Electrolysis was at 1000 v., the current being 15 milliamp. for a gas

space of 1 cm. H is always evolved at the cathode. Zn, Cd, Pb and Ni were not deposited from a soln. of their salts; neither was Cu deposited from  $\text{CuSO}_4$  or Hg from  $\text{HgNO}_3$ , although these metals are lower in the e. m. f. series than H. However, Ag, Au and Pt were deposited from solns. of  $\text{AgNO}_3$ ,  $\text{AuCl}_3$  and  $\text{PtCl}_4$ , resp. When the c. d. is increased by decreasing the gas space, Cu hydroxide is liberated by reason of the alkyl. at the cathode. Under the same conditions Zn remains in soln., evidently because of the formation of a zincate, but Zn hydroxide ppts. when the c. d. is decreased. If one does not take the precaution of leaving a considerable space between the electrodes and the wall of the U-tube, the discharge takes place between the electrode and the film of electrolyte on the walls. Only under these conditions T. observed a turbidity in the vicinity of the wall which after agglomeration proved to be metallic copper. The results agree with Volmer's theory of electrolytic polarization of metals according to which the overvoltage disappears only at active points of a preformed crystalline network. With a. c., the combination electrolyte-rarefied gas-Pt is a noteworthy detector, the positive current becoming rectified from the surface of the liquid toward the metal.

P. S. Roller

**Electrodes of the third type.** M. LeBlanc and O. Haruapp. *Z. physik. Chem.* A166, 321-42(1933).—A formula is derived for electrodes of the third type. The electrode Zn oxalate | Ca oxalate |  $\text{Ca}^{++}$  requires a long time for equil. but the final double decompn. corresponds quantitatively to the theory. By measuring soly. the equil. was calcd. for  $\text{CaWO}_4$ ,  $\text{Hg}_2\text{WO}_4$ ,  $\text{Hg}_2\text{C}_2\text{O}_4$ . The electrodes  $\text{Hg}_2\text{WO}_4$  |  $\text{CaWO}_4$  |  $\text{Ca}^{++}$  and  $\text{Hg}_2\text{C}_2\text{O}_4$  |  $\text{CaC}_2\text{O}_4$  |  $\text{Ca}^{++}$  were also investigated; the latter seems to be very usable. For solns. contg. chlorides, electrode combinations with mercurous salts are not applicable because of the formation of  $\text{HgCl}$ .

G. M. Murphy

**Electrodeposition of aluminum from non-aqueous solutions.** R. D. Blue and F. C. Mathers. *Trans. Electrochem. Soc.* 65, 14 pp.(preprint) (1934); cf. C. A. 27, 2629. Al of high purity can be deposited easily in bright, finely cryst., adherent form from a soln. made by dissolving metallic Al in  $\text{EtBr}$  and  $\text{C}_2\text{H}_5$  with  $\text{AlBr}_3$  as a starter or catalyst. Toluene, xylene,  $\beta$ -tetrahydronaphthalene and kerosene may be substituted for benzene under certain conditions and  $\text{EtCl}$ ,  $\text{MeCl}$  and ethylene dichloride for  $\text{EtBr}$ . The Al adheres well to Pt, Cu, Fe and cast Fe but not to Mg or Al. The bath has a current efficiency of 60% and over at both electrodes and a throwing power as high as 28. The bath does not deteriorate and can be operated indefinitely if moisture is excluded. The bath does not show a definite decompn. voltage, the potential drop varying directly and regularly with the current.

C. G. F.

**Methods of controlling deposits of zinc and cadmium.** J. Barv and P. Orłowski. *Usine* 42, No. 40, 21-3(1933).

Methods for comparing the electrodeposition of Zn and Cd with respect to resistance against corrosion and industrial checking of the thickness of the deposit are discussed. The Preece test for Zn (with 20%  $\text{CuSO}_4$  soln. at 18°) gives proper indication of required thickness for corrosion resistance. For testing Cd deposits a method is given depending on time required to dissolve the coating by a soln. of  $\text{HCl}$  and  $\text{SnCl}_2$ .

M. Hartenheim

**The electrolytic oxidation of glycolic acid in alkaline solution.** Eero Tommila. *Acta Chem. Fennica* 6B, 70 (1933)(in German); cf. C. A. 27, 910.—In the oxidation of glycolic acid low anodic potentials, with Fe, Ni or Cu, yield glyoxylic acid as the primary product, which is then further oxidized partly to oxalic acid and partly to formic acid. With higher anodic potentials (polished Pt)  $\text{HCHO}$  is the primary product. No glyoxylic acid is found.  $\text{H}_2$  also is formed at the higher anodic potentials. S. A. K.

**Electrolytic reduction of camphoric acid imide.** Buhei Sakurai and Yoshiyuki Tamura. *J. Electrochem. Assoc.* (Japan) 1, 139-43(1933).—Reduction does not occur in high  $\text{H}_2\text{SO}_4$  concn. such as 80% or at a temp. lower than 30° irrespective of the concn. of  $\text{H}_2\text{SO}_4$ ; while it goes on comparatively easily in  $\text{H}_2\text{SO}_4$  concn. as low as 5% or at a temp.

higher than 80° (in 15-30% concn. of  $\text{H}_2\text{SO}_4$ ).  $\beta$ -Camphidone (I) is easily formed in the higher  $\text{H}_2\text{SO}_4$  concn., while the yield of  $\alpha$ -camphidone (II) increases in the lower  $\text{H}_2\text{SO}_4$  concn. and almost only II is formed under 15% concn. At the higher temp. the yield of I and II decreases, bringing about an increased yield of camphidine (III). Prolonged electrolysis increases the yields of all three, but, beyond a certain limit, II decreases and III increases, up to an almost const. value. Reduction of I to III is very difficult, while that of II to III is comparatively easy; the yield of I is, therefore, almost const. It is reasonable to conclude that reduction of I gives III, and the properties of the two  $\text{CO}_2\text{H}$  groups in camphoric acid imide are different and are responsible for the different reducibilities of I and II and the different conditions for their formation.

K. Konda

**Electrolytic oxidation of piperidine.** Kazuo Yamamoto and Moriaki Yokoyama. *J. Electrochem. Assoc.* (Japan) 1, 160 2(1933).—Piperidine (5.15 g.) in 2 N  $\text{H}_2\text{SO}_4$  electrolytically oxidized with peroxidized Pb anode and Pt cathode at 0.05 amp./sq. cm. and 8 Faradays per mol. gives  $\delta$ -aminovaleraldehyde,  $\delta$ -aminovaleric acid (0.95 g.), glutaric acid (0.5 g.),  $\text{NH}_3$  (1.9 g. as  $\text{NH}_4\text{Cl}$ ), succinic acid (2.0 g.) and formic acid (1.8 g.). The anodic oxidation is, therefore, analogous to oxidation with peroxides. Compared with pyridine, piperidine reacts more easily with anodic  $\text{O}_2$  and behaves similarly to  $\text{C}_6\text{H}_6$ .

K. Konda

**Dry cells of standard sizes.** I. Saburo Makino. *J. Electrochem. Assoc.* (Japan) 1, 225 30(1933).—Empirical formulas representing the relation between wt. and capacity, and between av. discharge current per unit wt. of mixt. and life, of some dry cells of standard sizes are described.

K. Konda

**The alkaline accumulator. I. The electrolysis of alkali zincate solution.** Shosaburo Tanaka. *J. Electrochem. Assoc.* (Japan) 1, 143 9(1933).—For the preliminary expt. with the alk. accumulator, with a cathode filled with sol. active material, the relative values of the current at Ni electrode and the cathode p. d. were detd. in various alk. solns. contg. ZnO of different concns. NaOH soln. (5.7 N) contg. ZnO in a wt. ratio ( $\text{NaOH}/\text{ZnO}$ ) of 8-12 and 5.7 N KOH soln. with ZnO in a wt. ratio ( $\text{KOH}/\text{ZnO}$ ) of 12-16 can be used. The KOH soln. is, however, preferable. Upon electrolysis in alk. soln. with or without ZnO and Ni cathode, the Ni surface is changed into a favorable condition for the deposition of Zn, but this surface condition does not last. An amalgamated Ni cathode is most effective for prolonged Zn deposition.

**II. The electrolysis of alkali zincate solution.** 2. Shosaburo Tanaka and Kohei Iwasa. *Ibid.* 149 53. —Soly. of deposited Zn can be indirectly estd. by the measurement of  $\text{H}_2$  in cc. per hr. evolved during standing of the cell after the electrolysis: 1 cc.  $\text{H}_2$  is equiv. to 0.0029 g. Zn.  $\text{H}_2$  evolved is greatly diminished in 7 N KOH soln. contg. ZnO in a wt. ratio ( $\text{KOH}/\text{ZnO}$ ) of 12. Electrolysis with this soln. and a Ni-mesh cathode at about 1 amp./sq. dm. cathode gives the most compact Zn deposit. Upon washing the electrode with  $\text{H}_2\text{SO}_4$  to remove the surface oxide film, very good results are obtained. Amalgamated Ni-mesh cathodes increase the deposition rate of Zn and greatly lower its soly. Amalgamation seems to be the most suitable method for treating the cathode of an alk. accumulator. **III. Alkali zincate accumulator with nickel-mesh cathode.** 1. Shosaburo Tanaka and Tametsugu Tominaga. *Ibid.* 220 5.—The comparative expts. on cells with Ni-Fe anode and Ni cathode treated in 4 different ways showed that Ni-mesh cathodes give the most compact Zn deposit. Even with Ni-mesh cathodes the cryst. grains of Zn deposited become more and more coarse with repeated charge and discharge of the cell. The dropping off of Zn particles is very slight if discharged directly or within 4 hrs. after the charge; but after standing 1-2 days, an insol. ppt. is formed.

K. Konda

**Incandescent lamps as mercury-arc ballast.** L. J. Buttolph. *Gen. Elec. Rev.* 36, 482-5(1933).—In the operation of Hg arc lamps  $\frac{1}{2}$  the applied voltage is absorbed in series reactance or resistance. Efficient arc

ballasting can be obtained by a series resistance of a W lamp filament. Since the W filament when in series with a Hg arc experiences greater voltage changes than if connected directly to the supply line, an autotransformer must be employed to insure a large degree of voltage regulation. Various circuit diagrams are given and their performance characteristics discussed. E. W. Volkmann

**Electronics and electron tubes, gas- or vapor-filled tubes.** E. D. McArthur. *Gen. Elec. Rev.* 36, 501 5 (1933).—A general discussion of the operating characteristics of thyratron tubes with reference to various practical applications E. W. Volkmann

Reducing the toxicity of cyanide wastes (Eldridge) 14.  
Hardening high-speed steel (U. S. pat. 1,934,741) 9.  
Connector for elec. wires (U. S. pat. 1,936,185) 9.

**Batteries.** Charles H. Vince, Jr. *Brit.* 397,475, Aug. 22, 1933. A single-fluid primary cell comprises electrodes of Al (alloy) and Cu (alloy) sep'd. by paper, cotton wool, etc., in which the electrolyte is absorbed. The latter may be a NaOH soln. or granular NaOH may be packed in with the absorbent material, the NaOH becoming moist by deliquescence. Cf. C. A. 27, 5254.

**Electric batteries.** Irwin S. Joseph. *Fr.* 752,082, Sept. 15, 1933. The electrolyte of a battery of the Leclanché type is composed of an alk. soln. or an alk. gel and the pos. electrode of wood charcoal, preferably impregnated with an oxidation catalyst, rendered conductive and coated with paraffin.

**Electric batteries.** Miguel Sireol. *Fr.* 752,110, Sept. 16, 1933. An electrolyte for charging batteries is made by mixing water with  $MgSO_4$  in the proportion of 10.95% by wt., adding  $ZnSO_4$ , 2.8%, and collodion 2.10% as well as glycerol and  $Al_2(SO_4)_3$ . After 24 hrs.  $H_2SO_4$  is added till a d. of 1.225–1.280 is reached.

**Arrangements for charging electric secondary batteries** Siemens Brothers & Co. Ltd., David A. Christian and Hugh S. Double. *Brit.* 396,823, Aug. 17, 1933.

**Dry-cell batteries.** The Ever Ready Co. (Great Britain) Ltd. *Brit.* 390,068, Aug. 17, 1933

**Storage batteries.** D. & B. Electrical Co. Ltd. *Fr.* 750,200, Aug. 8, 1933. After discharging and emptying a battery the plates are treated with oxalic acid, then with  $H_2SO_4$ , and the battery is then filled with distd. water and a little pyrogallol acid.

**Molding materials such as gilsonian compositions as in the production of storage battery cell covers, etc.** Harvey D. Geyer (to Inland Mfg. Co.). U. S. 1,935,794, Nov. 21. Various details of app. and operation are described.

**Accumulators.** John A. Hamilton. *Brit.* 396,904, Aug. 17, 1933.

**Accumulators.** Accumulatoren-Fabrik A.-G. *Fr.* 752,016, Sept. 15, 1933. Liberation of gases from Pb accumulators after charging is avoided by coating the parts, composed of an alloy of Pb and Sb dipping into the electrolyte and not covered with active material, with an adherent insulating material not attacked by the electrolyte, e. g., hard or soft rubber. *Fr.* 752,017. The covering for the grating filled with active material is composed of a conducting material, particularly Pb or an alloy of Pb, the exterior face of which is covered with non-conducting material such as hard or soft rubber.

**Means for heating an electroplating or other vat.** Percy E. Randall. *Brit.* 397,565, Aug. 31, 1933.

**Electroplating apparatus with a rotating container for articles to be plated.** John T. Daniels. U. S. 1,936,382, Nov. 21. Mech. and structural features.

**Electrodeposition of indium.** Daniel Gray (to Oncoida Community, Ltd.). U. S. 1,935,630, Nov. 21. The article to be plated is made the cathode and an anode of indium is immersed in a bath such as may be formed of water 1 gal., KCN 15 o. and glycine 7 oz. (or cyanuric acid, abietic acid, adipic acid, acetyl-*m*-aminobenzoic acid, acetyl-*p*-aminobenzoic acid, acetaldehyde, Na bisulfite or *m*-aminobenzoic acid, serving to prevent pptn. of

the In). A c. d. of about 0.035 amps. per sq. in. or more is used to effect the deposition of indium.

**Galvanic precipitates.** Ernst Kelsen. *Ger.* 582,910, Aug. 25, 1933. In order to remove galvanic Fe ppts. easily from the anode, this is given an intermediate layer by galvanic pptn. thereon of W or Mo by electrolysis, e. g., of a soln. of  $(NH_4)_2MoO_4$  and  $NH_4Cl$ .

**Electrolytic condensers.** Preston Robinson (to Sprague Specialties Co.). U. S. 1,935,860, Nov. 21. A filming electrode such as Al foil is subjected to electrolytic formation, the formed electrode is provided with a pasty electrolyte which may be formed from boric acid, glycerol, etc., followed by baking for 2–15 hrs. at a temp. of about 50–80°.

**Electrolytic condenser.** Junius D. Edwards (to Aluminium Co. of America). U. S. 1,936,084, Nov. 21. Structural features.

**Electrolytic condenser.** N. V. Philips' Gloeilampenfabrieken. *Fr.* 751,806, Sept. 11, 1933.

**Electrolytic condensers.** N. V. Philips' Gloeilampenfabrieken. *Fr.* 751,981 2, Sept. 13, 1933. Closure means.

**Electrolytic condensers.** N. V. Philips' Gloeilampenfabrieken. *Fr.* 752,023, Sept. 15, 1933. At least one electrode is made of Al contg. less than 0.05% of Cu and the electrode is toughened, preferably by chem. means.

**Anodes for electrolytic condensers.** Frederick W. McNamara (to Sprague Specialties Co.). U. S. 1,936,252, Nov. 21. Structural details.

**Electrolytic rectifier and condenser anodes.** The British Aluminium Co. Ltd., Alfred G. C. Gwyer and Alfred N. D. Pullen. *Brit.* 397,538, Aug. 21, 1933. Al (alloy) anodes for electrolytic rectifiers and condensers are treated so as to form a comparatively thick, low-resistance oxide coating either chemically or electrolytically by d. c. and a dielec. thin oxide coating is then deposited thereon electrolytically by d. c.

**Electrolytic cells.** Charles Pouyau. *Brit.* 397,300, Aug. 24, 1933. In a cell of the filter-press type for the manuf. of Cl and alkalis the cubic capacity of the anode compartments is made greater than that of the cathode compartments to avoid loss of alkali by ionic migration.

**Electrolytic cell for light metals.** Wintershall A.-G. *Fr.* 752,310, Sept. 20, 1933. Light metals, particularly Mg, are made electrolytically by fused masses, the sp. gr. of which is higher than that of the sep'd. metal. The anode is placed in the center of the cell, while the cathodes are placed around it without a sep'd. wall. The cell is shaped approx. as an ellipse and the bottom is raised at the part further out from the circle of electrodes.

**Electrolytic baths.** Druckersetzter G. m. b. H. *Fr.* 750,457, Aug. 11, 1933. The diaphragms are finely and uniformly porous. They are made of a kind of asbestos paper or board, they have long fibers and are free from metal oxides.

**Aluminum.** Herbert Friedmann. *Ger.* 578,547, June 15, 1933. Clay, bauxite, kaolin or other materials contg.  $Al_2O_3$  are mixed with a substance such as Fe or Si which reduces the vapor tension of Al, and are fused in an elec. furnace to form a crude Al alloy. This is sep'd. by liquation to an alloy rich in Al and one poor in Al. Pure Al is then distd. off from the former.

**Iron.** Vereinigte Stahlwerke A.-G. (Friedrich Meissner, inventor). *Ger.* 580,732, July 15, 1933. Fe is obtained by electrolysis of fused  $FeCl_3$ . The latter is obtained by chlorinating Fe ores or Fe waste. A suitable arrangement of cell is indicated.

**Iron.** Vereinigte Stahlwerke A.-G. (Friedrich Meissner, inventor). *Ger.* 582,698, Aug. 18, 1933. Addn. to 580,732 (preceding abstr.). Electrolytic app. for obtaining pure Fe from ores or materials contg. Fe by converting the Fe into  $FeCl_3$  and electrolyzing this in the fused state is described.

**Steel.** Christian F. Arnold. *Ger.* 550,127, Nov. 4, 1933. In the manuf. of W steel in an elec. furnace, fused Fe is first freed from P and S by covering it in known manner with a slag contg. a comp'd. of F. The slag is

then replaced by a slag of alkali and alk. earth silicates not contg. a compd. of F, and W and other desired constituents of the steel are then added.

**Dental alloys.** Stefan Loos. *Fr.* 753,202, Oct. 12, 1933. Each of the constituents of the desired alloy is applied successively one on another on a matrix in very thin layers and in no. sufficient to form the desired thickness of plate. The outer layers are preferably of a precious metal. The metals are applied by electrolysis or by a pistol.

**Protecting light metals.** Siemens Elektro-Osmose G. m. b. H. *Fr.* 42,676, Sept. 4, 1933. Addn. to 702,206 (*C. A.* 25, 3922). In forming protective coatings on Al or alloys of Al, a layer of oxide on the cooperating electrode, and preferably also the protective coating on the articles, is obtained by using a satd. soln. of chromic acid. The temp. is 40–60° and the tension 40–60 v. during about 20 min.

**Hydrocarbons.** I. G. Farbenind. A.-G. (Walter Riedelberger, inventor). *Ger.* 587,129, Oct. 30, 1933. Unsatd. gaseous hydrocarbons, e. g.,  $C_2H_2$  and  $C_2H_4$ , are obtained from liquid hydrocarbons by causing a film of the latter to flow down the inside of the wall of an arc furnace in which the arc burns in a stream of H or a gas consisting mainly of H. App. is described.

**Acetylene.** I. G. Farbenind. A.-G. *Fr.* 750,521, Aug. 11, 1933. Gases contg. hydrocarbons are passed through several elec. arcs, the  $C_2H_2$  being eliminated after each treatment by the arc, and the energy per cu. m. of gas treated being increased from arc to arc. *Cf. C. A.* 27, 2101.

**Dehydrating chlorides.** Société de produits chimiques des terres rares (to Johnson Matthey & Co. Ltd.). *Brit.* 97,179, Aug. 22, 1933. See *Fr.* 736,415 (*C. A.* 27, 1285).

**Electric furnaces.** Siemens-Planawerke A.-G. für Kohlefabrikate. *Fr.* 752,041, Sept. 15, 1933. Construction of a continuously functioning electrode is described.

**Electric annealing furnace for wire or metal strip.** Allgemeine Elektricitäts-Ges. (Viktor Paschke, inventor). *Ger.* 587,134, Oct. 30, 1933.

**Induction furnaces.** Ugnis-Infra. *Fr.* 750,400, Aug.

**Induction electric furnace.** Edwin F. Northrup (to Ajax Electrothermic Corp.). U. S. 1,936,309, Nov. 21. Structural features.

**Device for charging electric arc furnaces.** Demag-Elektrostahl G. m. b. H. *Ger.* 578,944, June 19, 1933.

**Electrodes for gaseous conduction devices.** Richard E. Miesse (to General Scientific Corp.). U. S. 1,936,334, Nov. 21. The active surface of a base metal such as Ni is coated with a Ba compd. by dipping the base metal into a soln. of Ba azide, heating somewhat, and then heating to a still higher temp. in the presence of carbon to form Ba carbide which serves to prevent "sputtering."

**Electrode for electric arcs.** I. G. Farbenind. A.-G. *Ger.* 578,501, June 14, 1933. The electrode is coated with SiC or WC.

**Electric cleaning of gases.** Siemens-Schuckertwerke A.-G. *Ger.* 578,566, June 15, 1933. Gases difficult to ionize, such as furnace gases, are cleaned by a current of tension sufficient to cause the electrodes to emit sparks.

**Electrical apparatus for purifying gases.** Paul Herberlot. *Fr.* 750,383, Aug. 9, 1933.

**Precipitating electrode for electrofilter.** Siemens-Schuckertwerke A.-G. (Richard Heinrich, inventor). *Ger.* 577,050, May 22, 1933. Addn. to 575,746 (*C. A.* 27, 4745).

**Electric resistances.** Nürnberger Schraubenfabrik und Facondreherei. *Fr.* 751,745, Sept. 8, 1933. A non-conducting layer composed of a strongly adhesive colloidal material is interposed between a layer forming an elec. resistance and its ceramic support.

**Apparatus for electrometrically determining hydrogen-ion concentration.** Fritz Lux. *Brit.* 397,303, Aug. 24, 1933.

**Electric cut-outs.** Wm. H. Turner and Wm. H. Isherwood. *Brit.* 397,234, Aug. 24, 1933. The casing for an enclosed fuse contains a liquid which vaporizes when the fuse flows and raises the pressure to rupture the casing; the de-ionizing effect of the expanding, cooling and condensing vapor extinguishes the arc.

**Electron lamps.** Allgemeine Elektricitäts-Ges. *Fr.* 750,248, Aug. 7, 1933. Construction of cathodes is described.

L. P. WIGHTMAN

**The Gasparcolor process.** Paul Knoch. *Camera Lucida* 12, 83–5 (1933). The Gasparcolor process employs 3 photographic emulsions coated in superposition upon a common support. Each of these emulsions contains a dye of 1 of the 3 colors used in subtractive prints. In 1 form of the process, the top emulsion is dyed yellow and sensitized for green light, the intermediate emulsion is dyed magenta and sensitized for red light, and the bottom emulsion is dyed blue-green and sensitized for infrared radiation. The sensitive material is exposed, developed and fixed and then submitted to a soln. that destroys the dyes where they are not needed, but allows them to remain in the proper places to form the colored images. Pos. prints can be obtained from negatives or from positives depending upon the soln. used.

M. W. Seymour

**Fine grain panchromatic 16-mm. negative film.** Leopold Kutzsch. *Kino-technik* 15, 237–8 (1933).—Spectral sensitivity and density-log exposure curves are published for the new Agfa fine-grain panchromatic 16-mm. neg. film in comparison with the corresponding orthochromatic film which has been on the market for some time. Filter factors are also given for the film.

M. W. Seymour

**Quick developer for obtaining fine-grained images from coarse-grained emulsions.** A. Seyewetz. *Chimie & Industrie Special No.*, 1034–6 (June, 1933); *cf. C. A.* 27, 3291 and Lumière and S., *C. A.* 26, 929.—Appreciable decrease in the size of the grain can be obtained with the following formula, though it does not give as pronounced a decrease as the formula without hydroquinone:  $H_2O$

1000, gérol 4, hydroquinone 2, anhyd.  $Na_2SO_4$  65, borax crystals 7.5; the time of developing is 3 min. at 18°. In order to obtain max. decrease in grain size, developing should not be prolonged beyond the indicated time, otherwise the size of the grain gradually increases, and becomes about the same as with ordinary developers when the time is doubled. With fine-grained emulsions the grain size obtained is about the same as with coarse-grained emulsions.

A. Papineau-Couture

**A new effective fine-grain developing method and its aspect in motion picture technic.** Franz Baur and Gottlieb Imhof. *Kino-technik* 15, 291–4 (1933).—The procedure consists in desensitizing with pinakryptol green and following with phys. development. Panchromatic motion picture neg. film developed in this way is shown at 1000 times magnification compared with a representative transparency developed in a metol-hydroquinone developer. The negative is said to have the finer grain. (*Cf. Odell, C. A.* 27, 4182.)

O. E. Miller

**Development halos.** Lüppo-Cramer. *Phot. Rundschau* 70, 267–8 (1933).—Negatives, developed in dil. unagitated developers, such as glycine, frequently show pronounced clear halos surrounding areas of heavy density. This effect must be eliminated particularly in sensitometric and spectrographic work. The Eberhard and edge effects are believed to be varieties of this phenomenon, which is ascribed to the retarding action of local high concns. of oxidation products of the developer.

P. W. Vittum

**Protection against halation.** H. Harke. *Phot. Rundschau* 70, 170–2 (1933).—The effects of halation due to

scattering of light within the emulsion may be minimized by employing a slow soft developer which does not penetrate far into the emulsion. Rodinal or glycine is suggested. Papers of low contrast should be used in making prints from negatives in which halation is noticeable.

P. W. Vittum

**Progress in the field of sensitizers for deep red and infra-red in Germany since 1918.** W. Dietrich, H. Durr, and W. Zeh. *Z. wiss. Phot.* 32, 145-56 (1933). *Brit. J. Phot.* 80, 634-6 (1933). A review. The dyes known as di-carboxyanines (termed 'pentacarboxyanines' in the present paper) were first made in Germany by a process patented by W. König, and unsymmetrical members of this class have now been prepared. Recently unsymmetrical tri-carboxyanines have been obtained, the example given being derived from benzothiazole and 5,6-dimethylbenzothiazole. Suggestions for the preparation of dyes having 9 and 11 methine groups are available from the work of W. König.

I. G. S. Brooker

**New apparatus for measuring sensitivity.** G. Traub. *Phot. Rundschau* 70, 213-15 (1933). A description is given of the construction and operation of a sensitometer in which the light sensitive material is exposed through a step tablet to a standardized light source, and the sensitivity evaluated in terms of the exposure required to give a density greater by 0.1 than the fog density.

P. W. Vittum

**Photochemical destruction of the latent image with the aid of desensitizers.** H. Iuppo-Cramer. *Phot. Arch.* 60, 115-9 (1933). cf. *C. A.* 26, 885. Addition of KBr (1%) slightly increases the destroying action of red light, in the presence of phenosalframine or pinkryptol green, on the latent image of high speed emulsions. While with yellow light, in the absence of KBr, complete fogging results, its addition to the dye solution allows an extensive diminution of the latent image without production of fog. Unlike KBr, sulfite (5% Na<sub>2</sub>SO<sub>3</sub>) decreased the action of red light. With green light and in the presence of KBr, the result for phenosalframine over a series of emulsions are not parallel with those for pinkryptol green. A discussion is given of Ernst Heger's application of green light during the development of x-ray film that have been desensitized with pinkryptol green (*C. A.* 25, 206).

I. R. Bullock

**Modern high speed emulsions.** Curt Immermann. *Phot. Rundschau* 70, 229-2 (1933). A general discussion is presented of the improvement which have been made in recent years in photographic materials, particularly with regard to increased speed, color sensitivity, and latitude and decreased inherent fog, halation and graininess.

P. W. Vittum

**Dispense with potassium bromide? [Sodium chloride in photographic developers.]** Iuppo-Cramer. *Phot. Rundschau* 70, 151 (1933). Exception is taken to the general statement that chloride in developers has a retarding effect equal to that of bromide. Experimental evidence is presented to show that this is true only for a limited number of rapid developing solutions which are not retarded greatly by either salt. In other cases little or no retardation is effected by the addition of NaCl to the developer.

P. W. Vittum

**Warm sulfur tones.** Curt Immermann. *Phot. Rundschau* 70, 328-30 (1933). Formulas and procedures are given in detail for obtaining warm yellow-brown tones on AgBr papers.

P. W. Vittum

**Utilization of film scrap.** Kurt Bistring. *Nutrocellulose* 4, 161-2 (1933). A review.

I. M. S.

**Ramnazina oil [used in photography]** (Fr. pat. 752,093) 17

**Color photography.** Oliver A. Townsend (to Fru Colour Film Ltd.). U. S. 1,934,779, Nov. 14. See *Ir.* 738,196 (*C. A.* 27, 1563).

**Color photography.** I. G. Iarbofund A-G. Brit. 390,585, Aug. 10, 1933. A tripack such as described in Brit. 380,341 (*C. A.* 27, 3014) is provided with an addi-

1 yellow filter layer on the blue-sensitive emulsion in order to flatten the gradation of the blue record image and yield images of the same gradation on all 3 emulsion layers. The 2 yellow filters together absorb all blue rays. Cf. *C. A.* 28, 55.

**Color photography.** Victor von Gardanovits. Brit. 397,149, Aug. 15, 1933. Emulsion screens for color photography are produced by applying different emulsions in screen form to a base, the emulsion pertaining to a particular color, e. g., blue, having a total sensitiveness greater than those of the remaining colors so that the amount of light necessary for producing the image in the blue elements of the screen is without effect on the remaining emulsion screen elements pertaining to the other color. The screen may be produced by applying the screen elements to an elastic base as in Brit. 358,157 (*C. A.* 27, 210<sup>2</sup>) and transferring to the final screen carrier. The emulsion may be thickened with dextrin, sugar, gum arabic, albumin, etc., while collodion emulsions may be thickened with (artificial) resins. A yellow protective dye, e. g., aurumum G may be added to the red and green element of the screen and this dye may be removed eventually by dissolving out in H<sub>2</sub>O and the residual traces expelled by treatment with aq. H<sub>2</sub>O. The red elements are dyed with indigosol scarlet H B, the green with indigosol green A I and the blue with indigosol 013. These dyes are fixed by adding NaNO<sub>2</sub> and then treating with aq. H<sub>2</sub>SO<sub>4</sub>. The Ag image may be toned by Pt, Au, S, Se or other baths or with a suitable dye after bleaching in a bath of K Fe(CN)<sub>6</sub> oxalate may be the developer.

**Color photography.** Bela Gaspar. Brit. 397,170, Aug. 15, 1933. Multicolor photographic, particularly cinematograph, images are obtained by the simultaneous copying of a plurality of component color images onto a light sensitive multilayer material composed of superimposed Ag halide layers. The component images may be united to form a master image or combined by projection. The multilayer emulsions may contain dye or dye forming substances.

**Color photography.** Bela Gaspar. Ir. 719,342, Sept. 12, 1933. In making colored images by means of a layer colored in a diffused manner with coloring substance, the decomposition of the coloring substance in the layer takes place in the presence of an amount of Ag<sub>2</sub> higher than that which is necessary for the decomposition and this decomposition is followed by diminution of the excess of Ag<sub>2</sub> by an appropriate reducer, e. g., CuSO<sub>4</sub> 20, NaCl 20, water 100 g. and H<sub>2</sub>SO<sub>4</sub> 1 cc.

**Colored photographs.** Bela Gaspar. Ger. 557,111 (Oct. 31, 1933). Addition to 528,318 (*C. A.* 25, 4474). The process of Ger. 528,318 is modified by replacing the Ag<sub>2</sub> in the image by an oxidation catalyst, e. g., vanadyl ferrocyanide. The image is then treated with an oxidizing bath to develop the color.

**Photographic materials.** Bela Gaspar. Ir. 753,071 (Oct. 6, 1933). Ag halide layers are colored by deep blackish or black coloring substances or pigments and are sensitized for infrared radiation and, in addition, contingently, for the spectral field which corresponds to the absorption gaps of the coloring substances. Then naphthylamine 4B black is mixed with an Ag halide emulsion and a sensitizer such as cryptocyanine is added. Other examples are given.

**Photographic emulsions.** I. G. Iarbofund A-G (Wilhelm Schneider, inventor). Ger. 542,575, Aug. 1, 1933. Halogen Ag emulsions are sensitized by simple substituted compounds of the general formula

in which a bivalent atom of O, S, Se or Te takes the place of W, X, Y and Z and  $n = 1, 2$  or  $3$ . Thus, the emulsion

may be sensitized by the compd. obtained from 2 mols. of 3-hydroxythionaphthene, 1 mol. of  $\text{CHCl}_3$  and 3 mols. of  $\text{KONa}$ . Other examples are given.

**Photographic proofs.** Photo-Produits Gevaert S. A. Fr. 751,948, Sept. 12, 1933. Proofs are treated in a toning bath at such a low concn., or at a higher concn. for such a reduced time, that after drying the color tone of the picture is not changed, but there is produced a deepening of the black and a brightening of the whites. The toning agent, e. g., one contg. Se, may be added to one of the usual treating baths.

**Photographic films.** W. M. Still & Sons Ltd. and John L. Howell. Fr. 751,702, Sept. 8, 1933. Non-inflammable films are composed of a core of gelatin made insol. by  $\text{CH}_2\text{O}$  and coated on both sides with a thin layer of rubber and then an exterior layer of celluloid, collodion or other varnish which takes the sensitized emulsion. After application of the rubber it is dried and vulcanized, e. g., by gaseous  $\text{H}_2$ . To increase resistance to moisture about 2% of a mineral oil is added to the rubber soln., and to secure adhesion of the varnish a solvent for rubber is added to it.

**Colored films.** Béla Gáspár. Fr. 753,061, Oct. 6, 1933. One or more uncolored layers sensitive to light are combined with sensitive layers contg. a coloring substance serving at the same time as a filtering substance and to form the image. The uncolored layers may contain chromogen substances. The method is particularly advantageous for the production of trichrome photographs.

**Toning photographic prints.** Stephen D. West. Brit. 396,935, Aug. 17, 1933. The hypo-alum process for toning developed bromide prints is modified to reduce the time required by treating the developed print about 10 mm. at room temp. in a hypo-alum fixing bath and then subjecting it to hot  $\text{H}_2\text{O}$  vapor for a short time, e. g., 2-2.5 mm. with vapor at 50-60°. App. is described and a

formula for a hypo-alum bath contg. an addnl. hardener is given.

**Photosensitive bodies.** Carl Roehrich (to Sillree A.-G. (Sillree Ltd.)). U. S. 1,936,525, Nov. 21. A colloid layer such as gelatin on celluloid is photosensitized with an agent such as a soln. contg.  $(\text{NH}_4)_2\text{Cr}_2\text{O}_7$  adapted to harden the layer by reaction with light, and the material is treated with a dil. aq. alc. soln. to free the photosensitive surface of non-uniformly distributed sediments (the treatment being continued for only a short time so as to leave the sensitivity unimpaired).

**Anti-halation layers.** I. G. Farbenind. A.-G. Fr. 751,692, Sept. 7, 1933. Anti-halation layers for photographic films are composed of a colored colloidal layer insol. in water but sol. in alk. photographic baths, a synthetic resin contg. an OH or COOH group capable of forming a salt being used as binder for the dye. Thus, a soln. contg. resin (from salicylic acid and paraldehyde) 10, fuchsin 1 and iso-BuOH 100 g. is applied to the back of a cellulose acetate film to give a layer of 1-2  $\mu$ . Other examples are given.

**Cyanine dyes.** Leslie G. S. Brooker (to Eastman Kodak Co.). U. S. 1,935,096, Nov. 21. Dyes suitable for use as color sensitizers in photography are prepd. by condensing a  $\mu$ -methylnaphthothiazole quaternary salt with a quinolinium salt in the presence of an alkali and an inert org. solvent. Various examples with details of procedure are given. Cf. C. A. 27, 4412.

**Transferring pictures to fabric.** Sarah A. Boyle and Robert J. Boyle. U. S. 1,936,080, Nov. 21. The fabric is first impregnated with an adhesive comprising rubber with addns. such as rosin,  $\text{ZnO}$ , white wax and spermaceti; an intimate contact is then effected between the picture on the original material, such as paper, and the fabric; the fabric is stripped from the original picture-carrying material; substances are applied to bring out the coloring on the fabric, and a fixative is applied to fix the colors.

## 6—INORGANIC CHEMISTRY

A. R. MIDDLETON

**New developments in the chemistry of fluorine** Otto Ruff. *Angew. Chem.* 46, 739-42 (1933). A presentation of the latest developments of F chemistry, particularly with respect to compds. of F with Re, Cl, Br, I, O, S, N and C. Data for phys. consts. are given. Nine references.

**Fluorine polyhalides of organic amines.** Harold S. Booth, Wm. C. Morris and G. D. Swartzel. *J. Am. Chem. Soc.* 55, 4406-8 (1933). Org. amines form F polyhalides, similar to those formed by the alkali metals, on adding a cold satd. soln. of  $\text{ICl}_3$  to a cold satd. soln., slightly acidified, of the hydrofluoride of the amine, except in cases where the amine is chlorinated by the  $\text{ICl}_3$ . The tetramethylammonium fluoride iodine trichloride is the most stable and the monomethylamine salt the least. The pyridine salt is next in stability to the quaternary amine salt and both of them compare favorably with the corresponding alkali metal polyhalides. The thermal decompn. is primarily disson in the case of the alkali metal polyhalides. All the org. fluoride polyhalides thus far prepd. form orange-yellow tetragonal crystals.

**Ammoniates of the vanadium halides.** E. Ephraïm and I. Anava. *Helv. Chim. Acta* 16, 1273-87 (1933).  $\text{VCl}_3$  (I) is best prepd. by action of  $\text{Cl}_2$  at red heat upon an 80% V-Fe alloy. I is reduced to violet  $\text{VCl}_2$  (II) by refluxing in a stream of pure  $\text{H}_2$ . II is decomposed further to  $\text{VCl}$  at 500° by  $\text{H}_2$ . Higher temps. cause partial reduction to V.  $\text{VBr}_3$  is obtained by passing  $\text{Br}_2$  vapor along with  $\text{CO}_2$  over Fe-V at red heat and is sepd. from  $\text{FeBr}_3$  by fractional sublimation.  $\text{VBr}_2$  is obtained by careful reduction of  $\text{VBr}_3$  in a stream of  $\text{H}_2$ . All bi- and tri-valent V halides add approx. 6 mols.  $\text{NH}_3$ . These undergo deammoniation to form the pentammoniates, then the triammoniates. Nitrides or ammonobasic products are not formed directly as in the case of  $\text{VCl}_3$ , but

decompn. does take place at higher temps. All  $\text{NH}_3$  complexes described are very unstable toward air and  $\text{H}_2\text{O}$ . They do not resemble the corresponding Cr complexes. Comparison of the mol. vols. of the bi- and tri-valent V complexes indicates that the contraction is normal. Densities of the pure halides and their ammoniates are given. L. F. Audrieth

**Hydrated aluminates of calcium.** Jacques Lefol. *Compt. rend.* 197, 919-21 (1933).—With the method of Guichard (C. A. 19, 1219, 1355; 21, 2577), the dehydration of 1 hydrated Ca aluminates was studied between 20° and 350°; curves were obtained by plotting temp. against the no. of mols. of  $\text{H}_2\text{O}$  removed.  $4\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 12\text{H}_2\text{O}$  gave at 95° a hydrate contg. 10.5-11  $\text{H}_2\text{O}$  and at 175° one contg. 6  $\text{H}_2\text{O}$ . At 350° it still retained a little more than 3  $\text{H}_2\text{O}$ . The curve for  $3\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 21\text{H}_2\text{O}$  (needles) (I) did not show any peculiarity which would permit one to verify the existence of I. Doubtless the initial product was too moist and when heated attained the compn. of I at 110°, a temp. at which I is probably not stable. At 135° there is a hydrate contg. 8-8.5  $\text{H}_2\text{O}$ .  $3\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{H}_2\text{O}$  (cubic) gave between 200° and 310° a hydrate with 1.5  $\text{H}_2\text{O}$ . Up to 65°  $2\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 7\text{H}_2\text{O}$  gained almost 0.5  $\text{H}_2\text{O}$ . At 65° dehydration began, and at 150° there exists a hydrate with 5  $\text{H}_2\text{O}$ . Louise Kelley

**Specific oxidation reactions of selenium dioxide.** Robert Muller. *Ber.* 66B, 1668-70 (1933).—Oxidation of  $\text{EtO}_2\text{CCH}_2\text{CO}_2\text{Et}$  with  $\text{SeO}_2$  in  $\text{C}_6\text{H}_5\text{Me}_2$  at 130° for 16 hrs. gave  $(\text{HO})_2\text{C}(\text{CO}_2\text{Et})_2$  and  $(\text{HO})_2\text{CCO}_2\text{H}$ . Similarly

$\text{CH}_3\text{CO}_2\text{Et}$  and  $\text{SeO}_2$  in  $\text{C}_6\text{H}_5\text{Me}_2$  for 15 hrs. at 90° gave  $\alpha, \beta$ -diEt-diketobutyrate. Foster Dee Snell

**Sulfur monoxide.** III. The formation of sulfur monoxide in certain chemical changes. Peter W. Schenk and H. Platz. *Z. anorg. allgem. Chem.* 215, 113-28 (1933);

cf. C. A. 27, 3160; Gruner, C. A. 27, 4184.—Metals whose chlorides have greater heats of formation than their oxides tend to react with  $\text{SOCl}_2$  vapor as follows:  $\text{SOCl}_2 + 2\text{M} \rightleftharpoons 2\text{MCl} + \text{SO}$ , but if the reverse is true the tendency of the reaction is  $\text{SOCl}_2 + \text{M} = \text{MO} + \text{SOCl}_2$ . Of the first class of metals, Ag, Na, Sb and Sn react as indicated. Of the second class of metals, Zn and Mg react according to both equations giving a poor yield of SO at high temps. ( $300^\circ$  to  $450^\circ$ ) but Al reacts only according to the second equation. SnCl<sub>2</sub> and Ag react almost quantitatively with  $\text{SOCl}_2$  to give SO but  $\text{SO}(\text{OH})_2$  did not react with Na to produce SO. In disagreement with Gruner, S. and P. were unable to find any absorption spectrum bands of SO formed in the vapor state during the thermal decompn. of  $\text{Na}_2\text{S}_2\text{O}_4$  or during its decompn. with  $\text{H}_2\text{SO}_4$ . Also, S. and P. find that gaseous SO and alkali form  $\text{NaHSO}_2$  and  $\text{Na}_2\text{S}_2\text{O}_4$  but  $\text{S}_2\text{O}_2$  and alkali form  $\text{Na}_2\text{S}_2\text{O}_4$ , whereas Gruner believed SO and alkali formed  $\text{Na}_2\text{S}_2\text{O}_4$ . Spectroscopic investigation of the reaction between  $\text{H}_2\text{S}$  and  $\text{SO}_2$  showed that SO was not formed. The decompn. of  $\text{S}_2\text{O}_2$  to S and  $\text{SO}_2$  does not give SO in the gas phase as an intermediate product nor does the thermal decompn. of  $\text{SO}_2$  yield SO. The burning of S with excess S vapor at low pressures yields SO. SO is also formed in about 1% yield with air at atm. pressure and excess S vapor. O. E. Sheppard

**Dehydration of the dihydrate of magnesium chloride.** G. A. Abramov. *Metallurg* 8, No. 3, 11 19(1933). Expts. with a lab. furnace indicate the possibility of continuous production of anhyd.  $\text{MgCl}_2$  in molten form by passing a countercurrent of Cl through the descending charge. The charge consists of 2 kg.  $\text{MgCl}_2 \cdot 2\text{H}_2\text{O}$  and 0.1 kg. coke per hr. The temp. of the furnace varied from about  $300^\circ$  at the top to  $720^\circ$  at the bottom. The analysis of the product was  $\text{MgCl}_2$  75.85,  $\text{MgO}$  5 and  $\text{KCl} + \text{NaCl}$  12%. About 1.2 kg. Cl per kg.  $\text{MgCl}_2$  is required to prevent hydrolysis which represents a saving of about 50% as compared with HCl. H. W. R.

**Action of iodine water on silver nitrate. Kinetic study.** M. L. Josien. *Compt. rend.* 197, 988 90(1933); cf. C. A. 28, 398.  $\text{AgNO}_3$  reacts preferentially with the I in a 0.1 N iodine-iodide soln. The pptn. of the I from the KI which acts as a solvent for the iodine causes the pptn. of the iodine. The details of the reactions leading to this conclusion are given. Howard A. Smith

**Oxygen and halogen compounds of rhenium.** Ida Noddack and Walter Noddack. *Z. anorg. allgem. Chem.* 215, 129 84(1933); cf. C. A. 23, 785. Compds. of Re correspond to the following oxides:  $\text{Re}_2\text{O}$ ,  $\text{ReO}$ ,  $\text{Re}_2\text{O}_3$ ,  $\text{ReO}_2$ ,  $\text{Re}_2\text{O}_5$ ,  $\text{ReO}_3$  and  $\text{ReO}_4$ . Re melted with NaOH in  $\text{N}_2$  is not altered. As  $\text{O}_2$  becomes available the color changes through dark brown, light brown, sand yellow, olive green, dark green, brown, bright red, corresponding to varying oxidation of the Re.  $\text{ReO}_2$  reacts quantitatively with NaOH in  $\text{N}_2$  at  $500^\circ$  to form  $\text{Na}_2\text{ReO}_4$ , Na rhenite, insol. in NaOH or  $\text{H}_2\text{O}$ . This property of forming rhenites is analogous to the action of  $\text{MnO}_2$  in forming manganites. The color is identical with the first brown color resulting from fusion of Re and NaOH in the air. With oxidizing agents  $\text{Re}^{\text{IV}}$  is oxidized to  $\text{Re}^{\text{VII}}$ .  $\text{K}_2\text{ReO}_4$  was similarly prep'd.  $\text{ReO}_2$  and  $\text{BaO}$  did not fuse at  $1200^\circ$ . By proper admission of  $\text{O}_2$  to the melt of  $\text{NaReO}_3$ ,  $\text{Re}^{\text{V}}$  is formed. By fusion of proper amts. of  $\text{ReO}_2$  and  $\text{NaReO}_4$  with NaOH at  $700^\circ$  Na pyrohyporhenate, a sandy yellow cryst. salt, is slowly formed. Reaction is incomplete. The compn. approaches  $\text{Na}_4\text{Re}_2\text{O}_7 \cdot \text{H}_2\text{O}$ , analogous to the pyroantimonate, soly. in  $\text{H}_2\text{O}$  0.04 g. per l. Air oxidizes it to  $\text{Na}_2\text{ReO}_4$  or  $\text{NaReO}_4$ . Similar K and Ba salts were obtained and found to be much more sol. in  $\text{H}_2\text{O}$ . Admission of air to the  $\text{Na}_4\text{Re}_2\text{O}_7$  melt produces a green color due to rhenate. Fusion of NaOH with proper amts. of  $\text{ReO}_2$  and  $\text{NaReO}_4$  at  $350^\circ$  gives neither  $\text{Na}_2\text{ReO}_4$  nor  $\text{NaReO}_4$ . At  $500^\circ$  the former, analogous to the manganate, is obtained. Fusion of NaOH with  $\text{Ba}(\text{ReO}_4)_2$  and  $\text{ReO}_2$  at  $500^\circ$ , cooling to  $300^\circ$ , then after 1 hr. cooling to  $20^\circ$ , gave  $\text{BaReO}_4$ , leaf-green. It is very unstable. With excess air Re fused with NaOH forms

$\text{NaReO}_4$ . The melt is bright red while hot and yellow when cold. No  $\text{O}_2$  is evolved by heating the compd. at  $500^\circ$ . Fusion of NaOH and Ba metaperhenate,  $\text{Ba}(\text{ReO}_4)_2$ , forms  $\text{Ba}_2(\text{ReO}_4)_3$ , a salt of  $\text{H}_2\text{ReO}_5$ , or mesoperhenate. The latter was also ppt'd. by addn. of  $\text{Ba}(\text{OH})_2$  soln. to  $\text{NaReO}_4$  in 50% aq. NaOH soln.  $\text{Ba}_2(\text{ReO}_4)_3$  is hydrolyzed by  $\text{H}_2\text{O}$  to  $\text{Ba}(\text{ReO}_4)_2$  and  $\text{Ba}(\text{OH})_2$ .  $\text{H}_2\text{ReO}_5$  is weaker than  $\text{H}_2\text{CO}_3$ . Addn. of KI soln. to  $\text{KReO}_4$  in concd. HCl protected by  $\text{N}_2$  liberates 3I for each Re, forming  $\text{Re}^{\text{IV}}$ . At lower HCl concn. the reaction is slower. Attempts to reduce to intermediate stages gave mixts. of  $\text{Re}^{\text{VII}}$  and  $\text{Re}^{\text{IV}}$ . A brown cryst.  $\text{K}_2\text{Re}_2\text{OCl}_{10}$  was so obtained by crystn. from concd. HCl. When heated with 10 20% HCl this is converted into green  $\text{K}_2\text{ReCl}_6$ . At less than 8% HCl  $\text{ReO}_3$  seps. Addn. of HBr in place of HCl gave  $\text{K}_2\text{Re}_2\text{OBr}_{10}$  and  $\text{K}_2\text{ReBr}_6$ . The basic salt can be converted to the normal by heating with excess concd. halogen acid. Insol. Rh, Cs and Ag basic salts are ppt'd. from soln. of the K compd. Alkalies ppt.  $\text{ReO}_3$ . Oxidation forms  $\text{Re}^{\text{VII}}$  compds. Hydrolysis of  $\text{K}_2\text{Re}_2\text{OCl}_{10}$  gives a mixt. of  $\text{ReO}_3$  and  $\text{K}_2\text{ReCl}_6$ . Dil. acid hastens hydrolysis. There is a salt  $\text{K}_4\text{Ru}_2\text{OCl}_{10}$  similar to the  $\text{K}_2\text{Re}_2\text{OCl}_{10}$ , with which it forms mixed crystals. The oxychloride,  $\text{Re}_2\text{OCl}_6$ , was not obtained for the basic salt. Re was chlorinated and the liquid chloride dissolved in  $\text{H}_2\text{O}$  and diluted. Some  $\text{ReO}_2$  sepd. and apparently the unionized  $\text{Re}(\text{OCl})_2$  was in soln. A soln. of  $\text{ReO}_2$  in concd. HCl permits pptn. of  $\text{ReS}_2$ . On standing or heating the Re is all present as  $\text{H}_2\text{ReCl}_6$ . Salts of the structure  $\text{X} \cdot \text{Re}(\text{OH})\text{Cl}_5$  were not obtained (cf. Krauss and Dachlmann, C. A. 26, 4265). An HCl soln. of  $\text{H}_2\text{ReCl}_6$  gives green ppts. with  $\text{K}^+$ ,  $\text{Rh}^+$ ,  $\text{Cs}^+$ ,  $\text{Ti}^+$ ,  $\text{NH}_4^+$ ,  $(\text{CH}_3)_2\text{N}^+$ ,  $\text{C}_6\text{H}_5\text{N}$ , quinoline and nitron, having the structure  $\text{X}_2\text{ReCl}_4 \cdot \text{NH}_4\text{OH}$  ppts. brown  $\text{Re}(\text{O})_3$ . Acidity delays pptn. of  $\text{ReS}_2$  from  $\text{H}_2\text{ReCl}_6$ ; therefore under those conditions it can be ppt'd. from  $\text{K}_2\text{ReOCl}_{10}$  and from  $\text{Re}^{\text{VII}}$  compds. without effect on  $\text{H}_2\text{ReCl}_6$ . Solubilities of  $\text{KReCl}_6$ ,  $\text{CsReCl}_6$  and  $\text{K}_4\text{ReOCl}_{10}$  in 12% and 37% HCl and in 20%  $\text{H}_2\text{SO}_4$  are given at  $0^\circ$  and  $18^\circ$ . Ionization of  $\text{K}_2\text{ReCl}_6$  and  $\text{K}_4\text{ReOCl}_{10}$  is of the same order of magnitude as that of  $\text{K}_2\text{PtCl}_6$ . Similar results were obtained with Br compds. Pptn. of  $\text{K}_2\text{ReCl}_6$  by boiling in the absence of air is quant. Similar pptn. with NaOH followed by boiling is not complete. Part of the  $\text{Re}^{\text{IV}}$  is oxidized to  $\text{Re}^{\text{VII}}$  and part reduced. Isolation of  $\text{Re}^{\text{III}}$  is not quantitatively adequate to equal the oxidation. There is evidence of the presence of an  $\text{Re}^{\text{II}}$  compd. The reaction approximates  $9\text{Re}^{\text{IV}} = 3\text{Re}^{\text{II}} + 4\text{Re}^{\text{IV}} + 2\text{Re}^{\text{VII}}$ . Reduction of  $\text{ReCl}_4$  (or  $\text{ReCl}_5$ ) with Re gives mainly dark red  $\text{ReCl}_3$ . The reaction is rapid at  $400$   $500^\circ$ . Pptn. of  $\text{ReCl}_3$  with NaOH gives a brown ppt. in which Re is present at the various stages of oxidation represented approx. by  $9\text{Re}^{\text{III}} = 6\text{Re}^{\text{II}} + 2\text{Re}^{\text{IV}} + \text{Re}^{\text{VII}}$ . Strongly acid solns. of  $\text{ReCl}_4$  are very stable to strong oxidizing or reducing agents. Zn reduces it rapidly to  $\text{Re}^{\text{I}}$  at  $5^\circ$ .  $\text{ReCl}_4$  is not ionized.  $\text{C}_6\text{H}_5\text{N}$  forms  $\text{ReCl}_3$ , HCl,  $\text{C}_6\text{H}_5\text{N}$ . The ppt. from hydrolysis of  $\text{ReCl}_3$  in the absence of air is  $\text{Re}_2\text{O}_3$ . Similar Br compds. are obtained. Electrolysis of acid  $\text{K}_2\text{ReCl}_6$  gives  $\text{Re}^{\text{II}}$  and  $\text{Re}^{\text{IV}}$  at the cathode (cf. Machot, Schmid and Dising, C. A. 26, 1204).  $\text{ReCl}_2$  was not isolated as a solid but its soln. was isolated from Re in other valences and showed easy oxidation and other expected properties. Similarly, reduction of  $\text{ReCl}_3$  with Zn or Na-Hg at  $0^\circ$  gives  $\text{Re}^{\text{I}}$ . The soln. reduces  $\text{NaCNS}$  to  $\text{H}_2\text{S}$ , a distinction from  $\text{Re}^{\text{II}}$ . When the soln. is made alk. a brown ppt. is obtained and  $\text{H}_2$  is liberated.  $\text{ReOCl}_3$  was obtained by combustion of Re in  $\text{Cl}_2$  and displacement of  $\text{Cl}_2$  vapor by  $\text{O}_2$ . When dissolved in HCl it forms  $\text{H}_2\text{ReOCl}_6$ , as shown by cond. This hydrolyzes within 10 min. at  $0^\circ$  to  $\text{H}_2\text{ReCl}_6$  and  $\text{HReO}_4$ . The K salt can be ppt'd. but decomposes similarly. After reduction of  $\text{NaReO}_4$  with  $\text{SnCl}_2$ , addn. of  $\text{KCNS}$  and  $\text{C}_6\text{H}_5\text{N}$  gives  $\text{Re}(\text{CNS})_4 \cdot \text{CNS} \cdot \text{HNC}_6\text{H}_5$ . For detn. of the state of oxidation of Re compds. further oxidation in acid soln. usually gives low results because of the stability of  $\text{Re}^{\text{III}}$  and  $\text{Re}^{\text{IV}}$ . As a quant. oxidation method the use of alk.  $\text{Na}_2\text{CrO}_4$  and gravimetric detn. of the  $\text{Cr}_2\text{O}_3$  is recom-

ended. Analytical pptn. of Re with  $H_2S$  followed by  $NaOH$  solution with nitron is satisfactory. Foster Dee Snell  
**Mesoperrhenates.** B. Scharnow. *Z. anorg. allgem. Chem.* 215, 185-9 (1933).—By evapn. of an aq. soln. of  $a(ReO_4)_3$  protected from  $CO_2$  and contg. excess  $Ba(OH)_2$  the ratio of 1:6 to 1:360, a ppt. of  $Ba_3Re_2O_{10}$  is obtained.  $(OH)_2$  is not sufficiently sol. to ppt.  $Sr_2Re_2O_{10}$ , which is, however, obtained if to the soln. in which it is present strong  $NaOH$  soln. is added. Foster Dee Snell

Abegg, R., Auerbach, F., and Koppel, I.: Handbuch der anorganischen Chemie. Bd. IV, Abt. 3. Die Elemente der 8. Gruppe des periodischen Systems. Tl. 3. Kobalt. Lfg. 1. Leipzig: S. Hirzel. About 760 pp. About M. 72. Cf. C. A. 27, 678.

## 7--ANALYTICAL CHEMISTRY

W. T. HALL

**Indirect volumetric determinations.** C. V. Bordeianu. *Chem. Pharm.* 271, 514 (1933). Reply to that of J. Isenbrand (cf. C. A. 27, 5673). W. O. E.

**Analytical methods for analyzing mixtures of solvents present in "stabilin."** A. A. Vorob'eva. *Izvestiya central. Nauch.-Issledovatel. Inst. Koshevennoi Prom.* 132, No. 4, 11-16. Stabilin solvents may contain acetone, Et, Et, iso-Pr, Bu and Am acetates, EtOH, MeOH, iso-PrOH, BuOH, AmOH, benzene, toluene, xylene, gasoline and unsatd. compds. Methods for detg. all these ingredients are discussed and a systematic procedure is recommended. A. A. Bochtlingk

**Analysis with wedge spectra—its recent application to iron on a quantitative basis.** Morris Slavin. *Engineering J.* 134, 509-13 (1933).—Application of the spectrograph to det. 4 metals in Zn, and in concd.  $ZnSO_4$  solns. High purity is shown. The wedge-spectrum method is more rapid than the old methods because outside standards are not used and but one exposure is required. W. H. Boynton

**Volumetric method for the determination of barium and sulfates.** J. C. Giblin. *Analyst* 58, 752-3 (1933).—Take some yellow stains on white filter paper by adding drops of a soln. contg. the Na salt of rhodizonic acid. Titrate the sulfate soln. in the presence of acid with a dil. soln. of  $BaCl_2$  until a drop of the soln. gives a red color on a test paper. The results obtained by students in using the above procedure were good. W. T. H.

**Determination of iron.** C. T. Bennett and N. R. Campbell. *Quart. J. Pharm. Pharmacol.* 6, 436-42 (1933).—Official and other methods now in common use are reviewed and criticized. A new procedure is recommended which calls for a preliminary oxidation with  $KMnO_4$  followed by reduction with  $SnCl_2$  and titration with  $K_2Cr_2O_7$  with  $Ph_2NH$  as indicator. W. O. E.

**Iodometric and potassium permanganate determinations of lead in lead acetate.** S. F. Shubin and A. T. Troshchenko. *Khim. Farm. Prom.* 1933, 138-9.—The sample (2-2.5 g.) is shaken in a volumetric flask with 30% AcOH, made up to the mark with 30 cc. of 0.2 N  $K_2Cr_2O_7$  and 10 cc. and after 15 min. a filtered aliquot is taken, KI and  $HSO_4$  are added and the liberated I is titrated with  $Na_2S_2O_3$ . The  $KMnO_4$  method recommended is similar to that of U. S. P. IX and is less accurate than the iodometric method. L. Na-sarevich

**Determination of manganese by the method of R. Lang and F. Kurz in connection with the determination of silicon in cast iron.** A. Cotti. *Chem.-Ztg.* 57, 934 (1933).—The method depends upon the formation of valent Mn by induced oxidation produced by the action of dichromate and arsenite in the presence of HF and  $H_2PO_4$ . Treat 4 g. of sample with 50 ml. of 6 N  $HNO_3$ , transfer to a porcelain dish, add 8-9 ml. of concd.  $H_2SO_4$  and evap. to fumes. Cool, dil., and filter off  $SiO_2$ . To the filtrate add 10 cc. of 15%  $H_2O_2$  soln., evap. to a sirup and treat with satd.  $Na_2CO_3$  soln. until the ppt. that forms dissolves very slowly. Add 5 cc. of concd. HF and  $H_2PO_4$ , 1-1.7. Add a slight excess of 0.35 N  $K_2Cr_2O_7$  (10% excess of Mn + 5 ml.). Then add 5 cc. more of arsenite soln. (15 g.  $As_2O_3$  = 10 g.  $Na_2CO_3$  per l.) than was used of dichromate, add 3 drops of a phosphoric acid soln. of diphenylamine and titrate with standard  $FeSO_4$  soln. to a grass-green color. W. T. H.

**Determination of molybdenum in alloy steels, particu-**

larly in self-hardening steels, and the simultaneous determination of higher copper contents. W. Bruggemann. *Chem.-Ztg.* 57, 803-6 (1933).—The methods of attacking various kinds of steel are described and it is shown how best to ppt.  $CuS$  and  $MoS_3$  from the resulting soln. This ppt. can be dissolved in aqua regia and then the soln. can be made ammoniacal and the Cu titrated with KCN soln. In the filtrate the Mo can be detd. as  $PbMoO_4$ . The entire analysis requires about 3 hrs. W. T. H.

**Determination of silicon in sea water.** Thomas G. Thompson and Harold G. Houlton. *Ind. Eng. Chem., Anal. Ed.* 5, 417-18 (1933). The effect of 4 factors on the molybdate method for detg. Si in sea water was studied. Meta- and orthosilicates give equal colors. Variation of temp. between 7° and 25° did not change color intensity. The picric acid standards contg. mold growth, or after aging for 20 months, compared well with those freshly prepd. Many notes on the use of the method are appended. H. W. Leahy

**Technical spectrum analysis in the steel plant laboratory.** W. Gerlach. *Arch. Eisenhüttenw.* 7, 353-4 (1933).—In detg. Si in steel by spectrum analysis the selection of proper spectral lines is of utmost importance. M. H.

**Direct determination of sodium in the presence of large amounts of calcium, magnesium and ammonium.** Tokichi Noda. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 635 (1933).—Kahane's uranyl magnesium acetate method for detg. Na gave results accurately to 1% when the chloride solns. were diluted to concns. of 0.1 g. Ca/cc., 0.07 g. Mg/cc. and 0.04 g.  $NH_4$ /cc. K. Kammermeyer

**Determination of small quantities of bromine in the presence of large amounts of chlorine and iodine.** S. H. Bertram. *Biochem. Z.* 266, 417 (1933); cf. C. A. 27, 4266.—According to the directions given in the original paper, losses of  $I_2$  may occur which, however, can be prevented if during the second distn. there is added a little KI dissolved in 3 cc.  $H_2O$  + 2 drops of 4 N  $H_2SO_4$  and 10 drops of 1% starch soln. The starch decreases the volatility of the  $I_2$ . S. Morgulis

**Determination of fluorine in insoluble fluorides.** P. Urech. *Chem.-Ztg.* 56, 855-6 (1933).—The gravimetric detn. of F in insol. minerals by the method of Berzelius-Ros was subjected to crit. study and the results were compared with those obtained by the titration method of Greef. The latter method gave results which averaged 0.7% higher than those obtained by the former method and this is probably due to the sensitivity of the gravimetric method to the concn. of  $H^+$ . W. T. H.

**An improved micro method of estimating iodine.** M. Patnaik. *Indian J. Med. Research* 21, 237-48 (1933).—A modification of the Fellenburg-Newcomb-Sankaran method eliminating the evolution of fumes and the presence of reducing substances. Harry Eagle

**Determination of phosphorus in unalloyed steel, alloy steel and cast iron.** Karl Swoboda. *Chem.-Ztg.* 57, 934-41 (1933).—The methods as worked out in German industrial labs. are described. No new procedure is mentioned. W. T. H.

**Elon and sodium sulfite as reducing agents in the colorimetric determination of phosphorus.** G. van der Linde. *Analyst* 58, 755-6 (1933).—Na sulfite + hydroquinone have been used as reducing agents in the colorimetric detn. of inorg. P in blood, plant ashes, etc. A 3.128%

soln. of elon (*p*-methylaminophenol sulfate) can be substituted for the 1% soln. of hydroquinone. The color develops in 20 min. at 26.5° and is clearer than when hydroquinone is used. Values obtained by the hydroquinone-sulfite and elon-sulfite methods are given to show that the results are more accurate with the latter method.

W. T. H.

**New method for the determination of elemental sulfur.** Noel L. Allport. *Quart. J. Pharm. Pharmacol.* 6, 431 (1933). A new and rapid method is proposed which depends on conversion to thiocyanate by the use of KCN and triethanolamine. The method is applicable to both pptd. and sublimed S, to all official pharmaceutical preps. and to S lozenges. The accurate detn. of free S by this method is unaffected by the presence of sulfates.

W. O. E.

**The most important color tests in metallurgical laboratories equipped with the Leitz colorimeter.** Otto Kropf. *Chem.-Ztg.* 57, 843 (1933). The optical firm of Leitz in Wetzlar has recently placed a new colorimeter on the market. With it accurate detns. of C, Mn, Cr, Cu, Ti, V, Mo and S can be made in much less time than is required by the usual methods. The methods of analysis, which are not new, are described and the results compared with those obtained by the more conventional methods.

W. T. H.

**Rational analysis of nickel plating salts.** J. Maly. *Chem.-Ztg.* 57, 823 (1933).—A method is outlined for detg. sulfate, Ni, Mg, alkalies, Cl, NH<sub>4</sub>, citric acid, H<sub>2</sub>BO<sub>3</sub>, H<sub>2</sub>O and non-volatile residue, which are the constituents likely to be present.

W. T. H.

**Methods for the analysis of technical solvents. IV. Color tests for trichloroethylene, carbon tetrachloride and other chlorinated hydrocarbons of the aliphatic series.** Hans H. Weber. *Chem.-Ztg.* 57, 836 (1933); cf. C. A. 27, 1296. —As reagents use (A) a 2% soln. of  $\alpha$ -naphthol in cyclohexanol, (B) cyclopentanol and (C) a 2% soln. of phenolphthalein in cyclohexanol. Of reagents A or B, take 2 ml., 1 drop of the chlorinated hydrocarbon and a small piece of pure NaOH. Boil about 25 sec., pour into another tube and observe the color when cold. Then add an equal vol. of either 85% H<sub>2</sub>SO<sub>4</sub> or glacial AcOH and shake after standing 1 min. For the test with C, first prep. a glycol bath by taking a 200-cc. Erlenmeyer flask and placing about 30 ml. of glycol and a few boiling stones in it. Put a large test tube (18 × 2 cm.) in the flask and suspend in this an ordinary test tube through which water is flowing so that this tube acts as a reflux condenser. Place 2 drops of the chlorinated solvent in the larger tube, 2 ml. of the reagent C and 1 small piece of NaOH. Heat the glycol slowly to boiling and watch for any appearance of color. After heating exactly 5 min., pour off the soln. into an ordinary test tube, add 1 ml. of glacial HOAc and a few glass beads. Shake well. The colors obtained with 10 solvents and these 3 reagents are tabulated. V. **Determination of chlorinated hydrocarbons and aromatic compounds in gasoline.** Hans H. Weber and Frederick Hauck. *Ibid.* 915 16.—Recently mixts. of chlorinated hydrocarbons, benzene and gasoline have been recommended under various phantastic names for cleaning metals. In such mixts. the method of Marcusson, which depends upon nitration in the cold, is best suited for detg. aromatic hydrocarbons. For detg. the chlorinated hydrocarbons 2 methods have been used. A. —After detg. n, take 5 ml. of the mixt. and add 10 ml. of Pr alc., some MnO<sub>2</sub> or PbO<sub>2</sub> as catalyst and caustic alkali corresponding to the quantity necessary to combine stoichiometrically with the Cl present and heat under a reflux condenser. This dehalogenization is best accomplished in a 250-300 ml. Jena flask connected with a ground-glass fitting to an 8-bulb condenser, which has a little glass wool in the bottom bulb. B. —Treat 5 ml. of the mixt. with 10 ml. of a 2% soln. of  $\alpha$ -naphthol in cyclohexanol and heat under reflux condensation with the proper quantity of NaOH. After the sapon. has been accomplished by either of the above methods, free from solid residue by filtering, add water until 2 layers are formed and, in case

method A was used, add 2.5 vols. of 25% HCl. Remove the layer of liquid and treat the upper layer with 2.5 vols. of 85% H<sub>2</sub>SO<sub>4</sub>, mix well and cool if necessary. Continue to agitate for 15 min. Allow to settle, draw off the lower layer of liquid and treat the upper layer with fuming H<sub>2</sub>SO<sub>4</sub> contg. 20% of anhydride, taking special precautions to avoid overheating. Finally det. the d. of the upper layer of liquid. The necessary precautions and method of computing the results are explained.

W. T. H.

**Determination of methanol and ethyl alcohol in mixtures containing acetone and its homologs.** Ronald W. Hoff and John M. Macoun. *Analyst* 58, 749-52 (1933).

Place the sample contg. not more than 20 ml. of alc. in a 500-ml. Kjeldahl flask and dil. with water to about 100 ml. For each ml. of AcMe assumed to be present, add 1.5 g. of paraformaldehyde followed by 50 ml. of satd. NaCl soln. and 20 ml. of N NaOH. Slowly bring to a boil under a Liebig condenser of 60 cm. or more. By this time the reaction between the acetone and excess formaldehyde will be complete. To the just boiling mixt., add an excess of Fehling's soln. (usually 50-60 ml. is sufficient) through the top of the condenser and then cool the contents of the flask. Rinse down the condenser with a little water, remove the flask and slide down into it an open glass tube about 15 cm. long which will facilitate gentle boiling during the ensuing distn. Arrange the flask for distn. through a foam trap and a vertical condenser fitted with a straight adapter. Collect the distillate in a 100-ml graduated flask and det. the d. at the standard temp. Tables are given which show the percentage alc. by vol. corresponding to pure EtOH and pure MeOH. Then by taking a refractometer reading the percentage of each alc. can be detd.

W. T. H.

**A new method of estimating o-toluidine.** Shigezō Ueno and Haruo Sekiguchi. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 613 15 (1933).—The method is based upon the lowering of the m.p. of o-toluidine-HCl or -HBr by the *p*- and *m*-isomers.

Karl Kanuermeyer

**The toxicological detection of barbital, phenobarbital and phanodorn.** Joseph Peltzer. *Chem.-Ztg.* 57, 816 (1933).—Barbital (I), phenobarbital (II) and phanodorn (III) can be isolated from organs by digestion with 20% CCl<sub>3</sub>CO<sub>2</sub>H, followed by evapn. of the ext. and extn. with ether. Zwickler's methods (C. A. 26, 396) were used on the residue to identify the barbiturate and for its detn. I gives a stable blue Co-Ba complex even with excess Ba(OH)<sub>2</sub>-CH<sub>3</sub>OH soln., II a blue changing to yellow with excess Ba(OH)<sub>2</sub>-CH<sub>3</sub>OH soln. and III a blue which disappears with an excess of Ba(OH)<sub>2</sub>-CH<sub>3</sub>OH soln.

E. W. Scott

**The formalin titration of proteins.** D. W. Steuart. *Analyst* 58, 754 5 (1933).—A discussion of the ratio between total N and the vol. of 0.1 N NaOH used in the formal titration of 2 g. of com. *gelatin, casein, albumin, peptone, pepsin* and *pancreatin*.

**Reagent paper for glucose.** Maurice Fernand Masson. *Fr. 750,358*, Aug. 9, 1933. Paper is soaked in an alk. cuprotartaric soln. and dried. The intensity of color obtained after dipping in a liquid contg. glucose and drying gives an estn. of the glucose content.

**Determination of potassium.** Kali-Forschungs-Anstalt

G. m. b. H. *Fr. 750,319*, Aug. 8, 1933. K is detd. rapidly by pptn. of the K in the form of one of its salts difficultly sol. in water; concd. solns. of the precipitant which have previously been satd. or almost so with the K salt to be pptd. are used. Thus, a soln. of  $\text{NaClO}_4$  satd. with  $\text{KClO}_4$  may be used.

## 8--MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIKER

**Some new minerals.** H. Jüngemach. *Compt. rend.* 197, 1132-4(1933).—The new minerals are all natural from Tierra Amarilla, Chili. They are *amarillite*,  $\text{Na}_2\text{O} \cdot \text{Fe}_2\text{O}_3 \cdot 4\text{SO}_3 \cdot 10\text{H}_2\text{O}$ ; *kapparentite*,  $\text{Al}_2\text{O}_3 \cdot 2\text{SO}_3 \cdot 10\text{H}_2\text{O}$ ; *tenoglaucite*,  $\text{Fe}_2\text{O}_3 \cdot 4\text{SO}_3 \cdot 5\text{H}_2\text{O}$ ; and *paracoquimbite* which is a rhombohedral modification of coquimbite. The crystallographic properties are given, and those of copiapite, quenstedite and coquimbite which belong to the same group are revised. P. S. Roller

**Mineral deposits near the west fork of the Chulitna River, Alaska.** Clyde P. Ross. *U. S. Geol. Survey Bull.* 840E, 289-332(1933). E. H.

**Pure limestones of the Dordogne district.** J. E. Duchez. *Rev. matériaux construction trav. publics* 1933, 307-9, 340-3; cf. *C. A.* 27, 5280. Several deposits are discussed and their chem. compn. given. K. K.

**Graphite deposits near Poltavka.** I. I. Sobolev and V. S. Veselovskii. *Mineral. Sibir'e* 8, No. 7, 45-51(1933).—The chem. and phys. properties of the graphite and the results of a geological survey are described. C. Blanc

**New views on the formation of coal and petroleum.** P. Niggli. *Schweiz. Ver. Gas Wasserfach. Monats. Bull.* 13, 237-47(1933).—A lecture on coal and oil genesis reviewing existing hypotheses. It is pointed out that different processes may be responsible for the formation of these products in different locations. B. J. C. v. d. H.

**Investigation of resin occurrence in an early tertiary coal from southeast Borneo.** I. Borneo coal. H. H. Muller-Neugluck. *Angew. Chem.* 46, 751-3(1933). The resin was sepd. from the coal by 2 methods, settling in  $\text{CaCl}_2$  soln. and selective extr. with benzene. Borneo coal is a pitch lignite with inclusions of coniferous fossil resin. Karl Kammermeyer

**Volcanic history of Glass Mountain, Northern California.** Charles A. Anderson. *Am. J. Sci.* 26, 485-506(1933). The volcanic sequence of the region is reconstructed. Petrographic and chem. analyses of the principal rocks are given. The  $\text{Al}_2\text{O}_3$  curve is at a max. at 49%  $\text{SiO}_2$ , in contrast to 58% for the Lassen Peak volcanics. The  $\text{CaO}$  curve drops much more rapidly in the former than the latter. In the Medicine Lake group, the alk. index ( $\text{SiO}_2$  value at which  $\text{Na}_2\text{O} + \text{K}_2\text{O} = \text{CaO}$ ) is 58; at Lassen Peak it is 63.9. Further differences between the 2 suites are discussed. Alden H. Emery

**Age of Fitchburg granite.** Alfred C. Lane. *Science* 78, 435(1933).—Microanalysis of a 30 mg. sample of uraninite, extd. from granite from the Fitchburg quarries, was made

by Friedrich Hecht of Vienna (cf. *C. A.* 27, 2111) showing  $\text{ThO}_2$  3.86%,  $\text{U}_3\text{O}_8$  59.19% and  $\text{Pb/U} + 0.25\text{Th} = 0.049$ . There is so little Th that if the factor 0.36 is used instead of 0.25 there is no appreciable difference. If allowance is made for Act D and Th D an age would be derived of  $15,000 \log(1 + (\text{Ra G} - 2.37)/\text{U} = 50)) = 366$  million years. This granite is therefore akin to that from which Hillebrand analyzed a sample of uraninite many years ago. A. W. Furbank

**The conditions of formation of oolitic deposits as affected by movement of the terrestrial crust.** J. P. Arend. *Compt. rend.* 197, 847-50(1933).—The oolitic deposits N.E. of the Briey basin, adjoining Luxembourg, are composed almost entirely of 2 materials resulting from chem. pptn.: (1) carbonates of the alk. earths, and (2) of ferruginous character and including the micellar grains of constituents made up of the tri- and polyvalent elements: Fe, Al, Mn, Si, P, V, As. Neither the chem. compn. of the ppts. nor the amt. or nature of the constituents changed during the geological time required for a deposit of 55 m. The variations in the character of the beds were due alone to the changes which ensued in the proportions of the constituents present in the ancient Toarcian (upper Lias) Lake. The various factors tending to change the character of the hydrothermal waters subsequently arising are given. In general, the ferruginous ppts. increased with the  $p_{\text{H}}$  of the mother liquor, and the calcareous ones the reverse. It is evident that oolite formation is brought about by mol. layers which cause, through very slight changes in concn., sudden and quite considerable changes in surface tension; the effect of this is to cause the oolitic deposit always to have approx. the same character, and to resemble in many respects a living organism. A. W. F.

**Beekite in tertiary oil-bearing formations of southern Ecuador.** Geo. Sheppard. *Bull. Am. Assoc. Petroleum Geol.* 17, 1388-91(1933). Beekite is found along fracture planes of nodular siliceous masses. Silica has been leached from the matrix in the vicinity of the fracture planes and deposited on the latter. Alden H. Emery

**Iyengar, P. Sampat:** Ores and Their Rock Associates in Peninsular India. Mysore Geol. Dept., Bull. No. 13. Bangalore: Govt. Press. 13 pp. 1 rupee.

## 9 METALLURGY AND METALLOGRAPHY

D. J. DEMORESI, OSCAR F. HARDER AND RICHARD RIMBACH

**A quarter century of metallurgical progress.** Walter Robinson. *Can. Chem. Met.* 17, 210-12, 231-2, 234, 235(1933). *Engineering* 136, 725-8; cf. *C. A.* 27, 5281.—A review. W. H. Boynton

**Standards and specifications for metals and metal products.** Anon. U. S. Bur. Standards, *Miscellaneous Pub. No. 120*, 1359 pp.(1933). E. J. C.

**Unusual minerals in flotation products at Cananea mill studied quantitatively by the microscope.** A. M. Gaudin. *Eng. Mining J.* 134, 523-7(1933).—A new ore body contg. considerable covellite has been developed at the property of the Cananea Consolidated Copper Co. In studying the floatability of this Cu mineral, other minerals

of the enargite and tetrahedrite groups were observed, together with molybdenite. The latter may prove valuable as a by-product. The following minerals were recorded: "silicate," molybdenite, pyrite, chalcocopyrite, hornite, covellite, "gray Cu" and sphalerite. "Silicate" covered all the translucent gang minerals. Identification of each mineral by microscopic examn. is explained. W. H. B.

**The concentration of metals in the circulating load and their recovery.** W. B. Donoghue. *Can. Mining J.* 54, 470-1(1933).—A brief review of recent practice at the Central Manitoba mill. It appears that if the ton value of the circulating load in Au metallurgy is held down to not more than 3 times the ton value of the mill heads cer-

tain phantoms of the art may fade away. It may be accomplished by amalgamation or other treatment of the classifier sand. With the removal of all Au possible from the circulating load it seems reasonable to expect a shortening up of Au mill circuits and lower cost in operation and less trouble. Work on the circulating load constitutes an advance step in Au metallurgy, and of Ag, if it is in the native state.

W. H. Boynton  
**Production of vanadium pig iron by slag reduction.** V. K. Sokovnin *Metallurg* 8, No. 3, 55 8(1933). - Bessemer and open-hearth slags contg 7-12% V were reduced by C in an elec. furnace; 90-93% of the V in a Fe-Cr-V alloy contg. up to 14% V was recovered. The oxides are reduced from the slag in the order Fe-V-Cr-Mn. The process is easy and rapid.

H. W. Rathmann  
**Blast-furnace operations with peat fuel.** N. Chuzhevskii, A. Panbulov, A. Vavilov and V. Shmelov. *Stal* 3, No. 4 5, 13 22(1933). Air-dried peat contg. 17.25% H<sub>2</sub>O and 1.5-6.0% ash was used to produce a 3.5% Si pig iron with a peat to pig ratio of 3.5-4. Compn. of the top gases was CO<sub>2</sub> 9-10, CO 29-31, H<sub>2</sub> 9-10 and CH<sub>4</sub> 2-3%. The use of peat is considered economically possible.

H. W. Rathmann  
**Melting in the cupola furnace.** G. Itam. *Rev. fonderie moderne* 27, 291 5(1933). The general principles of melting in a cupola furnace are described. The different stages of the melting process and influence of coke, ash content, size of cupola and wind pressure are discussed.

M. H.  
**Sulfur in cupola practice.** I. Trifonov. *Gieserei* 20, 497 500(1933). Pig Fe absorbs S in the cupola only when molten, and only from combustible S compds. CuS reacts with FeO, but not with Fe, to form FeS when the atm. is oxidizing and insufficient CaO is present.

Curtis L. Wilson  
**The present status of some important corrosion problems.** H. van der Veen. *Het Gas* 53, 437 44(1933). A review.

B. J. C. van der Hoeven  
**The dependence of corrosion velocity of copper upon the thermal and mechanical pretreatment of the copper.** Du Bois. *Oberflächentechn.* 10, 235(1933). - Preliminary results show that corrosion of Cu is influenced by the arrangement of the crystallites, but there is a difference between refined and electrolytic Cu, and also between hard and soft electrolytic Cu. X-ray tests revealed that soft-annealed material has an orientated crystallite arrangement, hard material an unorientated. Electrolytic Cu showed a lower resistance against H<sub>2</sub>SO<sub>4</sub> than refined Cu. Rolling produces differences in the crystallite arrangement and therefore different corrosion resistance. It is proposed to use as a definition of the intensity of an attack by acid on a material not the percentage loss in weight but the time required for corroding away 1 mm thickness from the surface of the material by the corroding agent, and also to state previous thermal and mech. treatment of the material.

M. Hartenheum  
**Metals and condensed milk** (Thompson, et al.) 12. Theory of passivity. XIX. Structure of natural layers of Fe oxide in rusting processes (Muller, Machu) 2. App. for heating or cooling Fe ore (Ger. pat. 578,652) 1. Pyrometer for use with molten metals (U. S. pat. 1,936,140) 1

**Lead**—The Mineral Industry of the British Empire and Foreign Countries. 2nd ed. Issued by Imperial Inst. London: H. M. Stationery Office. 253 pp. 4s. Reviewed in *Ind. Eng. Chem.* 25, 1063(1933).

**Working up ores.** "Ekof" Erz- u. Kohle-Flotation G. m. b. H. (W. Schafer, inventor). Ger. 578,819, June 17, 1933. In working up non-sulfidic ores and minerals by flotation, resin acids and oils resulting from the extr. processes of sulfite and sulfate wood pulp are used as flotation agents.

**Treatment of lead ores.** Paul Garnichon (Robert Tournaire, inventor). Ger. 587,001, Oct. 28, 1933. This corresponds to Fr. 712,528 (C. A. 26, 1560), but gives addnl. details.

**Disintegration of beryllium ores, especially silicates.** Beryllium Development Corporation. Ger. 577,029, June 2, 1933. See Brit. 374,705 (C. A. 27, 4038).

**Disintegrating pyrite ores with sulfonic acid.** International Mining-Trust. Ger. 578,967, June 19, 1933. The ore is powdered, mixed with twice its mol. wt. of H<sub>2</sub>SO<sub>4</sub> and heated for some time to the b. p. of the acid. App. is described.

**Reducing metal oxides.** Società italiana per le industrie minerarie e chimiche. Ger. 579,949, July 3, 1933. App. for reducing metal oxides by heating them to 400-700° in heavy hydrocarbon vapor is described.

**Recovering noble metals.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Ger. 587,002, Oct. 28, 1933. In the known process in which waste alloys, etc., contg. noble metals and base metals are successively fused, comminuted, oxidized and treated with H<sub>2</sub>SO<sub>4</sub> to ext. base metals, the oxidation and extr. are facilitated by adding 3-10% of S or a reagent yielding S to the alloy before or during the oxidation.

**Apparatus suitable for the separation of gold from beach sand, etc., by centrifugal action.** Oatmer B. Germond. U. S. 1,936,130, Nov. 21. Structural and mech. features.

**Zinc metallurgy.** Charles R. Kuzell (to United Verde Copper Co.). U. S. 1,936,092, Nov. 21. A carbonaceous reducing agent is injected by means of steam into a molten bath contg. a Zn compd. such as a mat or slag to reduce the Zn compd. and vaporize metallic Zn (an excess of the reducing agent being used), and air is introduced into the app. used above the surface of the bath to oxidize the excess reducing agent and Zn vapor and form a fume contg. ZnO and generate heat for maintaining the bath in molten condition. The fume is collected. App. is described.

**Apparatus for continuous distillation and filtration of magnesium.** Österreichisch-Amerikanische Magnesit A. G. Fr. 750,183, Aug. 5, 1933.

**Blast furnaces.** Vereinigte Stahlwerke A.-G. Fr. 752,036, Sept. 15, 1933. Obturator for the hot air conduits is described.

**Blast-furnace charging top.** Charles O. Barks. U. S. 1,936,374, Nov. 21.

**Tilting forehearth for cupola furnaces.** Friedrich Schünke. Ger. 578,927, June 23, 1933.

**Furnace for heating copper billets.** Henry M. Koll (to Western Elec. Co.). U. S. 1,936,199, Nov. 21. A skid rail contacting with the billets is formed of an alloy of Cr 1 and Fe 2 parts.

**Continuous furnace for heating sheet metal, etc.** Akt.-Ges. Brown, Boveri & Cie. Ger. 584,712, Sept. 25, 1933. Addn. to 580,143 (C. A. 27, 4761).

**Apparatus for heat-treating and cooling metals.** Schloßmann A.-G. Fr. 751,943, Sept. 12, 1933.

**Furnace for recovering copper wire and lead from cables.** J. A. Topf & Sohne. Ger. 587,149, Oct. 31, 1933.

**Device for cooling Siemens-Martin and similar furnaces.** Österreichisch-Alpine Montangesellschaft (Friedr. Witting, inventor). Ger. 578,725, June 16, 1933.

**Suction box for Dwight-Lloyd apparatus.** Blei- und Silberhütte Braubach G. m. b. H. and Paul Wefelschuid. Ger. 578,874, June 20, 1933.

**Stripper for Dwight-Lloyd sintering apparatus.** Blei- und Silberhütte Braubach G. m. b. H. and Paul Wefelschuid. Ger. 578,958, June 20, 1933.

**Distilling metals.** Fried. Krupp Grusonwerk A.-G. Fr. 750,251, Aug. 8, 1933. Metals such as Zn and Cd are distd. from one or more muffles mounted in a rotating tubular furnace and turning with it. The sepn. of the metal vapors and the solid materials is carried out at such a temp. that a condensation of the vapors on the various parts of the charge is avoided. The residues are evacuated

by lateral tubes passing through the wall of the furnace while the material is charged and the vapors are evacuated along the axis of the furnace.

**Apparatus for filtering molten metals** Fortunc Roland Fr 750,209, Aug 8, 1933

**Polymetals** Soc Ltd Wagner Fr 750,302, Aug 8, 1933 In uniting sheets of different metals by hydraulic pressure, the metal forming the base, e g, Cu, and (or) the covering metal, e g, Au, is alloyed with a light metal such as Al or Be which lowers the sp gr.

**Cold-drawing metals** Russell Franks (to Elektro Metallurgical Co) U S 1,942,454, Oct 31 Metal to be drawn such as a ferrous alloy is coated with a vehicle such as a bronzing liquid contg scale like particles of Al the coating is hardened into a tough adherent film, and the metal is then drawn through a die Cf C A 28, 88

**Case-hardening ferrous metals by nitriding** John J Egan (to Elektro Metallurgical Co) U S 1,936,294 Nov 21  $\text{NH}_3$  is brought into contact with the surface heated to nitriding temp while there is closely placed adjacent the surface a metal such as Cu, brass, Al, Si, Cr, V, Mo, Ti or Mn, which may be in the form of a gauze wrapping and which serves to accelerate the nitriding.

**Articles such as cutting tools comprising tantalum carbide** Lloyd C Kelly (to General Elec Co) U S 1,940,435, Nov 21 A hard, tough, sintered compn consists of 1a carbide together with a binder making up about 3-25% of the compn and consisting substantially of W with a smaller proportion of Co.

**Cutting and grinding tools** Paul Hopf U S 1,935,188 Nov 21 For securing granular grinding material such as diamond carbide or silica to a support of hard metal such as iron or steel, the support is coated with soft metal the grinding material is pressed into this coating and the tool thus obtained is coated with a hard, corrosion resisting metal.

**Apparatus for manufacture of rolled strips of metal** Willard Sykes U S 1,936,311, Nov 21 Mech features.

**Apparatus for pickling steel sheets etc** George R Reimer U S 1,935,783 Nov 21 Mech and structural features.

**Apparatus for annealing tools** Heinrich Koppers A G Ger 582,553, Aug 17, 1933

**Pins for artificial teeth** Frederick Maulen (to Baker & Co) U S 1,936,333 Nov 21 Tooth pins are formed of a metal such as Ni having a plurality of coating layers of different corrosion resisting precious metals such as an outer layer of Au and an inner layer of an alloy of Pd with Au or Ag.

**Wire drawing die with a nib of tungsten carbide** Morris Simons U S 1,945,821, Nov 21 Structural details.

**Connector for electric wires** Orson W Brumser (25% to Andrew V Group) U S 1,946,185, Nov 21 A tubular connector is formed of Cu with an inner wall having a frangible coating of uneven thickness formed of harder metal resistant to corrosion such as a Ni-Cr alloy.

**Nitriding iron** Fried Krupp A G (Adolf Fry, inventor) Ger 579,968, July 3, 1933 Fe alloys are hardened by treatment with N first at a temp below the  $\alpha/\gamma$  transformation temp and then at higher temps.

**Device for making blocks from spongy iron** C A Buckelberg Ger 575,795, June 17, 1933

**Steel** Österreichische Schmidtstahlwerke A G (Leo Kluger inventor) Austrian 134,832, Oct 10, 1933 H of resist ant steel contains C 0.5-2, Cr 20-25, Al up to 2, up to 2, and Cu 1-5%, the remainder being Fe.

**Steel** Deutsche Edelstahlwerke A G Ger 578,945 June 19, 1933 A steel alloy contains 1-1.5% C, 2-8% W, 1-1% Cr, 0-5% V and up to 20% Co.

**Steel** Stahlwerke Rohling-Buderus A G and Alfr Kropf Ger 578,946, June 20, 1933 High-speed steel consists of C 0.8, Cr 4.0, W 13-22, Mo 0.5-1.0, V 1.0-1.5% and Ta up to 5%.

**Steel** Vereinigte Stahlwerke A-G Fr 752,208, Sept 19, 1933 Steel is given a surface resistant to wear

1 and a core of high tenacity by carbonizing a soft steel contg Mn 0.6-0.8% until the surface has the eutectoid compn corresponding to the above Mn content, and after ward submitting the sheet for a short time to a heating just above the equil pt of the starting metal and cooling in calm air. The steel may contain Si 0.35-0.8, Ni up to 3 and Cu up to 1.5% Fr 752,209 Wheel rims are made from a eutectoid steel of pure lamellar perlite texture, contg elements generating double carbides in amt such

2 that the content of C is below 0.9%, and contg preferably Si 0.35-0.8%, the steel being alloyed with Ni or Cu or both, e g, Ni 6-7 and Cu 1.5%. Fr 752,210 A eutectoid steel contg elements generating double carbides, particularly Mn, in amts such that the C content is below 0.9%, while preserving the lamellar perlite structure, is conformed by heating to below 850°.

The conformation may be carried out in 2 phases, the 1st to above 950°, the 2nd 3 to below 850° with cooling there. Fr 752,211 Steel alloys are made in a basic Siemens Martin furnace by adding to the slag the alloying elements e g, C, Mo, V, Ti, W, Cu or Ni in the form of their chem compds, e g, their ores, and they are extd from the slag by reduction at the same time as the Mn of the charge, a high temp and a high basicity of the slag are used. The elements pass into the bath of steel.

4 **Hardening high speed steel** Joseph Schlem U S 1,934,741 Nov 14 For hardening an article made of high speed steel of uniform compn, a thin adherent plating of Cr is electrodeposited on a selected portion of the article while leaving the remaining portion of the article free from the plating. The article is then heated to a temp above the crit temp to effect recrystn of the steel, then quenched to effect a general hardening throughout the entire mass without substantial change in compn except, 5 underneath the Cr plating where a thin underlying relatively soft low C Cr alloy layer is formed.

**Tempering steel** Deutsche Pektungesellschaft mb H Fr 733,231 Oct 12, 1933 Solns contg pectic substances as well as gum arabic and glucose, are used for tempering steel and like alloys to retard the lowering of the temp.

**Stainless steel** Thos Iirth & Sons Ltd Ger 577,521, June 1, 1933 See Brit 316,394 (C A 24, 1612)

6 **Softening cobalt alloy steel** Clifford A Nickle (to General Elec Co) U S 1,936,406, Nov 21 Co alloy steel is softened to render it easily machinable by heating to about 900-800° and quickly cooling.

**Aluminum and its alloys** Helmut Lichtmetall G m b H Fr 752,127, Sept 16, 1933 Particularly dense castings of Al and its alloys capable of taking a high polish are made by fusing the metal, adding a mixt of cryolite and fluorspar (4:1) and in amt sufficient to form a fluid film on the metal, and introducing into the bath K antimonate or BaO or a mixt of the 2.

**Chromium, etc** Heracus Vacuumschmelze A-G and Wilhelm Rohm Fr 42,643, Aug 23, 1933 Addn to 730,718 (C A 27, 262) Hydrocarbons, such as  $\text{C}_2\text{H}_6$ , benzene,  $\text{CH}_4$ , natural gas or coal gas, are added to the H used in the reduction process of Fr 730,718, and in amt such that the final product contains practically no C. 8 The H used may be less pure than in the former process.

**Black copper** Société générale métallurgique de Honnain Ger 578,674, June 16, 1933 Impure black Cu, especially that contg metals of the I group, is subjected to a preliminary refining process by fusing it with a slag contg CuO, in a shaft furnace.

**Alloys** W C Heracus G m b H Ger 578,676, June 16, 1933 The mech properties of Pt alloys contg 9 up to 10% Rh, Ni, Fe, Cr, Ta or W, or of Au alloys contg 5-25% Pt and 10% Rh, are improved by heating to over 700°, chilling, and hardening at 400° Cf C A 27, 946.

**Alloys** American Smelting & Refining Co Fr 42,704, Sept 14, 1933 Addn to 713,550 (C A 26, 1571) An alk earth metal carbide is added to a fused metal covered with an appropriate layer of slag and the bath is agitated to submit the particles of the carbide alternately

and constantly to the purifying and solvent action of the slag and of the molten metal. The carbide is in the form of "peas." The temp. is 700-800°.

**Alloys.** Imperial Chemical Industries Ltd. Fr. 753,035, Oct. 5, 1933. Alloys contg. Zn up to 37, Ni at least 2, Al at least 0.5% and Cu the rest are hardened by heating to 800-900°, cooling rapidly and reheating to 300-400°.

**Hard alloys.** Faustel Products Co. Inc. Fr. 752,049, Sept. 15, 1933. A hard alloy contains a carbide of a hard and refractory metal of the 5th group, a metal of the 6th group, and one or more metals of the Fe group, e. g., Ta carbide 80, W or Mo 9 and Ni 11%. Cf. C. A. 27, 3187.

**Working aluminum alloys.** Aluminum Ltd. Fr. 750,460, Aug. 11, 1933. See Brit. 395,273 (C. A. 28, 919).

**Magnetic alloys.** Siemens & Halske A.-G. (Franz Noll, inventor). Ger. 576,509, May 11, 1933. The magnetic properties of Fe alloys contg. Ni or Si are improved by coating the alloy with Na<sub>2</sub>SiO<sub>3</sub> or K<sub>2</sub>SiO<sub>3</sub> and heating.

**Shaped articles from carbide alloys.** Fried. Krupp A.-G. (Hermann Voigtlander and Otto Kaufels, inventors). Ger. 587,117, Oct. 30, 1933. See U. S. 1,895,950 (C. A. 27, 2415).

**Alkaline earth metal alloys of aluminum.** Gustaf N. Kirsebon (to Calloy Ltd.). U. S. 1,935,215, Nov. 14, 1933. See Fr. 749,346 (C. A. 27, 5711).

**Aluminum-magnesium alloys.** Robert S. Archer (to Aluminum Co. of America). U. S. 1,935,608, Nov. 21, 1933. Corrosion-resistant alloys contain Al together with Mg 5-16% and a Si-plus-Fe content of about 0.3-1.0% (with at least about as much Si as of Fe).

**Brass alloy.** Vereinigte deutsche Metallwerke A.-G. Ger. 582,842, Aug. 23, 1933. Addn. to 456,342. Brass for bearings contg. 54-59% Cu contains also 6-8% of Al plus Ni, the amt. of Ni being about double that of Al. Thus, an alloy may contain 57-89% Cu, 33.46% Zn, 2.22% Pb, 4.17% Ni and 2.26% Al.

**Copper alloys.** Siemens & Halske A.-G. (Gunter Hunsel and Karl Dorsch, inventors). Ger. 578,675, June 16, 1933. Cu alloys contg. As, Sb or Bi are worked up by vigorously stirring the powd. alloys with acid solns. of CuCl or CuCl<sub>2</sub>, removing the unchanged alloy, neutralizing the acid remaining in the lye and removing the Cu by usual methods. App. layout is indicated.

**Copper alloys containing silicon and manganese.** Herbert C. Jennison (to American Brass Co.). U. S. 1,936,397, Nov. 21, 1933. Alloys which have good strength and workability are formed of Cu together with Si 0.1-2.5 and Mn 0.01-0.4%. Cf. C. A. 27, 4768.

**Copper-tin alloys.** Johann Kalowi and Bruno Sachs. Ger. 581,507, July 28, 1933. See Fr. 720,087 (C. A. 26, 3772).

**Copper-tin alloys.** Bruno Sachs and Johann Kalowi. Ger. 582,858, Aug. 24, 1933. Addn. to 581,507 (preceding abstr.). Alloys of Cu and Sn are prevented from becoming brittle by heating to 820-970°C, cooling slowly to 495-525°, keeping at these temps. for several hrs. and finally chilling to room temp.

**Ferro-boron.** I. G. Farbenind. A.-G. Fr. 752,251, Sept. 20, 1933. Ferro-boron is obtained as a regulus by causing a mixt. of boracite and Fe oxide, e. g., magnetite, to enter into aluminothermic reaction with an alloy of Al and Mg, in the presence of an oxidizing agent such as KClO<sub>3</sub>.

**Alloy of cast iron.** The Mond Nickel Co. Ltd. Ger. 577,923, June 7, 1933. See Brit. 279,414 (C. A. 22, 2735).

**Iron-chromium-molybdenum-carbon alloy.** Hoersch-Köln-Neusen A.-G. für Bergbau und Huttenbetrieb. Fr. 750,197, Aug. 5, 1933. A rustless alloy contains Cr 16-22, Mo 1-3, C 0.1% and Fe the rest.

**Heat-treating magnesium alloys containing manganese.** John A. Gann and Leo B. Grant (to Dow Chemical Co.). U. S. 1,936,550, Nov. 21, 1933. Mg alloys such as those contg. over 0.5% Mn in solid soln. are subjected to heat treatment at 250-500°, in order to raise their yield point and Brinell hardness.

**Alloys of palladium, copper and silver.** Edmund M. Wise (to International Nickel Co.). U. S. 1,935,897, Nov. 21, 1933. Alloys which are suitable for dental uses, as elec. conductors, etc., contain Pd 25-98, Cu 1-50 and Ag 1% or more and are substantially free from Fe or other metals which would impair the ductility of the alloy. Cf. C. A. 27, 4210.

**Non-tarnishing alloys containing silver and indium, etc.** Wm. S. Murray and Daniel Gray (to Oneida Community, Ltd.). U. S. 1,934,730, Nov. 14, 1933. Alloys such as those contg. Ag together with In have their colors modified by the addn. also of a smaller proportion of Au, Pd, Cd or Cu.

**Rust prevention.** Chemieprodukte G. m. b. H. Ger. 578,520, June 14, 1933. Welded joints on Fe tubes are protected against rusting by a paste contg. petrolatum, pyroparaffins, protoparaffins, K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, Na<sub>2</sub>PO<sub>4</sub> and isocholesterol.

**Protecting metals.** I. G. Farbenind. A.-G. (Eduard Tschunkur, Albert Klamroth and Hans Ahrens, inventors). Ger. 579,955, July 3, 1933. Metals are protected against corrosion by non-oxidizing acids by adding aralkyl sulfides or polysulfides to solns. of the acids. Thus, benzyl sulfide is added to H<sub>2</sub>SO<sub>4</sub>.

**Protecting lead.** Compagnie générale d'électricité. Fr. 42,700, Oct. 10, 1933. Addn. to 716,148 (C. A. 26, 1892). Pb is sulfurized by the application of a grease contg. S or S derivs. Resin or resin oil may be added to the grease.

**Silver plating.** Alphonse Tabarant. Fr. 750,476, Aug. 11, 1933. Cu and Fe are silvered without external current in a liquid composed of 2 solns. A and B mixed together. A is obtained by dissolving Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> in water and adding AgBr. B is obtained by adding a satd. soln. of Pt chloride to water and then adding red K chromate. Decompn. of the final soln. by light is prevented by adding a little Ag blue called Borel.

**Apparatus for coating objects by immersion in fused metal baths.** Albin Bohacek. Ger. 582,862, Aug. 24, 1933.

**Coating aluminum alloys.** Vereinigte Aluminium-Werke A.-G. Ger. 587,257, Nov. 1, 1933. In protecting Al alloys from corrosion by coating them with Al or other Al alloys, a very thin layer of Pb, Cd or Sn or their alloys is interposed between the alloy and the coating. Diffusion of alloy components into the coating during the tempering of the alloy is thus prevented.

**Aluminum surfaces.** Aluminum Colors Inc. Fr. 750,391, Aug. 9, 1933. Surfaces of Al or Al alloys are covered with a layer of oxide which is treated by a metal compd. and an oxidizing agent in the dissolved state to produce a metal oxide of a characteristic color in the said layer.

**Corrosion-resistant coatings on aluminum and its alloys.** Alexander Jenuy and Nikolai Budloff (to Siemens & Halske A.-G.). U. S. 1,936,058, Nov. 21, 1933. Articles of Al or its alloys are immersed in a satd. soln. of chromic acid and an a. c. is passed between the articles through the soln.

**Coating iron with zinc.** Carl Wallmann and Wilhelm Radeker. Ger. 587,166, Oct. 30, 1933. Fe is dipped into fused Zn contg. a little Cr.

**Apparatus for galvanizing articles such as pipe lengths.** John W. Free (to Jones and Laughlin Steel Corp.). U. S. 1,935,087, Nov. 14, 1933. Structural and mech. features.

**Apparatus for galvanizing iron or steel wire, etc.** Julian L. Schueler. U. S. 1,936,487, Nov. 21, 1933. An adjustable device is provided for regulating the amt. of molten coating remaining on the material and flame-treating is provided for uniformly distributing the coating material.

**Phosphates of alkylolamine compounds.** Herbert O. Albrecht (to E. I. du Pont de Nemours & Co.). U. S. 1,936,533, Nov. 21, 1933. A compn. suitable for coating metals to prevent rusting and which is sol. in hydrocarbon solvents comprises a reaction product of an acid of P such as H<sub>3</sub>PO<sub>4</sub> with an ester consisting of the reaction product of an alkylolamine such as triethanolamine and a fatty acid, fatty oil or natural resin acid. Various examples and modifications are described.

**Welding electrode.** Alfred C. Castle (to A. M. Castle

& Co.). U. S. 1,936,348, Nov. 21. A ferrous metal welding rod is provided with an inner coating formed mainly of silica together with carbon and a binder such as "ferrotite" or Na silicate and with an outer coating comprising finely divided carbon,  $\text{MnO}_2$ ,  $\text{Na}_2\text{CO}_3$ , and  $\text{CaCO}_3$ . (U. S. 1,936,349 relates to a welding rod coating compn. comprising a major proportion of  $\text{CaCO}_3$ , together with  $\text{Fe}_2\text{O}_3$ , borax and quantities of  $\text{Na}_2\text{PO}_4$  and magnesia which together are not greater than the amount of the borax.)

**Welding flux compositions.** Ferdinand de Pape (to

La Soudure electrique autogene, Soc. anon.). U. S. 1,936,010, Nov. 21. A saline mixt. such as one comprising alk. chlorides is treated with an acid such as  $\text{H}_2\text{SiF}_6$  and after adding a compd. of a metal of the Ce group such as  $\text{Ce}(\text{SO}_4)_2$  the mass is peptized with a basic peptizing agent such as KOH. Cf. C. A. 27, 2660.

**Joining difficultly solderable metals.** Miner M. Austin (to Fansteel Products Co.). U. S. 1,936,222, Nov. 21.  $\text{K}_2\text{Ta}$  double fluoride is used as a flux in joining metals such as Ta, Nb or W with other metals.

## 10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CHARLACK J. WEST

**Pyrolysis of hydrocarbons. Further studies on the butanes.** Charles D. Hurd and Forrest D. Pilgrim. *J. Am. Chem. Soc.* 55, 4902-7 (1933); cf. C. A. 24, 53. Expts. with the butanes demonstrate that similar results may be expected in tubes of widely varying sizes if a const. contact time is maintained in the various tubes. The inverse relationship between temp. and contact time is pointed out. Decompn. of  $\text{C}_4\text{H}_{10}$  or iso- $\text{C}_4\text{H}_{10}$  in Fe or Ni tubes at  $600^\circ$  pursued practically the same course as that observed in quartz tubes; Monel, however, exerted a vigorous catalytic action at this temp. The change was largely one into C and H. The fact that no iso- $\text{C}_4\text{H}_{10}$  is formed during the pyrolysis is sufficient evidence that the C chain does not undergo rearrangement in this process.

C. J. West

**Pyrolysis of butane at low decomposition temperatures.** Charles D. Hurd, C. I. Parrish and F. D. Pilgrim. *J. Am. Chem. Soc.* 55, 5016-19 (1933).—The pyrolytic products from  $\text{C}_4\text{H}_{10}$  at incipient decompn. temps. include  $\text{C}_2\text{H}_4$ ,  $\text{C}_2\text{H}_2$  and traces of H as well as  $\text{CH}_4$  and  $\text{C}_3\text{H}_6$ . No evidence could be found to support the contention that there is scission at the exclusive C-C location in the mol. if temps. near the "initial decompn. temps." are used.

C. J. West

**Octanes.** Frank C. Whitmore and K. C. Laughlin. *J. Am. Chem. Soc.* 55, 5056 (1933). All 18 of the structurally isomeric octanes have been synthesized.

C. J. West

**Syntheses in the olefin series. V. Completing the survey of the hexenes and including certain heptenes and octenes.** Ivan Schurman and Cecil E. Board. *J. Am. Chem. Soc.* 55, 4930-5 (1933). cf. C. A. 27, 4770. Dehydration of  $\text{Me}(\text{OH})\text{CHMe}_2$  with  $(\text{CO})\text{H}_2$  gives  $\text{Me}(\text{CMe})_2$ ,  $b_{10}$  72.9-73.2°,  $n_D^{20}$  1.4081,  $d_4^{20}$  0.7081,  $n_D^{25}$  1.4113,  $n_D^{30}$  1.4067,  $n_D^{35}$  1.41775, and  $\text{Me}(\text{CHCMe})_2$ ,  $b_{10}$  55.6-56°,  $n_D^{20}$  1.420,  $d_4^{20}$  0.6810,  $n_D^{25}$  1.3899. The following methyl xanthates were prepd.: methyl-*tert*-butylcarbamate,  $b_{10}$  85.7°,  $d_4^{20}$  1.0255,  $n_D^{20}$  1.5242 (75% yield), methyl-*tert*-amyl,  $b_{10}$  110.2°,  $d_4^{20}$  1.0235,  $n_D^{20}$  1.5250, ethyl-*tert*-butyl,  $b_{10}$  92.2-93°,  $d_4^{20}$  1.0014,  $n_D^{20}$  1.5206; ethyl-*tert*-amyl,  $b_{10}$  118.20°,  $d_4^{20}$  1.0160,  $n_D^{20}$  1.5210; propyl-*tert*-butyl,  $b_{10}$  112.1°,  $d_4^{20}$  0.9950,  $n_D^{20}$  1.5122. Decompn. gives the following olefins: 3,3-dimethyl-1-butene,  $b_{10}$  11.2°,  $d_4^{20}$  0.6510,  $n_D^{20}$  1.3759, 3,3-dimethyl-1-pentene,  $b_{10}$  76.9°,  $d_4^{20}$  0.6061,  $n_D^{20}$  1.3901; 4,4-dimethyl-2-pentene,  $b_{10}$  76.6-77°,  $d_4^{20}$  0.6881,  $n_D^{20}$  1.3980, 4,4-dimethyl-2-hexene,  $b_{10}$  105.1-106°,  $d_4^{20}$  0.7202,  $n_D^{20}$  1.4120; 2,2-dimethyl-3-hexene,  $b_{10}$  100.1°,  $d_4^{20}$  0.7048,  $n_D^{20}$  1.4068; 1,2-Dibromo 3,3-dimethylpentane,  $b_{10}$  95.3-95.6°,  $d_4^{20}$  1.5615,  $n_D^{20}$  1.5109; 2,3-dibromo-1,4-dimethylpentane,  $b_{10}$  92.8-93°,  $d_4^{20}$  1.5538,  $n_D^{20}$  1.5080; 2,3-dibromo-1,4-dimethylhexane,  $b_{10}$  92.3°,  $d_4^{20}$  1.5148,  $n_D^{20}$  1.5113; 3,4-dibromo-2,2-dimethylhexane,  $b_{10}$  96.5-97°,  $d_4^{20}$  1.4856,  $n_D^{20}$  1.5032. As evidence that a skeletal rearrangement did not take place in the formation of these olefins, 1,4-dimethyl-2-pentene was reduced to 2,2-dimethylpentane, 3,3-dimethyl-1-pentene to 3,3-dimethylpentane, 4,4-dimethyl-2-hexene to 3,3-dimethylhexane and 2,2-dimethyl-3-hexene to 2,2-dimethylhexane.

C. J. West

**The point of cleavage of chemical linkage in unsaturated compounds.** Ryohei Oda. *Sci. Papers Inst. Phys.*

*Chem. Research* (Tokyo) 22, 47-58 (1933). O. has extended Schmidt's "double bond" rule (C. A. 26, 3710) for the splitting of the C-C linkage of unsatd. compds. of the paraffins, hexaphenylethane series, sugar splitting and hydrated splitting of polyales. to include the malonic acid series, nitro compds., halides, ethers, tertiary alcs. and mol. rearrangement involving unsatn. The double-bond rule is also assocd. with the disson. consts. of fatty acids.

Julius White

**Theory of multiple binding.** A. Burawoy. *Z. physik. Chem.* A166, 393-400 (1933); cf. C. A. 27, 2866. From optical considerations, B. concludes that org. compds. with double bonds are to be considered as being in electronic isomeric states. The states may be represented by the formulas:  $E = E' - E'' - E'''$ ;  $E = E' - E'' = E'''$

and  $E = E' - E'' = E'''$ . All properties of these compds. can be explained in this way. The reactivity of unsatd. compds. is also easily explained.

G. M. Murphy

**Properties of conjugated compounds. XVI. Dipole moments and atomic polarization of the monomethyl- and dimethylbutadienes.** E. Harold Farmer and Frank L. Warren. *J. Chem. Soc.* 1933, 1297-301; cf. C. A. 26, 2417.—Data are given for the dielec. const.,  $d$ , and polarization for solns. of  $\beta$ -Me,  $\beta,\gamma$ -di-Me and  $\alpha,\alpha$ -di-Me derivs. of butadiene at  $-75$  to  $50^\circ$  in intervals of  $25^\circ$ ; values for  $\mu \times 10^{18}$  e. s. u. are 0.15, 0 and 0.52, resp. The values for the dipole moment would seem to indicate that alkyl substitution at the  $\alpha$ -C atom of a butadiene chain causes a greater permanent polarization of the mol. than similar substitution at the  $\beta$ -C atom. XVII. Determination of the dipole moments of the monomethyl and dimethylbutadienes. *Ibid.* 1302-4.—Values for  $\mu \times 10^{18}$  e. s. u. are reported as follows for the alkyl derivs. of butadiene:  $\alpha$ -Me 0.50,  $\alpha,\beta$ -di-Me 0.53,  $\alpha,\gamma$ -di-Me 0.59,  $\alpha,\delta$ -di-Me 0.36, 0.31 (low- and high-boiling fractions),  $\beta,\gamma$ -di-Me 0. Values for  $d$  of  $\text{C}_4\text{H}_6$  solns. at  $25^\circ$  are given.

C. J. West

**Secondary isoamyl chloride, 3-chloro-2-methylbutane.** Frank C. Whitmore and Franklin Johnston. *J. Am. Chem. Soc.* 55, 5020-2 (1933).—Addn. of HCl to  $\text{Me}_2\text{CHCH}(\text{CH}_3)_2$  in sealed tubes in the dark at room temp. gives 88% of a mixt. of about equal amts. of *tert*- and *sec*-AmCl; the *tert*-AmCl was removed by repeated hydrolysis with  $\text{H}_2\text{O}$  at room temp. The  $\text{Me}_2\text{CHCHClMe}$   $b_{10}$  91.0°; it is stable at its b. p. at atm. pressure, stable at  $100^\circ$  for 24 hrs. and stable to  $\text{H}_2\text{O}$  at room temp. A new type of rearrangement resulting from the addn. to an olefinic linkage is indicated.

C. J. West

**$\alpha,\alpha$ -Dibromopentane.** John D. A. Johnson. *J. Chem. Soc.* 1933, 1531-2.— $\alpha,\alpha$ -Dibromopentane (I), prepd. from benzopiperidine and  $\text{PBr}_3$  and purified in the usual way, contains so much  $\text{PhCN}$  as to be almost unacted upon by  $\text{Mg}$  in  $\text{Et}_2\text{O}$ . The following process gives a pure product: the crude mixt., after removal of  $\text{POBr}_3$ , is washed, distd. and the fraction  $b_{10}$  105° or below in ligroin ( $b. p.$   $40^\circ$ ) extd. 7 times with concd.  $\text{H}_2\text{SO}_4$ ; the ligroin soln. is then washed with  $\text{NaOH}$  and  $\text{H}_2\text{O}$ , dried and distd. I m.  $-29.5^\circ$ ,  $b_{10}$  95.5°,  $d_4^{20}$  1.6995,  $d_4^{25}$  1.6583,  $n_D^{20}$  1.5136,  $n_D^{25}$  1.40.3,  $n_D^{30}$  1.36.8 dynes/cm.,  $[\eta]^{20}$  340.9,  $[\eta]^{30}$  341.0 (calcd. 331).

C. J. West

**Preparation of crotylmagnesium bromide. Effect of solvents on the yield of crotyl and allylmagnesium bromides.** Wm. G. Young, Arthur N. Prater and Saul Winstein. *J. Am. Chem. Soc.* 55, 4908-11 (1933).—The yield of crotylmagnesium bromide in Et<sub>2</sub>O is about 90% if the time for bromide addn. is 275 min., if the ratio of solvent to bromide is 0.5 and if 20-30-mesh freshly prepd. Mg turnings are used; Mg-Cu alloy has a detrimental effect. In Bu<sub>2</sub>O the tendency to coupling is far more pronounced than in Et<sub>2</sub>O. It is necessary to use much larger ratios of solvent (76) and of Mg to bromide (11-12) and extremely vigorous stirring is necessary.

C. J. West

**Molecular rotations in members of homologous series.** P. A. Levene and R. J. Mark. *J. Biol. Chem.* 103, 299-309 (1933).—On forming a homologous series with respect to R' in a substance of the type R'CH(CH<sub>2</sub>)<sub>n</sub>X the rotations vary more or less irregularly. In the series with respect to (CH<sub>2</sub>)<sub>n</sub>X as the functional group becomes more remote from the center of asymmetry the influence of CH<sub>2</sub>X approaches that of Me. Thus the rotation of Me(CH<sub>2</sub>)<sub>n-1</sub>MeCH(CH<sub>2</sub>)<sub>n-1</sub>CH<sub>2</sub>X should approach zero and the direction of rotation of members of the series higher with respect to (CH<sub>2</sub>)<sub>n</sub>Me should be opposite to that of the lower members. Such a condition holds when X is OH and n is 3 or 4 and when R' contains as many C atoms as the radical (CH<sub>2</sub>)<sub>n-1</sub>CH<sub>2</sub>OH. The zero rotation is due to the sum of the contributions of the substituents approaching zero since the alcs. give active bromides. 4-Methyl-1-heptanol, b<sub>18</sub> 81°, optically inactive, from 3-methyl-1-bromohexane Grignard compd and CH<sub>2</sub>O, with PBr<sub>3</sub> gave 1-1-methyl-1-bromoheptane, b<sub>18</sub> 80°, [M]<sub>D</sub><sup>25</sup> -14.5°. d-Et 8-methylenanthate, b<sub>28</sub> 95°, d<sub>4</sub><sup>25</sup> 0.865, [M]<sub>D</sub><sup>25</sup> 12.84, with Na and abs. alc. gave d-5-methyl-1-heptanol, b<sub>28</sub> 87°, [M]<sub>D</sub><sup>25</sup> 12°, which with PBr<sub>3</sub> gave d-5-methyl-1-bromoheptane, b<sub>18</sub> 86°, [M]<sub>D</sub><sup>25</sup> 14.92°. Similarly, d-Et 6-methylcaprylate, b<sub>28</sub> 110°, d<sub>4</sub><sup>25</sup> 0.868, [M]<sub>D</sub><sup>25</sup> 13.66°, gave d-6-methyl-1-octanol, b<sub>28</sub> 100°, d<sub>4</sub><sup>25</sup> 0.828, [M]<sub>D</sub><sup>25</sup> 12.5°, and d-6-methyl-1-bromooctane, b<sub>18</sub> 101°, d<sub>4</sub><sup>25</sup> 1.086, [M]<sub>D</sub><sup>25</sup> 13.96°. 1-Et 8-propylcaproate, b<sub>28</sub> 112°, d<sub>4</sub><sup>25</sup> 0.865, [M]<sub>D</sub><sup>25</sup> -5.9°, gave 1-5-propyl-1-hexanol, b<sub>28</sub> 110°, d<sub>4</sub><sup>25</sup> 0.828, [M]<sub>D</sub><sup>25</sup> -1.72°, and 1-5-propyl-1-bromohexane, b<sub>18</sub> 95°, d<sub>4</sub><sup>25</sup> 1.082, [M]<sub>D</sub><sup>25</sup> -7.78°. 1-Et 8-butylocaproate, b<sub>28</sub> 125°, d<sub>4</sub><sup>25</sup> 0.862, [M]<sub>D</sub><sup>25</sup> -2.84°, gave 5-butyl-1-hexanol, b<sub>28</sub> 125°, d<sub>4</sub><sup>25</sup> 0.831, optically inactive, and 1-5-butyl-1-bromohexane, b<sub>18</sub> 112°, d<sub>4</sub><sup>25</sup> 1.062, [M]<sub>D</sub><sup>25</sup> -5.29°. 1-Et 8-amylcaproate, b<sub>28</sub> 140°, d<sub>4</sub><sup>25</sup> 0.864, [M]<sub>D</sub><sup>25</sup> -1.69°, gave d-5-amyl-1-hexanol, b<sub>28</sub> 140°, d<sub>4</sub><sup>25</sup> 0.840, [M]<sub>D</sub><sup>25</sup> 1.85°, and 1-5-amyl-1-bromohexane, b<sub>18</sub> 124°, d<sub>4</sub><sup>25</sup> 1.044, [M]<sub>D</sub><sup>25</sup> -4.02°.

R. C. Elderfield

**Influence of a quaternary ammonium group on the hydrogen atoms of an adjacent methylene group.** Arnold O. Jackson and C. S. Marvel. *J. Am. Chem. Soc.* 55, 5000-2 (1933).—ClCH<sub>2</sub>CO<sub>2</sub>Et and Me<sub>4</sub>N in EtOH give 72% of carbethoxymethyltrimethylammonium chloride (I), m. 166.7°; the bromide (II), m. 158-9° (67% yield); BrCH<sub>2</sub>CONH<sub>2</sub> gives 86% of carbamylmethyltrimethylammonium bromide (III), m. 203-4°; bromocyanooacetamide, m. 176.7° (61% yield), gives 77% of cyanooacetamidatrimethylammonium bromide (IV), m. 199-200°. Treatment of I and II with EtONa and EtBr did not effect alkylation of the -CH<sub>2</sub>- group; I is changed into II in the reaction. IV is converted into III by hot EtOH-EtONa. III is not alkylated by EtONa and an alkyl halide.

C. J. West

**The effect of ethyl radicals on the thermal decomposition of azomethane. The kinetics of the thermal decomposition of tetraethyllead. Ethyl radicals and hydrogen.** John A. Leermakers. *J. Am. Chem. Soc.* 55, 4508-18 (1933).—The kinetics of the thermal decompn. of Pb-Et<sub>2</sub> were studied at 245°, 260° and 275° and from initial pressures of 13-52 mm. The decompn. was found to be unimol. and 96-97% homogeneous. The rate consts. are given accurately given by the equation  $k_1 = 1.2 \times 10^{12} e^{-10,900/RT}$  sec.<sup>-1</sup>. Since the rate of decompn. of PbEt<sub>2</sub> at temps. around 275° is not affected by the presence of

CH<sub>3</sub>N<sub>2</sub> (I), Et radicals do not react with I. One may conclude therefore that there are no chains accompanying the unimol. decompn. of I. Et radicals react very little, if at all, with H<sub>2</sub> at 275°. The activation energies of bimol. reactions of Et radicals with H<sub>2</sub> or I are calcd. to be greater than 15 kg. cal.

Louise Kelley

**Organic reactions with boron fluoride. VI. Reaction of acetamide with alcohols and phenol.** Frank J. Sowa and Julius A. Nicuwlund. *J. Am. Chem. Soc.* 55, 5052-3 (1933); cf. C. A. 27, 4785.—The addn. compd. formed between AcNH<sub>2</sub> and BF<sub>3</sub> reacts rapidly with alcs. and PhOH to form acetates and monoaminoboron fluoride, by this method the acetates of MeOH, EtOH, iso-PrOH, BuOH, tert-BuOH and PhOH have been prepd. in yields of 71, 69, 32, 50, 38 and 50%, resp. It is possible to recover practically all of the BF<sub>3</sub> by treatment with H<sub>2</sub>SO<sub>4</sub>.

C. J. West

**Triphenylsilyl ethylamine, (C<sub>6</sub>H<sub>5</sub>)<sub>3</sub>Si.C<sub>2</sub>H<sub>5</sub>NH<sub>2</sub>.** Charles A. Kraus and Harry Batough. *J. Am. Chem. Soc.* 55, 5008-14 (1933).—Ph<sub>3</sub>SiBr and Li in EtNH<sub>2</sub> form triphenylsilyl ethylamine, m. 45°; it does not dissociate at 150° in a high vacuum; in boiling Et<sub>2</sub>O, Ph<sub>3</sub>Si<sub>2</sub> is formed, it does not react with Na in liquid NH<sub>3</sub>. Li in EtNH<sub>2</sub> gives Li triphenylsilyl (I), a cryst. solid. I and NH<sub>4</sub>Br give Ph<sub>3</sub>SiH, LiBr and NH<sub>3</sub>; PhBr gives Ph<sub>3</sub>Si and LiBr. I and Me<sub>3</sub>SnCl.NH<sub>3</sub> in liquid NH<sub>3</sub> give trimethylstannyl-triphenylsilyl, a viscous liquid; with Na in liquid NH<sub>3</sub>, there results Ph<sub>3</sub>SiNa and Me<sub>3</sub>SnNa; Br gives Me<sub>3</sub>SnBr and Ph<sub>3</sub>SiBr.

C. J. West

**Aliphatic germanium derivatives. III. Ethylgermanium trihalides.** H. A. Flood. *J. Am. Chem. Soc.* 55, 4935-8 (1933); cf. C. A. 26, 2720. GeI<sub>4</sub> and EtI, heated in an air-free tube at 110° for 3 days, give 86% of ethylgermanium triiodide (I), lemon-yellow, b<sub>28</sub> 281°, m. -1.3° to -2.5°; it is stable at 300° but at 350° gives gas and GeI<sub>4</sub>; while I does not react appreciably with "mol." Ag at 220°, it reacts slowly with hot Hg and rapidly with other more electropos. metals at temps. as low as 100°. Ag I and freshly prepd. Ag<sub>2</sub>O give monoethylgermanium oxide, (EtGeO)<sub>2</sub>O (II), a glass, which does not m. at 300° but sublimes and decompn. at higher temps. in vacuo HCl gives the trichloride, b<sub>18</sub> 141°. Ammonolysis of I gives the nitride. II and P<sub>2</sub>O<sub>5</sub>, over which HBr is passed, gives the tribromide, b<sub>28</sub> 200°; the trifluoride, b<sub>28</sub> 112°, m. -15.5° to -16.5°.

C. J. West

**Improved method of preparing diethylgermanium derivatives.** L. Horvitz and H. A. Flood. *J. Am. Chem. Soc.* 55, 5055 (1933).—EtGeI<sub>3</sub> and an excess of 40-60 Ph-Bi alloy are heated in the absence of air to 150° for 1-2 days, the product is extd. with dry Et<sub>2</sub>O or ligrom and the viscous yellow residue in EtI is heated at 125° for 2-3 days and the EtGeI<sub>3</sub> distd. Et<sub>2</sub>GeI<sub>2</sub> b<sub>28</sub> 252°, m. 2° to -1°; Et<sub>2</sub>GeCl<sub>2</sub>, b<sub>28</sub> 175°, m. -39° to -37°. The impure diiodide may be hydrolyzed by aq. NaOH to the oxide.

C. J. West

**Condensation reactions of unsaturated aldehydes. IV. Formation of dicrotonaldehyde and of octatrienal from crotonaldehyde.** Konrad Bernhauer and Robert Drobniak. *Biochem. Z.* 266, 197-201 (1933).—Methods of prepn. are described.

S. Morgulis

**Acetamide and benzamide.** F. Govaert. *Natuurw. Tijdschr.* 15, 149-53 (1933).—AcNH<sub>2</sub> and BzNH<sub>2</sub> can readily be prepd. from the chlorides + liquid NH<sub>3</sub>, 40-50 cc. dry liquid NH<sub>3</sub> is condensed in a 25 × 3 cm test tube; to it is added dropwise in 15 min. 15 g. AcCl in 50 cc. Et<sub>2</sub>O while shaking mechanically (heat liberated). The NH<sub>3</sub> is evapd., the ether distd. off and the mass extd. twice with boiling EtOH, this is evapd., and the product redistd. in vacuo; yield 10 g. (88%). For BzNH<sub>2</sub> there is substituted 15 g. BzCl in 60 cc. Et<sub>2</sub>O. After evapn. of the NH<sub>3</sub> the ether is sucked off, the solid residue shaken with H<sub>2</sub>O to remove NH<sub>4</sub> salts and the remaining BzNH<sub>2</sub> is dried; yield 98%. An alternate method for both substances is: Pass through 50-60 cc. ether cooled to -20° a rapid NH<sub>3</sub> stream and add after a few min. slowly 15 g. AcCl in 30-40 cc. ether (10 min.); the reaction is instantaneous. Pour off the ether and distil (a small amt

of amide is dissolved), ext. the solid residue with warm  $\text{H}_2\text{O}$ , distill off and vacuum-distill; yield 88–90%. For  $\text{BzCl}$ , the residue after sucking off the ether is washed with cold  $\text{H}_2\text{O}$  and dried; yield quant. The ether used in the expts. should be distd. over  $\text{Na}$ .

B. J. C. van der Hoeven

**Some ammonolytic reactions.** Edward C. Franklin. *J. Am. Chem. Soc.* 55, 4912–15 (1933).—The method of prep. of  $\text{Et}_2\text{NCN}$  and its hydrolysis are in accordance with the assumption that it is a di-Et ammonocarbonate. Ammonolysis of  $\text{Et}_2\text{NCN}$ ,  $\text{Pr}_2\text{NCN}$  and  $(\text{iso-Bu})_2\text{NCN}$  give approx. 100%  $\text{K}_2\text{NCN}$  and about 75%  $\text{R}_2\text{NH}$ .  $\text{PhN}:\text{C}(\text{NHPh})_2$  in liquid  $\text{NH}_3$  at  $200^\circ$  gives  $\text{PhNH}_2$  and  $\text{HN}:\text{C}(\text{NH}_2)_2$ .  $\text{KNH}_2$  and dialkylcyanamides in cold liquid  $\text{NH}_3$  give  $\text{K}$  salts of dialkylguanidines; *Me*, *Et*, *iso-Pr*, *iso-Bu*, *iso-Am* were prep.; also the  $\text{Na}$  salts of *Et* and *iso-Bu*.  $\text{H}_2\text{NCO}(\text{NHMe})$  on ammonolysis gives  $\text{MeNH}_2$ ,  $\text{CO}(\text{NH}_2)_2$  and guanidine;  $(\text{PhNH})_2\text{CO}$  and  $\text{NH}_3$  give  $\text{PhNH}_2$  and  $\text{CO}(\text{NH}_2)_2$ , with some guanidine;  $\text{NH}_2$  in  $\text{EtOH}$  at  $150^\circ$  gives  $\text{PhNH}_2$  and  $\text{CO}(\text{NH}_2)_2$ .  $\text{AcONH}_2$  or  $\text{AcNH}_2$  in  $\text{NH}_3$ - $\text{NH}_4\text{Cl}$  gives  $\text{MeC}(:\text{NH})\text{NH}_2$ , readily hydrolyzed to  $\text{AcNH}_2$  and then  $\text{AcOH}$ .  $\text{MeC}(:\text{NPh})\text{NIHPh}$  and  $\text{NH}_3$  give  $\text{MeC}(:\text{NH})\text{NH}_2$  and  $\text{PhNH}_2$ ; diphenylbenzamidine behaves similarly.  $\text{PhNHAc}$  gives  $\text{MeC}(:\text{NH})\text{NH}_2$  and  $\text{PhNH}_2$ .  $\text{PhCCl}_2$  and  $\text{NH}_3$  give 75%  $\text{PhCN}$ .

C. J. West

**Metallic salts of carboxazyl acids.** Edward C. Franklin. *J. Am. Chem. Soc.* 55, 4915–17 (1933).—Alkaline metal amides react in liquid  $\text{NH}_3$  with acid amides (carboxazyl acids) to give metallic salts; there were prep.:  $\text{HCONiK}$ ,  $\text{HCONiNa}$ ,  $\text{AcNHK}$ ,  $\text{PrCONiK}$ ,  $\text{BuCO-NiK}$ ,  $\text{C}_6\text{H}_5\text{CONiK}$ ,  $\text{BzNHK}$ ,  $\text{C}_6\text{H}_5\text{CONiK}$  and  $\text{CH}_3\text{CONiK}$ . When heated in the dry state these salts yield satd hydrocarbons and  $\text{KNCN}$ . Attention is called to the close resemblance between the reactions represented by the equations:  $\text{RCOK} + \text{KOH} = \text{RH} + \text{KCO}_2$ ,  $\text{RC(Ni)NHK} + \text{KNH}_2 = \text{RH} + \text{K}_2\text{CN}_2$  and  $\text{RCNiK} = \text{RH} + \text{KNCN}$ .

C. J. West

**Rotation of polar groups in organic compounds.** Julian M. Sturtevant. *J. Am. Chem. Soc.* 55, 4478–85 (1933).—In certain cases of strong dipole interaction between polar groups capable of rotation about a single bond in org. mols., application of quantum methods to the study of the motion of these groups leads to practically the same results as those obtained on the classical theory at temps. within the range of exptl. observations. With  $\text{Ac}_2$  the calcd. values of the elec. moment agree very well with expt. over a temp. range of  $200^\circ$ . Classical calcns. indicate that the elec. moment of  $\text{HCO}_2\text{H}$  should show a considerable temp. variation; this agrees with exptl. observations.

Louise Kelley

**Polymerization and ring formation. XIX Many-membered cyclic anhydrides.** Julian W. Hill and Wallace H. Carothers. *J. Am. Chem. Soc.* 55, 5023–31 (1933); cf. *ibid.* 28, 1054.—Data are presented on the anhydrides of dibasic acids  $(\text{CH}_2)_n(\text{CO}_2\text{H})_2$ , where  $n$  is 4–12 and 16, the anhydrides are all linear polymers and when heated in a mol. still they are depolymerized, yielding volatile products ( $\beta$ -anhydrides). The latter are either cyclic monomers or dimers depending upon the unit length,  $n + 3$ . The compds. thus obtained are rings of 5, 18 (dimeric), 10, 22 (dimeric), 12, 26 (dimeric), 14, 18 and 19 atoms. The dimers are cryst. solids which polymerize instantly when heated above their m. ps. The monomers are liquids or low-melting solids which polymerize at lower temps. than the dimers. The monomers of 8–10 and 12 atoms are exceedingly unstable and polymerize rapidly even below room temp. The following  $\alpha$ -polyanhydrides were prep. by refluxing the acid with 6 parts  $\text{Ac}_2\text{O}$  for 4–6 hrs. and pptg. from  $\text{C}_6\text{H}_6$  with petrol ether: *pinelic* (I), m.  $53\text{--}55^\circ$ ; *suberic* (II), m.  $65\text{--}66^\circ$ ; *azelaic* (III), m.  $53\text{--}55^\circ$ ; *undecanedioic* (IV), m.  $69\text{--}70^\circ$ ; *dodecanedioic* (V), m.  $86\text{--}87^\circ$ ; *brassylic* (VI), m.  $78\text{--}80^\circ$ ; *tetradecanedioic* (VII), m.  $80\text{--}91^\circ$ ; *stearic* (VIII), m.  $94\text{--}95^\circ$ . These react with  $\text{PhNH}$  to furnish the dibasic acid, its monoanilide and its anilide in the ratio 1:2:1. *Monoanilides*: I, m.  $108\text{--}9^\circ$ ;

II, m.  $128\text{--}9^\circ$ ; III, m.  $107\text{--}8^\circ$ ; IV, m.  $112.5\text{--}3^\circ$ ; V, m.  $123^\circ$ ; VI, m.  $118.6\text{--}9.5^\circ$ ; VII, m.  $124\text{--}5^\circ$ ; VIII, m.  $128\text{--}9^\circ$ . *Dianilides*: I, m.  $155\text{--}6^\circ$ ; II, m.  $186\text{--}7^\circ$ ; III, m.  $186\text{--}7^\circ$ ; IV, m.  $160\text{--}1^\circ$ ; V, m.  $170\text{--}1^\circ$ ; VI, m.  $160\text{--}1^\circ$ ; VII, m.  $169.5\text{--}70^\circ$ ; VIII, m.  $162\text{--}3^\circ$ . In the study of the depolymerization of these anhydrides, the product, size of ring, m. p. and stability were detd. Adipic, monomer, 7, m.  $20^\circ$ , unstable; I, monomer, 8, liquid, extremely unstable; II, dimer, 18, m.  $56\text{--}7^\circ$ , stable up to m. p.; III, monomer, 10, liquid, extremely unstable; sebacic, dimer, 22, m.  $68^\circ$ , stable up to the m. p.; IV, monomer, 12, liquid, extremely unstable; V, dimer, 26, m.  $76\text{--}8^\circ$ , stable up to the m. p.; VI, monomer, 14, liquid, unstable; VII, monomer, 15, liquid, unstable; VIII, monomer, 19, m.  $36\text{--}7^\circ$ , unstable. The  $\beta$ -anhydrides on being heated or allowed to stand readily revert to a polymeric form, the  $\gamma$ -anhydride; in their phys. properties these are generally practically indistinguishable from the  $\alpha$ -anhydrides; however, the latter structurally are probably open chains terminated by  $\text{Ac}$  groups while the former, at least when freshly formed under anhyd. conditions, are perhaps giant rings. XX. Many-membered cyclic esters. *Ibid.* 5031–9.—By heating linear polyesters with catalysts under certain conditions it is possible in many cases to bring about a smooth depolymerization to the corresponding monomeric and/or dimeric esters. This method makes it possible for the 1st time to prep. macrocyclic esters in good yields. The cyclic carbonates and oxalates are obtained most easily. The ratio in which the 2 forms, monomer (I) and dimer (II), are obtained is detd. in part by the exptl. conditions and in part by the nature of the ester, especially by its unit length. Monomers of 7–12 atoms are especially difficult to obtain. The following give the unit length, proportion of I and II in the distillate and the phys. properties: ethylene carbonate, 5, exclusively I, m.  $30^\circ$ , b.  $238^\circ$ ,  $n_D^{20}$  1.4158,  $d_4^{20}$  1.3079, trimethylene carbonate, 6, exclusively I, m.  $47\text{--}8^\circ$ , b.  $135^\circ$ ,  $n_D^{20}$  1.4409,  $d_4^{20}$  1.2282; tetramethylene carbonate, 7, mixt. of II, m.  $175\text{--}6^\circ$ , and tetrahydrofuran; pentamethylene carbonate, 8, exclusively II, m.  $117\text{--}8^\circ$ ; hexamethylene carbonate, 9, almost exclusively II, m.  $128\text{--}9^\circ$ ; heptamethylene carbonate, 10, almost exclusively II, m.  $97\text{--}8^\circ$ ; octamethylene carbonate, 11, almost exclusively II, m.  $116\text{--}7^\circ$ ; the I b.  $74\text{--}6^\circ$ , m.  $21.5\text{--}3^\circ$ ,  $d_4^{20}$  1.0727,  $n_D^{20}$  1.4065; nonamethylene carbonate, 12, almost exclusively II, m.  $95\text{--}5.5^\circ$ ; the I b.  $63\text{--}4^\circ$ , m.  $34\text{--}5^\circ$ ,  $d_4^{20}$  1.0240,  $n_D^{20}$  1.4528; decamethylene carbonate, 13, mixt. of I and II; II m.  $105\text{--}6^\circ$ ; I b.  $92\text{--}3^\circ$ , m.  $10\text{--}11^\circ$ ,  $d_4^{20}$  1.0354,  $n_D^{20}$  1.4659; undecamethylene carbonate, 14, mixt. of I and II; II m.  $97\text{--}7.5^\circ$ ; I b.  $104.5^\circ$ , m.  $40\text{--}1^\circ$ ,  $d_4^{20}$  0.9968,  $n_D^{20}$  1.4544; dodecamethylene carbonate, 15, almost exclusively I, b.  $118\text{--}9^\circ$ , m.  $11\text{--}2^\circ$ ,  $d_4^{20}$  1.0036,  $n_D^{20}$  1.4639; the II m.  $93\text{--}5^\circ$ ; tridecamethylene carbonate, 16, almost exclusively I, b.  $149\text{--}50^\circ$ , m.  $23\text{--}24.5^\circ$ ,  $d_4^{20}$  0.9888,  $n_D^{20}$  1.4622; tetradecamethylene carbonate, 17, only I, b.  $144\text{--}6^\circ$ , m.  $21\text{--}2^\circ$ ,  $d_4^{20}$  0.9814,  $n_D^{20}$  1.4622; octadecamethylene carbonate, 21, only I, b.  $165\text{--}9^\circ$ , m.  $36\text{--}7^\circ$ ,  $d_4^{20}$  0.9273,  $n_D^{20}$  1.4537; triethylene glycol carbonate, 11, mixt. of I and II, I being liquid; tetraethylene glycol carbonate, 14, only I, b.  $128\text{--}30^\circ$ , m.  $42\text{--}4^\circ$ ,  $d_4^{20}$  1.1961,  $n_D^{20}$  1.4569; decamethylene oxalate, 14, only I, b.  $125\text{--}6^\circ$ ,  $d_4^{20}$  1.0812,  $n_D^{20}$  1.4730; undecamethylene oxalate, 15, only I, b.  $120\text{--}3^\circ$ , m.  $23\text{--}4.5^\circ$ ,  $d_4^{20}$  1.0623,  $n_D^{20}$  1.4700; decamethylene malonate, 15, only I, b.  $117\text{--}8^\circ$ ,  $d_4^{20}$  1.0599,  $n_D^{20}$  1.4695; decamethylene succinate, 16, only II, m.  $108\text{--}9^\circ$ ; ethylene sebacate, 14, almost exclusively II, m.  $80\text{--}1^\circ$ ; trace of I, m.  $40\text{--}1^\circ$ ; ethylene undecanedioate, 15, II, m.  $143^\circ$ ; trace of I, m.  $35^\circ$ ; ethylene dodecanedioate, 16, only II, m.  $95\text{--}6^\circ$ ; ethylene tridecanedioate, 17, only II, m.  $145\text{--}6^\circ$ ; ethylene tetradecanedioate, 18, only II, m.  $102\text{--}3^\circ$ ; trimethylene sebacate, 15, only II, m.  $108\text{--}10^\circ$ ; self ester of  $\omega$ -hydroxy-pentadecanoic acid, 16, almost exclusively II, m.  $83\text{--}4^\circ$ ; the I m.  $31\text{--}2^\circ$ . 9-Decen-1-ol b.  $85\text{--}6^\circ$ ,  $d_4^{20}$  0.8446,  $n_D^{20}$  1.4480 (phenylurethan, m.  $49\text{--}50^\circ$ ). Mol. wts. of many of the above compds. in freezing  $\text{C}_6\text{H}_6$  are given. Macrocyclic esters show no tendency to polymerize spontaneously;

they do, however, polymerize at elevated temps. especially in the presence of catalysts for ester-interchange. **XXI. Physical properties of macrocyclic esters and anhydrides. New types of synthetic musks.** *Ibid.* 5039-43.—Macrocyclic esters and anhydrides have odors closely resembling those of the ketones and lactones of the same ring size. The rings in the neighborhood of 15 atoms have musk-like odors. The mol. refractions show a neg. exaltation. M. ps. in the carbonate series oscillate from 1 member to the next. **XXII. Stereochemistry and mechanism in the formation and stability of large rings.** W. H. Carothers and Julian W. Hill. *Ibid.* 5043-52.—The formation of macrocyclic ketones from salts of the dibasic acids probably involves first a linear polyketone which is subsequently cracked or decompd. The ketones thus follow a course already established for esters and anhydrides. The characteristic analogies and differences in the 3 series can be explained by taking into account the nature of the reactions involved and the steric effects of peripheral atoms. Rings of more than 5 atoms cannot be regarded as entirely strainless. The probable nature of the strains in large rings is indicated. C. J. West

**Hydrogenolysis of succinates and glutarates.** Bruno Wojcik and Homer Adkiss. *J. Am. Chem. Soc.* 55, 1939-46(1933).—Hydrogenolysis of  $(\text{CH}_3\text{CO}_2\text{Et})_2$  gives  $\text{HOCH}_2\text{CH}_2\text{CH}_2\text{CO}_2\text{Et}$ ,  $(\text{CH}_3\text{CH}_2\text{OH})_2$  (I), butyrolactone (II),  $\text{PrCO}_2\text{H}$  and probably tetrahydrofuran; I is obtained in 72% yield, together with 41 g. II, when 523 g. ester and II at 300 atm. are allowed to react at 250° over 30 g. Cu-Cr oxide. Succinic anhydride gives 31% II and some  $\text{PrCO}_2\text{H}$  and  $(\text{CH}_3\text{CO}_2\text{H})$ . Di-Et  $\alpha$ -methylsuccinate gives 72% of 2-methylbutane-1,4-diol,  $b_d$  126.7°, and some iso-AmOH; the  $\alpha$ -iso-Pr deriv. (100 g.) during 6.5 hrs. gives 7.3 g. alics.,  $b_d$  123.7°, 8.1 g. isohexyl alc., 3.2 g. 3,4-dimethylpentan-1-ol,  $b_d$  159-62°,  $n_D^{20}$  1.4261, 11.8 g. unchanged ester and 16.4 g. 2-isopropylbutane-1,4-diol,  $b_d$  119.22°,  $n_D^{20}$  1.4535. Di-Et  $\alpha$ -butyl- $\alpha$ -acetylsuccinate gives 79% of 2-butylbutane-1,4-diol,  $b_d$  135.7°,  $n_D^{20}$  1.4530; the  $\alpha$ -benzyl deriv. gives 35% of 2-benzylbutane-1,4-diol,  $b_d$  162.5°,  $n_D^{20}$  1.5210, and an equal quantity of 3-benzylbutan-1-ol. Di-Et  $\alpha,\gamma$ -dicarboxyglutarate (166 g.) gives 17.2 g. pentane-1,5-diol; 65 g. of the  $\beta$ -Me deriv. gives 18.2 g. of 3-methylpentane-1,5-diol; 153 g. of the  $\beta$ -Ph deriv. gives 13.8 g. 3-phenylpropan-1-ol, 47.6 g. of 3-phenylpentane-1,5-diol and 1.1 g. of 2,4-dimethylphenylpentane-1,5-diol; the  $\beta$ -Pr deriv. (40 g.) gives 14.2 g. alics. and H<sub>2</sub>O, 3.7 g. hexyl alc. and 8.7 g. 3-propylpentane-1,5-diol,  $b_d$  134.6°,  $n_D^{20}$  1.4569. Di-Et  $\alpha,\gamma$ -diacetyl- $\beta$ -phenylglutarate (79 g.) gives 40 g. 2,4-dichloro-3-phenylpentane-1,5-diol. Di-Et dodecamethylenedicarboxylate (202 g.) gives 141 g. tetradecane-1,14-diol. Di-Et  $\alpha$ -keto- $\beta$ -methylsuccinate (202 g.) gives 184 g. di-Et  $\alpha$ -hydroxy- $\beta$ -methylsuccinate; the  $\alpha$ -HO deriv. (102 g.) gives 53.5 g. alics. and  $\text{H}_2\text{O}$ , 19.3 g. 3-methylbutane-1,2-diol and 13.2 g. 2-methylbutane-1,4-diol. Di-Et  $\alpha$ -ethyl- $\alpha$ -acetyladipate,  $n_D^{20}$  1.4445 (46 g.), gives 2.6 g. alics.,  $b_d$  45.90°, and 18.1 g. 2-ethylpentane-1,5-diol. Di-Et  $\alpha,\gamma$ -diacetyl- $\beta$ -phenylglutarate (35 g.) gives 31.1 g. 3,5-dicarboxy-1-phenylheptane-2,6-diol,  $m$  162.3°. Di-Et  $\alpha$ -phenylsuccinate (38 g.) gives 16.2 g. 3-phenylbutan-1-ol and 3.2 g. 2-phenylbutane-1,4-diol. Di-Et  $\alpha$ -acetylsuccinate (144 g.) gives 40.2 g. alics. and H<sub>2</sub>O, 21.2 g. of a lactone,  $\text{C}_8\text{H}_{10}\text{O}_2$ ,  $b_d$  85.7°, and 38.9 g. glycols,  $b_d$  113-4°. Di-Et  $\beta$ -phenylglutarate (35 g.) gives 21.2 g. 3-phenylpentane-1,5-diol. Di-Et  $\alpha$ -acetylglutarate (139 g.) gives 18.3 g. of 2-ethylpentan-1,5-diol and pentane-1,5-diol. These results lead to certain conclusions with regard to the relation of structure to susceptibility to cleavage of C to C and C to O linkages and with regard to feasible methods for prep. various glycols and alics. C. J. W.

**Preparation of l-tartaric acid by the oxidation of d-gulonic lactone.** J. K. Dale and W. F. Rice, Jr. *J. Am. Chem. Soc.* 55, 4984-5(1933).—A yield of 1.6% of l-tartaric acid has been obtained by the oxidation of d-gulonic lactone, which is easily obtained from xylose. Details are given. C. J. West

**Hexacyanocobaltic acid and propyl alcohol.** Franz Hölzl, Walter Brell and Guido Schinko. *Monatsh.* 62, 349-58(1933).—As in the case with EtOH,  $[\text{Co}(\text{CN})_6]\text{H}_2$  (I) forms primary, secondary and tertiary salts with PrOH. This was verified by vapor-pressure measurements obtained upon evapn. of  $[\text{Co}(\text{CN})_6] \cdot (\text{PrOH})_3$  at 0°, 25° and 40°. On heating I in PrOH the acidity drops continuously until a const. value is reached. Addn. of water to the alc. accelerates the drop in proportion to the water content and reduces the acidity to a lower const. value. Among the reactions taking place under these conditions are (1) esterification with the formation of NC complexes, particularly in alc. with little or no water, (2) splitting off of HCN and formation of  $\text{RNH}_2$ , accelerated by the addn. of water. In 98 and 90% PrOH there were formed the equil. compds. II (violet) and III (dark rose), resp. These substances produce RNC and  $\text{RNH}_2$ , resp., when treated with NaOH. Upon heating III for a long time in *vacuo* there was obtained the water-insol. compd.  $[(\text{CN})_5\text{Co}(\text{CN})_2\text{Co}(\text{CN})_5]\text{H}_2$ ,  $[(\text{NC})_5(\text{H}_2\text{O})_2\text{CoCNCo}(\text{CN})_5(\text{H}_2\text{O})(\text{Pr})]\text{H}_2$ ,  $[(\text{NC})_5(\text{H}_2\text{O})(\text{OH})\text{CoCNCo}(\text{CN})_5(\text{H}_2\text{O})(\text{Pr})]\text{H}_2$  (II)  $[(\text{NC})_5(\text{H}_2\text{O})\text{CoCNCo}(\text{CN})_5(\text{H}_2\text{O})]\text{H}_2$ ,  $[(\text{NC})_5(\text{OH})\text{CoCNCo}(\text{CN})_5(\text{OH})]\text{H}_2$  (III).

**Dielectric constants. XI. Electric moment of amides and substituted ureas.** G. Devoto, with Raffaello Di Nola. *Gazz. chim. ital.* 63, 495-9(1933); cf. C. A. 27, 4227.—The elec. moments of some of the aq. polar compds. already studied were measured in non-polar org. solvents. The following data give the compds., their  $\mu$  values (in D) and the solvent ( $\text{C}_6\text{H}_6$  (I) or dioxane (II)):  $(\text{MeHN})_2\text{CO}$ , 5.1, I;  $(\text{EtN})_2\text{CO}$ , 3.3, I;  $\text{NCNH}_2$ , 3.8, I; pyrrolidone, 2.3, I;  $\text{AcNH}_2$ , 3.6, II;  $\text{BzNH}_2$ , 3.6, II;  $\text{PrHNCONH}_2$ , 4.1, II;  $\text{SO}_2(\text{NH}_2)_2$ , 3.9, II;  $p\text{-O}_2\text{NC}_6\text{H}_4\text{CONH}_2$ , 4.9, II;  $p\text{-H}_2\text{NC}_6\text{H}_4\text{CONH}_2$ , 4.7, II. The high  $\mu$  values of the amides are noteworthy, i. e., they are of the same order of magnitude as those of nitriles. Nevertheless the existence of a semi-polar bond for the CN group is contradicted by the values of  $p\text{-O}_2\text{N}$ - and  $p\text{-H}_2\text{NC}_6\text{H}_4\text{CONH}_2$ , and the results indicate a strong elec. moment of a wholly different nature from that of nitriles. Substitution either of a pos. or of a neg. group increases the moment, in contrast to the effect in the couple:  $p\text{-O}_2\text{NC}_6\text{H}_4\text{NH}_2$  and  $p\text{-O}_2\text{NC}_6\text{H}_4\text{CN}$ . The identical  $\mu$  values of  $\text{AcNH}_2$  and  $\text{BzNH}_2$  (higher than that of  $\text{NH}_3$ ) indicate the incorrectness of the classical  $\text{RC}(\text{:O})\text{NH}$  formula of amides, and the greater probability of the  $\text{RC}(\text{:NH})\text{OH}$  formula, which can in turn be expressed in semi-polar form. In water, the semi-polar form of  $\text{AcNH}_2$  probably becomes polar,  $\text{MeC}(\text{:NH})^+\text{O}^-$ , whereas this does not happen to  $\text{BzNH}_2$ . While solid sulfamide is probably  $\text{O}_2\text{S}(\text{NH}_2)_2$ , in solvents with low dielec. consts. it has an amidic or semi-polar form, and in solvents with high dielec. consts. it has a polar form. In general the results show the irregular character of the  $\text{CONH}_2$  substituent, and the influence of the solvent on the structure of the mol. bonds. C. C. Davis

**Mechanism of carbohydrate oxidation. XVI. Action of aqueous solutions of potassium hydroxide on l-rhamnose.** Gale F. Nadeau, Mildred Rathff Newlin and Wm. L. Evans. *J. Am. Chem. Soc.* 55, 4957-63(1933); cf. C. A. 27, 1580.—The yields of lactic acid from l-rhamnose (shown as curves) lie between those from glucose and mannose on the one hand and arabinose on the other at 50° and 75°; in the case of xylose the yields of lactic acid are still higher than those from arabinose. The yields of  $\text{AcCHO}$  are influenced by the temp. and the concn. of the alkali employed; at 75° the max. is much lower than at 50°. There is no way to differentiate between glyceric and lactic aldehydes as the source of pyruvic aldehyde osazone in the case of rhamnose, which is more like the hexoses than arabinose in this respect.

C. J. West

**Mutarotation of  $\alpha$ -l-glucose in heavy water.** Eugene Pascu. *J. Am. Chem. Soc.* 55, 5056-7(1933).—A sample of  $\alpha$ -l-glucose which shows a velocity coeff. of mutarotation in  $\text{H}_2\text{O}$  of 0.00540, shows in  $\text{H}_2\text{O}$  of  $d_2^{20}$  1.06 a coeff.

0.00290. It is concluded that on soln. of a reducing sugar in heavy  $H_2O$  the displaceable H atom of that sugar is immediately replaced by a heavy H atom of the heavy  $H_2O$  and that the mutarotation is indeed due to oxo-cyclo desmotropy. C. J. West

**A new acetonefructose. Derivatives of  $\gamma$ -fructose.** Leonidas Zervas and Pius Sessler. *Ber.* 66B, 1698 703 (1933).—Fructose cyanohydrin, obtained in 15 g. yield from 18 g. fructose in 15 cc. water at 0° treated with 1 cc. of 20% aq.  $NH_3$  and 8 cc. anhyd. HCN, m. 114–15° (hexaacetate, m. 80–2°), gives with  $BzCl$  and pyridine 91% of the *pyridine addn. product* (I),  $C_{21}H_{35}O_8N \cdot C_5H_5N$ , m. 128° (cor.),  $[\alpha]_D^{25} - 13.3^\circ$  (pyridine), of 1,6-dibenzoyl-fructose cyanohydrin (II), m. about 150°. The free II can be obtained, with great loss, by recrystg. I from alc. contg. a little HCl, but it is not stable. When I is dissolved in AcOH, the pyridine is replaced by AcOH; the *product*,  $C_{21}H_{37}O_8N \cdot AcOH$ , m. 140° (cor.). I cannot be tritylated, which indicates that it contains no free primary alc. groupings. Boiling of I in AcOEt with  $Ag_2CO_3$  eliminates the HCN and gives 91% 1,6-dibenzoylfructose (III), m. 114–15° (cor.),  $[\alpha]_D^{25} - 7.3^\circ$  (alc.) 5 min. after soln., 2.0° (const.) after 10 hrs.; in glacial AcOH the end value,  $[\alpha]_D^{25} 1.8^\circ$ , is reached at once. That there is no rearrangement in the reaction is indicated by the regeneration of I from III with HCN in pyridine. With acetone contg. a little concd.  $H_2SO_4$ , 8 g. III gives 5.5 g. 1,6-dibenzoyl-2,3-acetone- $\alpha$ -d-fructofuranose (IV), m. 118° (cor.),  $[\alpha]_D^{25} 13.5^\circ$  (alc.), 12.7° (acetone), does not reduce Fehling soln. and forms a *benzoate* (V),  $C_{26}H_{35}O_9$ , m. 137° (cor.),  $[\alpha]_D^{25} - 9^\circ$  (acetone). 2,3-Acetone- $\alpha$ -d-fructofuranose VI (1.6 g. from 3.5 g. IV in aq. MeOH with  $Ba(OH)_2$ ), m. 50°,  $[\alpha]_D^{25} 18.9^\circ$  (water),  $[\alpha]_D^{25} 14.1^\circ$  (acetone), is strongly hygroscopic, does not reduce Fehling soln. even after long boiling, is not further acetonated by shaking 5 days in acetone with anhyd.  $CuSO_4$  and cannot be oxidized by  $Ph(OAc)_2$  according to Criegee (therefore contains no adjacent free HO groups), gives with  $BzCl$  in pyridine the tri-Bz deriv. (V), with AcO-pyridine a *triacetate*, m. 55°,  $[\alpha]_D^{25} - 8^\circ$  (EtOH), and with  $Ph_2CCl$  in pyridine a *dibenzyl deriv.* in 15% (cor.),  $[\alpha]_D^{25} - 5.2^\circ$  (pyridine). Like all acetone-sugars, VI is stable toward alkalis but is easily hydrolyzed by acid. Polarimetric measurements of the hydrolysis in 0.5 N HCl at 20° give for  $K$  6.19 to  $7.02 \times 10^{-4}$ , in N HCl  $6.75 \times 10^{-4}$ , i. e., value about  $1/4$  that for sucrose. C. A. R.

**Nitro derivatives of  $\beta$ -diketones.** N. J. Toivonen, E. Oja and O. Ojala. *Acta Chem. Fennica* 6B, 67 8 (1933) (in German).—2,5,5-trimethyl-1,3-cyclohexanedione (I) was prepd. by heating a mixt. of MeBr, MeONa and 2,5-dimethyl-1,3-cyclohexanedione in an autoclave. I on soln. in concd. or moderately dil.  $HNO_3$  nitrated readily to yield 2-nitro-2,5,5-trimethyl-1,3-cyclohexanedione (II), needles, m. 145–3°. II with strong NaOH in a N atm yielded the di-Na salt of  $\beta,\beta$ -dimethyl- $\delta$ -keto- $\epsilon$ -nitroheptanoic acid (III) in good yields. The Ag salt is difficultly sol. III seps. from ether-petr. ether in broad needles, m. 60–2°. The di-Na salt of III on treatment with NaOBr yielded an oil  $C_{12}H_{17}BrNO_2$ , b. 165–7°, which was identified as  $\alpha,\alpha$ -dibromonitroethane, and  $\epsilon,\epsilon$ -dimethylglutaric acid. Although the action of alkali on II opened the ring, reduction in acid or neutral soln. split off the nitro group. Sn and HCl gave 90.6% and  $Na_2SO_3$ , 82% of the calcd.  $NH_3$ . Zn and AcOH yielded 91.5% of the calcd.  $NO$ . All reductions gave I in good yields in the pure state. S. A. Karjala

**Synthesis of some cyclic  $\Delta^2$ -unsaturated ketones.** R. S. Thakur. *J. Chem. Soc.* 1933, 1481 5.— $\alpha$ -Cyclohexylidenepropionyl chloride and MeZnI give  $\alpha$ -methylcyclohexylidenecetone (I), the semicarbazone of which was split into 2 fractions, m. 193–3° (II) and 155–60° (III). The I regenerated from II by  $(CO_2H)_2$ , b. 91–8°,  $d_4^{20} 0.9410$ ,  $n_D^{20} 1.4877$ ,  $J$  4.4% (5 min.), 5.9% (10 min.); oxidation gives cyclohexanone; the semicarbazone is a mixt. of II and III. The I from III b. 100–1°,  $d_4^{20} 0.9412$ ,  $n_D^{20} 1.4857$ ,  $J$  12.9% (5 min.), 14.8% (10 min.).  $\alpha$ -Methylcyclohexenylacetone (IV), b. 93–4°,  $d_4^{20} 0.9287$ ,

$n_D^{20} 1.4701$ ,  $J$  89.1% (5 min.), 98% (10 min.). Starting with I, the % of  $\Delta^2$ -ketone decreased from 98% in 30 min. to 10% in 63 hrs. The fully equilibrated ketone gives a semicarbazone m. 170°, depressing the m. p. of II. Catalytic reduction of  $\alpha$ -cyclohexylidene- or  $\alpha$ -cyclohexenylpropionic acid gives  $\alpha$ -cyclohexylpropionic acid, m. 62°; chloride (V), b. 91–4°; amide, m. 156–7°; anilide, m. 135–6°; *p*-toluide, m. 155–6°. Reduction of IV gives  $\alpha$ -methyl- $\alpha$ -cyclohexylacetone (VI), b. 80–90°,  $d_4^{20} 0.9130$ ,  $n_D^{20} 1.4582$ , and  $\gamma$ -cyclohexyl-*sec*-butyl alc., b. 109–10°,  $d_4^{20} 0.9215$ ,  $n_D^{20} 1.4715$ ; oxidation gives VI. VI was also prepd. from V and MeZnI. The semicarbazone of VI (3 fractions) m. 110–20°, 113–18° and 155–6°. 2-Methylcyclohexylidenecetone (VII), regenerated from the semicarbazone, m. 197°, b. 99–101°,  $d_4^{20} 0.9399$ ,  $n_D^{20} 1.4908$ ,  $J$  5.7% (5 min) and 7.0% (10 min.). 2-Methylcyclohexenylacetone, b. 102°,  $d_4^{20} 0.9361$ ,  $n_D^{20} 1.4774$  (semicarbazone, m. 174–5°). The % of  $\Delta^2$ -ketone in VII decreased from 85% after 10 min. to 7.5% in 42 hrs.; the value at equil. may be taken as 90% of the  $\Delta^2$ -ketone; mobility about 175, time for half-change 47 min.; the equilibrated ketone gives the  $\beta$ -semicarbazone, m. 170°.  $\alpha$ -Methyl-*trans*-decalydranaphthylidene-2-acetone,  $d_4^{20} 0.9678$ ,  $n_D^{20} 1.5025$ ,  $J$  39.7% (10 min.), thus contg. the  $\Delta^2$ -ketone; the semicarbazone m. 214–5° (decompu.). After treating with 2 N  $HClONa$  for 5 days, the ketone had  $n_D^{20} 1.4933$ ,  $J$  70.2% (10 min.); the semicarbazone m. 195–6° and did not depress the m. p. of the  $\beta$ -semicarbazone. C. J. West

**Naphthenic and naphthenesulfonic acids.** IV. V. VI. M. Naphtali. *Fellchem. Umschau* 40, 219 23 (1933); cf. C. A. 27, 5062; 28, 4681.—A summary of recent publications, discussing the constitution and giving a table of consts. for various naphthenic acids from Roumanian crude, illuminating and lubricating oil, from gas and from Californian, German and Galician oil. The analysis and methods of analysis are discussed. P. Escher

**The quantum mechanical stability of a benzene molecule.** M. Markov. *J. Chem. Physics* 1, 784 8 (1933).—The Heitler-London-Rumer treatment of valence bonds is applied to benzene, considered as a system of 6 trivalent CH groups. Partial soln. of the secular equation of the 34th degree shows that this model of the benzene ring is unstable relative to 3 HIC CH mol., in disagreement with expt. This method does not recognize the directional properties of Slater-Pauling valence bonds.

Gerald M. Pettv

**Catalytic oxidation of ethylbenzene in the liquid phase.** C. E. Semseman and J. J. Stubbs. *Ind. Eng. Chem.* 25, 1266 7 (1933); cf. C. A. 26, 5921. —Bubbling  $O_2$  through PhEt in the presence of pptd.  $MnO_2$  catalyst for 5.75 hrs. yields PhCOMe (51.8% max., at 115°),  $BzOH$  (36.5% max., at 120°) and  $PhCH(OH)Me$  (11.7–16.3%). The best yield of PhCOMe (63.2%) was obtained by keeping the temp. at 130° for 45 min. (induction period), followed by 5 hrs. at 115°. T. H. Chilton

**Pseudonitrosite of asarone.** Viktor Bruckner. *J. prakt. Chem.* 138, 268 74 (1933).—Asarone (2,4,5-(MeO) $_3$ - $C_6H_2CH_2CH_2CH_2Me$ ) (I) in  $Et_2O$  and satd. aq.  $NaNO_2$ , treated with 20%  $H_2SO_4$ , give 80% of the *pseudonitrosite* (II),  $(C_{12}H_{17}O_6N_2)_2$ , yellow, m. 130° (decompu.); a by-product is 2,4,5-(MeO) $_3$ - $C_6H_2H_2NO_2$ . I and  $NaNO_2$  in AcOH at 50–60° give the *glyoxime peroxide* of  $\alpha,\beta$ -diketodihydroasarone, m. 149°. II (10 g.) with 8%  $BzOH$ -KOH gives 7.2 g.  $\beta$ -nitroasarone (III), m. 101°; this exists in 2 forms, red and yellow prisms; it does not add Br in  $CS_2$ . At the b. p. there results 3.5 g. III and 3 g. acrylaldehyde. Elec. reduction of III gives  $\beta$ -amino-dihydroasarone, m. 187°. II and  $Ac_2O$  with a little  $H_2SO_4$  give  $\alpha$ -acetoxy- $\beta$ -nitrodihydroasarone, golden yellow, m. 141°;  $BzOH$ -KOH gives III. C. J. West

**Optical activity in relation to tautomeric change. I. Conditions underlying the transport of the center of asymmetry in tautomeric systems.** C. K. Ingold and C. L. Wilson. *J. Chem. Soc.* 1933, 1493–505.—The immediate question may be stated as follows: given 2 mutually convertible triad tautomerides (I and II), each contg. only

1 asym. center (\*), which is in each case situated at the point of attachment of the mobile group [X], it is required to find whether an optically active modification of I would, on conversion under ordinary non-asym. conditions, yield an optically active tautomer (II):

[X]

[X]

The theoretical object is concerned with the problem of whether or not particular electron pairs are mechanistically coupled in conjugated electrometric systems. The original should be consulted for the discussion. Mesityl oxide and PhMgBr give an oil, probably PhMeC(OH)-CH:CM<sub>2</sub>, which cannot be esterified and is readily dehydrated to  $\gamma$ -phenyl- $\alpha$ -methylbutadiene, b<sub>18</sub> 94.6°, possibly identical with Klages'  $\alpha$ -phenyl- $\alpha,\gamma,\gamma$ -trimethylallene (Ber. 37, 2305(1904)).  $\alpha$ -Phenylcrotyl alc. (III), b<sub>1</sub> 88-90°, n<sub>D</sub><sup>20</sup> 1.5412; C<sub>6</sub>H<sub>5</sub>(CO)<sub>2</sub>O, alone or in C<sub>6</sub>H<sub>5</sub>N, gives  $\alpha$ -phenylbutadiene and a dimer, b<sub>1</sub> 160°; III and succinic anhydride at 100° for 30 hrs. give  $\alpha$ -phenylcrotyl succinate, m. 72-80°, which is probably a mixt. of *cis*- and *trans*-isomers; in C<sub>6</sub>H<sub>5</sub>N there results 80% of a II succinate, m. 76-8°.  $\alpha$ -Ethylcrotyl alc., b<sub>70</sub> 135-42°, was sepd. into 6 fractions; that b<sub>70</sub> 137.1° (30% of the total) gives a *p*-nitrobenzoate, m. 42-3.5°, a 3,5-dinitrobenzoate, m. 47-8°, and a *H* phthalate, m. 51.3°; these crystallize with difficulty. 3-Phenyl-2-methylindenone (IV) gives a 2,4-dinitrophenylhydrazones, deep red, m. 250° (decompn.); 3-phenyl-2-methylindanone gives a 2,4-dinitrophenylhydrazones, red, m. 176-7°. IV and PhMgBr give 1-hydroxy-1,3-diphenyl-2-methylindene, m. 92°; catalytic reduction and distn give 1,3-diphenyl-2-methylindene, m. 108°; attempts to introduce a H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub> or Me<sub>2</sub>NC<sub>6</sub>H<sub>4</sub> group were not successful; in 1 expt. Me<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>MgBr in C<sub>6</sub>H<sub>5</sub>N gave *p*-dimethylaminophenylpyrrolidine, buff, m. 228-9°. Details are given of the reduction of fluorenone oxime with a 90% yield of 9-fluorenylamine (V); with PhAc at 100° there results 50% of  $\alpha$ -phenylethylidene-9-fluorenylamine (VI), m. 156.5-7.5°, and some fluorenylidene-9-fluorenylamine (VII), S-yellow, m. 175° (decompn.); VII also results from V and fluorenone. If the reaction is carried out at 140-50° or if V is heated at 180°, bifluorenyl is formed. Warming VI with 1.33 *N* EtOH-EtONa at 85° for 4 hrs. gives a mixt. of azomethines which could not be sepd.; by-products were also formed which complicated the reaction. Phthalobenzohydrylimide, m. 149-50°, results from Ph<sub>2</sub>CHBr and C<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>NH or C<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>NK or from Ph<sub>2</sub>CHNH<sub>2</sub> and C<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>O. Ph<sub>2</sub>CHN:CHPh (VIII) and Ph<sub>2</sub>C:NCHPh (IX) form a eutectic mixt., m. 50°, contg. 25% of VIII; the equil. mixt. contains 57% of IX; the unimol. velocity const. is 0.50 min.<sup>-1</sup>. Benzohydrylidenebenzohydrylamine, m. 152°, results from Ph<sub>2</sub>CHNH<sub>2</sub> and Ph<sub>2</sub>CCl<sub>2</sub>; benzohydrylidene- $\alpha$ -phenylethylamine, from Ph<sub>2</sub>CCl<sub>2</sub> and MePhCHNH<sub>2</sub>, m. 52°; the *p*-Me deriv., from *p*-MeC<sub>6</sub>H<sub>4</sub>CCl<sub>2</sub>Ph, pale yellow green oil, b<sub>0</sub> 198-201°; isomerization was very slow. The *p*-Cl deriv. (X) b<sub>0</sub> 195-8°, from *p*-ClC<sub>6</sub>H<sub>4</sub>CCl<sub>2</sub>Ph (b<sub>1</sub> 160°, b<sub>2</sub> 207-9°); the equil. mixt. with EtOH-EtONa contains approx. equal proportions of the 2 isomers and half-conversion to equil. occurs in about 2 days. *l*-MePhCHNH<sub>2</sub> (XI), b<sub>1</sub> 54°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> -22.92° (benzoate, m. 163.3.5°); *d*-MePhCHNH<sub>2</sub> (XII), b<sub>70</sub> 187°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> 22.22°. Optically active X from impure XII has [ $\alpha$ ]<sub>D</sub><sup>20</sup> -4.32°, [ $\alpha$ ]<sub>D</sub><sup>25</sup> -5.58° (EtOH, c 5.56°); on hydrolysis the XII recovered often had a higher rotation than the XII used; this was not observed with optically pure XII. XI gives a X with [ $\alpha$ ]<sub>D</sub><sup>20</sup> 13.9°, [ $\alpha$ ]<sub>D</sub><sup>25</sup> 19.4° (1.932 g. in 25 cc. EtOH). The isomer produced by isomerization, PhMeC:NCHPhC<sub>6</sub>H<sub>4</sub>Cl, had no perceptible rotatory power. *p*-Chlorobenzohydrylamine (XIII) b<sub>0</sub> 161°, b<sub>14</sub> 193°; *l*-Cl salt, m. 304-5° (decompn.); benzoate, m. 163.5-4°; aceto-*p*-chlorobenzohydrylamide, m. 132°. XIII could not be resolved through the *d*- $\alpha$ -bromocamphor-*s*-sulfonate, m. 251°. The *l*-malate m. 171°, [ $\alpha$ ]<sub>D</sub><sup>25</sup> -5.4° (1 g. in 25 cc. MeOH); the *H* *l*-malate m. 100° (decompn.),

[ $\alpha$ ]<sub>D</sub><sup>25</sup> 0.46° (1 g. in 25 cc. MeOH); the *d*-bromocamphor-10-sulfonate of *l*-XIII m. 218° and gives a *l*-XIII with [ $\alpha$ ]<sub>D</sub><sup>25</sup> -206°.  $\alpha$ -Phenylethylidene-*p*-chlorobenzohydrylamine could not be purified.

C. J. West

The influence of substituents on the rate of saponification of benzal chloride. Fritz Asinger and Gunther Lock *Monaish.* 62, 323-43(1933).—The speed of hydrolysis of PhCHCl<sub>2</sub> (I) and its 2-, 3- (II) and 4-Cl, 2- (III), 3- (IV), and 4-Me, 2-, 3-, and 4-nitro-, 2,5-, 3,5- and 2,6-Cl<sub>2</sub>, 2,3,6-tri-Cl (V) and 2,4,6-tri-Me (VI) derivs. were detd. in 50 or 71% Me<sub>2</sub>CO at 50° or 50% EtOH (96.7%) at 83.5°, according to the speed. The hydrolysis is a pseudo 1st order reaction, the speed being independent of the actual concn. of the reactant. The results showed that the Cl and NO<sub>2</sub> derivs. were hydrolyzed more slowly than I while the Me compds. reacted faster. With increasing no. of like constituents the increase or decrease was multiplied tremendously. The speed of hydrolysis of the NO<sub>2</sub> derivs. was of the same order as that of the di-Cl compds. The effect of the substituents was qualitatively the same as that in PhCH<sub>2</sub>Cl and in either case cannot be explained by steric hindrance for it depends not upon their position but on their kind and no. In 50% Me<sub>2</sub>CO the "half-value time," i. e., the time necessary for 50% of the substance to be hydrolyzed, was 5, 155 and 0.03; times that in 50% EtOH at 50° and 83.5° and 71% Me<sub>2</sub>CO, resp. The following new compds. used in the work were prepd. by the action of PCl<sub>5</sub> on the corresponding aldehyde. The no. in parenthesis designates yield; the acid and yield obtained upon refluxing the compd. with KMnO<sub>4</sub> are noted in some cases. II (75), b<sub>70</sub> 235-7°, b<sub>11</sub> 105°, 70% 3-ClC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H. V (81), b<sub>12</sub> 145.50°, m. 83°. III (80), b<sub>12</sub> 105.7°, *o*-MeC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H. IV (85), b<sub>11</sub> 110.1°; the aldehyde was obtained in 25% yield from *m*-MeC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>. VI (85), b<sub>12</sub> 139-40°, m. 37°, 70% 2,4,6-Me<sub>3</sub>C<sub>6</sub>H<sub>2</sub>CO<sub>2</sub>H.

I. M. Levine

Tris(arylamino)ethylenes. VI. The colored by-products from the synthesis of tris(arylamino)ethylenes. Rinosuke Shibata and Tetsunosuke Nishi. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 625-30(1933); cf. C. A. 28, 475<sup>1</sup>. Two by-products were obtained in the reaction between *p*-toluidine and CCl<sub>4</sub>:CHCl, one as yellow needles, m. 141°, and the other as black-red needles, m. 207°. The yellow compd. has the general formula RN.C.(NHR)CH:NR, where R is the aryl radical and the particular compd. had the formula C<sub>22</sub>H<sub>22</sub>N<sub>3</sub>. Identification tests are described.

Karl Kammermeyer

The velocity of diazotization of aromatic amines. Shigezo Ueno and Tazō Susuki. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 615 19(1933).—The velocity of diazotization of 47 amines in 0.05-4 *N* HCl and of 10 amines in 0.05-1 *N* HBr was detd. and found to depend mainly on the kind and concn. of acid used and to be practically independent of the H<sup>+</sup> concn. beyond a certain limit.

Karl Kammermeyer

Replacement of the diazo group by the acetoxy group H. L. Haller and P. S. Schaffer. *J. Am. Chem. Soc.* 55, 4954-5(1933).—*m*-ClC<sub>6</sub>H<sub>4</sub>N<sub>2</sub>BF<sub>4</sub> and AcOH, gently heated, give about 50% of *m*-chlorophenyl acetate, b<sub>2</sub> 84-6°, b<sub>12</sub> 108°. *p*-AcNHCC<sub>6</sub>H<sub>4</sub>N<sub>2</sub>BF<sub>4</sub>, decompn. 135° (cor.) (84% yield), and Ac<sub>2</sub>O give 52% of *p*-AcNHC<sub>6</sub>H<sub>4</sub>OAc, m. 151.5-2.5° (cor.). Since the aryl acetates are readily hydrolyzed to the phenols, the reaction provides a ready method of replacing the NH<sub>2</sub> group by the HO group when the normal decompn. of the diazo body with H<sub>2</sub>O does not take place.

C. J. West

The reaction between diazonium salts and trinitromethane. G. Ponzio. *Gazz. chim. ital.* 63, 471-8(1933).—Earlier expts. on the action of ArN<sub>2</sub>OAc compds. on KC(NO<sub>2</sub>)<sub>3</sub> (C. A. 10, 1178; 11, 1155) established the formation of compds. of the ArN<sub>2</sub>C(NO<sub>2</sub>)<sub>3</sub> type. On the other hand, the formation of Ar(CH<sub>2</sub>O<sub>2</sub>N<sub>3</sub>) and ArN:NC(OH):NOH compds. by their decompn. is, in the face of later expts., incorrect. However, the belief of Quilico (C. A. 26, 5950; 27, 1348) that the decompn. products are ArN(NO)N:CO compds. is also incorrect because they do not give the reactions of *N*-NO deriva. of aryl-

hydrazines or of NO or :CO groups. Instead,  $\text{Ar}(\text{CO}_2\text{N})_2$  compds. are internal anhydrides of  $\text{ArN}(\text{:NOH}): \text{NCO}_2\text{H}$

acids, i. e.,  $\text{O.N:NAr:N.CO}$ , which agrees with their decomn. upon fusion, their stability toward water,  $\text{H}_2\text{O}$ ,  $\text{PhNH}_2$ , etc., and their reactions with alk. alcoholates. With cold  $\text{MeOK}$  and  $\text{EtOK}$  they give 100% yields of the K salts of the acid esters, thus

$\text{CO.N:NAr:N} + \text{ROK} \rightarrow \text{ArN}(\text{:NOK}).\text{NCO}_2\text{R}$ . The latter compds. with dil. acids form  $\text{ArN}(\text{NO})\text{N}(\text{NO})_2\text{R}$  compds., already prepd. by Longo (cf. C. A. 8, 1234). The reaction between  $\text{Ar}(\text{CO}_2\text{N})_2$  compds. and strong bases is not simply:  $\text{Ar}(\text{CO}_2\text{N})_2 \rightarrow \text{ArN}_2 + \text{O}_2$ , because N is liberated and  $\text{ArN}_2$  and  $\text{CO}_2$  are formed or decomn. of salts of  $\text{ArN}(\text{:NOH}): \text{NCO}_2\text{H}$  acids, which are first formed from  $\text{Ar}(\text{CO}_2\text{N})_2$  compds. Contrary to Julico (loc. cit.), the behavior of  $\text{ArN}_2\text{C}(\text{NO}_2)_2$  compds. is not analogous to that of  $\text{ArN}_2\text{C}(\text{NO}_2)_2\text{Ph}$  compds. (cf. P, C. A. 8, 2692), and since the former contain an extra  $\text{NO}_2$  group they should in moist  $\text{Et}_2\text{O}$  first form  $\text{ArN}(\text{NO})\text{N}(\text{NO})\text{CONO}_2$  compds. and then by the action of water should form  $\text{ArN:NCONO}_2$  compds. (under the same conditions  $\text{ArN}_2\text{C}(\text{NO}_2)_2\text{Ph}$  compds. form successively  $\text{ArN}(\text{NO})\text{N}(\text{NO})\text{Bz}$ ,  $\text{ArN}(\text{NO})\text{NHBz}$  and  $\text{ArN:N}$  compds.). It is moreover very improbable that  $\text{Ar}(\text{CO}_2\text{N})_2$  compds. are formed from  $\text{ArN}_2\text{C}(\text{NO}_2)_2$  compds. by elimination of  $\text{N}_2\text{O}$ . Even if  $\text{ArN}_2\text{C}(\text{NO}_2)_2$  compds. are azo derivs., this is not true of  $\text{ArN}_2\text{C}(\text{NO}_2)_2$  compds., and the latter are diazonium salts, as is established by the present expts. and by the constitution of  $\text{Ar}(\text{CO}_2\text{N})_2$  compds. into which they are transformed the compd.  $p\text{-O.NC}_6\text{H}_4(\text{CO}_2\text{N})_2$  (I) formed by the action of  $\text{ArH}$  on  $p\text{-O.NC}_6\text{H}_4\text{N}_2\text{C}(\text{NO}_2)_2$  (cf. Quilico, C. A. 27, 148) can also be prepd. by the action of concd.  $\text{HNO}_3$  on

$\text{Ph}(\text{CO}_2\text{N})_2$ . Its structure is  $\text{O.N:N}(\text{C}_6\text{H}_4\text{NO}_2\text{-}p)\text{:N.CO}$ , and it is straw-yellow, m.  $165^\circ$ , sol. in concd.  $\text{H}_2\text{SO}_4$  without coloration even with  $\text{PhOH}$ , gives with  $\text{PhNH}_2$  a bright red color, which disappears on exposure to air, does not react with  $\text{PhNHNH}_2$  in  $\text{Et}_2\text{O}$ . In ice-cold abs.  $\text{EtOH}$  it reacts with alc. KOH thus:  $\text{I} + \text{KOH} \rightarrow p\text{-O.NC}_6\text{H}_4\text{N}(\text{:NOK}).\text{NCO}_2\text{K}$ , in fact addn. of dil.  $\text{H}_2\text{SO}_4$  gives 100% of  $p\text{-O.NC}_6\text{H}_4\text{N}(\text{NO})\text{NHC(O)Et}$ . Under similar conditions I and  $\text{MeOK}$  form 100% of  $p\text{-O.NC}_6\text{H}_4\text{N}(\text{NO})\text{NHC(O)Me}$ . C. C. Davis

**Interaction of chloro-substituted aldehydes with chloro-substituted arylhydrazines** F. D. Chattaway and Allan Alder *J. Chem. Soc.* 1933, 1484-90. 2,5- $\text{Cl}_2\text{C}_6\text{H}_3$ ,  $\text{NHNH}_2$ ,  $\text{HCl}$  (I) and butylchloral hydrate (II), shaken with  $\text{EtOH}$  for 0.5 hr, give 2,5-dichlorobenzeneazo- $\beta$ , $\gamma$ -chloro  $\Delta^9$ -butylene (III), red, m.  $101^\circ$ ; on standing gives VI. III in  $\text{C}_6\text{H}_6$  with  $\text{HCl}$  gives the pale yellow 2,5-dichloro 2,5-dichlorophenylhydrazone, which loses  $\text{HCl}$  when warmed, giving III. Boiling III in  $\text{C}_6\text{H}_6$  gives 2,5-dichloro 2,5-dichlorophenylhydrazone (IV), m.  $90^\circ$  (Ac deriv. (V), m.  $150^\circ$ ). I and II in  $\text{AcOH}$  give isomer (VI) of IV, pale yellow, m.  $116^\circ$  (Ac deriv. (VII), m.  $139^\circ$ ). Either V or VII, satd. with  $\text{Cl}$  in hot  $\text{CHCl}_3$ , gives  $\alpha,\alpha,\beta,\beta$ -tetrachlorobutylaldehyde 2,5-dichloro- $\Delta^9$ -butylphenylhydrazone, m.  $154^\circ$ ; reduction gives 2,5- $\text{Cl}_2\text{C}_6\text{H}_3\text{NH}_2$ . II and 2,4,5- $\text{Cl}_3\text{C}_6\text{H}_2\text{NHNH}_2$  (VIII) in  $\text{EtOH}$  at  $40-50^\circ$  give  $\alpha,\beta$ -dichloro 2,4,5-trichlorophenylhydrazone, pale yellow, m.  $86^\circ$  (Ac deriv., m.  $123^\circ$ ). In boiling  $\text{EtOH}$  II and VIII give  $\beta$ -chloro- $\alpha$ -ketobutylaldehyde 2,4,5-trichlorophenylhydrazone, pale yellow, m.  $102^\circ$ ; boiling with 2,5- $\text{Cl}_2\text{C}_6\text{H}_3\text{NHNH}_2$  in  $\text{EtOH}$  gives the 2,4,5,2',5'-pentachlorodiphenylazone of  $\alpha$ -ketobutylaldehyde, yellow, m.  $212^\circ$ . I and chloral hydrate in  $\text{H}_2\text{O}$  give 2,5-dichlorobenzeneazo- $\beta,\beta$ -dichloroethylene, orange-red, m.  $93^\circ$ . In  $\text{EtOH}$  the reaction product is 1,1-glyoxylate 2,5-dichlorophenylhydrazone, yellow, m.  $140^\circ$ ; the 2,4,5-tri- $\text{Cl}$  deriv. m.  $102^\circ$ . Either  $\text{Cl}$  deriv. in  $\text{CHCl}_3$ , satd. with  $\text{Cl}$ , gives  $\beta$ -chloroglyoxylate 2,4,5-trichlorophenylhydrazone, pale yellow, m.  $115^\circ$ ; concd.  $\text{NH}_4\text{OH}$  gives the  $\omega\text{-NH}_2$  deriv., m.  $140^\circ$ . C. J. West

**Glucoisidic azo dyestuffs.** Burckhardt Helferich, Otto

Lang and Ernst Schmitz-Hillebrecht. *J. prakt. Chem.* 138, 275-80 (1933).— $\alpha\text{-C}_6\text{H}_4(\text{OH})_2$ ,  $\beta$ -pentaacetyl-d-glucose and  $p\text{-MeC}_6\text{H}_4\text{SO}_3\text{H}$ , heated 40 min. at  $125-30^\circ$ , give 40% of tetraacetylpyrocatechol- $\beta$ -d-glucoside, m.  $114-6.5^\circ$ ,  $[\alpha]_D^{25} -15.1^\circ$  ( $\text{CHCl}_3$ );  $\text{N NaOH}$  gives pyrocatechol- $\beta$ -d-glucoside, crystals with 1 mol.  $\text{Me}_2\text{CO}$ , m.  $129-33^\circ$ ,  $[\alpha]_D^{25} 71^\circ$  ( $\text{H}_2\text{O}$ ); it is split by emulsin.  $\text{Ph-N}_2\text{Cl}$  gives 3,5-bis(benzeneazo)pyrocatechol-1- $\beta$ -d-glucoside, violet, m.  $214-51^\circ$  (decompn.); the Na salt is orange-red;  $p\text{-MeOC}_6\text{H}_4\text{N}_2\text{Cl}$  gives 4-methoxy- $\beta$ -d-glucosido-4'-hydroxyazobenzene, m.  $220-2^\circ$ , split by emulsin diazobenzene-sulfonic acid gives Na 3- $\beta$ -d-glucosido-4'-hydroxyazobenzene- $t'$ -sulfonate, amorphous, orange-red,  $[\alpha]_D^{25} -41^\circ$  ( $\text{H}_2\text{O}$ ). All m ps. are cor. C. J. W

**Course of oxidation of primary hydrazines. II. Action of oxidizing acids upon primary aromatic hydrazines.** (I). A. Zeide, S. M. Sherlin and G. I. Bras. *J. prakt. Chem.* 138, 225-30 (1933); cf. C. A. 27, 4784.— $\text{PhNHNH}_2$  (I) and excess  $\text{HClO}_3$  give 30%  $\text{PhCl}$ ;  $\text{HIO}_3$  gives 25%  $\text{PhI}$ ;  $\alpha$ -quinolyldiazine and  $\text{HIO}_3$  give 25%  $\alpha$ -iodoquinoline and 20% of carbostyryl. I and  $\text{H}_2\text{AsO}_4$  at  $0^\circ$  give phenylhydrazine arsenate,  $\text{I.H}_2\text{AsO}_4$ , which is decomd. by  $\text{Cu}$  in  $\text{H}_2\text{O}$  at  $70^\circ$  to give a mixt. of  $\text{PhAsCl}_2$  and  $\text{Ph}_2\text{AsCl}$ . Oxidation of I with  $\text{H}_2\text{AsO}_4$  in the presence of  $\text{Cu}$  at  $75^\circ$  gives 0.98%  $\text{PhAsCl}_2$ , 59.06%  $\text{Ph}_2\text{AsCl}$  and 5.08%  $\text{Ph}_3\text{As}$ ; in the presence of  $\text{HCl}$  the yield of  $\text{PhAsCl}_2$  is 50%. I and  $\text{PhAsO}_2\text{H}_2$  give the compd.  $\text{I.PhAsO}_2\text{H}_2$ , m.  $94^\circ$  (decompn.); in the presence of  $\text{Cu}$ , 14.15 g. I gives 13.81 g.  $\text{PhAsCl}_2$ , corresponding to the undecomd.  $\text{PhAsO}_2\text{H}_2$ , 14.09 g.  $\text{Ph}_2\text{AsCl}$  and 4.72 g.  $\text{Ph}_3\text{As}$ . I (33 g.) in 3 g.  $\text{EtOH}$ , added to 105 g.  $\text{H}_2\text{AsO}_4$  in 150 cc.  $\text{H}_2\text{O}$  and 15 cc. 0.5  $\text{N CuSO}_4$  at  $45^\circ$ , gives 1 g.  $\text{PhAsCl}_2$ , 3.35 g.  $\text{Ph}_2\text{AsCl}$  and 13.5 g.  $\text{Ph}_3\text{As}$ .  $\text{PhAsO}$  and excess I on standing 8-10 days give the compd.,  $\text{I.PhAsO}_2\text{H}_2$ , m.  $100-1^\circ$ .  $p\text{-MeC}_6\text{H}_4\text{NHNH}_2$  (61 g.) and  $\text{H}_2\text{AsO}_4$  with  $\text{Cu}$  give 21.7 g.  $p\text{-MeC}_6\text{H}_4\text{AsCl}_2$ , 31.5 g.  $(p\text{-MeC}_6\text{H}_4)_2\text{AsCl}$  and 7.2 g.  $(p\text{-MeC}_6\text{H}_4)_3\text{As}$  (72.2% yield of As compds.). C. J. West

**Thermal decomposition of trinitrotriazidobenzene and of other polynitropolyazidobenzenes.** Oldrich Turek. *Chimie É. industrie Special No.*, 883-7 (June, 1933); cf. C. A. 26, 848.—2,4-Dinitro-1,3,5-triazidobenzene (I), m.  $116-17^\circ$  (decompn.), insol. in  $\text{H}_2\text{O}$ , sol. in  $\text{Me}_2\text{CO}$  and boiling  $\text{EtOH}$ , slightly sol. in cold  $\text{EtOH}$ , is produced by refluxing  $\text{C}_6\text{H}_5(\text{NO}_2)_2\text{Cl}$  or  $\text{C}_6\text{H}_5(\text{NO}_2)_2\text{Br}$  in aq.  $\text{Me}_2\text{CO}$  with alc.  $\text{NaN}_3$ , pouring into  $\text{H}_2\text{O}$  and recrystg. from  $\text{EtOH}$ . 2,4,6-Trinitro-1-azidobenzene (picryl azide) (II), m.  $92-3^\circ$ , is obtained in practically quant. yield by adding with const. agitation a concd.  $\text{Me}_2\text{CO}$  soln. of picryl chloride to a concd. soln. of  $\text{NaN}_3$  in dil.  $\text{EtOH}$  at atm. temp. The thermal decomps. of 2,4,6-trinitro-1,3,5-triazidobenzene (III), I and II were studied by measuring the amt. of N given off by heating 1%  $\text{Me}_2\text{CO}$  solns. of the substances in the dark at  $61^\circ$  (b. p. of  $\text{CHCl}_3$ ) and  $76.5^\circ$  (b. p. of  $\text{CCl}_4$ ) and also the solids at  $50^\circ$ . The activation energies of the reactions, calcd. from the rate of liberation of N at different temps., were calcd. as: II 22,400, I 25,300, III 23,800 cal. The temp. coeffs. were: II 2.69, I 2.80, III 2.75. As the resp. values are very close to one another, it is concluded that they depend primarily on the presence of the azoimide groups or of the azoimide and nitro groups in  $\alpha$ -position to each other in the  $\text{C}_6\text{H}_3$  ring, while the actual no. of azoimide and  $\text{NO}_2$  groups has apparently no effect on these values. III is very much more stable to heat than I or II, both in soln. and in the cryst. state, in spite of the fact that it contains a considerably higher proportion of N than can be liberated; this is attributed to the perfect symmetry of its mol. At  $50^\circ$ , I first turns brown, becomes semi-liquid and is transformed into a dark swollen mass which solidifies to a dark brown substance; decomn. is most rapid when the mass is in a semi-cryst. state; liberation of N is manifestly not confined to the azoimide groups, but becomes more complex. The phenomenon is due to the fact that liberation of N lowers the m. p. of the reaction products below  $50^\circ$ , and the resultant fusion increases both mobility and rate of reaction. A. P.-C.

**Addition products of *p*-phenoxyphenyldialkylphosphines with carbon disulfide.** W. C. Davies and C. J. O. R. Morris. *Bull. soc. chim.* 53, 980 (1933); cf. *C. A.* 25, 5602. The constitution of the products of the addn. of tert. phosphines to CS<sub>2</sub> is discussed and a coordination formula R<sub>3</sub>P → S:C:S is suggested. This is in accordance with the behavior of the compds. but is in variance with the formulation of Jacobson accepted by Huntzsch and Hibbert (*C. A.* 14, 536). These red cryst. addn. compds. are unstable and decomp. on melting. In soln. they exist as an equil. mixt., R<sub>3</sub>P·CS<sub>2</sub> ⇌ R<sub>3</sub>P + CS<sub>2</sub>. This instability renders the investigation of their constitution by parachor and dipolar moment detns. difficult if not impossible. Any formulation of these products must explain the lack of combination between R<sub>3</sub>P and CO<sub>2</sub> or COS and between amines or tert. amines with CS<sub>2</sub>. The phosphines, *p*-PhOC<sub>6</sub>H<sub>4</sub>PR<sub>2</sub> (R = Me, Et or Pr) were prepd. (*C. A.* 27, 966) by the reaction between the requisite RMgBr compd. and *p*-PhOC<sub>6</sub>H<sub>4</sub>PCl<sub>2</sub>. The addn. of 3 cc. CS<sub>2</sub> with shaking, to a mixt. of 2 cc. *p*-PhOC<sub>6</sub>H<sub>4</sub>PR<sub>2</sub> and 4 cc. 96% EtOH gave *p*-phenoxyphenyldimethylphosphine compd. C<sub>17</sub>H<sub>15</sub>OP<sub>2</sub>S<sub>2</sub>, m. 87.5°. The almost colorless soln. in boiling EtOH became red on cooling and deposited red crystals. The corresponding *di-*tert** compd., C<sub>17</sub>H<sub>15</sub>OP<sub>2</sub>S<sub>2</sub>, m. 67°, dissoc. in soln. and yields, on the addn. of MeI, white rectangular tabls. of *p*-PhOC<sub>6</sub>H<sub>4</sub>IPr<sub>2</sub>·MeI, m. 163°. The *di-*tert** compd., C<sub>17</sub>H<sub>15</sub>OP<sub>2</sub>S<sub>2</sub>, m. 57°, is stable in soln. but the cryst. material rapidly loses CS<sub>2</sub> on exposure to the air. A red soln. but no cryst. solid was formed by adding CS<sub>2</sub> to *p*-ClC<sub>6</sub>H<sub>4</sub>IPr<sub>2</sub>. C. R. Addnall

**Reactions of sodium triphenylstannide with polyhalogenated methanes.** Charles A. Kraus and Harry Batough. *J. Am. Chem. Soc.* 55, 5014-16 (1933).—Ph<sub>3</sub>Sn, treated with Na in liquid NH<sub>3</sub> and then with CH<sub>2</sub>Cl<sub>2</sub>, gives *di*-triphenylstannylmethane, m. 101.5°; CHCl<sub>3</sub> gives *tri*-triphenylstannylmethane, m. 128°; with CCl<sub>4</sub> the main reaction product was Ph<sub>3</sub>Sn and NaCl.

C. J. West

**Rearrangement of *o*-acetamido sulfoxides.** Alfred Levi, Leonard A. Warren and Samuel Smiles. *J. Chem. Soc.* 1933, 1490-3; cf. *C. A.* 27, 195. —*1*-Chloro-2-nitro-2'-aminodiphenyl sulfide, deep yellow, m. 130°, results from 2-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>SH and 2,5-Cl<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NO<sub>2</sub>; *Ac* deriv. (I), yellow, m. 150°. 2-Nitro-2'-acetamidodiphenyl sulfide and H<sub>2</sub>O<sub>2</sub> in AcOH at 100° for 2 hrs. give the corresponding sulfoxide (II), pale yellow, m. 160°; the sulfoxide (III) from I, pale yellow, m. 179-80°; the free NH<sub>2</sub> compd. from III, orange, m. 162°. Rearrangement of III with 2 mols. N NaOH and reaction with MeI at 53° gives 2-*o*-nitrophenylaminophenyl Me sulfoxide (IV), *o*-MeOSC<sub>6</sub>H<sub>4</sub>NHCH<sub>2</sub>CH<sub>2</sub>NO<sub>2</sub>, orange, m. 149-51°; oxidation gives the sulfone, yellow, m. 130-1°. III and 3 mols. N NaOH, heated at 100° for 0.5 hr. with free access of air, appear to give the sulfonic acid, since with dil. HI and SO<sub>2</sub> it yields bis[2-(*o*-nitrophenyl)-aminophenyl] disulfide, red, m. 149-51°; with 1 mol. NaOH and MeI III gives the *Ac* deriv. of IV, yellow, m. 160-1°. II gives 2-(*p*-chloro-*o*-nitrophenyl)aminophenyl Me sulfoxide, orange, m. 152°; the sulfone m. 187°. 2-Nitrophenyl 4-hydroxy-*m*-tolyl sulfoxide, yellow, m. 206-7°; this does not rearrange with NaOH, nor does 2-nitrophenyl 2-hydroxy-1-naphthyl sulfoxide, yellow, m. 144° (decompn.); *Ac* deriv., pale yellow, m. 169°.

C. J. West

**Basis for the physiological activity of onium compounds.** XV. Sulfonium compounds. R. R. Renshaw and D. S. Scarle. *J. Am. Chem. Soc.* 55, 4951-3 (1933); cf. *C. A.* 27, 2432-3. Sulfonium salts were prepd. by condensing sulfides with mol. equivs. of halide and Hg salt using Me<sub>2</sub>CO or EtOH as the solvent, then treating with solid AgNO<sub>3</sub> and pptg. the Hg and Ag with H<sub>2</sub>S. (PhCH<sub>2</sub>)<sub>2</sub>S(NO<sub>3</sub>)Me, m. 79°, was prepd. from (C<sub>2</sub>H<sub>5</sub>)<sub>2</sub>S(I)Me.HgI<sub>2</sub>, m. 155°; (PhCH<sub>2</sub>)<sub>2</sub>S(NO<sub>3</sub>)CH<sub>2</sub>CO<sub>2</sub>Et, m. 120°, resulted from (C<sub>2</sub>H<sub>5</sub>)<sub>2</sub>S(Br)CH<sub>2</sub>CO<sub>2</sub>Et.HgI<sub>2</sub> or from (C<sub>2</sub>H<sub>5</sub>)<sub>2</sub>S(Br)CH<sub>2</sub>CO<sub>2</sub>Et.HgBr<sub>2</sub>. Ph<sub>2</sub>S(NO<sub>3</sub>)Me, m. 108°, was prepd. from Ph<sub>2</sub>S(I)Me.HgI<sub>2</sub>, m. 95°. Me<sub>2</sub>S, BrCH<sub>2</sub>CH<sub>2</sub>-

Oph and HgBr<sub>2</sub> give Me<sub>2</sub>S(Br)CH<sub>2</sub>CH<sub>2</sub>Oph.HgBr<sub>2</sub>, m. 70-1°, from which was prepd. Me<sub>2</sub>S(NO<sub>3</sub>)CH<sub>2</sub>CH<sub>2</sub>Oph, m. 62-5°. Et<sub>2</sub>S(Br)CH<sub>2</sub>CH<sub>2</sub>Oph.HgBr<sub>2</sub>, m. 78°; the nitrate was a gummy semi-solid. Pr<sub>2</sub>S(Br)CH<sub>2</sub>CO<sub>2</sub>Et, m. 70°. (PhCH<sub>2</sub>)<sub>2</sub>S(Br)CH<sub>2</sub>CO<sub>2</sub>Et.HgBr<sub>2</sub>, m. 127°.

C. J. West

**Preparation of tris(hydroxytriaryl) sulfonium salts.** D. Liebermann. *Compt. rend.* 197, 921-3 (1933); cf. *C. A.* 27, 1873. Tris(hydroxytriaryl) sulfonium chloride, may be prepd. by treating a phenol (3 mols.) with SOCl<sub>2</sub> (2 mols.), the latter being added drop by drop with shaking and continual cooling. In prepg. similar compds. from naphthols, the latter are added gradually to SOCl<sub>2</sub>. The following sulfonium chlorides were prepd.: *tris*-(hydroxyphenyl), m. 261-2° (decompn.) (*tetra*-Bz deriv., m. 35°); *tris*-(hydroxy-*o*-tolyl), pale rose, m. 190° (*tetra*-Bz deriv., m. 39°); *tris*-(hydroxy-*m*-tolyl), m. 273-4° (decompn.) (*tetra*-Bz deriv., m. 41°); *tris*-(*α*-hydroxy-naphthyl), greenish, m. above 350°; *tris*-(*β*-hydroxy-naphthyl), of which 2 isomers were obtained, one m. 227°, the other, yellow, m. 273-4°. All of these compds. give colors with H<sub>2</sub>SO<sub>4</sub>. Louise Kelley

**Attempted resolution of some substituted disulfonyl-methanes and the resolution of *α*-*p*-carboxyphenyl-sulfonyl-*α*-*p*-tolylthioethane.** F. Barry Kipping. *J. Chem. Soc.* 1933, 1506-10. —*Et p*-mercaptobenzoate (I), b. 162-4°, b. 275°, oxidation with I in EtOH gives bis(*p*-carbethoxyphenyl) disulfide, m. 65-6°. I and Cl-CH<sub>2</sub>Ac with NaOH give *p*-carbethoxyphenylthioacetone, m. 53-4°, oxidized to *p*-carbethoxyphenylsulfonylacetone (II), m. 88°, by acid KMnO<sub>4</sub> (Na salt (III)). III and PhCH<sub>2</sub>I in EtOH give the *α*-benzyl deriv., EtO<sub>2</sub>CC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>CH(CH<sub>2</sub>Ph)Ac, m. 104°, hydrolyzed to HO<sub>2</sub>CC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>CH(CH<sub>2</sub>Ph), m. 232-3°, whose *Et* ester m. 77-8°. II and di-*p*-tolyl disulfide in EtOH give a mixt. of *p*-carbethoxyphenylsulfonyl-*p*-tolylthiomethane (IV), m. 121°, and *α*-*p*-carbethoxyphenylsulfonyl-*α*-*p*-tolylthioacetone (V), m. 86-7°. IV and V are hard to sep. but if the reaction is heated for 7 hrs., IV may be obtained in 80% yield. The free acid (VI) from IV m. 205-6° (Na salt, needles). Oxidation of VI with KMnO<sub>4</sub> in AcOH gives *p*-carboxyphenylsulfonyl-*p*-tolylsulfonylmethane (VII), m. 210-2° (*Et* ester (VIII), m. 147-5°); the Na salt of VIII and PhCH<sub>2</sub>I give the benzyl deriv., m. 116-7°, the free acid (IX) m. 185-6°; IX could not be resolved, the following salts were prepd.: *quinine*, m. 215°, [α]<sub>D</sub><sup>25</sup> -115°, [α]<sub>D</sub><sup>25</sup> -132° (CHCl<sub>3</sub>, c 1.3); *nor-d*-*α*-ephedrine, m. 115-8°, *l*-menthylamine, m. 214-5°; *d*-sec-butylamine, m. 205-7°; *cinchonidine*, [α]<sub>D</sub><sup>25</sup> -65°, [α]<sub>D</sub><sup>25</sup> -75° (CHCl<sub>3</sub>, c 1); *l*-phenylethylamine, m. 186°. Condensation of VII with di-Ph disulfide in EtOH-EtONa gives *p*-carboxyphenylsulfonyl-*p*-tolylsulfonylphenylthiomethane, m. 212° (*Et* ester, m. 126-7°); this could not be resolved; *quinine* salt, m. 209-10°, [α]<sub>D</sub><sup>25</sup> -111.5°, [α]<sub>D</sub><sup>25</sup> -127° (CHCl<sub>3</sub>, c 1.2); *l*-menthylamine salt, m. 184-5°, [α]<sub>D</sub><sup>25</sup> -10-7° (CHCl<sub>3</sub>, c 1.07). I and MeCHBrAc with EtOH-EtONa, followed by oxidation, give 77% of *α*-*p*-carbethoxyphenylsulfonyl-*α*-*p*-tolylthioethane (X), m. 66-7°; with di-*p*-tolyl disulfide and hydrolysis this gives di-*α*-*p*-carboxyphenylsulfonyl-*α*-*p*-tolylthioethane (XI), HO<sub>2</sub>CC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>CH(CH<sub>2</sub>SO<sub>2</sub>CH<sub>2</sub>Ph)<sub>2</sub>, m. 168-9° (*Et* ester, m. 72°, chloride, m. 83-4°); this is resolved by *l*-menthylamine, the least sol. fraction of which salt m. 199-202°, [α]<sub>D</sub><sup>25</sup> 57° (CHCl<sub>3</sub>, c 1.2); *d*-X, m. 160°, [α]<sub>D</sub><sup>25</sup> 130° (CHCl<sub>3</sub>, c 0.55); in 1 equiv. NaOH the acid has a half life period of 10 hrs., in NH<sub>4</sub>OH about 60 hrs. The *quinine* salt m. 180-1°, [α]<sub>D</sub><sup>25</sup> -100° (CHCl<sub>3</sub>, c 0.6); the *d*- and *l*-Me esters, m. 131-2°, [α]<sub>D</sub><sup>25</sup> ± 134° (CHCl<sub>3</sub>, c 1.025). *d*-*Et* ester, m. 44-5°; *d*-acid chloride, m. 101-2°, [α]<sub>D</sub><sup>25</sup> 145° (CHCl<sub>3</sub>, c 1.31). *α*-*p*-Carboxyphenylsulfonyl-*α*-*p*-tolylsulfonylthioethane, m. 233-4°; *Et* ester, m. 120-1°. Me ester, m. 141°; this could not be resolved; the following salts were prepd.: *quinine*, m. 211-2°; *l*-menthylamine, m. 187-91°, [α]<sub>D</sub><sup>25</sup> -18.6° (EtOH, c 1.5); *cinchonidine*, m. 177-8°, [α]<sub>D</sub><sup>25</sup> -85.5° (CHCl<sub>3</sub>, c 1.08); *l*-hydroxyhydrindamine, m. 208-10°, [α]<sub>D</sub><sup>25</sup> -72° (Me<sub>2</sub>CO, c 0.84); *l*-phenylethylamine, m. 214-6°. *α*-*p*-Carboxy-

*phenylsulfonol- $\alpha$ -methylthioethane*, m. 185° (decompn.); salts: *l*-hydroxyhydrindamine, m. 194°,  $[\alpha]_{D}^{25} -91^{\circ}$  (Me<sub>2</sub>CO, *c* 0.6); *strychnine*, m. 234°,  $[\alpha]_{D}^{25} -10.3^{\circ}$  (CHCl<sub>3</sub>, *c* 0.63); *l*-menthylamine, m. 174.7°,  $[\alpha]_{D}^{25} -21^{\circ}$  (EtOH, *c* 0.76); *quinine*, m. 217°,  $[\alpha]_{D}^{25} -160^{\circ}$  (CHCl<sub>3</sub>, 1.3). The acid could not be resolved nor could its oxidation product,  *$\alpha$* -*p*-carboxyphenylsulfonol- *$\alpha$* -*p*-methylsulfonylethane, m. 273°; salts: *d*-hydroxyhydrindamine, m. 186.7°,  $[\alpha]_{D}^{25} 85^{\circ}$  (Me<sub>2</sub>CO, *c* 0.7); *quinine*, n. 165.7°,  $[\alpha]_{D}^{25} -94.5^{\circ}$  (CHCl<sub>3</sub>, *c* 0.51); *l*-phenylthylamine, m. 195.8°; *cinchonidine*, m. 183.4°,  $[\alpha]_{D}^{25} -78.7^{\circ}$  (EtOH, *c* 1.53); *l*-menthylamine, m. 189.40°,  $[\alpha]_{D}^{25} -18.3^{\circ}$  (EtOH, *c* 2.26). C. J. West

**Identification of mercaptans with 2,4-dinitrochlorobenzene.** II. R. W. Bost, J. O. Turner and M. W. Conn. *J. Am. Chem. Soc.* 55, 4956 7(1933); cf. C. A. 26, 3230.—The following 2,4-dinitrophenyl thiethers are reported: *decyl*, m. 85° (all m. ps. col.); *undecyl*, m. 40°; *lauryl*, m. 89°; *allyl*, m. 71.5°; *o*-thiocresol, m. 101°; *m*-isomer, m. 90.5°; *p*-chlorothiophenol, m. 123°; *p*-Br deriv., m. 142°;  *$\alpha$* -thionaphthol, m. 176°;  *$\beta$* -isomer, m. 145°; *cyclohexyl*, m. 138°; *ethylenethiohydrin*, m. 100.5°; *dimethylene di*-, m. 248°;  *$\alpha$* -methylmethylenedi-, m. 226°; *trimethylene di*-, m. 194°; *tetramethylene di*-, m. 170°; *pentamethylene di*-, m. 170°; *hexamethylene di*-, m. 218°. The monothiols are golden yellow; the dithiols of the dimercaptans are an orange. Sulfones of 2,4-dinitrophenyl thiethers: *decyl*, m. 93°; *undecyl*, m. 97°; *lauryl*, m. 101°; *cetyl*, m. 105°; *o*-thiocresol, m. 155°; *m*-isomer, m. 144.5°; *p*-chlorothiophenol, m. 170°; *p*-Br deriv., m. 190°; *cyclohexyl*, m. 172°. C. J. West

**Glucosides of *p*-nitrophenol and *p*-aminophenol and their fermentative degradation.** Burkhardt, Hellerich and Otto Peters. *J. prakt. Chem.* 138, 281 3(1933).—Catalytic reduction of tetraacetyl-*p*-nitrophenol- $\beta$ -D-glucoside in MeOH gives the *tetra-Ac deriv.*, m. 127–30°,  $[\alpha]_{D}^{25} -15.5^{\circ}$  (CHCl<sub>3</sub>), of *p*-aminophenol  $\beta$ -D-glucoside (I), m. 157–60°,  $[\alpha]_{D}^{25} -65^{\circ}$  (H<sub>2</sub>O). *p*-Nitrophenol  $\beta$ -D-glucoside is decompd. to the extent of 85% in 15 min. in emulsion; I is decompd. to the extent of 50% in 50 min. C. J. West

**Cymorcinol.** W. Treibs. *J. prakt. Chem.* 138, 281 8 (1933).—Cymorcinol (I) forms an *acetate*, b. 270°. With 4 atoms Br per mol. I gives a *di-Br deriv.*, yellow, m. 65°. HNO<sub>3</sub> and I form a *NO compd.*, brown-red, m. 112°, reduction with SnCl<sub>2</sub> and HCl gives *hydroxythymoquinone* (II), m. 170° (semicarbazone, m. 217°). Oxidation of I gives II. Oxidation of I with O<sub>2</sub> in MeOH-KOH gives *dihydroxythymoquinone*, red, m. 220°. C. J. West

**Molecular rearrangement of  $\alpha,\beta$ -unsaturated ethers.** Walter M. Lauer and Marvin A. Spielman. *J. Am. Chem. Soc.* 55, 4923 30(1933).—The following *Br-Br ethers* were prepd.: *p*-PhCH(OMe)CH<sub>2</sub>Br, b<sub>28</sub> 117–8° (65% yield); *p*-ClC<sub>6</sub>H<sub>4</sub>CH(OMe)CH<sub>2</sub>Br, b<sub>28</sub> 151.6° (51%), PhCH(OPr)CH<sub>2</sub>Br, b<sub>28</sub> 146.8° (66%); PhCH(OBu)CH<sub>2</sub>Br, b<sub>28</sub> 165.6° (57%); PhCH(OAm-iso)CH<sub>2</sub>Br, b<sub>12</sub> 140–3° (81%),  *$\alpha$* -butoxystyrene (I), b<sub>28</sub> 131.5–5.5°, n<sub>D</sub><sup>20</sup> 1.5493; *p*-chloro- $\alpha$ -methoxystyrene (II), b<sub>28</sub> 118.21°, n<sub>D</sub><sup>20</sup> 1.5510 (59%); *p*-chloroacetophenone semicarbazone, m. 202–4°.  $\alpha$ -Methoxystyrene (20 g.), heated 2 hrs. at 300°, gives 13 g. BzEt and 2 g. BzMe (CHCl<sub>3</sub> sol., m. 104–4.5° (dioxime, m. 166–7°); dehydration gives 2,5-diphenyl-3-methylfuran, m. 57–8°. Condensation of PhC(=CH<sub>2</sub>)OMe and BzMe, heated 2 hrs. at 300°, gives (CH<sub>3</sub>Bz)<sub>2</sub>.  $\alpha$ -Ethoxystyrene (25 g.), heated at 300° for 1 hr., gives 14.4 g. BzPr, b<sub>20</sub> 115.21°, and 1.5 g. 1,2-dibenzoylbutane, b<sub>20</sub> 234–45°, n<sub>D</sub><sup>20</sup> 1.5795.  $\alpha$ -Propoxystyrene gives 20% valerophenone and impure 1,2-dibenzoylpentane. I (5 g.) gives 3.7 g. caprophenone. II gives *p*-chloropropiophenone, b<sub>11</sub> 134–7° (semicarbazone, m. 175–6°), and 1,2-bis(*p*-chlorobenzoyl)propane, m. 116.5–7°.  $\alpha$ -Isobutoxystyrene gave isopentene, isopentane, PhAc, *Ph isohexyl ketone*, b<sub>11</sub> 145.8°, n<sub>D</sub><sup>20</sup> 1.5067 (semicarbazone, m. 144–5°), and (Cl<sub>2</sub>Bz)<sub>2</sub>. Heating 10 g. each of I and II together to 265° for 3 hrs. gave PhAc and BzEt, thus showing that a strictly intra-

mol. mechanism is untenable. The mechanism advanced involves complex formation between 2 ether mols. followed by rearrangement in either of these 2 parts of the complex body. C. J. West

**3,5-Dichlorobenzaldehyde.** Fritz Asinger and Gunther Luck. *Monatsh.* 62, 344–8(1933).—By chlorinating 3,5-Cl<sub>2</sub>C<sub>6</sub>H<sub>3</sub>Me (in the prepn. of which from 4,6-Cl<sub>2</sub>-2-MeC<sub>6</sub>H<sub>3</sub>NHAc it was found most effective to hydrolyze the latter compd. with 50% H<sub>2</sub>SO<sub>4</sub> to yield 80–5% of the amine) at 180–90° and hydrolyzing 50 g. of the product by agitation with fuming H<sub>2</sub>SO<sub>4</sub> (8% SO<sub>3</sub>) for 30 hrs. at room temp., there were obtained 70–80% 3,5-dichlorobenzaldehyde (I), b<sub>748</sub> 235–40°, m. 65°, and 10–2% 3,5-Cl<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>H (II), which latter compd. was also formed from I by oxidation in 74% yield. The following derivs. of I were also prepd.: *NaHSO<sub>3</sub> addn. compd.*; *aldoxime*, m. 112°; *phenylhydrazone*, m. 106.5°; 3,5-dichlorobenzal chloride (III), m. 36.5° (18 g. from 17.6 g. I and 20.8 g. PCl<sub>5</sub>); 3,5-dichlorocinnamic acid (IV), m. 176° (3.9 g. by refluxing 4 g. I, 2.5 g. NaOAc and 1.9 g. Ac<sub>2</sub>O), which upon bromination yielded 3,5-dichloro- $\alpha,\beta$ -dibromocinnamic acid, m. 209°. II results from the oxidation of IV. In an unsuccessful attempt to hydrolyze III by heating it with water and an excess of Ca(OH)<sub>2</sub> to 200° in an autoclave there were obtained IV and 3,5-dichlorobenzyl alc. (V), m. 82°, which same 2 products were formed in 90% yield by subjecting I to the same conditions. By interaction with PCl<sub>5</sub> V is converted to 91% of the corresponding chloride, m. 36°. I. M. L.

**Replacement of groups by hydrogen in certain substituted methanes.**  $\alpha$ -Tribromoacetophenones. C. Harold Fisher. *J. Am. Chem. Soc.* 55, 5003 8(1933).—2,4,6,3,5-Me<sub>2</sub>Br<sub>2</sub>C<sub>6</sub>COCH<sub>3</sub> (I) in Me<sub>2</sub>CO liberates 1, from KI, giving 2,4,6,3,5-Me<sub>2</sub>Br<sub>2</sub>C<sub>6</sub>COCH<sub>2</sub>Br; this also results from 2,4,6,3,5-Me<sub>2</sub>Br<sub>2</sub>C<sub>6</sub>Ac and Br in AcOH; reduction with Zn in AcOH removes the  $\alpha$ -Br atom. I and EtMgBr give 2,4,6,3,5-Me<sub>2</sub>Br<sub>2</sub>C<sub>6</sub>COCH<sub>2</sub>Br, as does N<sub>2</sub>H<sub>4</sub>, PhOH and PhAc; I is unchanged by refluxing in Me<sub>2</sub>CO for 1 hr. 2,4,6-Me<sub>3</sub>C<sub>6</sub>H<sub>2</sub>Ac and Br in AcOH give the  $\alpha,\alpha$ -di-Br deriv. (II), m. 73.4°; alkali has little effect; ClCH<sub>2</sub>COCH<sub>2</sub>Br<sub>2</sub> dissolves in aq. KOH several hundred times as rapidly as does II. C. J. W.

**Isomerism in halochromic compounds.** II. P. Pfeiffer and H. Kleu. *Ber.* 66B, 1704 13(1933); cf. C. A. 27, 4787.—The formation of isomeric monoperochlorates (colorless or light colored NH<sub>4</sub> and colored oxonium or carbenium salts) seems to be quite general for amino ketones and a no. of addnl. pairs of isomers has been prepd.; in some cases, the theoretically expected diperochlorates have been obtained. All these salts are readily split down into their components by water but the isomers generally show characteristic differences in the ease with which they are hydrolyzed, sometimes the colorless, sometimes the colored isomer being the more easily hydrolyzed. The colorless salts can, in general, be obtained by dissolving the amino ketone in excess of dil. aq. HClO<sub>4</sub>. To prep. the colored salts advantage can often be taken of the fact that they are the primary hydrolysis products of the diperochlorates. Even when the latter are too sol. to be isolated, the colored monoperochlorates can generally be obtained by dilg. (with water) solns. of the amino ketones in 70% aq. HClO<sub>4</sub>, which contain the diperochlorates. Where the diperochlorates are too readily hydrolyzed the colored monoperochlorates are obtained by isomerizing the colorless salts by crystn. from ClCH<sub>2</sub>CO<sub>2</sub>H. The following *p*-chlorates are described: *p*-Dimethylaminobenzal-*p*-chloroacetophenone (the ketone itself forms yellow needles, m. 140.0–5°), needles sol. in hot AcOH with faint violet color, and blue-violet crystals; *p*-Dimethylaminobenzal-*p*-methylacetophenone (free ketone, golden yellow, m. 122–3°), needles sol. in hot AcOH with deep blue-red color, and blue, finely cryst. powder (also yields a yellow diperochlorate); *p*-Dimethylaminobenzal-*p*-methoxyacetophenone, needles sol. in AcOH with Bordeaux-red color, and fine, dark blue needles; *p*-Dimethylaminobenzalacetone, brownish yellow crystals sol. in AcOH with blue color, and bluish green

**Phenol ketones of diphenylmethane, -ethane, -propane and certain of their reduction products.** H. Wöjahn. *Arch. Pharm.* 271, 417-31(1933).—The disinfecting power of simple phenols is in general increased by introduction of alkyls in the nucleus. Thus, it develops that the activity of 2,4-(HO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CH<sub>2</sub>Ph, as compared with its corresponding mono-HO deriv., is almost 5 times as great, that furthermore extension of the aliphatic chain, e. g., transition of diphenylmethane to diphenylethane derivs., involves a further increase, thereupon suffering diminution again in the analogous propane deriv. The results of the present investigation are outlined in the following summary, after employing the procedure followed by Clemmensen: The at. rearrangement via Fries, e. g., transition of the acyclic radical to the nucleus, is readily effected in the case of hydroxydiphenylmethane, ethane and -propane, involving both *p*- and *o*-formation. The formation of *o*-ketones by heat treatment (baking) is somewhat disadvantageous; by treatment in PhCl, however, the process is measurably improved. The resorcinol monoketones of diphenylmethane, -ethane and -propane are most advantageously prep'd. by the action of AlCl<sub>3</sub> on like mols. of the diester and free phenol in PhNO<sub>2</sub>. Aliphatic ketones are susceptible of reduction via Clemmensen; with increase in the chain, however, the yields become correspondingly less. The following new compds. are described and characterized: 2-Hydroxydiphenylmethane: 5-Ac (I), C<sub>15</sub>H<sub>14</sub>O<sub>2</sub>, m. 137.8° (phenylhydrone, yellow needles m. not sharply 122.4°); 5-EtCO, m. 153°; 5-PrCO, m. 142°; isovaleryl, m. 121°. 2-Methoxydiphenylmethane: 5-Ac, m. 101.2°; 5-EtCO, m. 119°; 5-PrCO, m. 106°; isovaleryl, m. 66°. From I by reduction with Zn and HCl was obtained 5-ethyl-2-hydroxydiphenylmethane, b<sub>17</sub> 197°, becoming yellowish brown, and similarly were prep'd. the 5-Pr, b<sub>1</sub> 205°, 5-Bu, b<sub>18</sub> 211°, and 5-iso-Am compds., b<sub>18</sub> 222°. 1-Hydroxydiphenylmethane: 5-Ac (II), m. 56° (4-Me ether, yellow oil, b<sub>22</sub> 223°); 5-Et, from II by reduction with Zn and AcOH + HCl, b<sub>22</sub> 212.15°, identical apparently with the phenolic product described by Marschalk; 5-EtCO, m. 75.6°; 5-PrCO, m. 52°; 5-isovaleryl, b<sub>22</sub> 223°. 4-Hydroxydiphenylethane (III), prep'd. from PhCH<sub>2</sub>COPh by reduction with Hg-Zn and HCl and identical with the phenol obtained by Stoermer and Kippe in another way, yielded the following derivs.: 5-Et, from III in the form of its acetate with AlCl<sub>3</sub>, yellow oil, b<sub>18</sub> 250°, and crystals m. 52°; 5-EtCO, b<sub>18</sub> 220°, m. 17-8°; 5-PrCO, yellow oil, b<sub>18</sub> 240.2°; 5-isovaleryl, yellow oil, b<sub>18</sub> 247°. 5-Acetyl-4-hydroxydiphenylpropane, yellow oil, b<sub>18</sub> 232°. 2,4-Dihydroxydiphenylmethane: 5-Ac, m. 149° (phenylhydrazone, C<sub>15</sub>H<sub>10</sub>O<sub>2</sub>N<sub>2</sub>, yellow needles, m. 146°; 2,4-di-Me ether, C<sub>17</sub>H<sub>16</sub>O<sub>2</sub>, m. 110°), yields on reduction the 5-Et deriv.; 5-EtCO (IV), m. 92°; 5-PrCO, m. 72°; 5-isovaleryl, m. 115°. Reduction of IV yields the 5-Pr deriv., b<sub>18</sub> 225°, identical with the reduction product from 5,2,4-Tris-(HO)-C<sub>6</sub>H<sub>3</sub>Br described by Rosenmund, Buchwald and Deligiannis. Similarly were obtained the 5-Bu, yellow oil, oxidizing easily in the air, b<sub>18</sub> 238-40° (decompn.), and 5-iso-Am deriv., yellow oil, b<sub>18</sub> 241°. 2,4-Dihydroxydiphenylethane: 5-Ac, m. 136°; 5-EtCO, m. 85.6°; 5-isovaleryl, m. 102°. 2,4-Dihydroxydiphenylpropane: 5-Ac (from the diester of dihydroxydiphenylpropane), m. 106°; 5-EtCO, m. 78°; 5-isovaleryl, m. 105°.

W. O. E.

**Halogenated benzophenones.** Josef Ganzmüller. *J. prakt. Chem.* 138, 311-12(1933).—*p*-C<sub>6</sub>H<sub>4</sub>Cl<sub>2</sub> (14.5 g.), 14.5 g. AlCl<sub>3</sub> and 11.5 cc. BzCl, heated over a small flame for 3 days, give 2,5-dichlorobenzophenone, m. 85-6°; *o*-ClC<sub>6</sub>H<sub>4</sub>COCl gives 2',2',5-trichlorobenzophenone, m. 145-7°, 2,4-Cl<sub>2</sub>C<sub>6</sub>H<sub>3</sub>COCl gives 2',4',2,5-tetrachlorobenzophenone, m. 176°.

C. J. West

**Oxidation products of benzophenone oxime.** W. H. Hunter and W. S. Dyer. *J. Am. Chem. Soc.* 55, 5053-5 (1933).—Expts. with K<sub>2</sub>Fe(CN)<sub>6</sub>, I in a dry medium and Ag<sub>2</sub>O in C<sub>6</sub>H<sub>6</sub> or Et<sub>2</sub>O are reported. The definite products are Ph<sub>2</sub>CO, a yellow compd. C<sub>12</sub>H<sub>10</sub>ON<sub>2</sub>, m.

156-7°, and a compd. (C<sub>12</sub>H<sub>10</sub>NO)<sub>4</sub>, m. 193° (decompn.). C. J. West

**Rubenes, organic compounds possessing the property of absorbing and regenerating free oxygen.** Charles Dufraisse. *Bull. soc. chim.* 53, 789-849(1933).—An address. The discussion of the chemistry of rubenes includes the usage of the proposed new nomenclature, methods of prep'n., tabulation of known rubenes and their phys. properties, the constitution of tetraphenylrubene (I) (formerly "rubrene") and mention of collateral researches on ethynylmethyls, indenenes and on the satellites of I. The description of the special study of the oxidation of rubenes comprises the absorption and reemission of free O by the rubenes with a detailed account of the fundamental expts. with I, and a discussion of the constitution of the oxyrubenes. The address concludes with several remarks concerning dissociable oxides, including a comparison between inorg. and org. dissociable oxides, mention of other org. dissociable oxides and references to the respiratory pigments. A bibliography of 80 references is appended.

C. R. Addinall

**Dissociable organic oxides. A second isomer of oxytetraphenylrubene.** Leon Eudelin. *Compt. rend.* 197, 691-3(1933); cf. *C. A.* 27, 1880.—Agitation of oxytetraphenylrubene (I) in benzene with 50% H<sub>2</sub>SO<sub>4</sub>, concd. HCl, or other strong acid solns. gives an isomer of I, C<sub>16</sub>H<sub>12</sub>O<sub>2</sub>.C<sub>6</sub>H<sub>6</sub> (II), m. 205°, contg. 1 atom of active H. II is unstable to light and heat, decomp. to indefinite substances and yielding neither O nor rubene. The dissociability, the fundamental property of I, is absent in this isomer II. It differs in its instability from the previously known isomer (C. A. 24, 5747), which can be distd. unaltered. On reduction with Zn and AcOH, II gives almost quant. yields of a naphthalene, C<sub>10</sub>H<sub>8</sub> (C. A. 26, 2189), suggesting a close relation of II to rubene.

C. R. Addinall

**Arsonic acids of the fluorenone and the fluorenol series.** Gilbert T. Morgan and Jessie Stewart. *J. Chem. Soc.* 1933, 1454-7; cf. *C. A.* 26, 4040.—Na aminofluorenone-2-arsonate (I) and ClCH<sub>2</sub>CONHCONH<sub>2</sub>, NaI and NaOH in dil. EtOH, boiled 4 hrs., give fluorenone-6-glycineureide-2-arsonic acid, red-purple (Na salt, purple); the min. curative dose for trypanosomiasis is 6 mg. per 20 g. mouse; the Me deriv. (Na salt, red) is inactive; the Ph deriv., bright red (Na salt, orange-pink; di-Na salt, crystals with 6 mols. H<sub>2</sub>O), is slightly active in max. doses. Na 7-hydroxyfluorenone-2-arsonate and ClCH<sub>2</sub>CONH<sub>2</sub> give a small yield of Na 7-carbamylmethoxyfluorenone-2-arsonate, whose M. C. D. is 10. 2-Amino-9-fluorenol through the diazo reaction gives 9-fluorenol-2-arsonic acid (Na salt, yellow). Catalytic reduction of I (60 atm.) gives Na aminofluorenol-2-arsonate (II); the free acid is amphoteric; Ac<sub>2</sub>O gives the 7-acetamido deriv. (Na salt, pale yellow) and the 7-acetamido-9-acetoxy deriv. II and ClCH<sub>2</sub>CONH<sub>2</sub> give 9-fluorenol-7-glycineamide-2-arsonic acid (Na salt, pale pink); there is also formed a 9-O-carbamylmethyl deriv. (di-Na salt), which has no therapeutic action. II and KCNO in H<sub>2</sub>O give 7-carbamido-9-fluorenol-2-arsonic acid, pale yellow (Na salt, crystals with 2 mols. H<sub>2</sub>O); Me deriv. (Na salt, crystals with 0.5 mol. H<sub>2</sub>O); Ph deriv., yellow (di-Na salt, with 3 mols. H<sub>2</sub>O, pale yellow); these are slightly active in max. doses. C. J. West

**The condensation of benzoin and resorcinol.** Otto Dischendorfer. *Monatsh.* 62, 263-83(1933).—The condensation of benzoin (I) and *m*-C<sub>6</sub>H<sub>4</sub>(OH)<sub>2</sub> (II) in the presence of 73% H<sub>2</sub>SO<sub>4</sub> led to the formation of III (acetate, m. 112°), lin- (IV) and ang-m-benzotetraphenyldifuran (V), m. 203.4°, the last in small quantity. The method of Japp and Meldrum (*J. Chem. Soc.* 75, 1035(1899)), who isolated III and IV, was followed with the exception that the crude III was converted into the benzoate (VI), m. 160-2°, and sapond., instead of isolating it in the pure state directly. The yield was thus increased from 7.5 to 80%. The structures of these compds. and their derivs. were verified by oxidation with CrO<sub>3</sub>. In all cases the double bond in the furan ring was split. VI

upon oxidation gave 2,4-dibenzoylbenzophenone, 2,4-(BzO)<sub>2</sub>C<sub>6</sub>H<sub>2</sub>COPh, m. 143-4°, which was sapond., yielding 2,4-(HO)<sub>2</sub>C<sub>6</sub>H<sub>2</sub>COPh. This last compd. was also synthesized by condensation of II and BzCl in the presence of AlCl<sub>3</sub>. Likewise, IV and V were transformed by action of CrO<sub>3</sub> to 1,3,4,6-C<sub>6</sub>H<sub>2</sub>(OH)<sub>4</sub>Br<sub>2</sub> (VII), and 2,4-dihydroxy-1,3-dibenzoylbenzene, m. 103-4°, resp. IV in CCl<sub>4</sub> reacts with Br<sub>2</sub> to give 93% of *ms*-di-Br deriv. (VIII), m. 291-2°, which yielded upon oxidation 2,5-dibromo-4,6-dihydroxy-1,3-dibenzoylbenzene (IX), m. 256°; the *ds*-BzO deriv. of IX, obtained before hydrolysis, m. 246-7°. Severe oxidation of IX with alk. KMnO<sub>4</sub> resulted in BzOH only, confirming the position of the Br atoms on the ring susceptible to destructive oxidation by the presence of the 2 free OH groups. In an attempt to prep. IX by brominating VII there was obtained only the 2- or 5-Br deriv., m. 212°, even with an excess of Br<sub>2</sub>. By means of a similar series of reactions originating with IV (in boiling AcOH) and coned. HNO<sub>3</sub> there were obtained *ms*-nitro-*lin*-*m*-benzo tetraphenylidifuran (X), m. 281°, and the 5-nitro deriv. of VII (XI) (dibenzoyl m. 255°), which like IX yields only BzOH upon oxidation with alk. KMnO<sub>4</sub>. Position 5 for the NO<sub>2</sub> group is preferable to that of 2 since XI is light yellow in color in contrast to the orange color of 1,3,2-C<sub>6</sub>H<sub>2</sub>(OH)<sub>2</sub>NO<sub>2</sub>. Reduction of X with PhNIINH<sub>2</sub> gave the corresponding amino compd. which sinters 250-60°. Nitration of IV (2 g.) with a large excess of HNO<sub>3</sub> yielded 0.3 g. of the tetranitro deriv., m. 242-3°, the structure of which with respect to the NO<sub>2</sub> groups is as yet unknown. M. ps. of mixts. of I and II were detd. No evidence of compd. formation was obtained. The eutectic mixt., m. 83°, consisted of 46% I and 54% II.

I. M. Levine

**7-Phenylthio derivatives of deoxybenzoin.** Wm. A. Mitchell and Samuel Smiles. *J. Chem. Soc.* 1933, 1529. Reduction of the phenylmercaptide of benzil with Zn and AcCl gives 7'-acetoxy-7-phenylthiostilbene, m. 141°, hydrolysis gives 7-phenylthiodoxybenzoin, m. 81°. 7-(5-Chloro-2-methoxyphenylthio)-7'-acetoxy-7-phenylthiostilbene, m. 114°; hydrolysis gives 7-(5-chloro-2-methoxyphenylthio)-deoxybenzoin, m. 102°, also obtained by condensing 5-chloro-2-methoxyphenylthiol with benzoin in EtOH with dry HCl; a excess of thiol is used there results 7,7'-bis(5-chloro-2-methoxyphenylthio)stilbene, m. 208°. The phenylmercaptide of  $\omega$ -phenylthioacetophenone, m. 82°, results from benzoylcarbonyl acetate and phenylthiol with dry HCl in EtOH.

C. J. W.

**Condensation and ring closure in the naphthalene series.** VII. Reaction of phthaloylnaphthol with hydroxylamine and with diazomethane. Louis F. Fieser. *J. Am. Chem. Soc.* 55, 4963 76(1933); cf. C. A. 27, 1793.—Phthaloylnaphthol (I) (10 g.) in 200 cc. EtOH and 20 cc. 6 N NaOH with 15 g. NH<sub>2</sub>OH.HCl, refluxed 2 hrs., gives 9 g. 1-hydroxy-7,12-pleiadenedione 7-oxime (II), yellow, m. 242°; it is recovered unchanged after boiling with alkali for several hrs. and after heating with 82% H<sub>2</sub>SO<sub>4</sub> 1 hr. on the steam bath; diacetate, pale yellow, m. 237°; by heating II at 300-20° gives a dehydro product, C<sub>18</sub>H<sub>8</sub>O<sub>2</sub>N e-yellow, m. 260° (monoacetate, pale yellow,

m. 208°); it shows no change on heating in EtOH-KOH or on short heating with coned. H<sub>2</sub>SO<sub>4</sub>. The isomeric anhydro compd. of 1,6-dihydroxypleiadenedione oxime, yellow, m. 202°, results from the ketone and NH<sub>2</sub>OH in alkali. The 12-oxime (IV) is formed in addn. to II, if the amt. of alkali is increased but is best prepd. from VIII. IV, yellow, m. 262°, with the formation of V, in EtOH contg. alkali IV is fairly stable but in aq. solns. V is formed. The diacetate (VI), pale yellow, m. 174°, is best prepd. in C<sub>6</sub>H<sub>6</sub>N. The anhydro compd. (V) of IV, m. 227°, results as indicated above and also in nearly quant. yield from 1 g. of the Me ether of I, 30 cc. EtOH, 8 cc. 6 N NaOH and 1.5 g. NH<sub>2</sub>OH.HCl. III has not been converted into V, so that they are not stereoisomers. I in 30 cc. H<sub>2</sub>O and 2 cc. 6 N NaOH, treated with 1 g. NH<sub>2</sub>OH in H<sub>2</sub>O in the cold, gives an addn. product, C<sub>18</sub>H<sub>12</sub>O<sub>2</sub>N<sub>2</sub> (VII), pale yellow, decomp. about 135°; on heating in alkali there results H and V; in cold C<sub>6</sub>H<sub>5</sub>N and Ac<sub>2</sub>O there results a diacetate (VIII) of IV, pale yellow, m. 163°, easily hydrolyzed by cold EtOH-KOH to IV. VIII is not identical with VI; with C<sub>6</sub>H<sub>5</sub>N, VII gives the Me ether of I. Neg. results were obtained from the attempted reaction of I with MeNH<sub>2</sub>OH, PhNIINH<sub>2</sub>, Ph<sub>3</sub>NNH<sub>2</sub>, NH<sub>2</sub>CONHNH<sub>2</sub> and nitroxy. I and N<sub>2</sub>H<sub>4</sub> give an addn. product, yielding with Ac<sub>2</sub>O and C<sub>6</sub>H<sub>5</sub>N a hydrazone diacetate, pale yellow, m. 199-200°. The reaction of I with CH<sub>3</sub>N<sub>2</sub> furnishes certain indications that I exists largely in a tautomeric, quinonoid form. I (7 g.) in 180 cc. C<sub>2</sub>H<sub>5</sub>Cl<sub>4</sub> with C<sub>6</sub>H<sub>5</sub>N<sub>2</sub> gives 2.8-3.1 g. of the compd. C<sub>20</sub>H<sub>12</sub>O<sub>4</sub> (IX or X), pale yellow, m. 208°; the reduction product with Zn and AcOH, C<sub>20</sub>H<sub>16</sub>O<sub>4</sub>, m. 245° (acetate,

m. 184°). VIII. Some further derivatives of pleiadene. *Ibid.* 4977-84.—The following compds. were prepd. in connection with the study of the action of NH<sub>2</sub>OH on phthaloylnaphthol (I). The reaction of AlCl<sub>3</sub> on 2,3-C<sub>10</sub>H<sub>6</sub>(OH)<sub>2</sub>, 2-phenanthrol or 2,5,7-Me<sub>3</sub>C<sub>10</sub>H<sub>6</sub>OH with C<sub>6</sub>H<sub>5</sub>(CO)<sub>2</sub>O (II) at 160-200° gives 32% 1,2-dihydroxy-7,12-pleiadenedione, yellow, m. 233°; 85-90% of the 1-hydroxy-4,5-benzo deriv., yellow, m. 240° (acetate, pale yellow, m. 227°), and the 2,6-dimethyl-1-hydroxy deriv., yellow, m. 209° (acetate, pale yellow, m. 205°). II and 2,6,7-Me<sub>3</sub>C<sub>10</sub>H<sub>6</sub>OMe with AlCl<sub>3</sub> give 3',7'-dimethyl-6'

*methoxy-1'-(or 2')-naphthoyl-2-benzoic acid* (III), m. 212°, and a small quantity of the *3',7'-dimethyl-2'-methoxy-1'-naphthoyl deriv.*, yellow, m. 223°. Heating III with 2%  $\text{H}_2\text{SO}_4$  0.5 hr. on the steam bath gives *2',4'-dimethyl-3'-methoxy-1,2-benzanthraquinone*, yellow, m. 235°.  $2,7\text{-C}_{10}\text{H}_6(\text{OMe})_2$  (IV) yields a mixt. of the 8- and 7-sulfonates, whose *p*-toluidine salts m. 279° and 286°, resp. IV and II give *2',7'-dimethoxy-1'-naphthoyl-2-benzoic acid*, m. 201° (Me ester, m. 114°); the *2',6'-dimethyl-4-methoxy deriv.*, yellow, m. 261°. Reduction gives *2',7'-dimethoxy-1'-naphthylmethyl-2-benzoic acid* m. 101°; *2',6'-dimethyl-4-methoxy deriv.*, m. 236°. Ring closure gives the following *1,9-pleiadones*: *1,6'-dimethoxy*, yellow, m. 201°; *1,6-di-IO deriv.*, yellow, m. 233; *1,6-di-IO deriv.*, m. 220°; *2,6-dimethyl-4-methoxy deriv.*, bright yellow, m. 211°; *2,6-dimethyl-4-hydroxy deriv.*, bright yellow, m. 280°. Catalytic reduction of I (1 g.) gives 7.3 g. *1-hydroxy-7,12-dihydropleiadene*, m. 179° (acetate, m. 136°). *1,6-Dimethyl-7,12-dihydropleiadene* (V), m. 133°; Se had little effect at 350°; S at 260° gives a compd.  $\text{C}_{20}\text{H}_{16}\text{S}$ , pale orange, m. 217°. Br in AcOH gives the compd.  $\text{C}_{20}\text{H}_{17}\text{Br}$ . AcOH, which could not be crystd. and decomp. 150–60°. Shaking this compd. with  $\text{C}_6\text{H}_5\text{N}$  gives a Br deriv. of V, m. 179°. C. J. West

**Synthesis of certain naphtha(1,2,4,3')coumarin derivatives.** Robert Robinson and J. D. Rose *J. Chem. Soc.* 1933, 1469–72. *m*- $\text{C}_6\text{H}_4(\text{OH})_2$  and Et benzoylsuccinate condensed with 55%  $\text{H}_2\text{SO}_4$  give the Et ester I, m. 177°, of *7-hydroxy-4-phenylcoumarin-3-acetic acid* (II), m. 249–50°; the *7-MeO deriv.* (III), m. 200°, results from I and Me $\text{SO}_4$  in 10% aq. NaOH and hydrolysis, using less Me $\text{SO}_4$ , gives *1-Me-2-Et phenyl-2,4-dimethoxyphenylmethylenesuccinate*, m. 93°; II gives the Me ester, m. 101°. II and Ac $\text{O}$ , refluxed 12 hrs., give the *1,7-di-Me deriv.*, m. 230°, of *1,7'-dihydroxy-naphtha(1,2,4,3')coumarin*, yellow, does not m. 360°. III gives the *4-Me deriv.*, pale yellow, m. 181°, of *4-hydroxy-7'-methoxynaphtha(1,2,4,3')coumarin*, yellow, m. 205–7°. III and PO in xylene, refluxed 4 hrs., give *7'-methoxy-1-7'-methoxy-1'-phenylcoumarin-3'-acetyl* naphtha(1,2,4,3')coumarin (?), yellow, m. 237°. Et veratroylsuccinate, m. 82°; Et  $\alpha,\alpha$ -veratroylacetylsuccinate, m. 98°. Et veratroylsuccinate and *m*- $\text{C}_6\text{H}_4(\text{OH})_2$  give Et *1-hydroxy-4-veratroylcoumarin-3-acetate*, crystals with 1 mol.  $\text{H}_2\text{O}$ , m. 172. Hydrolysis and boiling with Ac $\text{O}$  gives *1,7'-dihydroxy-7,5-dimethoxynaphtha(1,2,4,3')coumarin*, m. 256–7°. Et *m*-methoxybenzoylsuccinate, b.p. 211°, does not condense with *m*- $\text{C}_6\text{H}_4(\text{OH})_2$ . C. J. W.

**$\alpha$ -Methyl-trans-hexahydroindene-2-acetic acid and the reduction of  $\Delta^{\alpha}$ - and  $\Delta^{\beta}$ -unsaturated trans-hexahydro-2-hydrindene compounds.** R. S. Thakur. *J. Chem. Soc.* 1933, 118–21, cf. *C. A.* 26, 5941—While the dehydration of 1,2-dihydroxy- $\alpha$ -methyl-trans-hexahydroindene-2-acetic acid with  $\text{P}_2\text{O}_5$  invariably produces an inseparable mixt. of  $\alpha$ -methyl-trans-hexahydroindene-2-acetic acid I and a  $\Delta^{\alpha}$ -isomer (II),  $\text{SOCl}_2$  yields only I (the  $\Delta^{\alpha}$  acid is produced in considerable quantities in both cases). The Et ester of I b.p. 150–1°,  $d_4^{20}$  0.9747,  $n_D^{20}$  1.472,  $J$  83.3° (10 mm.). This ester, treated with  $\text{P}_2\text{O}_5$ , gives no II. I m. 80–1°; amide, m. 131–2°. The structure of I follows from its oxidation to *trans*-hexahydrophthalic acid, *trans*-hexahydrohomophthalic acid (III) and (CO $\text{H}$ ) $_2$ . Catalytic reduction gives  $\alpha$ -methyl-trans-hexahydroindeneacetic acid, m. 104–5°, also obtained from  $\alpha$ -methyl-trans-hexahydrohydrindylidene-2-acetic acid; amide, m. 196°; anilide, m. 170–7°.  $\alpha$ -Methyl-trans-hexahydrohydrindyl-2-acetone, by reduction of the unsatd. compd., b.p. 149°,  $d_4^{20}$  0.9400,  $n_D^{20}$  1.461 (semicarbazone, m. 179–80°; oxime, m. 85–6°). *trans*-Hexahydrohydrindene-2-acetic acid, m. 102–3°; amide, m. 180. *trans*-Hexahydrohydrindyl-2-acetone, b.p. 141°,  $d_4^{20}$  0.9396,  $n_D^{20}$  1.4719; semicarbazone, m. 202–3° (decompn.); oxime, m. 68–70°. III can be readily prep'd pure and in large quantities by oxidizing *trans*-hexahydro-2-hydrindone with concd.  $\text{HNO}_3$ . C. J. W.

**Condensation products of bicyclic ketones.** R. S. Thakur. *J. Chem. Soc.* 1933, 1477–81.—Condensation

of *trans*-hexahydro-2-hydrindone with dry HCl gives *trans*-hexahydrohydrindylidene-2-*trans*-hexahydrohydrindone (I) and a hydrocarbon, ( $\text{C}_8\text{H}_{12}$ ) $_n$  ( $n$  probably 3), m. 116–8°; EtONa gives only I, m. 100–5°; I forms a *2,4-dinitrophenylhydrazones*, deep orange, m. 248° (decompn.); *phenylhydrazones*, m. 193–4° (decompn.); *p*-nitrophenylhydrazones, brick-red, m. 267° (decompn.); semicarbazones, m. 180° and on crystn. 234–5°; oxidation of I gives the original ketone and its peroxide. *trans*- $\beta$ -Decalone (II) and dry HCl give a mixt. of 2 Cl compds.,  $\text{C}_{20}\text{H}_{30}\text{OCl}$ , m. 130–1° and 118–9°; elimination of HCl by  $\text{C}_6\text{H}_5\text{N}$  gives the compd.  $\text{C}_{20}\text{H}_{28}\text{O}$ , b.p. 228–30° (semicarbazones, m. 207°). II and EtONa give a resin-like solid which could not be crystd. The ketone  $\text{C}_{20}\text{H}_{30}\text{O}$  (*C. A.* 26, 5939) is probably  $\Delta^1$ -*trans*-octahydronaphthyl-2-*trans*- $\beta$ -decalone, since the final product of oxidation is *trans*-cyclohexane-1,2-diacetic acid. This was sep'd. into 2 forms, m. 125–6° (III), and 75–80° (IV); the semicarbazones of III m. 212° (decompn.); of IV, m. 224–5° (decompn.); the same *phenylhydrazones*, m. 153–4°, was obtained from both; the *2,4-dinitrophenylhydrazones* of III, orange, m. 175–6°; of IV, m. 146–7° and on crystn., 194–5°; the *p*-nitrophenylhydrazones, of III, yellow, m. 208° (decompn.); of IV, m. 191–3°. C. J. West

**Reduction products of the hydroxyanthraquinones.** XIV. Arthur G. Perkin and Norman H. Haddock. *J. Chem. Soc.* 1933, 1512–20—Attree and P. showed (*C. A.* 25, 1518) that oxidation of 1-hydroxy-2-methoxyanthrone with I in  $\text{C}_6\text{H}_5\text{N}$  gives a compd.  $\text{C}_{20}\text{H}_{18}\text{O}_2$ , which is believed to be *3,9-dihydroxy-2,8-dimethoxy-5,6,11,12-dibenzoperylene-1,10-quinone* (I); the mechanism of this reaction is discussed. Acetyl-4-bromoisovaleryl-2-Me ether, with  $\text{SnCl}_4$ -HCl in AcOH on boiling for 1 hr., gives *4-bromo-1-hydroxy-2-methoxyanthrone* (II), orange, and 4-hydroxy-3-methoxyanthranol, m. 198–200°. II, Ac $\text{O}$  and  $\text{C}_6\text{H}_5\text{N}$  give *4-bromo-1-acetoxy-2-methoxy-9-anthranilic acid*, yellow, m. 185–8°. II boiled in  $\text{C}_6\text{H}_5\text{N}$  or  $\text{PhNO}_2$  gives I. 4-Bromoisovaleryl-2-Me ether,  $\text{BzCl}$  and  $\text{C}_6\text{H}_5\text{N}$ , heated at 100° for 5 min., give *4-bromo-1-benzoyloxyisovaleryl-2-Me ether*, m. 207–8°; boiling with Cu in  $\text{PhNO}_2$  gives *4,4'-dibenzoyloxy-3,3'-dimethoxy-1,1'-bianthraquinonyl*, yellow, m. above 360°; with 5% EtOH-KOH there results the *4,4'-di-IO deriv.* (III), orange, does not m. 360°; *Ac deriv.*, pale yellow, m. 322–6°;  $\text{H}_2\text{BO}_3$  in  $\text{H}_2\text{SO}_4$  at 140° gives *3,3',4,4'-tetrahydroxy-1,1'-bianthraquinonyl*, orange-red, whose *Ac deriv.* m. 280–2°. III and Cu in  $\text{H}_2\text{SO}_4$ , heated at 140–50°, give *4,4'-dihydroxy-3,3'-dimethoxyhelianthron* (IV), red-brown-green, m. 335–7°; *diacetate*, scarlet, m. 267–9°. The tetrahydroxyhelianthron (V) with Ac $\text{O}$  and  $\text{C}_6\text{H}_5\text{N}$  gives *3,3',4,4'-tetraacetoxynaphthabianthron*, pale yellow, m. about 360°, and the *tetra-Ac deriv.* of V, orange, m. 282–6°. The sulfonation of V is described. Oxidation of 1-hydroxy-2-methoxyanthrone (VI) with I in  $\text{C}_6\text{H}_5\text{N}$  gives I and IV; 1,1'-dihydroxy-2,2'-dimethoxybianthron gives the same products. Air oxidation of VI also gives I and IV. II and  $\text{C}_6\text{H}_5\text{N}$  slowly give I. IV, as the K salt, with  $\text{Me}_2\text{SO}$  and  $\text{Na}_2\text{CO}_3$ , heated to 140°, give *3,3',4,4'-tetramethoxyhelianthron*, scarlet, m. 263–5°, and a *3,3',4'-tri-Me deriv.* (?), scarlet, m. 285–7°. I under the same conditions gives a *tetra-Me ether*, scarlet, crystg. with 1 mol. AcOH, m. 314–5°, and a *tri-Me ether*, red, m. 289–90°. 1-Hydroxy-2-methylanthraquinone on reduction gives *1-hydroxy-2-methylanthron*, pale yellow, m. 136–8°; oxidation with I in boiling  $\text{C}_6\text{H}_5\text{N}$  gives *3,9-dihydroxy-2,8-dimethyl-5,6,11,12-dibenzoperylene-4,10-quinone*, leaflets resembling aniline blue; if the oxidation reaction is cooled, the product is *4,4'-dihydroxy-3,3'-dimethylhelianthron*, green-iridescent red needles, whose *di-Ac deriv.*, orange, m. 297–300°. 3-Bromoisovaleryl-2-Me ether, yellow, m. 136–7°; 33% HCl gives the *2-Me ether*, orange-yellow, m. 146–7° (*Ac deriv.*, m. 150–1°).

C. J. West

The action of Grignard reagents on benzanthrone, a case of 1,6-addition. Matawo Nakanishi. *Proc. Imp. Acad. (Tokyo)* 9, 394–7 (1933).— $\text{PhMgBr}$  in excess reacted with benzanthrone (I) to give a yellow-brown

compd.  $C_{20}H_{14}O$  (II), m. 186°. II must be 3-phenylbenzanthrone formed by 1,6-addn., since it showed an orange-red halochromism with concd.  $H_2SO_4$ , gave  $\alpha-C_6H_4(CO)C_6H_4CO_2H$  on oxidation with  $Na_2Cr_2O_7$ -AcOH, and its mono-Br deriv. with NaOEt formed an isoviolanthrone dye. 1,2- and 1,4-Addn. are eliminated because the products of such addn. could not possess these properties. 1-Phenylbenzanthrone (III), m. 182°, was prep'd. from anthrone (IV) and  $PhCOCH_2CH_2Cl$  by condensation with 72%  $H_2SO_4$ . A mixt. of II and III showed a decided m. p. depression. III on oxidation gave  $\alpha$ -benzoylanthraquinone and its mono-Br deriv. formed no dye with NaOEt. The attempted synthesis of II was unsuccessful. Anthrafuchson (V) was formed by 1,6-addn. of  $PhMgBr$  to benzylidencanthrone. V was also prep'd. from IV and  $Ph_2CCl_2$ . II gave  $BzOH$  and a colorless compd.  $C_{21}H_{16}$ , m. 242°, when oxidized with  $KMnO_4$  in  $Me_2CO$ . I and  $BuMgBr$  formed 3-butylbenzanthrone, m. 96°, having properties similar to II. E. W. S.

**Synthesis of octahydrophenanthrene derivatives.** James D. Fulton and Robert Robinson. *J. Chem. Soc.* 1933, 1463-6.—Cyclohexene, gradually added to a mixt. of  $SnCl_4$ ,  $PhCH_2COCl$  and  $CS_2$  at  $-15^\circ$ , and the product heated 2 hrs. at  $180^\circ$  with  $PhNEt_3$ , gives benzyl  $\Delta^1$ -cyclohexenyl ketone, m. 44.5° (semicarbazone, m. 171-2°). Cyclohexanone and  $PhCH_2CH_2MgBr$  give 1- $\beta$ -phenylethylcyclohexanol, m. 56.5°, and probably 1- $\beta$ -phenylethylcyclohexene, b. 112-3°,  $n_D^{20}$  1.5402; nitrosocyclohexide, m. 118-9°; nitropiperidide, m. 117 8°. Cyclohexene oxide gives the 2-isomer, b. 135-6°, m. 17-8° (91.5% yield); *p*-nitrobenzoate, m. 73.5°. 2-Chloro- $\beta$ -phenylethylcyclohexane, b. 130-4° (not pure), and  $AlCl_3$  in petrol. ether give 1,2,3,4,9,10,11,12-octahydrophenanthrene, b. 135 7°; heating with S gives phenanthrene. 2- $\beta$ -Phenylethylcyclohexanone, b. 135 6° (oxime, m. 74-5°; semicarbazone, m. 157°);  $EtMgBr$  gives 2- $\beta$ -phenylethyl-1-ethylcyclohexanol (I), b. 147 8°;  $ZnCl_2$  gives 2- $\beta$ -phenylethyl-1-ethyl- $\Delta^1$ -cyclohexene, b. 113-4°,  $n_D^{20}$  1.5306. I, converted into the chloride and treated with  $AlCl_3$ , gives 12-ethyl-1,2,3,4,9,10,11,12-octahydrophenanthrene (I'), b. 113 6°,  $n_D^{20}$  1.5387; heating with S gives phenanthrene and anthracene. *Et* 3,4-dimethoxycinnamate, m. 56°; di-Br deriv., m. 107 8°;  $EtOH$ -KOH gives 3,4-dimethoxyphenylpropionic acid, m. 154°; heating with  $PhNEt_3$  at  $150-60^\circ$  gives 3,4-dimethoxyphenylacetylene, m. 73-4°. *Et* homovertrate, b. 159 60°; amide, m. 139°.  $\beta$ -3,4-Dimethoxyphenylethyl alc., m. 47 8°; phenylurethan, m. 99°; *p*-nitrobenzoate, m. 85°. 3,4-Dimethoxymandelonitrile, m. 104-5°; the  $HCl$  salt of the imino *Et* ester m. 139-40°. C. J. West

**Decarboxylation temperatures of some furoic acids.** Henry Gilman, A. M. Jamney and C. W. Bradley. *Iowa State Coll. J. Sci.* 7, 429-31 (1933).—The Norris graphical method for detg. the temp. of decarboxylation of malonic acids was applied to 16 furoic acids. The m. ps. and decarboxylation temps., resp., of the acids are as follows: 2-Furoic acids: unsubstituted, 132°, 158°; 5-Me, 107°, 123 5°; 5-*tert*-Bu, 105°, 125-7°; 5-Cl, 175°, 180-2°; 5-Br, 185°, 177 9°; 3,5-di-Cl, 156-7°, 168-70°; 3,5-di-Br, 108-8.5°, 174°; 5-I, 193°, —; 5-nitro, 186°, 201 3°. 3-Furoic acids: unsubstituted, 122°, 152°; 2-Me, 101°, 101-3°; 2,4-di-Me, 114°, 129°; 2-methyl-5-nitro, 154.5°, 172°; 2,4-dimethyl-5-nitro, 182°, 185 6°. *o*-Anisic acid, 98°, 213 15°; *p*-anisic acid, 106-7°, 243-5°. F. E. Brown

**Polyhalogenated ketones. III. Pyrrole.** G. Sanna and Francesco Athene. *Gazz. chim. ital.* 63, 479-84 (1933); cf. S. and Massidda, *C. A.* 25, 2720.—The synthesis previously used gives favorable results in the pyrrole series, where the mol. is sensitive to many reagents.

In the present work, 2 derivs. of  $HN:CH:CH:CH:CCO-Me$  are described. These new compds. behave differently from indoles toward alkalis in that, instead of replacement of halogen by OH, there is some sort of change involving a rapid blackening of the soln., followed by notn. of a black substance similar to pyrrole blacks.

$NH_3$ , in water, EtOH or a closed tube, also forms black substances. Since with  $NH_3$  there is probably no oxidation, the black substance may result from condensation of 2 or 3 mols. (as has been proved for halogenated ketones of the indole series (*loc. cit.*), and possibly have 1 of the

following formulas:  $[HN:CH:CH:CH:CCOCH:]_2$  (I) or

$HN:CH:CH:CH:CCOCH:CH(CO:CH:CH:CH:NH):$ .

$CHCO:CH:CH:CH:NH$  (II). Expts. on the catalytic reduction and oxidation of the blacks obtained are in progress. Ice-cold magnesylpyrrole and  $Cl_2CHCOCl$  in anhyd. EtO yield, by extn. with  $Et_2O$ ,  $\alpha$ -dichloroacetyl-

pyrrole,  $HN:CH:CH:CH:CCOCHCl_2$  (III), m. 90°, sol. in cold concd.  $H_2SO_4$ , gives a wine-red color with  $HNO_3$ , and a rose-colored soln. in hot aq.  $HCl$ , is sol. in alk. hydroxides,  $NH_4OH$  and  $C_6H_5N$ , reduces hot  $NH_4$ -AgNO<sub>3</sub> and Fehling soln., and with alkaloids ppts. compds. of various colors. The stability of the 2 Cl atoms toward water is high, and several hrs. in boiling water decomps. it only slightly. III and 5% aq. KOH (2 mols.), boiled and acidified with dil.  $H_2SO_4$ , ppts. an amorphous brown-black compd., with a mol. wt. of approx. 600, does not contain Cl and is sol. in hot caustic alkalis; it is probably a condensation compd. with the structure II. With concd.  $NH_4OH$  in a sealed tube for 6 hrs. at 95°, II forms a microcryst. brown substance contg. no Cl, without a sharp m. p., and with a mol. wt. around 250. It is probably a condensation compd. with constitution I. Prep'd. like III, with crystn. from boiling water,  $\alpha$ -trichloroacetylpyrrole (IV) m. 67°, is sol. in cold concd. and hot dil. mineral acids, hot  $NH_4OH$ , and hot caustic alkalis, and reduces Fehling soln. by formation of a small quantity

of  $CHCl_3$ , thus:  $IV + KOH \rightarrow HN:CH:CH:CH:CCO_2K + CHCl_3$ . Prolonged heating in aq. KOH causes a deep-seated change, with pptn. of a black substance which could not be crys'd. The same substance is probably also formed in hot concd.  $NH_4OH$ , but this was not verified. C. C. Davis

**Experiments on the synthesis of physostigmine (eserine).** VIII. F. E. King, Robert Robinson and H. Sugimoto. *J. Chem. Soc.* 1933, 1472-5; cf. *C. A.* 27, 2443.—The acid, m. 170°, reported in part II (*C. A.* 26, 1929) is now recognized to be 3-keto-4-*o*-carboxybenzoyl-10-ethoxy-7-methyl-3,4,5,6-tetrahydro-4- $\psi$ -carboline. Hydrolysis gives the di-K salt of 5-ethoxy-3-methyl-3-( $\beta$ -*o*-carboxybenzamidoethyl)indolenine-2-carboxylic acid. 1-Eserethole (I) gives a *II d*-tartrate, m. 164 6°. *dl*-Norserethole and *p*- $MeC_6H_4SO_3Me$  give an oil, substantially *dl*-eserethole (II). I gives a *H d*-racemate, m. 159°, and a *H l*-tartrate, m. 172-3°. Attempts to resolve II by means of *l*-tartaric acid were inconclusive. II methopurate, orange-red, m. 184-6°; I methopicate, orange-red, m. 190° (decompn.). *Et c*-phenoxy- $\gamma$ -methylpentane- $\beta$ , $\beta$ -dicarboxylate, b. 211-2°, results from  $\delta$ -phenoxysec-butyl bromide and  $CHMe(CO_2Et)_2$ . IX. Improvement in the synthesis of *dl*-eserethole. F. E. King, Mario Liguori and R. Robinson. *Ibid.* 1475 7.— $\gamma$ -Phenoxy- $\alpha$ -methylbutyraldehyde (I) gives a 2,4-dinitrophenylhydrazon, yellow, m. 109-10°. I and *p*- $MeOC_6H_4NIINH_2$  in EtOH, refluxed 1 hr. and treated with  $HCl$ , give 5-methoxy-3-methyl-3- $\beta$ -phenoxethylindolenine, which did not crystallize; picrate, yellow, m. 157°, methiodide, golden yellow, m. 180-1°. The methiodide could not be dephenoxylated by hot  $HBr$  or other means.  $\gamma$ -Phthalimido- $\alpha$ -methylbutyramide, m. 162 3°. the butyronitrile m. 102°; the butyraldehyde, oily, forms a 2,4-dinitrophenylhydrazon, yellow, m. 191°; condensed with *p*- $EtOC_6H_4NIINH_2$  and treated with satd. EtOH-HCl, there results 5-ethoxy-3-methyl-3-( $\beta$ -phthalimidoethyl)indolenine, the methosulfate of which is hydrolyzed to *dl*-norserethole. C. J. West

**Binuclear isomerism of the biphenyl type.** II. A. J.

Chalmers and P. Lions. *J. and Proc. Roy. Soc. N. S. Wales* 67, 178-99 (1933).—Phenacylbenzoylacetate ester, condensed with  $\alpha$ -naphthylamine, gives *Et* 1- $\alpha$ -naphthyl-2,5-diphenylpyrrole-3-carboxylate (I), m. 181-2°. Hydrolysis of I yields the corresponding acid, m. 278-80°. Phenylacetoveratrone, refluxed with PhNHNH<sub>2</sub> in EtOH, gives the *hydrazone* (II), m. 153-4°. Treatment of II with EtOH satd. with dry HCl ppts. 2-(3',4'-dimethoxyphenyl)-3-phenylindole (III), m. 197°. Veratrole, reacting with succinic anhydride and AlCl<sub>3</sub> in CS<sub>2</sub>, yields 3,4-dimethoxybenzoylpropionic acid (IV), m. 163°. Nitration of IV at 0° gives 6-nitro-3,4-dimethoxybenzoylpropionic acid, m. 115°. Asym. phenylmethylhydrazone of IV, m. 171°, undergoes successful cyclization in xylene satd. with dry HCl to give 1-methyl-2-(3',4'-dimethoxyphenyl)-indolyl-3-acetic acid (V), m. 153-6°. Bromination of V in CCl<sub>4</sub> results in a mono-Br deriv., m. 206-7°. Treatment of 2,4-dimethoxybenzoylpropionic acid in glacial AcOH with PhNMeNH<sub>2</sub> gives 1-methyl-2-(2',4'-dimethoxyphenyl)indolyl-3-acetic acid, m. 210°. A cold soln. of 40 g. *o*-BrC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>CHAcCO<sub>2</sub>Et (VI) in 350 cc. alk., treated with 6 g. NaOH in 20 cc. H<sub>2</sub>O and then after 1 min a suspension of the diazonium chloride from 2,5-Cl<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub> (23 g.), HCl (45 cc.) and NaNO<sub>2</sub> (10 g.), yields *Et*  $\alpha$ -(2,5-dichlorobenzene- $\alpha$ -(*o*-bromophenyl)- $\alpha$ -acetylacetate (VII), m. 142-3°. Dry HCl passed into alc. VII gives the *Et* ester (VIII), m. 108-9°, of *o*-bromophenylpyruvic acid 2,5-dichlorophenylhydrazone (IX), m. 194°, obtained by hydrolysis of VIII with alc. KOH. PhCH CHAcCO<sub>2</sub>Et, treated as in the prepn. of VII, yields 1,3-phenyl-4,7-dichloroindole-2-carboxylate (X), m. 130°. Hydrolysis of X with alc. KOH gives the acid (XI), m. 216-8°. When VI is treated with a diazonium soln. from aniline as in the prepn. of VII, *Et* 3-*o*-bromophenylindolyl-2-carboxylate (XII), m. 164-5°, is obtained. Hydrolysis of XII gives the acid (XIII), m. 231-2°. VI in EtOH and NaOH when treated with diazotized  $\beta$ -C<sub>10</sub>H<sub>7</sub>NH<sub>2</sub>, HCl and NaNO<sub>2</sub> gives cryst. fractions from EtOH of 1,3-*o*-bromophenyl-4,5-benzotindole-2-carboxylate (XIV), m. 249°, and the 5,6-benzotindole isomer (XV), m. 217°. The corresponding acids obtained by hydrolysis m. 229 and 189°, resp. PhNMeNH<sub>2</sub> reacting with 3,4-MeO<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CH<sub>2</sub>COCO<sub>2</sub>H yields 1-methyl-3-(3',4'-dimethoxyphenyl)indole-2-carboxylic acid (XVI), m. 194°. Dry HCl passed into alc. XVI eliminates the carboxyl group instead of esterifying it, yielding 1-methyl-3-(3',4'-dimethoxyphenyl)indole (XVII), m. 104°. W. J. P.

Condensation products of isatin with pyrroles (pyrrole blue). P. Pratesi. *Atti accad. Lincei* 17, 954-60 (1933).—The reactions of mono-, di-, tri- and *N*-substituted pyrroles with isatin have been studied in the general problem of detg. the compn. of pyrrole blue. *N*-Methyl-, *N*-phenyl-, *N*-ethyl- and *N*-acetylpyrroles do not give any blue product. 2,3-Dimethylpyrrole (I) and 3-methyl-4-ethylpyrrole (II) both give blue products, C<sub>14</sub>H<sub>10</sub>ON, and C<sub>14</sub>H<sub>14</sub>ON<sub>2</sub>, resp., with the elimination of H<sub>2</sub>O. II also forms a small amt. of a violet product cpd by the different solv. in boiling AcOH. 2,5-Dimethylpyrrole does not react. Of the trisubstituted compds., 2,4-dimethyl-3-ethylpyrrole alone was tried; it gives a blue product, C<sub>16</sub>H<sub>16</sub>ON<sub>2</sub>, like the above.

A. W. Contieri

Methylation of pyrazoles with diazomethane. K. v. Auwers and O. Ungenach. *Ber.* 66B, 1690-4 (1933); *C. A.* 27, 5327.—Whereas the *Et* ester of 4-phenylpyrazole-3(5)-carboxylic acid (I) with alk. Me<sub>2</sub>SO<sub>4</sub> gives about equal parts of the 2 structurally isomeric *N*-Me derivs. and the *Et* ester of 3(5)-phenylpyrazole-5(3)-carboxylic acid (II) behaves similarly with alk. MeI, the *Me* esters with CH<sub>2</sub>N<sub>2</sub> give almost exclusively the compds. III and IV, whence it may be concluded that I and II have definite structures corresponding to III and IV. On the other hand 3(5)-methyl-5(3)-chloropyrazole (V) with CH<sub>2</sub>N<sub>2</sub>, just as with Me<sub>2</sub>SO<sub>4</sub> or MeI, yields the 2 *N*-Me derivs., although its Na salt with MeI in the complete absence of moisture gives only VI. V seems therefore to be a mixt. while its Na salt exists in only 1

form. 1-Methyl-4-phenylpyrazole-5-carboxylic acid, m. 210-11° (gas evolution), is difficultly esterified (*Et* ester, m. 52.5-3.5°; *Me* ester (III), m. 69°); 1,4,3-isomer, hydrated needles, m. about 100° and, anhyd., 132° (*Me* ester, m. 122-3°).

C. A. R.

Benzo- and naphthopyrazolyl-*o*-benzoic acids. A. Corbellini and A. Cecchi. *Gazz. chim. ital.* 63, 489-94 (1933).—In connection with previous expts. by Corbellini and Barbaro (*C. A.* 26, 3250) on pyrazolic acids, the synthesis of benzo- and naphthopyrazolyl-*o*-benzoic acids by the intramol. reaction of NHNH<sub>2</sub> and CO groups was studied. The lactam (I) of *o*-[2-aminobenzoyl]benzoic acid (II), prep'd. by a patented method (French pat. 670,812 (1929)) (30 g. of I from 60 g. of phenylphthalimide) was converted by boiling dil. NaOH and AcOH to II, which in EtOH with HCl gas and treatment with Na<sub>2</sub>CO<sub>3</sub> yielded the *Et* ester of II, pale yellow, m. 71-2°. I saponified by boiling 5% NaOH, acidified with concd. HCl, diazotized, added to SnCl<sub>4</sub> in ice-cold concd. HCl and the ppt. purified with Na<sub>2</sub>CO<sub>3</sub> and HCl, yields *o*-[4,5-benzopyrazolyl-3]benzoic acid (III), m. 184-6.5°.  $\beta$ -Naphthylphthalimide (cf. *Gazz. chim. ital.* 15, 479 (1885)) (5 g.), added to a fused mixt. of AlCl<sub>3</sub> (16 g.) and NaCl (3.5 g.) and heated at 260-5°, decompd. with ice, boiled in dil. HCl, and extd. with PhCl, yields 0.2-0.3 g. of the lactam

C<sub>12</sub>H<sub>9</sub>CO.NH.C<sub>10</sub>H<sub>6</sub>CO (IV), light yellow, m. 277.5° (uncor.). In boiling 5% NaOH, with acidification by AcOH, it yields *o*-[2-aminonaphthoyl]benzoic acid, H<sub>2</sub>NC<sub>10</sub>H<sub>6</sub>CO.C<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H, orange-yellow, m. 279-9.5° (uncor.). Various attempts to verify its constitution by conversion into known compds. by substitution of the NH<sub>2</sub> by H or OH were ineffectual. IV, saponified, as before, diazotized, and reduced with SnCl<sub>4</sub>, yields *o*-[4,5-naphthopyrazolyl-3]benzoic acid (V), light yellow, m. 238-8.5°. In a similar way II yields *o*-[4,5-benzopyrazolyl-3]-benzoic acid (VI) (cf. Corbellini and Barbaro, *loc. cit.*). V is not the same as the isomer formed by oxidation of the decompn. product of the tetrazo deriv. of 2,2'-diamino-1,1'-binaphthyl by KMnO<sub>4</sub> (cf. Corbellini and Barbaro, *loc. cit.*).

C. C. Davis

Bicarbazyls. IV. Synthesis of 1,1'-bicarbazyl. T. F. Macrae and S. Horwood Tucker. *J. Chem. Soc.* 1933, 1520-3; cf. *C. A.* 21, 2898.—(2-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>·*o*-ClC<sub>6</sub>H<sub>4</sub>NO<sub>2</sub> and BaCO<sub>3</sub>, heated at 230° for 14 hrs., give 12% of 2,2'-bis(*o*-nitrophenylamino)biphenyl (I), ruby-red, m. 188.5-9.5°; many variations of the expt. are reported; *N,N*-di-Ac deriv., pale green, m. 246-9°. 2-*o*-Nitrophenylamino-2'-aminobiphenyl, orange, m. 113-4.5°; HCl salt, bright scarlet, m. 222°; 2'-diacetylaminobenzyl, bright scarlet, m. 192-4°. Reduction of I with SnCl<sub>2</sub> and HCl gives 50% of 2,2'-bis(*o*-aminophenylamino)biphenyl, m. 235-7°. Through the diazo compd. there results 2,2'-di-1',2'-3'-benzotriazolylbiphenyl, crystals with 1 mol. C<sub>6</sub>H<sub>6</sub>, m. 194-6°; it also appears to cryst. with EtOH, MeOH and AcOH; on heating, N is evolved and 1,1'-bicarbazyl, m. 205-7°, results; it seps. with 2 mols. AcOH. V. Synthesis of 3,9'-bicarbazyl. Margaretta C. Nemes and S. H. Tucker. *Thid.* 1523-5.—*o*-p-Nitrophenylcarbazole, whose structure was established by synthesis, gives 80% of the *p*-NH<sub>2</sub> deriv.; heating 6-8

hrs. with  $\alpha\text{-ClC}_6\text{H}_4\text{NO}_2$  and  $\text{Na}_2\text{CO}_3$  gives 40% of 9-*p*-(*o*-nitrophenylamino)phenylcarbasole, ruby-red, m. 181-5°; picrate, orange, m. 170°; *Ac* deriv., orange, m. 205-7°; *o*- $\text{MeI}_2$  deriv., cream, m. 115-6° (80% yield); picrate, m. 137°; *Ac* deriv., m. 180-1°; 9-*p*-1",2",3"-benzotriazolylphenylcarbasole, salmon-pink, m. 163° (80% yield); heating gives 55% of 3,9-*incarbazyl*, m. 212-4°; 9-*Ac* deriv., cream, m. 197°. Carbazole,  $\alpha\text{-ClC}_6\text{H}_4\text{NO}_2$  and  $\text{K}_2\text{CO}_3$ , boiled 3 hrs., give 10% of 9-*o*-nitrophenylcarbasole, m. 156°; 9-*o*-acetamido deriv., cream, m. 150°. All m. ps. are cor. C. J. West

4(or 5)-Hydroxymethyl-2-thiolimidazole. Arnold O. Jackson and Carl S. Marvel. *J. Biol. Chem.* 103, 191-5 (1933).—Bromoacetylphthalimide (I) boiled with  $\text{NaOAc}$  in abs. alc. gave  $\omega$ -acetoxyacetylphthalimide, m. 141-2°. This with 20%  $\text{HCl}$  at 85-95° gave hydroxyaminoacetone-*HCl*, m. 136-7°, which with 60%  $\text{KSCN}$  soln. gave 4(or 5)-hydroxymethyl-2-thiolimidazole (II), m. 203-4°, whose structure was proved by oxidation with  $\text{FeCl}_3$  to 4(or 5)-hydroxyimidazole. Attempted replacement of the OH in II by Cl gave polymers. Condensation of I with cyanacetamide gave  $\omega$ -phthalimidouacetylcyanoacetamide, m. 196-7°, which on bromination gave a mixt. of monobromide, m. 209-300°, and dibromide, m. 345-6°, with the position of the Br unknown. R. C. Elderfield

Glycosine of Debus. II. Carbon salts of tetranitro-bimidazole and methylation of nitroimidazole. Kurt Lehmsiedt. *Ann.* 507, 213-25 (1933); cf. *C. A.* 21, 3364.—The Na salt of tetranitroimidazole (I) and  $\text{BzCl}$  or  $\text{AcCl}$  in  $\text{C}_6\text{H}_5\text{N}$  give only the pyridine salt of I,  $\text{C}_6\text{H}_5\text{O}_6\text{N}_4\cdot 2\text{C}_6\text{H}_5\text{N}$ , yellow, decomp. 233°; the imidazole salt,  $\text{C}_6\text{H}_5\text{O}_6\text{N}_4\cdot 2\text{C}_6\text{H}_5\text{N}$ , orange, decomp. 325°. The Na salt of I and  $\text{Me}_2\text{SO}_4$ , shaken at 20-5° for 5 min., give 4-methyl-1,1',5,5'-tetranitro-2,2'-bimidazole (II), crystg. with 2 mols.  $\text{H}_2\text{O}$ , yellow, decomp. 273-1°; *Na* salt, crystals with 4 mols.  $\text{H}_2\text{O}$ , light brown needles; *Ag* salt, yellow needles. Reduction of II gives the 1,1'-diamino deriv., the Na salt crystg. with 4 mols.  $\text{H}_2\text{O}$  as blood-red needles; the free amine is a light brown, amorphous mass. The anhyd. Na salt of II and  $\text{Me}_2\text{SO}_4$  give, on warming on the water bath, the 4,4'-*di-Me* deriv. (III) of I, light yellow, decomp. 239-40°. The 4-*Et* deriv. (IV) of I, crystg. with 2 mols.  $\text{H}_2\text{O}$ , light yellow, m. 250° (decomp.); the *Na* salt seps. with 2 mols.  $\text{H}_2\text{O}$ ; the 4,4'-*di-Et* deriv., light yellow, decomp. 203°. I and  $\text{CH}_3\text{N}_3$  in abs.  $\text{Et}_2\text{O}$  give III. IV and  $\text{CH}_3\text{N}_3$  give the 4-*Me* deriv. of IV, decomp. 226°. III (1.7 g.) and 4.5 cc. 5 *N*  $\text{NaOH}$  in 30 cc.  $\text{Me}_2\text{CO}$ , shaken 15 min., give 1.25 g. of the brick-red salt,  $\text{C}_6\text{H}_5\text{O}_6\text{N}_4\text{Na}_2\cdot \text{H}_2\text{O}$  (V); the concd.  $\text{H}_2\text{SO}_4$  soln. (yellow) gives on pouring into  $\text{H}_2\text{O}$ , a blue dye sol. in  $\text{H}_2\text{SO}_4$  with a violet-red color. V dissolved in  $\text{H}_2\text{O}$  without warming and shaken with 2 *N*  $\text{HCl}$ , gives the indigo-blue dye  $\text{C}_6\text{H}_5\text{O}_6\text{N}_4$  (VI). III and hot  $\text{MeOH-MeONa}$  give 92% of 1,1'-dimethoxy-1,4'-dimethyl-5,5'-dinutro-2,2'-bimidazole, m. 212° (decomp.), warming with dil.  $\text{NaOH}$  and acidification gives VI. In 1 prepn. of II there was also formed 1-methyl-4'-methylene-1,1',5,5'-binutro-2,2'-bimidazole-5'-nitronic acid *Me* ester (VII), light red, decomp. 127°, crystals with 1 mol.  $\text{H}_2\text{O}$ . 4(5)-Nitroimidazole gives a yellow Na salt, 6.75 g. of which with  $\text{Me}_2\text{SO}_4$  gives 3.85 g. of 4-nitro- and 0.925 g. of 5-nitro-1-methylimidazole.

C. J. West

Isomeric 2-iminotolyl-3-tolyl-4-*p*-chloro- and *p*-bromo-

phenyl- $\Delta^4$ -thiazolines. Raymond M. Hann and E. Emmet Reid. *J. Am. Chem. Soc.* 55, 4998-5000 (1933).—The following phenyl- $\Delta^4$ -thiazolines were prepd. by the general reaction  $\text{XC}_6\text{H}_4\text{COCH}_2\text{Br} + \text{RN:C(SH)NHR}$ : 2-iminophenyl-3-phenyl-4-*p*-chloro (I), m. 204° (all m. ps. cor.) (*HCl* salt, m. 228-9°); 2-iminophenyl-3-phenyl-4-*p*-bromo (II), m. 206°; 2-imino-*o*-tolyl-3-*o*-tolyl-4-*p*-chloro (III), pale yellow, m. 132°; *p*-Br deriv. (IV), pale yellow, m. 123°; 2-imino-*p*-tolyl-3-*p*-tolyl-4-*p*-chloro (V), m. 227°; *p*-Br deriv. (VI), m. 239°. The yields were 80-90%. *Picrates*: I, golden, m. 206°; II, golden, m. 203°; III, yellow, m. 187°; IV, yellow, m. 196°; V, yellow, m. 183°; VI, yellow, m. 193°. C. J. West

Preparation of halo and other 2-phenylbenzopyrylium salts. Catherine G. Le Fevre and Raymond J. W. Le Fevre. *J. Chem. Soc.* 1933, 1532.—The following process gives perchlorates of pyrylium compds. in 1 step: to the appropriately substituted acetophenone (0.01 g.-mol.) and salicylaldehyde (0.01 g.-mol.) in 40 cc. anhyd.  $\text{Et}_2\text{O}$ , is added  $\text{HClO}_4$  (70%, 3 cc) and the mixt. satd. with  $\text{HCl}$  at 0°; after 24 hrs. the cryst. perchlorate is washed with  $\text{Et}_2\text{O}$ . C. J. West

Synthesis in the chromone group. X. Coumarin and chromone formation. Tara C. Chaudha, Harbhajan S. Mahal and Krishnasani Venkataraman. *J. Chem. Soc.* 1933, 1450-62; cf. *C. A.* 27, 5329. The action of an acid anhydride and the Na salt of an acid on a phenolic ketone may produce the acyl deriv. of the ketone, a chromone, a 3-acetylated chromone or a coumarin; 10 examples are given with references. Phloracetophenone,  $\text{Ac}_2\text{O}$  and  $\text{PhCH}_2\text{CO}_2\text{Na}$  give the *di-Ac* deriv., m. 169° of 5,7-dihydroxy-3-phenyl-1-methylcoumarin, m. 282-3°. *o*- $\text{HO}_2\text{C}_6\text{H}_4\text{Ac}$  (I),  $\text{PhCH}_2\text{CO}_2\text{Et}$  and Na, heated 4 hrs. on the steam bath, give 2-benzylchromone, pale yellow, m. 86°. I,  $\text{PhCH}_2\text{COCl}$  and  $\text{PhCH}_2\text{CO}_2\text{Na}$ , heated 6 hrs. at 180°, and the product hydrolyzed, give 3-phenyl-4-methylcoumarin but no chromone. *Ph* phenylacetate, from the chloride and  $\text{PhOH}$ , b. 174°, m. 50°; heating with  $\text{AlCl}_3$  gives a mixt. of *o*-hydroxyphenyl benzyl ketone (II), m. 60° (2,4-dinitrophenylhydrazine, pale orange, m. 219°), and the *p*-isomer, m. 151° (2,4-dinitrophenylhydrazine, deep orange, m. 221°). II,  $\text{Ac}_2\text{O}$  and  $\text{AcONa}$ , heated 8 hrs. at 170-80°, give 2-methylisoflavone, m. 110°;  $\text{Bz}_2\text{O}$  and  $\text{BzONa}$  give 2,3-diphenylchromone, m. 152°.  $\omega$ -Methoxyacetophenone,  $\text{PhCH}_2\text{CO}_2\text{Na}$  and  $\text{Ac}_2\text{O}$  in  $\text{Et}_2\text{O}$  give the 7-*Ac* deriv., m. 163°, of 7-hydroxy-3-phenyl-4-methoxymethylcoumarin, m. 213°; resorpropionophenone gives the 7-*Ac* deriv., m. 205°, of 7-hydroxy-3-phenyl-4-ethylcoumarin, m. 254°.  $\beta$ -Naphthyl phenylacetate, m. 87°;  $\text{AlCl}_3$  in  $\text{CS}_2$  gives 1-phenylacetyl-2-naphthol, m. 101°, also prepd. from  $\beta\text{-C}_{10}\text{H}_7\text{OH}$ ,  $\text{PhCH}_2\text{COCl}$  and  $\text{AlCl}_3$  in  $\text{CS}_2$ ; with  $\text{Ac}_2\text{O}$  and  $\text{AcONa}$  there results 3-phenyl-2-methyl-1,4- $\beta$ -naphthopyrone, cream, m. 161°;  $\text{Bz}_2\text{O}$  and  $\text{BzONa}$  give 2,3-diphenyl-1,4- $\beta$ -naphthopyrone, m. 188°. 1-Benzyl-2-naphthol,  $\text{Ac}_2\text{O}$  and  $\text{PhCH}_2\text{CO}_2\text{Na}$  give 3,1-*di*phenyl-1,2- $\beta$ -naphthopyrone, m. 221-2°. C. J. West

Rosenmund aldehyde synthesis in the pyridine series. II. Roderich Graf and Paul Lászlo. *J. prakt. Chem.* 138, 231-8 (1933); cf. *C. A.* 26, 5096.—4,5,6-Trichloropyridine acid chloride on catalytic reduction gives a mixt. of 2,3,4-trichloropyridine, m. 45-7°, and 4,5,6-trichloropyridine-2-aldehyde, m. 94-5°, crystg. with 2 mols.  $\text{H}_2\text{O}$ , m. 65-7°; phenylhydrazine, yellow, m. 203-4°; 50%  $\text{KOH}$  gives the 2-methanol, m. 84°. 5-Chloronicotinic acid chloride (5 g.) gives 0.8 g. of 5-chloropyridine-3-aldehyde, m. 60-70°; phenylhydrazine, yellow, m. 150-61°. 5-Bromopyridine-3-aldehyde, obtained in small yield, was analyzed as the phenylhydrazine, yellow, m. 156-7°. 2,6-Dibromoisonicotinic acid chloride did not yield an aldehyde. C. J. West

Action of ultra-violet rays on pyridine. IV. The formation of photo products from pyridine derivatives by ultra-violet light of various wave lengths. Hans Freytag. *J. prakt. Chem.* 138, 264-7 (1933); cf. *C. A.* 27, 2687.—Most of the  $\text{C}_6\text{H}_4\text{N}$  derivs. studied (2-, 3- and 4-Me, 2,4- and 2,6-di-Me and 2,3,4,5-( $\text{CO}_2\text{H}$ )<sub>4</sub>) are acted upon

by wave lengths of 265–248  $\mu$  and very slightly by 240  $\mu$ ; the 3-NH<sub>2</sub> deriv. shows the greatest reaction at 313  $\mu$ , although some effect is noted from 365 to 240  $\mu$ . The 2,6-di-Me and the 2-NH<sub>2</sub> derivs. are not changed.

C. J. West

**4-(N-Piperidyl)pyridine.** Roderich Graf and Robert Lehmann. *J. prakt. Chem.* 138, 239–43 (1933).—4-Chloropicolinic acid and piperidine with a trace of CuO, heated 5 hrs. at 130–5°, give 4-(N-piperidyl)pyridine-3-carboxylic acid, crystals with 4 mols. H<sub>2</sub>O, m. 77°; it is purified through the purple Cu salt; HCl salt, m. 225°; III salt, crystals with 1 mol. H<sub>2</sub>O, m. 200–10° (decompn.); Me ester, m. 52–3°. Above the m. p. the acid loses CO<sub>2</sub>, giving 4-(N-piperidyl)pyridine, b<sub>12</sub> 164°, m. 80°; chloroaurate, orange, m. 961 3°; picrate, deep yellow, m. 142°; methiodide, yellow, m. 150°.

C. J. West

**Several nucleus-substituted-pyridine- $\beta$ -carboxylic acid diethylamides.** Roderich Graf, Sr., Antonella Theyer and Renato Purkert. *J. prakt. Chem.* 138, 259–63 (1933).

Pyridine-3,5-dicarboxylic acid, through the chloride, gives a tetraethylamide, m. 73 5°. 6-Methylnicotinic acid azide and Et<sub>3</sub>NH give 6-methylpyridine-3-carboxylic acid diethylamide, b<sub>12</sub> 160–4°; 2,6-dimethylpyridine-3,5-dicarboxylic acid tetraethylamide, b<sub>12</sub> 230°, m. 82 3°, has a very bitter taste. 3-Bromopyridine-3-carboxylic acid diethylamide, yellow oil, b<sub>12</sub> 189°; 3,5-di-Cl analog I, yellow oil, b<sub>12</sub> 191–2°. 5-Chlorobenzotriazole-3-carboxylic acid diethylamide, m. 113 5°, results by reacting I with N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O, giving the 6-hydrazino deriv., which is then diazotized.

C. J. West

**N-Methylolamides of several pyridine- and quinolinemonocarboxylic acids.** Roderich Graf. *J. prakt. Chem.* 138, 262 8 (1933).—Picolinic acid amide (3 g.) in 2.2 cc. 40% HCHO, 3 cc. H<sub>2</sub>O and 0.1 g. K<sub>2</sub>CO<sub>3</sub>, heated until the amide dissolves, gives pyridine-3-carboxylic acid N-methylolamide, m. 102–4°; 6-Me deriv., m. 95°. Nicotinic acid amide gives the pyridine-3-carboxylic acid deriv., m. 141 2° (decompn.). Quinaldic acid amide gives the quinaldine-2-carboxylic acid deriv., m. 129 31°. 2-Butoxyquinoline-4-carboxylic acid amide (I) m. 161–2°; the N-methylol deriv. m. 110° (decompn.); HCHO and Et<sub>3</sub>NH give 2-butoxy-4-quinolyl diethylmethylenediamine, m. 60–1°, dil. HCl gives I; 20% HCl gives methylenbis-2-butoxyquinonic acid amide (I), m. 290°. Benzoyl-diethylmethylenediamine under the same conditions gives methylenedibenzamide, m. 218–9°.

C. J. W.

**Symmetrical secondary hydrazides of several pyridine- and quinolinemonocarboxylic acids.** Roderich Graf. *J. prakt. Chem.* 138, 280 91 (1933).—Picolinic acid chloride and N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O in C<sub>6</sub>H<sub>6</sub> give sym-di(2-pyridoyl)-hydrazine, m. 218 9°; 3-pyridoyl isomer, m. 227–8°; 4-pyridoyl isomer, m. 254–5°; sym-di(2-quinoloyl)-hydrazine, m. 239–40°; 4-quinoloyl isomer, m. 251 6°; sym-di(2-phenyl-4-quinoloyl)-hydrazine, m. 328 9°.

C. J. West

**5-Chloro- and 5,6-dichloronicotinic acids.** Roderich Graf, Ernst Lederer-Ponzer, Viktor Kopetz, Renato Purkert and Paul Lászlo. *J. prakt. Chem.* 138, 244–58 (1933). Nicotinic acid HCl salt (100 g.) and 180 g. SOCl<sub>2</sub>, gently boiled 5 days and then heated in tubes 12 hrs. at 180°, give 50–60% of a mixt. of the 5-Cl and 5,6-dichloro (I), in about equal amts.; more SOCl<sub>2</sub> increases the proportion of the di-Cl acid. 5-Aminopyridine-3-carboxylic acid (II), m. 238–90° (decompn.). II through the diazo reaction gives the 5-Br deriv., m. 182–3°; chloride, m. 74–5°; Me ester, m. 98–9°; Ph ester, m. 80 7°. The chloride and N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O in C<sub>6</sub>H<sub>6</sub> give sym-bis(5-bromo-3-pyridoyl)-hydrazine, m. 308° (decompn.). The Me ester gives 5-bromopyridine-3-carbonyl hydrazide, m. 191 3° (benzal deriv., m. 191 3°); the azide m. 88–9° (decompn.) and with abs. EtOH gives 5-bromo-3-carbathoxypyridine, m. 150–1°; Me ester, m. 109–70°; heating the Et ester with 30% NaOH gives 5-bromo-3-aminopyridine (III), b<sub>12</sub> 149–50°, m. 66 7°; the intermediate Na 5-bromo-3-pyridylcarbamate was also analyzed; Me deriv. of III, m. 127–8° (dihydrate, m. 76–8°); picrate of III, deep yellow, m. 212–3°; chloroaurate, red-orange,

m. 185–7°. 5-Iodopyridine-3-carboxylic acid, m. 220°; Ph ester, m. 100–1°; Me ester, m. 121°; Et ester, m. 86–7°; amide, m. 221–2°. 5-Hydroxypyridine-3-carboxylic acid, m. 299° (decompn.). The Et ester of I and N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O give Et 5-chloro-6-hydrazinopyridine-3-carboxylate (IV), m. 137–8°; the hydrazide, gray, m. 238–40°; the free acid m. 248–9° and was also obtained directly from I. IV on diazotizing yields Et 5-chlorobenzotriazole-3-carboxylate, m. 95–6°; the free acid m. 195–6°; heating with HCO<sub>2</sub>H gives 5-chlorobenzotriazole-3-carboxylic acid, m. above 300°. I and concd. NH<sub>4</sub>OH at 180–90° give 6-amino-3-chloropyridine-3-carboxylic acid, m. 323° (decompn.); Me ester, m. 163–5°; the Me ester of the 6-HO deriv. m. 218°.

C. J. West

**Addition of 8-hydroxyquinoline by thorium and uranium 8-hydroxyquinolates.** Francis J. Frere. *J. Am. Chem. Soc.* 55, 4362–5 (1933).—Th(C<sub>9</sub>H<sub>6</sub>NO)<sub>4</sub>·C<sub>9</sub>H<sub>6</sub>NOH is pptd. from Th salts by 8-hydroxyquinoline (I), without H<sub>2</sub>O of crystn.; it loses 1 mol. I at 160–170°. So likewise UO<sub>2</sub>(C<sub>9</sub>H<sub>6</sub>NO)<sub>2</sub>·C<sub>9</sub>H<sub>6</sub>NOH, which loses I at 200°.

T. H. Chilton

**Attempts to find new antimalarials. VI. Preparation of  $\beta$ -6,7-dimethoxy-4-quinaldylethylamine dihydrochloride.** Kozo Miki and Robert Robinson. *J. Chem. Soc.* 1933, 1467 9; also Haq, Kapur and Ray, *C. A.* 27, 5331.—2,4,5-H<sub>2</sub>N(MeO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CO(CH<sub>2</sub>)<sub>2</sub>CO<sub>2</sub>H, m. 141–2 5°, Me<sub>2</sub>CO and NaOH in EtOH give  $\beta$ -6,7-dimethoxy-4-quinaldylpropionic acid (I), m. 249°; HCl salt, m. 216° (decompn.); Me ester, m. 101.5–2°; hydrazide, m. 188.5°; azide, decompn. 94–5°; EtOH gives  $\beta$ -6,7-dimethoxy-4-quinaldylethylurethan, m. 154°; this is converted into a substituted phthalamide, which is hydrolyzed to  $\beta$ -6,7-dimethoxy-4-quinaldylethylamine, whose di-HCl salt seps. with 2 mols. H<sub>2</sub>O and does not m. 270°. Autocondensation of I (NaOH in EtOH) gives a compd., C<sub>21</sub>H<sub>24</sub>O<sub>4</sub>N<sub>2</sub>, m. 271–2° (decompn.).

C. J. West

**Acridones. V. 3-Nitrophenylantranil.** Ioan Tanasescu and Eugen Ramontianu. *Bull. soc. chim.* 53, 918–23 (1933); cf. *C. A.* 21, 3905.—By modifying the technic of sepn. of the products formed in the synthesis of 3-nitroacridone by the condensation of 2,4-(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CHO with C<sub>6</sub>H<sub>6</sub>, the intermediate 3-nitrophenylantranil (I) (*C. A.* 26, 1285) has been isolated. The phys. consts. of I are very similar to those of 2,4-(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>Bz (II) simultaneously formed in the reaction. To a soln. of 5 g. of 2,4-(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CHO in 20 cc. C<sub>6</sub>H<sub>6</sub> was added 15 cc. concd. H<sub>2</sub>SO<sub>4</sub>. The mixt. was agitated and settled for 24 hrs. Diln. of the H<sub>2</sub>SO<sub>4</sub> layer with H<sub>2</sub>O gave a brick-red compd. which on extn. with C<sub>6</sub>H<sub>6</sub>, recrystn. from AcOH (in which acridone is insol.) and recrystn. from 96% EtOH yielded 1.6 g. of I, C<sub>12</sub>H<sub>7</sub>N<sub>3</sub>O<sub>3</sub>, m. 174–5°; HgCl<sub>2</sub> complex, m. 190° (decompn.). The original benzene layer contained II. Reduction of I with SnCl<sub>2</sub> and concd. HCl gave 3-aminophenylantranil (III), C<sub>12</sub>H<sub>10</sub>N<sub>2</sub>O, m. 155 6°; HgCl<sub>2</sub> complex, m. 192°. A similar reduction of II invariably produced III. Benzoylation of III yielded 3-benzoylaminophenylantranil, C<sub>20</sub>H<sub>14</sub>N<sub>2</sub>O<sub>2</sub>, m. 260° (decompn.). Treatment of 0.6 g. of I, II or III with 50 cc. boiling water contg. a little CaCl<sub>2</sub>, 5 cc. 96% EtOH and 4 g. powd. Zn for 1.5 hrs. formed 2,4-(H<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>Bz, m. 132°; di-Bz deriv., C<sub>27</sub>H<sub>18</sub>N<sub>2</sub>O<sub>2</sub>, m. 201°.

C. R. A.

**Some physical constants of thioxane, selenoxane and dithiane.** John D. A. Johnson. *J. Chem. Soc.* 1933, 1530.—Thioxane, b<sub>77</sub> 69.9°, b<sub>100</sub> 100°, b<sub>140</sub> 137.7°, m. –17°,  $n_D^{20}$  1.5081; selenoxane, b<sub>77</sub> 79.5°, b<sub>100</sub> 100.8°, b<sub>140</sub> 156.0°, m. –21.5°,  $n_D^{20}$  1.5480; dithiane, b<sub>77</sub> 115.6°, b<sub>100</sub> 163.7°,  $n_D^{20}$  1.4217. B. ps. at other pressures are given.

C. J. West

**1,4-Selenothiane.** Charles S. Gibson and John D. A. Johnson. *J. Chem. Soc.* 1933, 1529–30.—(CICH<sub>2</sub>CH<sub>2</sub>)<sub>2</sub>S and Na<sub>2</sub>Se, boiled 4 hrs., give a small yield of 1,4-selenothiane, m. 107°; it reacts readily with Br. (CICH<sub>2</sub>CH<sub>2</sub>)<sub>2</sub>Se and Na<sub>2</sub>S give Se and C<sub>2</sub>H<sub>4</sub>(?). Al<sub>2</sub>Se<sub>3</sub> and the sulfide give dithiane.

C. J. West

**Synthesis of heterocyclic compounds by means of isothiourea ethers.** J. F. Deck and F. B. Dains. *J. Am. Chem. Soc.* 55, 4980–91 (1933).—The following Me iso-

thiourea ethers were prepd.: *di-p-bromodiphenyl*, m. 129°; *m-nitrodiphenyl*, m. 87-9°; *di-m-tolyl*, m. 97.5°; *mono-bromodiphenyl*, m. 79-80°; *thiomethyl ether of methylphenylurea* (I), m. 58-9° (*perchlorate*, m. 114°). Me salicylate and the diphenyl thioether, heated at 180°, give *2-phenylimino-3-phenyl-1,3,4-benzoxazin-1-one*, m. 157-8°; salol gives a 68% yield; *2-o-tolylimino-3-o-tolyl deriv.* (I), m. 114°; refluxing with concd. HCl and EtOH for 4 hrs. gives *3-o-tolyl-1,3,4-benzoxazine-2,4-dione*, m. 129-30°; the *p-isomers* m. 163-4° and 221°. *2-Phenylimino-3-p-bromophenyl-1,3,4-benzoxazin-1-one*, m. 135-6°; hydrolysis with dil. acid gives PhNH<sub>2</sub> and *3-p-bromophenyl-1,3,4-benzoxazin-2,4-dione*, m. 214°. *o-HOC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>Ph* and I give *2-phenylimino-1,3,4-benzoxazin-1-one*, m. 189°; boiling 40% H<sub>2</sub>SO<sub>4</sub> gives *1,3,4-benzoxazine-2,4-dione*. *o-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H* and Me isodiphenylthiourea, fused at 170-80° or heated in C<sub>6</sub>H<sub>5</sub>Me<sub>2</sub>, give *2-phenylimino-3-phenyl-4-ketotetrahydroquinazoline*, m. 163°, and *3-phenyl-2,4-diketotetrahydroquinazoline*, m. 271°. *o-MeNHC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H* gives *1-methyl-2,4-diketo-3-phenylquinazoline*. *2-p-Tolylimino-3-p-tolyl-4-ketotetrahydroquinazoline*, m. 149°; *3-p-tolyl-2,4-diketotetrahydroquinazoline*, m. 273°; *1-methyl-2-keto-3-p-tolyl-4-ketotetrahydroquinazoline*, m. 190°; *2-o-tolylimino-3-o-tolyl-4-ketotetrahydroquinazoline*, m. 157-9°. *o-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H* and the Me ether of monophenylthiourea give a mixt., which could not be sep'd. *o-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub>* and Me isodiphenylthiourea give *2-anilinobenzimidazole*, m. 188°; *2-p-tolylaminobenzimidazole*, m. 207°; *2-o-isomer*, m. 182°. *o-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>OH* and Me pseudodiphenylthiourea, heated 2 hrs. at 170°, give *1-anilinobenzoxazole*, m. 170°; *1-p-tolylamino deriv.*, m. 178°; *m-isomer*, m. 146°; *4-chloro-1-phenylamino deriv.* (II), m. 190°; *4-chloro-1-p-tolylamino deriv.*, m. 204.5°; *4-nitro-1-phenylamino deriv.*, m. 235°; *1-nitro-1-p-tolylamino deriv.*, m. 222-4°; *o-isomer*, m. 173-4°; *m-isomer*, m. 207°. II, EtOH and CS<sub>2</sub>, refluxed 36 hrs., give *4-chloro-1-mercaptobenzoxazole*, m. 262°; *4-NO<sub>2</sub> deriv.*, m. 235-8°. PhNHCH<sub>2</sub>CO<sub>2</sub>Et and I give *1,3-diphenyl-2-phenylimino-5-imidazolone*, m. 150-1° (*4-m-nitrobenzyl deriv.*, yellow, m. 170°). *1-Phenyl-2-p-tolylimino-3-p-tolyl-5-imidazolone* (III), m. 158°; *1-p-tolyl-2-keto-3-phenyl-5-imidazolone*, m. 153°; *m-nitrobenzyl deriv.* of III, m. 156°; *1-o-tolyl-2-o-tolylimino-3-phenyl-5-imidazolone*, m. 130°; *1-o-tolyl-2-keto-3-phenyl-5-imidazolone*, m. 126°; *1-phenyl-2-phenylimino-3-p-tolyl-5-imidazolone*, m. 126° (*4-m-nitrobenzyl deriv.*, m. 176°); *1-phenyl-2-keto-3-p-tolyl-5-imidazolone*, m. 155°. C. J. West

**Extinction curves of a few alkaloids of the quinoline group.** I. Manta. *Z. physik. Chem.* B22, 465-8 (1933).

The extinction curves of the following alkaloids were obtained in 0.001 and 0.005 N alc. soln.: quinoline and *p*-methoxyepidine; quinidine and quinine; cinchonine and cinchonidine; ethylidoquinine and diidoethylquinine, chitennine. The pairs of comp'd. show nearly the same form of curve. G. M. Murphy

**Alkaloids of fumariaceous plants. VIII. Corydalis aurea**, Willd. and the constitution of bicucine. R. H. F. Manske. *Can. J. Research* 9, 436-42 (1933); cf. C. A. 27, 5148.—The chem. examn. of the alkaloids of *Corydalis aurea* has shown an unusual complexity and of the total of more than 10 alkaloids thus far isolated only 6 are now described. The record deals chiefly with the stems and leaves of the plant in which protopine was present in exceptionally low concn. (0.025%). Equally exceptional is its high concn. in the roots (1.6%). 1-Tetrahydropalmatine constituted the largest fraction of the remaining alkaloids, and its present isolation is the first on record although the *d*-form was previously known. Two new and well-characterized alkaloids, which have been named capaurine and capauridine, resp., are isomeric and are best represented by the empirical formula C<sub>21</sub>H<sub>27</sub>N<sub>3</sub>O. Each contains 1 phenolic HO and 4 MeO groups, and yield on methylation non-phenolic bases which do not appear to be identical. The presence of 2 bases, bicuculline and bicucine, which were first recorded in this series of papers, has again been demonstrated. The constitutional analysis of the new bases, as well as the isolation and characterization of the minor alkaloids, is in progress. Bicuculline and

bicucine are shown to be closely related and interconvertible. The latter is the free  $\gamma$ -HO acid of which the former is the lactone. J. W. Shipley

**Sinomenine. XXXVIII. Dihydrosinomenilane and its degradation** Kakuji Goto and Hideo Shishido. *Ann.* 507, 296-300 (1933); cf. C. A. 27, 4235.—Dihydrosinomenilane and PCl<sub>5</sub> in CHCl<sub>3</sub> give *6-dichlorodihydrosinomenilane*, m. 110-6°; catalytic reduction gives *dihydrosinomenilane*, m. 145-50°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> 34.15° (0.1757 g. in 10 cc EtOH); the diazo reaction is pos. in a diln. of  $2 \times 10^{-6}$  methiodide, m. 85-7°; the latter with 16.5% KOH, heated 1 hr., gives 65% of *des-N-methyl-dihydrosinomenilane* (I), m. 183-5°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> -98.22° (0.1858 g. in 25 cc. EtOH), the methiodide, m. 225-7°, gives with 16.6% KOH 60% of *sinomenilane* (II), m. 85-90°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> -178.03° (0.2258 g. in 10 cc. EtOH). Catalytic reduction of I gives the *dihydro deriv.*, m. 143-6°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> 45.48° (0.2089 g. in 10 cc. EtOH), the methiodide, amorphous, gives with 16.5% KOH *dihydrosinomenilane*, m. 55°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> -104.63° (0.2074 g. in 10 cc. EtOH); this also results by the catalytic reduction of II.

(II)

C. J. West

**Derivatives of 1-methyltropine** B. K. Blount and Robert Robinson. *J. Chem. Soc.* 1933, 1511-12. Levulinide, Ca acetonedicarboxylate and MeNH in H<sub>2</sub>O give *1-methyltropine*, b<sub>p</sub> 124°, isolated through the *picrate*, yellow, m. 201° (65% yield), *methiodide*, m. 273-82° (decompn.); the base forms a cryst hydrate in the air; a dipiperonyldene deriv could not be prep'd. Reduction with Na and BuOH gives 50% of *1-methyl-4-tropine*, m. 71°; *picrate*, yellow, explodes at 280°; *IIb* salt, m. 286° (decompn.); *Bz deriv.* (*methyltropocaine*), b<sub>p</sub> 210°; *picrate*, yellow, m. 163-4°. C. J. West

**Strychnos alkaloids LXXVII. Benzal and C-benzyl derivatives of brucine and strychnine and of their sulfonic acids.** Hermann Leuchs and Helmut S. Overberg. *Ber.* 66B, 1711-18 (1933). cf. C. A. 28, 156.—The 3 sulfonic acids (I, II, III) obtained with MnO<sub>2</sub> and H<sub>2</sub>SO<sub>4</sub> from brucine and from strychnine all condense with BzH like the bases themselves and hence it is not the groupings, (undoubtedly (a)N CO CH<sub>2</sub>) that condenses with BzH which is involved in the sulfonation. Although benzal derivs. of the 4th sulfonic acid (hydrate) of each base were not prep'd. there can hardly be any doubt that these acid also still contain the group which condenses with BzH. *Benzalbrucinesulfonic acid I* (I) with CrO<sub>3</sub> gives 67% of a well cryst. acid (II), with a compn., C<sub>24</sub>H<sub>24</sub>(O<sub>2</sub>N)<sub>2</sub>, analogous to that of the Hansen C<sub>10</sub> acid; CrO<sub>3</sub> therefore does not attack the benzal group, the presence of which was further demonstrated by the development of the aldehydic odor on boiling with alkali. It can be made oxidizable by reduction to the PhCH<sub>2</sub> group, which is easily effected by Na-Hg; unlike catalytic hydrogenation, this leaves the original double bond of the brucine unchanged. The benzyl derivs. are attacked by CrO<sub>3</sub> with formation of BzOH (and BzH). KMnO<sub>4</sub> in acetone, on the other hand, attacks only the double bond in the benzyl derivs. *C-Benzylstrychninesulfonic acid I*, from the benzal comp'd. (C. A. 27, 3478), cryst powder, [ $\alpha$ ]<sub>D</sub><sup>20</sup> -159° (in 2 mol 0.1 N NaOH). *Benzal acid II*, prisms with 9.8% H<sub>2</sub>O, [ $\alpha$ ]<sub>D</sub><sup>20</sup> -440° (2 mols. 0.1 N NaOH); *benzyl acid*, prisms with 7.7% H<sub>2</sub>O, [ $\alpha$ ]<sub>D</sub><sup>20</sup> -123.3° (0.1 N NaOH). *Benzal acid III*, amorphous, yellow ppt. with 9-9.6% H<sub>2</sub>O. *benzyl acid*, amorphous flocks with 9.5-10.1% H<sub>2</sub>O, m. 205° (foaming), loses 1 H<sub>2</sub>O (of constitution) at 115-20° and 15 mm. *C-Benzylstrychnine* (III), leaflets from alc., m. 65°, foams about 90° (preps. from MeOH m.

102–5° (foaming)), loses 7.8% in wt. at 50–70° and 15 mm.,  $[\alpha]_D^{25} = -76^\circ/\text{d.}$ ; *methiodide*, decomps. around 305°. With  $\text{KMnO}_4$  in acetone III gives 30% *C-benzylstrychninonic acid*,  $\text{C}_{20}\text{H}_{25}\text{O}_6\text{N}_2$ , sinters about 200°, m. 208–10° (foaming), loses 6.5–7.8% in wt. at 100–20° and 15 mm.,  $[\alpha]_D^{25} = -19.0^\circ$  (in 1 mol. 0.1 *N* NaOH), is only slightly sol. in *N*  $\text{KHCO}_3$ , readily in *N*  $\text{NH}_3$ , gives the Otto reaction but none with  $\text{FeCl}_3$ , is reduced by Na–Hg to the *strychninolic acid*, m. 220–3°, loses 12.05% in wt. at 100–20° and 15 mm., dissolves readily in *N*  $\text{NH}_3$  and NaOH, from which a powder (probably the strychninoline) soon seps. *C-Benzylhydrostrychnine*, from the benzal compd. (Kotake and Mitsuwa, *C. A.* 27, 5334) and Na–Hg, m. 187–9° (evacuated tubes),  $[\alpha]_D^{25} = -13.4^\circ/\text{d.}$  (abs. alc.); *methiodide*, m. around 310° (decompn.). Benzalbrucine with  $\text{CrO}_3\text{--H}_2\text{SO}_4$  gave the *benzal-Haussen acid*, isolated as the *perchlorate*,  $\text{C}_{20}\text{H}_{25}\text{O}_6\text{N}_2\cdot\text{HClO}_4$ , powdery ppt. with 5.7–11.1%  $\text{H}_2\text{O}$ ,  $[\alpha]_D^{25} = -229^\circ/\text{d.}$  (0.7% soln. in water), sinters 70–140°, m. 240–5° (foaming and turning yellow) *C-Benzylbrucine*, from the benzal compd. with Na–Hg, powder with alk. reaction, isolated as the *methiodide*, needles with 10.1%  $\text{H}_2\text{O}$ , m. 255–8°; its *dihydro deriv.*, from benzalbrucine with H and Pt oxide, is amorphous (*methiodide*, also amorphous). I, yellow prisms with 12.2%  $\text{H}_2\text{O}$ ,  $[\alpha]_D^{25} = -23.2^\circ$  (in 2 mols. 0.1 *N* NaOH); *benzyl acid*, prisms with 9.0–9.3%  $\text{H}_2\text{O}$ ,  $[\alpha]_D^{25} = -146.3^\circ$  (0.1 *N* NaOH). II, seps. in 2 forms mutually interconvertible by seceding in *N/30* NaOH: squares or tables with 12.4–13.3%  $\text{H}_2\text{O}$ , and needles or prisms with 7.3%  $\text{H}_2\text{O}$ ,  $[\alpha]_D^{25} = -103.8^\circ$ . *Benzyl acid*, from II with Na–Hg, needles losing 3.5% in wt. at 95° and 15 mm.,  $[\alpha]_D^{25} = -104^\circ$  (in 1 mol. 0.1 *N* NaOH). *Benzalbrucinesulfonate II*, yellow prisms and tables with 6.6%  $\text{H}_2\text{O}$ ,  $[\alpha]_D^{25} = -346.5^\circ$  (in 2 mols. 0.1 *N* NaOH); *benzyl acid*, tables with 6.6%  $\text{H}_2\text{O}$ ,  $[\alpha]_D^{25} = -112^\circ$  (0.1 *N* NaOH). C. A. R.

Compounds of sparteine with substituted cyclic barbituric acids. Fernand Mercier and L. J. Mercier. *Compt. rend.* 197, 941 (1933); cf. *C. A.* 24, 5377; 25, 4659. To ethylphenylmalonylurea (2 mols.) in hot 96% EtOH was added 1 mol. of sparteine base in Et<sub>2</sub>O. The mixt. was heated at 50°; when it had become sirupy, crystn. was started. The neutral ethylphenylbarbiturate of sparteine (I),  $[\text{CO}(\text{NHCO})_2\text{C}_6\text{H}_4]_2\text{C}_{10}\text{H}_{18}\text{N}_2$ , m. 148–50°. I (dry) does not decomp. when heated for 3 hrs. at 110°; after 3 hrs. at 135° its decompn. is about 5%. In aq. soln. I decomp. at 100°, giving its constituents. Its satd. aq. soln. has a *pH* of 6.4. *Methylphenylbarbiturate of sparteine* (II), m. 151–6°. When II (dry) is heated for 1 hr. it undergoes 5% decompn. at 110°, 15% at 120° and 30% at 130°. In aq. soln. it decomp. at 70°. The *pH* of its satd. aq. soln. is 6.6. Louise Kelley

Protein salts of organic bases. M. A. Lisitzuin. *Biochem. Z.* 266, 25–8 (1933).—Protein forms salts with org. bases in strictly equiv. amts. Methods are described for prep. caseinates with piperidine, pyridine, nicotine, cocaine, methylaniline, ethylenediamine, arginine, glucosamine, brucine, cocaine, veratrine, strychnine, quinine, morphine and some protamines. In every instance the reaction is stoichiometric; the aq. solns. may be clear or milky, except that of morphine caseinate, which salt is sol. neither in  $\text{H}_2\text{O}$  nor in alc. but in 60–70% alc. They are not coagulated by heat, the solns. frequently clearing up on warming, and some (glucosamine caseinate) are pptd. by  $(\text{NH}_4)_2\text{SO}_4$ . S. Morgulis

Ascaryl alcohol. Fr. N. Schulz and Max Becker. *Biochem. Z.* 265, 253–9 (1933).—Ascaryl alc., obtained from the fat of ascards, has the compn.  $\text{C}_{20}\text{H}_{35}\text{O}_4$  (Flury's formula is  $\text{C}_{21}\text{H}_{36}\text{O}_4$ ), as detd. by elementary analysis and mol. wt. detns. and from the fact that glycerol is part of its mol. constitution, accounting for the uneven C no. No double bond was demonstrable; the alc. can be acetylated and benzoylated, yielding a diacetate m. 52° and a dibenzoate m. 37°, the m. p. of the pure alc. being 84°. Pure preps. were obtained by sapon. of the diacetate, but the alc. can also be obtained from the total fat by a process of fractionation. On heating at a high temp. the development of the pungent fumes of acrolein is obvious, but the

combination with the glycerol is not etheral since it can not be hydrolyzed by sapon. S. Morgulis

Genuine glucosides of *Digitalis lanata*, the diglanides A, B and C. Arthur Stoll and Walter Kreis. *Helv. Chim. Acta* 16, 1049–98 (1933); cf. *C. A.* 27, 3777.—The application of the enzyme-hindering extn. method of Kreis, used previously in the isolation of scillaren A (*C. A.* 27, 4806), to the extn. of the glucosides from the leaves of *Digitalis purpurea* gave, in place of the previously obtained digitoxin, a new glucoside, *purpurea glucoside A* (I), richer in sugar than digitoxin by 1 mol. of glucose. The complete hydrolysis of I yielded a mixt. of 1 mol. digitoxigenin, 3 mols. digitoxose and 1 mol. of glucose. The fresh leaves of this *Digitalis* contain an enzyme, *digipurpase*, which promotes the hydrolysis of I into digitoxin and glucose in the course of the usual extn. procedures. The enzyme-hindering extn. of the fresh leaves of the Hungarian *Digitalis lanata* permitted the isolation of a splendidly crystd. glucoside, *diglanide* (II), m. 245–8° (decompn.),  $[\alpha]_D^{25} = 33.3^\circ$  (in 95% EtOH). The phys. consts. of II were not altered by repeated crystns. from MeOH, EtOH and AcOH and the various fractions showed the same Keller–Kiliani color phenomena. A soln. of 4.623 g. of II (calcd. on the vacuum dried wt.) in 137 cc. 95% EtOH was mixed with 125 cc. 2 *N*  $\text{H}_2\text{SO}_4$  and maintained at 40° for 6 hrs. From this mixt. was crystd. out, by the addn. of various org. solvents, 1.72 g. (37.2%) of aglucones (III). After the removal of III and the org. solvents the mother liquor was adjusted to a 1%  $\text{H}_2\text{SO}_4$  concn., covered with toluene and kept at room temp. for 4 months. This mild hydrolysis yielded the 2 sugars, digitoxose and *diglanidobiose* (IV),  $\text{C}_{19}\text{H}_{26}\text{O}_{10}$ , m. 227°,  $[\alpha]_D^{25} = 30.1^\circ$ , in a mol. proportion of 2 to 1. IV was hydrolyzed into a mixt. of 1 mol. glucose and 1 mol. digitoxose by boiling in 5%  $\text{H}_2\text{SO}_4$  for 15 hrs. over a free flame. Fractional crystn. of III sepd. the aglucone mixt. into the known aglucones, digitoxigenin, gitoxigenin and digoxigenin. In addn. to the 3 aglucones and the 2 sugars the complete acid hydrolysis of II gave 1 mol. of AcOH, recognized by alk. titration, isolated as AcOAg and estd. by a microacetyl detn. The isolation of the aglucones proved that II consisted of at least 3 glucosides present as a homogeneous mixt. of completely isomorphous substances. By distribution between  $\text{CHCl}_3$  and a mixt. of MeOH and  $\text{H}_2\text{O}$  in the proportion of 1 to 5 a gradual sepn. was obtained. In the preliminary operation a mixt. was chosen which yielded an insol. layer between the 2 liquid phases so that each operation gave 3 fractions. Each of these fractions was similarly treated and after several repetitions of this shaking-out process the terminal solns. yielded 3 individual glucosides. From these substances obtained in this wasteful procedure it was possible to det. empirically the distribution coeffs. for the 3 glucosides and for II when 1 g. of glucoside was shaken with 100 cc. MeOH, 500 cc.  $\text{CHCl}_3$  and 500 cc.  $\text{H}_2\text{O}$  for 30 sec. at 25°. An AcOH soln. of II contr.  $\text{FeCl}_3$  when layered over concd.  $\text{H}_2\text{SO}_4$  gave a beautiful blue AcOH layer and a vivid red  $\text{H}_2\text{SO}_4$  ring. This red color, superimposed on a brown color due to the sugars formed by partial hydrolysis, diminished as the glucoside of the gitalin group was removed. Aided by this Keller–Kiliani color reaction and by a careful partition by means of the  $\text{CHCl}_3\text{--MeOH--H}_2\text{O}$  solvents controlled by the previously ascertained distribution coeffs. II was sepd. into the 3 new glucosides, *diglanide A* (V),  $\text{C}_{20}\text{H}_{28}\text{O}_{10}$ , m. 245–8°,  $[\alpha]_D^{25} = 31.4^\circ$  (in 95% EtOH); *diglanide B* (VI),  $\text{C}_{20}\text{H}_{28}\text{O}_{10}$ , m. 245–8°,  $[\alpha]_D^{25} = 36.7^\circ$  (in 95% EtOH); and *diglanide C* (VII),  $\text{C}_{20}\text{H}_{28}\text{O}_{10}$ , m. 245–8°,  $[\alpha]_D^{25} = 33.5^\circ$  (in 95% EtOH). One g. of each dissolves in 225, 600 and 1500–2000 cc.  $\text{CHCl}_3$ , resp. A table is provided in which the properties of these glucosides and those of the previously known digoxin (*C. A.* 24, 2753) and lanadigin (*C. A.* 25, 377) are compared. The investigation of the individual glucosides confirmed the findings from II in every way. From the pure glucosides the corresponding aglucone, digitoxigenin from V, gitoxigenin from VI and digoxigenin from VII, could be easily obtained in pure form and in good yields by hydrolysis. The accompanying sugars proved to be 2 mols. of digi-

- toxin and 1 mol of diglucanidobiose and from each individual glucoside an Ac group could be quantitatively separated. The pharmacological properties of II and its components V, VI and VII have been studied and reported by Rothlin (*C A* 27, 3752). The toxicity of II lies in the order of magnitude of the digitoxins and amounts to 0.34 mg per kg for cats and 400 I.D. per 1 mg for frogs. II has been successfully introduced into therapy in numerous clinics, and Hochrein and Ickelheimer have reported the treatment of 60 cases of heart disease (*C A* 27, 3752). The individual nature of V, VI, VII and the established compound and purity enables the dosage to be controlled in a way not possible with the probably partially decomposed galenic preparations. (R Addinall)
- Isocholesterol II** The chemistry of lanosterol. Charles Donic and Donald C. Garrett. *J Soc Chem Ind* 52, 355-61 (1933), cf (*C A* 27, 3719).—Pure lanosterol (I), m 140.5°,  $[\alpha]_D^{25}$  57.9°. I prepd from purified lanosteryl benzoate (II), m 191.5°,  $[\alpha]_D^{25}$  74.2°, and lanosteryl acetate (III), m 113.5°, had identical properties. The sapon value of III indicates the formula  $C_{30}H_{50}O$  for I. AmOH and Na with I gave unchanged I and dihydrolanosterol (IV), m 143°,  $[\alpha]_D^{25}$  51.0° (acetate, m 119.20°). I was unaffected by Na and EtOH or by 10%  $H_2SO_4$  in alc. Controlled oxidation of I with  $CrO_3$  in AcOH gave lanostenone (V),  $C_{30}H_{48}O$ , m 116.5°,  $[\alpha]_D^{25}$  71.9° (semicarbazone, m 242.3°). Phenylhydrazine, decomps 140.5-75°, 2,4-dinitrophenylhydrazine, m 207°, a ketone (VI), m 88.5-95°,  $[\alpha]_D^{25}$  51.4° (PhNHNH<sub>2</sub> deriv, m 117.20°), and a leucic acid (VII),  $[\alpha]_D^{25}$  64.2° (2,4-dinitrophenylhydrazine, m 133.4°), having a mol wt of 389 by titration. Vigorous oxidation with  $CrO_3$ -AcOH mixt gave MeCO and other volatile ketones. V with Na and EtOH formed lanosterol 1 (VIII), m 142.5-35°,  $[\alpha]_D^{25}$  58.7° (acetate, m 126.7°,  $[\alpha]_D^{25}$  59.1°). Sapon of the acetate regenerated VIII instead of I, thus differing from cholesterol. I in EtOH with Br in AcOH formed a Br deriv (IX), m 177°, contg 1.2 atoms of Br per  $C_{30}$  unit. IX with Zn in AcOH gave I. With NaOH, lanosterol B (X), m 149.5-50°,  $[\alpha]_D^{25}$  58.9° (acetate, m 118°,  $[\alpha]_D^{25}$  55.0°, benzoate, m 192.3°,  $[\alpha]_D^{25}$  78.7°), was formed. Sapon of these esters regenerated X. X with  $CrO_3$ -AcOH mixt gave V. Dihomologous acetate dibromide (XI) and NaOH yielded X. IX with  $CrO_3$ -AcOH mixt oxidized to dibromolanostene (XII), m 188°,  $[\alpha]_D^{25}$  -10.5° (2,4-dinitrophenylhydrazine, m 199.200°). Zn and AcOH with XII produced a gum. I in  $CHCl_3$  formed a mono ozonide (decomps 150°), which with  $H_2O$  decomposed to form a volatile ketone (semicarbazone, m 252°), having a lemon odor and an acid (XIII), m 225° (mol wt 523 by titration). I, VIII and X respond only faintly to the typical sterol color reactions and the Iordell-Jaffe Br reaction is neg. Oxidation shows the OH group in I to be secondary and  $\beta$ ,  $\gamma$  to a double bond in a ring system by analogy to other sterols, and a side chain of more than 8 C atoms probably terminated by a  $-CHMe_2$  or  $=CMe_2$ . The formation of IX can be explained by assuming substitution of Br followed by addn of HBr, giving a mixt of mono- and di Br derivs. At least 1 reactive double bond is present in I and perhaps 2. Br/OH titration indicates only 1, but I values indicate 3. The I values by Dun's method were I, 170.5, 174.5, III, 167.3, IX, 120.8, XI, 115.0, V, 140.4, VIII, 174.9, X, 181.1, VII, 41.3, XIII, 63.5. D and G were unable to find isocholesterol in South African *Euphorbia* latex as had been reported. (J W Scott)
- Retanmic** (Wunschendorff, Valier) 17. Insecticidal action of some furan compounds (Giblin, et al) 15. Sp. oxidation reactions of SeO (Muller) 6. Conversion of  $NH_4OCN$  into uric acid (Warner, Slitt) 2. Velocity of decomposition of diazo compounds in water (Yamamoto, et al) 2. Thermal decomposition of propyl microplastic (Laylor, Layng) 2. Electrolytic oxidation of piperidine (Yamamoto, Yokoyama) 4. Electrolytic reduction of camphoric acid imide (Sakurai, Iamura) 4. Colloidal state of cholesterol, cholesterol esters and lecithin (Rentezov, Supalova) 11A. App for feeding catalyst to pressure reaction vessels such as used for converting  $C_2H_2$  to  $AcH$  (U S pat 1,935,627) 1. Treating liquids with gases as in "phosgenating" amino compounds (U S pat 1,935,190) 1. Modifications of the gutta-percha hydrocarbon (de Jong) 30.
- British Standard Specifications** No 506 Methyl Alcohol, No 507 Ethyl Alcohol, No 508 Normal Butyl Alcohol, No 509 Acetone London Brit Standards Inst, Publications Dept 2s 2d
- Apparatus for producing hydrocarbons from methane** Franz Fischer. Ger 583,851, Sept 13, 1933. Addn to 578,311 (*C A* 27, 4239).
- Aliphatic hydrocarbons** Henry Drayfus. Fr 750,496, Aug 11, 1933. Hydrocarbons are decomposed, particularly to unsatd gaseous hydrocarbons such as olefins, by a heat treatment as vapors in the presence of CO and (or)  $CO_2$ , e.g., 5-20% of  $CO_2$ .
- Transforming hydrocarbons** I G Farbenund A-G (Paul Feller, Hermann Wiegmann and Hans Hubert, inventors). Ger 578,778, June 16, 1933. Hydrocarbons, such as  $CH_4$  or its homologs, are transformed into  $C_6H_6$  or other aromatic hydrocarbons, by heating to high temps in periodically heated chambers contg non-metallic heat storing material coated with Si or Cr as catalyst. Thus, the chambers may contain chamotte plates coated with Si. Of the total  $CH_4$  heated periodically therein, 35% is changed, mostly to  $C_6H_6$ .
- Dehydrogenation of hydrocarbons** I G Farbenund A-G. Ger 578,567, June 15, 1933. In carrying out the above process, catalysts consisting of Co or Fe or mixts of the 5-7 groups of the periodic table, or their compounds, especially oxides, are used. These metals or compounds may have Pb, Zn, Sn or Cd, or their compounds, or solid oxides of the metalloids of the 5th group, admixed. The mixt is then heated to over 200° in a current of hydrogen of metalloids of the 5th and 6th groups. Thus, active C soaked in  $(NH_4)_2MoO_4$ ,  $Pb(NO_3)_2$  and  $H_3PO_4$  is heated to 300° in a current of  $H_2$ . Cyclohexane vapor is led over the resulting catalyst at 140° to give a product contg 10-45%  $C_6H_6$ .
- Chlorinating aromatic hydrocarbons** Joseph R. Musy (to Monsanto Chemical Co). U S 1,935,618 Nov 21. In the production of products such as chlorobenzene, an aromatic hydrocarbon such as  $C_6H_6$  in vapor phase is caused to react with  $Cl_2$  and O in the presence of a catalyst, a compound of Al together with Cu, Fe or Co such as a Deacon process catalyst.
- Organic oxygen compounds** Henry Drayfus. Fr 753,168, Oct 9, 1933. Ethers are heated in the presence of an oxidation and (or) dehydrogenation catalyst. O and steam may also be present. AcH and a proportion of AcOH and  $Ac_2O$  may be obtained in this way from EtO.
- Oxidizing aromatic compounds** Philip Kucer (to General Aniline Works). U S 1,935,919, Nov 21. See Ger 557,219 (*C A* 27, 304).
- Oxidation products of sulfurized hydrocarbons** I G Farbenund A-G (Karl Keller, inventor). Ger 583,853 Sept 14, 1933. The sulfurized derivs of higher aliphatic hydrocarbons described in Ger 557,215 (*C A* 27, 310) and 559,739 (*C A* 27, 730) are oxidized, e.g., by treatment with  $HNO_3$  or  $KMnO_4$  at 40-50°. The oxidation may be stopped at the stage when compounds of the disulfide type are present, or may be continued to produce sulfonic acids. The latter are useful as protective colloids and are assistants in the treatment of textiles. The less highly oxidized products are useful as emulsifying agents. Examples are given. Cf (*C A* 27, 5337).
- Separating organic compounds, such as acetic acid from their mixtures** Horace B. Olevy and Leonard Fallow (to Celanese Corp of America). U S 1,936,172, Nov 21. In such systems as the system of concd  $HOAc$  from its solns by forming an azeotropic mixt with an added entraining substance such as  $C_6H_6$ , the entraining agent is vaporized before bringing it into contact with the mixt undergoing separation.
- Unsaturated hydrocarbons** I G Farbenund A-G
- Retanmic (Wunschendorff, Valier) 17. Insecticidal action of some furan compounds (Giblin, et al) 15. Sp. oxidation reactions of SeO (Muller) 6. Conversion of  $NH_4OCN$  into uric acid (Warner, Slitt) 2. Velocity of decomposition of diazo compounds in water (Yamamoto, et al) 2. Thermal decomposition of propyl microplastic (Laylor, Layng) 2. Electrolytic oxidation of piperidine (Yamamoto, Yokoyama) 4. Electrolytic reduction of camphoric acid imide (Sakurai, Iamura) 4. Colloidal state of cholesterol, cholesterol esters and lecithin (Rentezov, Supalova) 11A. App for feeding catalyst to pressure reaction vessels such

(Walter Reppe and Ulrich Hoffmann, inventors). Ger. 578,994, June 21, 1933. Mono- or polyhydric alcs. and steam or water vapor are led over phosphates (except  $\text{AlPO}_4$ ) which have an acid action under the conditions of the reaction. Thus, 1,3-butylene glycol contg. 20% water is vaporized and led over  $\text{CePO}_4$ . A 90% yield of butadiene is obtained. Other examples are given.

**Oxidation of olefins.** Henry Dreyfus. Brit. 397,161, Aug. 3, 1933. O-contg. org. compds. other than glycols or alcs. are produced by oxidation under pressure of olefins contg. not more than 5 C atoms with O or air in presence of  $\text{H}_2\text{O}$  or steam at least sufficient to sat. the gases at room temp. and pressure but insufficient to produce substantial quantities of alc. products such as glycols, the production of which is covered by Brit. 387,372 (C. A. 27, 4540). The gases may be passed through hot liquids contg. O-carriers of an acid nature, e. g., chromic acid,  $\text{Mn}(\text{OAc})_2$ ,  $\text{Cr}(\text{OAc})_3$ , which may be dissolved in  $\text{H}_2\text{O}$  or  $\text{AcOH}$ . Diluent gases, e. g.,  $\text{N}$ ,  $\text{CO}_2$ , may be used. When ethylene oxide is desired its further oxidation may be minimized by using moderate temps., a considerable quantity of diluent, high speed of the gas and avoidance of acid catalyst in the reaction zone,  $\text{NH}_3$  or other volatile base being added to the gases if desired. To produce  $\text{AlH}$  hydration catalysts, e. g.,  $\text{H}_3\text{PO}_4$ ,  $\text{ZnCl}_2$ , may be used or the products of reaction may be passed over these catalysts at 300–400°. The formation of  $\text{AcOH}$  is favored by the use of excess O, relatively high temps. and oxidation catalysts such as Ag, Cu or their oxides. Propylene may be oxidized to  $\text{Me}_2\text{CO}$  and butylenes and amylenes to the corresponding ketones. Cf. C. A. 27, 3942.

**Hydration of olefins.** Henry Dreyfus. Brit. 397,187, Aug. 21, 1933; Fr. 749,951, Aug. 2, 1933. Aliphatic alcs. and ethers are prepd. by absorbing olefins at elevated temp. and pressure in aq. solns. of acids that are weaker than  $\text{H}_2\text{SO}_4$ , e. g.,  $\text{H}_3\text{PO}_4$  and org. sulfonic acids, and hydrolyzing the product after addn. of the appropriate amt. of  $\text{H}_2\text{O}$  (vapor). Acid concns. used are 40–80% for absorption of  $\text{C}_2\text{H}_4$ , 40–75% for  $\text{C}_3\text{H}_6$  and 40–60% for higher olefins. Pressures of 30–200 atm. and temps. of 100–300° may be used and catalytic substances, e. g., Ag,  $\text{V}_2\text{SO}_4$ ,  $\text{Cu}_2\text{O}$ ,  $\text{CaSO}_4$ ,  $\text{FeSO}_4$ ,  $\text{PbSO}_4$ ,  $\text{Hg}_2\text{SO}_4$ , may be present. Cf. C. A. 27, 4539.

**Alcohols.** Air Reduction Co., Inc. Fr. 749,478, July 25, 1933. Alcs. are made in a continuous manner by passing a mixt. of steam and an alkylene hydrocarbon in contact with an acid catalyst under high pressure and using the heat of the reaction products to form more steam and hydrocarbon mixt. An app. is described. Cf. C. A. 27, 1981.

**Separating terpene alcohols from mixtures.** Adolf Kaufmann. Ger. 582,917, Aug. 25, 1933. Dehydrated mixt. contg. terpene alcs. are treated with neutral alkyl esters of  $\text{H}_3\text{BO}_3$ . The mixt. is then warmed and distd. The terpene alcs. go over first as esters of  $\text{H}_3\text{BO}_3$ . The non alk. constituents go over next. The residue contains esters which may be obtained by crystn. Examples are given.

**Alcohols and ethers.** Henry Dreyfus. Brit. 396,107, July 24, 1933. Divided on 394,375 (C. A. 28, 1721) and 394,671 (C. A. 28, 1723). The hydration of olefins collected with  $\text{H}_2\text{O}$  or steam in presence of a chloride of a metal at least as electropos. as Ni, the salt being of acid character and sol. in about twice its wt. of  $\text{H}_2\text{O}$ , e. g.,  $\text{ZnCl}_2$ ,  $\text{CaCl}_2$ ,  $\text{MgCl}_2$ . The salts may be used solid, molten or in soln. and may be supported on inert carriers. The temp. may be 100–350° or more and pressure of 15–25 atm. or more may be used. For producing  $\text{Et}_2\text{O}$  2 or more vols. of  $\text{C}_2\text{H}_4$  may be used for 1 of steam while for alc. equal vol. may be used.

**Ethers.** Henkel & Cie. G. m. b. H. Fr. 751,923, Sept. 12, 1933. Ethers contg. at least 8 C atoms in the mol. are made by causing esters of higher aliphatic or hydroaromatic alcs. and hydroxy acids to react with alcs. or phenols in an alk. medium or with alcoholates or phenolates. Examples are given of the prepn. of  $\beta$ -hydroxyethyl (b<sub>1</sub> 170–4°),  $\beta$ , $\gamma$ -dihydroxypropyl (b<sub>1</sub> 210–5°), and glycerol monododecyl ether, b<sub>1</sub> 198°, also glycerol

monotetra- (b<sub>1</sub> 206–7°), -hexa- (b<sub>1</sub> 205–6°) and -octadecyl ether (b<sub>1</sub> 215–20°, slight decompn.) and an ether from Na dodecylsulfate and  $\text{PhOH}$ , m. 25°. Cf. C. A. 27, 4242.

**Sorbitol ethers and the like.** Walter E. Lawson (to E. I. du Pont de Nemours & Co.). U. S. 1,936,093, Nov. 21. Ethers such as ethyl or benzyl sorbitol are prepd. by the action of an etherifying agent such as ethyl or benzyl chloride on sorbitol or other hexahydric 6 C alc. in the presence of an alkali such as  $\text{NaOH}$ .

**Aldehydes.** I. G. Farbenind. A.-G. Fr. 750,467, Aug. 11, 1933. Aldehydes are prepd. by passing a mixt. of unsatd. carboxylic acids or volatile derivs. of these and  $\text{HCOOH}$  or volatile derivs. of this over a decarboxylation catalyst while heating, the partial pressure of the unsatd. acid or its deriv. being maintained in the reaction chamber at most at  $1/30$  atm.

**Aromatic aldehydes.** Edgar T. Olson. U. S. 1,935,914, Nov. 21. An aldehyde such as benzaldehyde is prepd. by treating a hydrocarbon such as  $\text{C}_6\text{H}_6$  with CO in the presence of a catalyst such as  $\text{AlCl}_3$  and of moisture (suitably at a temp. of about 20–50° in a described app.).

**Aromatic aldehydes.** Imperial Chemical Industries Ltd. and Leonard E. Hinkel. Brit. 397,124, Aug. 15, 1933. Aromatic aldehydes are manufd. by treating an aromatic hydrocarbon or an ether of a mono- or polyhydric phenol, preferably at 60° or above, with  $\text{HCN}$  (or a metal cyanide),  $\text{HCl}$  and  $\text{AlCl}_3$  in excess of 1 mol. to every 2 CN groups in the  $\text{HCN}$  or metal cyanide and treating the aldimine so obtained with acid. Examples describe the prepn., by the action of  $\text{AlCl}_3$ ,  $\text{HCN}$  and  $\text{HCl}$ , of (1)  $\text{HzII}$  from  $\text{C}_6\text{H}_6$ , (2) *p*-tolmaldehyde from  $\text{PhMe}$  and (3) 2,4-dimethylbenzaldehyde from *m*-xylene. Other starting materials specified are mesitylene, anisole, phenetole, diphenyl ether, dialkyl ethers of pyrocatechol, resorcinol or hydroquinone, di- and trialkyl ethers of pyrogallol or phloroglucinol.

**Esters.** Edward H. Strange and Thomas Kane. Fr. 752,008, Sept. 15, 1933. Esters are prepd. by combining an aliphatic monocarboxylic acid in the presence of a suitable catalytic or chem. agent at a temp. above the b. p. of the desired ester. Suitable catalytic or chem. agents include chlorides, bromides, phosphates and sulfates of Zn, Al, Hg, Cu, Cd, Bi and Sb,  $\text{H}_2\text{SO}_4$ ,  $\text{H}_3\text{PO}_4$ ,  $\text{NaHSO}_4$ ,  $\text{Et}_2\text{SO}_4$  and  $\text{PhSO}_3\text{H}$ . Examples are given of the prepn. of  $\text{AcOI}$ r.

**Esters.** Alexander Wacker Ges. für elektrochemische Industrie G. m. b. H. Fr. 752,150, Sept. 16, 1933. Glycerides of aliphatic acids are transformed to alkyl esters by the action of aliphatic alcs. on the glycerides in the presence of catalysts, using only a small excess of alc. above that theoretically necessary. The liberated glycerol is insol. in the reaction mixt. Hydrocarbons may be added to hasten the sepn. of glycerol. Ether may be used as a solvent for the glyceride, alc. and catalyst.

**Vinyl esters.** I. G. Farbenind. A.-G. (Walter Weibezahn, inventor). Ger. 582,544, Aug. 16, 1933. See U. S. 1,912,608 (C. A. 27, 4243).

**Ester of substituted benzoic acid.** I. G. Farbenind. A.-G. (Otto Eisleb, inventor). Ger. 582,715, Aug. 21, 1933. The  $\beta$ -dimethylaminoethyl ester of 4-butylamino-benzoic acid is prepd. by converting the acid into the ester by usual methods or by butylating the ester of 4-amino-benzoic acid. The ester m. 153–4° and its mono- $\text{HCl}$  m. 147–8°. Examples are given.

**Disulfuric ester of dihydro-3,3'-dichlorodanthraquinone-1,2,2',1'-dihydroazine.** David A. W. Fairweather and John Thomas (to Scottish Dyes Ltd.). U. S. 1,936,474, Nov. 21. This compd., which dissolves in water with a blue color, is produced by oxidation of the disulfuric ester of dihydro-2-amino-3-chloroanthraquinone.

**Amines.** The Goodyear Tire & Rubber Co. Fr. 751,712, Sept. 8, 1933. Amines are prepd. by hydrogenating under pressure in the liquid phase and in the presence of a catalyst, a reaction product or a mixt. of an amine contg. the group  $=\text{NH}$  and an aliphatic or cyclic aldehyde or a ketone. Examples are given of the prepn. of dicyclohexyl- (b<sub>10</sub> 115–120°), *N*-butylcyclohexyl- (b. 200–4°),

*N*-butylphenethyl- ( $b_{10}$  130-5°), *N*-dibutylphenethyl- ( $b_{10}$  162 8°), di- $\alpha$ -furfuryl- ( $b_{2,3}$  103-6°), and  $\gamma$ -phenyl-propyl-amine,  $b_1$  75-80°, and *N*-butylpiperidine,  $b_1$  170-4°.

**Aromatic amines.** The Goodyear Tire & Rubber Co. Fr. 760,243, Aug. 7, 1933. Secondary aromatic amines are prepd. by causing a hydroxyaromatic compd. to act on a primary amine in the presence of a dehydrating agent which is not decomposed at the temp. of reaction and which gives, by ionization, an electroneg. group to which are joined one or more acid H atoms or which can give rise to one or more acid H atoms. Boric acid or alkali bisulfates, bisulfite, metabisulfites, acid phosphates, acid oxalates or pyrosulfates may be used. Phenyl- $\beta$ -naphthylamine may be made in this way from  $\beta$ -naphthol and PhNH<sub>2</sub>.

**Aromatic amines from phenols.** Paul Herold and Friedrich Reubold (to I. G. Farbenind. A.-G.). U. S. 1,935,209, Nov. 14. Reaction such as the production of toluidine from vapors of cresol and NH<sub>3</sub> while heating in the presence of a dehydration catalyst such as Al(OH)<sub>3</sub> is effected under a pressure of 50-300 atm., which serves to give high yields.

**Ketones.** Schering-Kahlbaum A.-G. Fr. 751,807, Sept. 11, 1933. Unsaturated ketones are prepd. by causing selenious acid or anhydride to react on unsaturated compds. containing the grouping CH:CHCH<sub>3</sub>. The reaction may be carried out in the presence of a solvent for the Se compd. and under pressure, and using the action of ultra-violet light instead of heat. Examples are given of a ketone from 1-menthene,  $b_1$  212-20° (a thiosemicarbazone, m. 158°), from  $\alpha$ -pinene,  $b_1$  97-100° (semicarbazone, m. 208-11°), from  $\beta$ -pinene,  $b_1$  82-1°, from dipentene,  $b_{10-11}$  98-105° (semicarbazone, m. 201-2°), from 3-menthene,  $b_{10}$  89-93° (semicarbazone, m. 172-5°) and from eugenol, m. 95° (benzoate m. 117°).

**Aryl ketones.** Alphons O. Jaeger (to Selden Co.). U. S. 1,936,091, Nov. 21. For producing a diaryl ketone such as naphthyl phenyl ketone, a keto aromatic acid such as naphthoylbenzoic acid is heated in the presence of a small amt. of a compd. of a metal other than an alkali or alk. earth metal, such as oxide of Zn or Cu, to a temp. at which CO<sub>2</sub> is given off and the heating is continued until evolution of CO<sub>2</sub> ceases.

**Ketones of the cycloolefin series.** Schering-Kahlbaum A.-G. (Erwin Schwenk and Erich Borgwardt, inventors). Ger. 582,545, Aug. 16, 1933. SiO<sub>2</sub> or H<sub>2</sub>SiO<sub>4</sub> is caused to react on cycloolefins. Thus, methyleyclohexene is heated with SiO<sub>2</sub> to give methyleyclohexenone. Other examples are given.

**Catalytic apparatus suitable for producing ketones from alcohols, etc.** Koloman Roka (to Deutsche Gold- und Silber-Scheidanstalt vorm. Roessler). U. S. 1,936,118, Nov. 21. Various details of construction and operation are described.

**Ketone hydrazones.** Ernst Herdickekerhoff and Fritz Ballauf (to General Aniline Works). U. S. 1,935,712, Nov. 21. An alkali metal or Mg salt of a phenylhydrazine-sulfonic acid is heated with about an equimol. proportion of acetone, acetophenone, a *Bz*-chloro- or -methyl-substitution product of acetophenone or cyclohexanone, in aq. soln. neutral to litmus and with addn. of a water-miscible inert org. solvent (suitably at a temp. of about 95°). Products are obtained suitable for use as dye intermediates and several examples with details of procedure are given.

**Phenols from aromatic hydrocarbon halides.** Willy Rittler (to Chemische Fabrik von Heyden A.-G.). U. S. 1,936,507, Nov. 21. In forming a phenol such as PhOH, a hydrocarbon halide such as PhCl together with water vapor and at a temp. of 350-600° is passed over minerals containing hydrosilicate such as fuller's earth in the presence of Cu. App. is described.

**Aminobiaryls.** I. G. Farbenind. A.-G. (Georg Kränzlein, Paul Ochwat and Karl Moldaenke, inventors). Ger. 582,844, Aug. 24, 1933. *p*-Aminobiaryls are prepd. by the action of hydrocarbons of the C<sub>6</sub>H<sub>5</sub> series on *N*-halogen compds. of acyl derivs. of aromatic amines in the presence of a condensing agent such as metal halide, and

in the presence or absence of org. diluents and in absence of moisture. The product is sapon. Thus, *N*-chloroacetanilide is dissolved in C<sub>6</sub>H<sub>6</sub> and treated with AlCl<sub>3</sub> with ice cooling to give *p*-acylamino-biphenyl which, on sapon., gives *p*-aminobiphenyl. The prepn. of 3-methyl-4-amino-biphenyl, m. 43°, 3,4'-dimethyl-4-aminobiphenyl, m. 205-7°, 3,4'-dimethyl-4-acetamidobiphenyl, m. 199-200°, 3-methyl-4-acetamido-4'-chlorobiphenyl, m. 226°, 4-benzoyl-amino-3-methylbiphenyl, m. 180°, 3,5'-dimethyl-4-amino-biphenyl,  $b_1$  210-12°, and 4-propionylaminobiphenyl, m. 182-3°, are also described.

**Halogenated substances.** I. G. Farbenind. A.-G. (Karl Keller and Ferdinand Münz, inventors). Ger. 578,793-4, June 17, 1933. Addns. to 576,710 (C. A. 28, 338°). The method of 576,710 for halogenating fatty acids is applied to compds. of the general formula RCOX, where R represents a paraffin, olefin or acetylene residue containing OH, and X represents Cl, NX<sub>2</sub>, X<sub>3</sub> (X<sub>1</sub> and X<sub>2</sub> representing H, alkyl or aryl), or OR<sub>1</sub> (R<sub>1</sub> representing a monohydric alc. residue). Thus, the monoethylanilide of oleic acid is treated with Cl to give a chlorinated product with the ethylanilide group intact (578,793). The method of 576,710 is also varied by using Br at raised temps. instead of Cl (578,794).

**Reaction products of ketene.** George Hartland Law (to Carbide and Carbon Chemicals Corp.). Brit. 397,025, Aug. 17, 1933. An org. substance which yields ketene, e. g., Me<sub>2</sub>CO, is thermally decomposed, the reaction products are rapidly passed into intimate contact with a liquid cooling medium, non-reactive with ketene, to condense less volatile substances and the uncondensed gas is used to form reaction products of ketene. Suitable cooling liquids are hydrocarbons, e. g., C<sub>6</sub>H<sub>6</sub>, C<sub>6</sub>H<sub>14</sub>, C<sub>6</sub>H<sub>12</sub>, all phatic ethers, e. g., Et<sub>2</sub>O, iso-Pr ether, and aliphatic ketones, e. g., Me<sub>2</sub>CO, MeEtCO. App. is described Cf. C. A. 27, 306.

**Polyvinyl compounds.** Leland C. Shriver (to Carbide and Carbon Chemicals Corp.). Brit. 397,361, Aug. 24, 1933. Vinyl compds., e. g., vinyl chloride, vinyl esters of aliphatic acids such as vinyl acetate, propionate or butyrate or styrene, or mixts. thereof, are polymerized with the aid of acetyl benzoyl peroxide (I), if desired in conjunction with other catalysts, promoters and accelerating agents. In an example a mixt. of vinyl chloride and acetate is heated under pressure to 40° in Me<sub>2</sub>CO soln. in the presence of I in the form of the crude product obtained by passing dry air or O through a mixt. of BzH and Ac O. Less than 1% of catalyst is required.

**Diazo compound.** I. G. Farbenind. A.-G. (Karl Schnitzspahn and Rudolf Jung, inventors). Ger. 586,354, Oct. 20, 1933. The diazo compd. of *o*-aminoozotoluene is pptd. from soln. as diazonium acid sulfate and dried, alone or after admixture with diluents or auxiliary substances used in dyeing, e. g., Na<sub>2</sub>SO<sub>4</sub>, borax, or Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>. Compds. stable to storage are obtained. Cf. C. A. 28, 175° and following abstr.

**Diazo compounds.** I. G. Farbenind. A.-G. (Karl Schnitzspahn and Wilhelm Koch, inventors). Ger. 586,355, Oct. 21, 1933. Stable solid diazo compds. containing a free NH<sub>2</sub> group are prepd. from halo-1,4-diaminobenzenes not containing a COOH or SO<sub>3</sub>H group by treating these with sufficient mineral acid and nitrite to diazotize one NH<sub>2</sub> group only, and converting the product into the solid form by a standard method, e. g., as ZnCl<sub>2</sub> double salt or as borofluoride or arylsulfonate. Examples are given.

**Tetrazo compounds.** I. G. Farbenind. A.-G. Brit. 397,034, Aug. 17, 1933. See Ger. 586,353 (C. A. 28, 485°).

**Aminoaralkylaryl compounds.** Alphons O. Jaeger (to Selden Co.). U. S. 1,936,090, Nov. 21. Aralkylaryl compds. are prepd. by causing a phthalide to react with a halogenated aromatic nucleus in the presence of AlCl<sub>3</sub>, hydrolyzing the AlCl<sub>3</sub> addition product formed to produce halogenated diarylmethanecarboxylic acid and treating the latter, without complete purification, with NH<sub>3</sub>, a sol. NH<sub>4</sub> salt or a primary amine. Various details and examples are given and products are obtained which can be

ring-closed to form corresponding anthrone compds. suitable for production of dyes.

**m-Alkyl ethers of protocatechuic aldehyde.** J. D. Riedel-E. de Haën A.-G. Fr. 751,687, Sept. 7, 1933. Glyoxylic salt are treated in a basic medium with mono-alkylprotocatechuic ethers, then the products obtained, preferably without sepn., are treated with moderately acting oxidizing agents. Cf. C. A. 27, 993.

**Barbituric acid derivatives.** I. G. Farbenind. A.-G. Fr. 753,178, Oct. 9, 1933. Dicyanodiamide is united by condensation with disubstituted malonic acids or cyanoacetic acids or their derivs. such as esters, chlorides or nitriles. The cyanimino compds. are alkylated and the alkyl cyanimino compds. are transformed by sapon. into N-monoalkyl 5,5-disubstituted barbituric acids. Examples are given of the prepn. of 1-cyano-2-imino-5,5-ethylphenyl- (m. 223°), 1-cyano-2-imino-3-methyl-5,5-ethylphenyl- (m. 150 1°), 5,5-ethylphenyl-3-methyl- (m. 176°), 5,5-methylphenyl-3-methyl (m. 154°), 5-(Δ¹)-cyclohexenyl-5-methyl-6-imino-3-cyano- (decompn. 265°), 5-(Δ¹)cyclohexenyl-5-methyl-3-methyl- (m. 146°), 5,5-ethylphenyl-3-ethyl- (m. 102°) and 5,5-diallyl-3-methyl-barbituric acid, m. 80°. Cf. C. A. 27, 3947.

**Aminodiphenylamine derivatives.** I. G. Farbenind. A.-G. Fr. 752,207, Sept. 19, 1933. Derivs. of 4-amino-diphenylamine, substituted in the 3-position by an alkoxy or alkyl group are prepd. by coupling a diphenylamine, substituted in the 3-position by alkoxy or alkyl but not substituted in the 4-position, with an appropriate diazonium compd., and splitting the azo dye thus formed by a reducing agent in known manner. Examples are given of the following derivs.: 3-methoxy-3'-methyl, m. 52-3° (acetyl compd., m. 166-7°), 3,2'-dimethoxy, m. 104-5°, 3-methoxy-2'-ethoxy-, 3-ethoxy-, m. 77-8°, 3-methoxy-3'-chloro, m. 78-9°, 3-m-propyloxy 52-3°, 3-n-butoxy, m. 57-8°, 3,6-dimethoxy, m. 117-8°, 3-methoxy-5-methyl, m. 61-5°, 3-methoxy-6-methyl, m. 80-1°, 3-methoxy-2'-methyl, m. 60-1° (acetyl compd. m. 144-5°), 3-methoxy-2'-chloro, m. 84-5°, 3-methoxy-2',5'-dimethyl, m. 89-90° (acetyl compd. m. 129-30°), 3-methoxy-2'-methyl-3-chloro, m. 102-3°, 3-methoxy-2',5'-dichloro, m. 116-7°, 3,6-dimethyl, m. 86-7°, 3-methyl-3'-chloro, m. 188° (acetyl compd. m. 144-5°), 3-benzyloxy, m. 91-2°, 3,2'-dimethyl-6,5'-dichloro, m. 81-2°, 3-isopropyloxy, m. 73-4°, 3,6-diethoxy, m. 81-2°, and 3-cyclohexyloxy, m. 100-1°.

The prepn. of the following is also given: 4-nitro-3-methoxy-N-benzoyl- (m. 166-7°), 4-nitro-3-methoxy-N-formyl- (m. 133-4°), 3-ethoxy-N-acetyl- (m. 88-9°), 4-nitro-3-ethoxy-N-acetyl- (m. 105-6°) and 4-nitro-3-methoxy 3'-chloro-N-acetyldiphenylamine, m. 112-3°. All the m. ps. given are uncorrected.

**α-Hydroxyanthrone derivatives.** Karl Zalm and Hans S. Hohenmaier (to General Aniline Works). U. S. 1,935,928, Nov. 21. By reducing an anthraquinone compd. contg. in the α-position an -O-acetyl or -O-benzoyl radical, in the presence of a diluent of neutral to weakly acid reaction (suitably at temps. of about 50-100°), products such as 1-hydroxy-4-acetoxy-5,8-dichloroanthrone (m. 222°) and the like are obtained. Several examples with details of procedure are given. The reduction is carried out either with substances having a reducing action such as Na hyposulfite, Zn or the like, or with H in the presence of a catalyst, such as Ni. As solvents may be used: dil. acetic acid, alc., decahydronaphthalene, water or the like. There are thus obtained: from 1-acetoxyanthraquinone α-hydroxyanthrone m. 238-40°, from chrysazin diacetate an α-hydroxyanthrone m. 247-8° and from quinizarin diacetate an isomeride m. 208°. Analogous compds. are obtained from alizarin- and anthrarufin diacetate, as well as from substitution products of the said compds.

**Anthrapyridone derivatives.** Chemische Fabrik vorm. Sandoz. Ger. 578,995, June 20, 1933. Anthraquinone derivs. with at least an amino or alkylamino group in the α position are condensed with esters of the general formula R(COO)H·COO-alkyl (R₁ representing Ph, alkyl or alkoxy residues), in the presence of a small amt. of condensing agent. Thus, α-aminoanthraquinone is boiled

with the diethyl ester of malonic acid in the presence of a small amt. of AcONa to give carbethoxyppyridone, m. 312-313°. The prepn. of dianthrapyridone, m. 340°, carbethoxymethyl-4-bromoanthrapyridone, m. 183-185°, 5-chloro-1-methylanthracetylpyridone, m. 263°, acetyl-2-methyl-4-bromoanthrapyridone, m. 350° (with decompn.), carbethoxy-2,4-dibromoanthrapyridone, m. 202°, acetyl-2,4-dibromoanthrapyridone, m. 333° (with decompn.), carbethoxy-4-methoxyanthrapyridone, m. 298° (with decompn.), acetyl-4-methoxyanthrapyridone, m. 316° (with decompn.), carbethoxy-5-hydroxyanthrapyridone, m. 303° (with decompn.), and 4-p-toluino-2-bromoanthracarbethoxyppyridone, is also described.

**Substituted pyrazolones.** Hans Stenzl (to Hoffmann-LaRoche Inc.). U. S. 1,936,488, Nov. 21. See Ger. 565,799 (C. A. 27, 2456).

**Arylides of 1-(carboxyphenyl)pyrazolone.** Soc. pour l'ind. chim. à Bâle. Ger. 582,806, Aug. 23, 1933. 1-(Carboxyphenyl)-5-pyrazolone obtained from aromatic aminocarboxylic acids is condensed with aromatic amines. Thus, 1-(3'-carboxyphenyl)-3-methyl-5-pyrazolone is condensed with β-naphthylamine in a mixt. of pyridine and diethylaniline contg. PCl₃. Other examples are given. The products are used in the prepn. of dyes.

**Condensation products.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Fr. 42,653, Sept. 1, 1933. Addn. to 722,050 (C. A. 26, 4062). Alcs., esters and other derivs. of high mol. wt. are prepd. by passing not only alcs. but aldehydes, such as AcH, and esters, such as AcOEt, along with H over a mixed catalyst contg. a stable metal oxide having a weak basic action or none and a metal or metals known for their hydrogenating or dehydrogenating action, the metal being not more than 10% of the wt. of the catalyst. Examples are given.

**Polymerization products.** Röhm & Haas A.-G. Fr. 753,045, Oct. 5, 1933. Acrylic acid, its homologs, salts or esters are polymerized alone or mixed in the presence of solvents in which the monomer is sol. but the polymer is not. By esters is to be understood those in which the alc. group of the monomer ester has at least 2 C atoms less than the acyl radical. Examples are given of the use of paraffin oil, ozokerite, ceresin and a mixt. of paraffin oil and CCl₄.

**Polymerization products.** I. G. Farbenind. A.-G. Fr. 750,520, Aug. 11, 1933. Products having a degree of polymerization higher than that of dioxane are prepd. by heating ethylene oxide or α-propylene oxide in the presence of a solid polymerization product of inorg. nature, but not metallic and having an alk. reaction and in the presence of an org. liquid which does not react with the alkylene oxide. Such liquids include ethylene chloride or bromide, acetone, CCl₄, C₆H₆, PhCH₃, cyclohexane, Et₂O, AcOEt and AcO-Bu.

**Concentrating aliphatic acids.** Julius A. Brachfeld and Albert Smola. Austrian 135,002, Oct. 25, 1933. Aq. solns. of lower aliphatic acids are neutralized with a difficultly acylated amine b. above 130°, other than a simple aromatic amine. The salt soln. obtained is then dehydrated by distn. at a temp. below the dissoen. temp. of the salt, preferably with the aid of the vapor of a water-insol. org. solvent which forms an azeotropic mixt. with water, e. g., benzene. Finally, the dehydrated salt is decompd. by heat. Suitable amines are ethanol- and propanol-amines and morpholine derivs. App. is described.

**Citric acid.** Montan- und Industrialwerke vormals. Joh. D. Starek. Ger. 578,820, June 17, 1933. A process for the prepn. of citric acid by the fermentation of solns. of sugar or carbohydrates by the aid of mildew fungus is described.

**Ketocholanic acid.** J. D. Riedel-E. de Haën A.-G. (Gustav Reverey, inventor). Ger. 582,727, Aug. 21, 1933. Pptd. hydroxycholanic acids are treated with an aq. soln. of CrO₃ at temps. of about 40°. Thus, a soln. of cholic acid in NaOH is diluted with water and stirred with kieselguhr. An aq. soln. of Na₂Cr₂O₇ is added to ppt. the acid in the kieselguhr. Concd. H₂SO₄ is then added

to give dehydrocholic acid m. 233-5°. Other examples are given. Cf. C. A. 27, 5758.

**1,4-Diaminoanthraquinone-2,3-disulfonic acid.** I. G. Farbenind. A.-G. *Fr.* 753,138, Oct. 7, 1933. Boric acid ester, particularly boracetic ester, of 1,4-diamino-2,3-dihaloanthraquinone is treated with neutral sulfites. The production of the ester and the transformation may be carried out in a single operation. The reaction may be carried out in the presence of PhOH.

**1,4-Diamino-2-aryloxyanthraquinone-3-sulfonic acids.** I. G. Farbenind. A.-G. (Berthold Stein and Fritz Baumann, inventors). *Ger.* 583,936, Sept. 12, 1933. Addn. to 561,442 (C. A. 27, 1000). 1,4-Diamino-2,3-dihaloanthraquinones are heated with aromatic hydroxy compds. and sulfites in the presence of feebly alk. metal compds. capable of combining with acids, *e. g.*, alkali perborates, MnO<sub>2</sub>, PbO<sub>2</sub>, MgO or ZnO. Preferably, at least 10 mols. of aromatic hydroxy compd. and 2-3 mols. of sulfite are taken per mol. of anthraquinone deriv. The reaction may be effected under pressure. Examples are given.

**Aliphatic anhydrides.** Henry Dreyfus. *Fr.* 751,823, Sept. 11, 1933. Aliphatic acids, particularly AcOH, mixed with a limited amt. of steam are submitted to a thermal decompn. The preferred amt. of steam is 8-15% of the wt. of AcOH and the preferred temp. 500-700°. Cf. C. A. 28, 180<sup>a</sup>.

**Aliphatic anhydrides.** Henry Dreyfus. *Fr.* 752,270, Sept. 20, 1933. The decompn. of aliphatic acids to anhydrides, *e. g.*, AcOH to Ac<sub>2</sub>O, is carried out in the presence of catalysts whose action is accelerated or seconded by a metal oxide, *e. g.*, an oxide of Al, Ti, V or an alk. earth metal. The catalyst may be Ca tungstate or NaPO<sub>3</sub>.

**Sulfonating phthalic anhydride.** Soc. pour l'ind. chim. à Bâle. *Ger.* 578,724, June 16, 1933. Addn. to 572,962 (C. A. 27, 4250). In sulfonating phthalic anhydride by heating it with SO<sub>3</sub> by the method of 572,962, the mixt. of anhydrides is heated so that only a little of the SO<sub>3</sub> distills off. Examples are given.

**Vinyl bromide, etc.** La soc. anon. des ateliers de constructions mécaniques Ischer Wyss. *Fr.* 751,969, Sept. 13, 1933. Vinyl bromide, its higher homologs and  $\alpha$ - and  $\beta$ -bromo (and chloro)propylenes are used as *refrigerating agents* in cycles where the agent is compressed. *Fr.* 751,970. Vinyl bromide is prepd. from gaseous mixts. contg. C<sub>2</sub>H<sub>4</sub> (obtained by fractionated sepn. from coke-oven gases) by reaction with Br<sub>2</sub> and introducing the resulting gas into a liquid which immediately decomposes the ethylene bromide to vinyl bromide, *e. g.*, an alc. soln. of KOH, after which the CH<sub>2</sub>:CHBr is eliminated by distn. from the gases which escape.

**Aminoanthraquinonesulfonyl chlorides.** I. G. Farbenind. A.-G. *Brit.* 397,190, Aug. 21, 1933. POCl<sub>3</sub> is reacted with an aminoanthraquinonesulfonic acid, or a salt thereof, advantageously in the presence of POCl<sub>3</sub>. When using the free sulfonic acid an alkali metal chloride is advantageously added. In examples Na 2-aminoanthraquinone-3-sulfonate, 1-amino-4-bromoanthraquinone-2-sulfonic acid and Na 1-aminoanthraquinone-2-sulfonate are treated with POCl<sub>3</sub> in presence of POCl<sub>3</sub> and with or without NaCl. The products react with amines, *e. g.*, PhNH<sub>2</sub> and hydroxyethylamine, to give the corresponding sulfonamides.

**Liquefying tribromoethyl alcohol.** I. G. Farbenind. A.-G. (Erich Goth, inventor). *Ger.* 582,520, Aug. 16, 1933. Addn. to 479,520 (C. A. 23, 4951). The method of 479,520 for liquefying C<sub>2</sub>H<sub>5</sub>Br(OH) is modified by treating the alc. with higher primary or polyhydric alcs., esters, ethers, ketones or acetals. Examples are given.

**Ozonized acetone.** Chem. Fab. von Heyden A.-G. (Georg Schroeter, inventor). *Ger.* 557,516, July 26, 1933. Addn. to 495,021 (C. A. 25, 1922). The process of *Ger.* 495,021 is effected in the presence of an org. catalyst, particularly H<sub>2</sub>O.

**Nitrating diethylene glycol.** Arthur Hough. U. S.

1,936,020, Nov. 21. Diethylene glycol is added alone to a mixt. comprising HNO<sub>3</sub>, H<sub>2</sub>SO<sub>4</sub> and water, the HNO<sub>3</sub> and H<sub>2</sub>SO<sub>4</sub> being in about equal proportions and the water, initially, being over 5% (suitably about 6-7%) of the mixt., in order to form the dinitrate.

**Glycol ethers.** I. G. Farbenind. A.-G. (Gerhard Steinmig and Karl Baur, inventors). *Ger.* 578,722, June 16, 1933. Addn. to 558,646 (C. A. 27, 512). The method of 558,646 for prepg. the above by treating alkylene oxides with alcs. in the presence of activated hydro-silicate, is varied by using F compds. as the catalyst. Thus iso-PrOH and C<sub>2</sub>H<sub>5</sub>O are heated with BF<sub>3</sub> to give an 80% yield of the monoisopropyl ether of C<sub>2</sub>H<sub>5</sub>(OH).

**Purifying ether.** Ferdinand W. Nitardy (to E. R. Squibb & Sons). U. S. 1,935,658, Nov. 21. For removing O and oxidation products from ether, a bulk supply of ether contg. such impurities is subjected to intimate contact with metallic Cu and may also be brought into contact with Mg(OH)<sub>2</sub>. App. is described.

**Thiourea.** Emil Hene. *Ger.* 582,626, Aug. 17, 1933. CaCN<sub>2</sub> is treated with sol. hydro-sulfides of alkali or alk. earth metals with addn. of S at temps. below 150°. The thiourea is leached out of the reaction mass by water or org. solvents. Examples are given.

**Camphene.** Schering-Kahlbaum A.-G. (Irwin Schwink and Kurt Schmidt, inventors). *Ger.* 578,569, June 15, 1933. Pinene or nopinene vapor and water vapor are led over a catalyst comprising BPO<sub>4</sub> and a carrier substance. Examples are given.

**Oxidizing naphthalene.** Henry O. Forrest and Per K. Frølich (to National Synthetic Corp.). U. S. 1,936,444, Nov. 21. For producing compds. such as phthalic anhydride, liquid naphthalene is contacted with molecular O in a closed system at a temp. between the normal boiling and crit. temps. of naphthalene and under a pressure substantially in excess of the vapor pressure of naphthalene at the temp. employed. Various generally similar oxidations also are described. Cf. C. A. 27, 4540.

**Oxidizing anthracene.** Julius Schmudlm. *Ger.* 578,723, June 16, 1933. Anthracene is oxidized by O or gases contg. O at ordinary or raised pressure by fusing the anthracene and using V<sub>2</sub>O<sub>5</sub> or salts of H<sub>2</sub>VO<sub>4</sub> as a catalyst. The Fe or Ag salts of H<sub>2</sub>VO<sub>4</sub> are preferred.

**Optically active menthols.** Howards & Sons Ltd. John Read and Wm. J. Grubb. *Brit.* 397,212, Aug. 21, 1933. A mixt. of *d*- and *l*-menthol is resolved into its components by esterifying with *d* or *l*-menthoxyacetic acid, isolating 1 of the esters by fractional crystal and hydrolyzing the same under conditions such that the liberated menthoxyacetic acid is not decompd., *e. g.*, by treatment with a slight excess of dil. alc. alkali soln. Esterification is preferably effected with the optically active menthoxyacetyl chloride, prepd. by treatment of the acid with thionyl chloride, in the presence of a tertiary base, *e. g.*, pyridine, quinoline.

**Xylenol.** Gilbert T. Morgan and Alfred F. J. Pettit. *Brit.* 397,148, Aug. 18, 1933. A salt of *p*-xynol-sulfonate acid is prepd. by sulfonating a mixt. of xylenols contg. *p*-xynol with less H<sub>2</sub>SO<sub>4</sub> than that required for monosulfonating the mixt., neutralizing the sulfonated mixt. and fractionally crystg. The salt may then be de-sulfonated to yield *p*-xynol. Suitable salts include the NH<sub>4</sub>, Na, K, Ca and alkylamine, *e. g.*, monomethylamine, salts.

**1-Arylamino-2-alkylantraquinones.** Alexander Wurtz (to E. I. du Pont de Nemours & Co.) U. S. 1,936,077, Nov. 21. For producing a 1-arylamino-2-alkylantraquinone such as 1-anilino-2-methylantraquinone, an arylamine such as PhNH<sub>2</sub> and a 1-chloro-2-alkylantraquinone such as 1-chloro-2-methylantraquinone are refluxed in the presence of a Cu salt such as CuSO<sub>4</sub> an alc. such as EtOH and an alkali metal salt of a satd. aliphatic acid such as anhydrous NaOAc at a temp. of about 100°, followed by cooling to about 20-25° and sepn. of the product. Cf. C. A. 28, 182<sup>a</sup>.

## 11—BIOLOGICAL CHEMISTRY

PAUL F. HOWE

## A—GENERAL

ARTHUR W. DOX

**Sulfur in the animal organism.** L. Silberstein. *Compt. rend.* 197, 1008-9(1933).—S detns. in various animals and their organs are given. M. L. C. Bernheim

**The enzymic cleavage of ammonia from thymonucleic acid by rabbit liver.** Ernst Buding. *Z. physiol. Chem.* 222, 6-10(1933).—Rabbit liver dried with  $\text{Me}_2\text{CO}$  contains an enzyme system which splits off  $\text{NH}_3$  from thymonucleic acid. The system consists of 2 components, one of which is sol., the other insol. in  $\text{H}_2\text{O}$ . Both are inactivated by heat. Neither one is active independently of the other, but the activity is largely restored by mixing the 2. Part of the  $\text{NH}_3$  liberated comes from the guanidine nucleus. A. W. Dox

**The inhibitory effect of primary alcohols on the lipase of carp liver.** IV. Joseph C. Kernot and Henry W. Mills. *Z. physiol. Chem.* 222, 11-15(1933); cf. *C. A.* 26, 3070.—The lipases of carp and pig liver are inhibited to practically the same extent by primary alcs. In the series:  $\text{MeOH}$ ,  $\text{EtOH}$ ,  $\text{PrOH}$ ,  $\text{BuOH}$ ,  $\text{AmOH}$ , hexyl alc. and octyl alc., each member has about 1 times the inhibitory effect of its next lower homolog. A comparison of  $\text{PhCH}_2\text{CH}_2\text{OH}$  and  $\text{PhMeCHOH}$  shows that Ph in the  $\alpha$ -position has a greater inhibiting effect than it has in the  $\beta$ -position, especially at lower concns. Traube's rule for substances with capillary activity applies here. The hydrolysis of Et crotonate is about 14 times slower than that of Et butyrate, showing that the presence of a double bond diminishes the velocity of hydrolysis as well as the capillary activity. A. W. Dox

**Formation of cysteine from cystine by irradiation.** Paul Szendro, Ulrich Lampert and Fritz Wrede. *Z. physiol. Chem.* 222, 16-20(1933).—Ultra-violet irradiation of a 0.5% soln. of L-cystine in 0.1 N HCl or NaOH causes a decomn. during which  $\text{H}_2\text{S}$ , S and cysteine are formed. The cysteine was identified by color reactions, isolation, analysis, sp. rotation, prepn. of the benzyl deriv. and oxidation to cystine. The yield was about 5%. A. W. Dox

**The optical activity of phytol.** Th. Wagner-Jauregg. *Z. physiol. Chem.* 222, 21-31(1933).—Phytol has a sp. rotation of  $0.79^\circ$  before, and  $0^\circ$  after distn. The 17.5% residue then has a rotation of  $6.6^\circ$ . Either the phytol itself before distn. is optically inactive or else it has a rotation not exceeding  $-0.48^\circ$ . A sterol isolated from crude phytol m.  $137.9^\circ$  and has  $[\alpha]_D -27.1^\circ$  in  $\text{CHCl}_3$ . The yellow mother liquor contained d-rotatory substances. A. W. Dox

**Cardiac glucosides. III. Scillarenase.** A. Stoll, W. Kreis and A. Hofmann. *Z. physiol. Chem.* 222, 24-38 (1933). The prepn. of a cryst. glucoside from squill is much easier after the bulb sections have been immersed for a time in  $\text{EtOAc}$ . The product is then not identical with the original glucoside, but results from a cleavage of the scillarene A into proscillaridin A and d-glucose through the intervention of a *scillarenase*. The glucose is thereby split off from scillarene A, and not from the scillabiose which may be obtained by acid hydrolysis of the glucoside and further hydrolyzed into d-glucose and rhamnose. Scillarenase is a desmo-enzyme which remains in the cell residues and cannot be exd. by  $\text{H}_2\text{O}$  and  $\text{MeAc}$  but is highly active in aq. suspension. It is injured by  $\text{EtOAc}$  and  $\text{MeOH}$  and inhibited by dil.  $\text{EtOH}$ . Its optimum  $\text{pH}$  is 5.6 and optimum temp.  $37^\circ$ . It is highly specific for scillarene A and does not attack the digitalis glucosides with terminal glucose grouping. Other glucosidases, however, can split off glucose from scillarene A. A. W. Dox

**The lipoids of animal organs. VIII. The occurrence of lignocerylphosphosine in beef spleen.** Caspar Tropp and Volker Wiedersheim. *Z. physiol. Chem.* 222, 39-43

(1933).—The lignocerylphosphosine obtained by Pränkel and Bielschowsky (*C. A.* 27, 3955) in 0.06% yield from mammalian liver has now been isolated from beef spleen. The yield in the 1st 2 runs was the same as that reported by F. and B., but that of the 3rd run was more than twice as great. The difference is attributed to seasonal variation caused by access of the animals to green fodder. Although 75 kg. of spleen was worked up, no evidence was obtained of the presence of any other ceramide. A. W. Dox

**Callicrein. VIII. The detection and occurrence of callicrein in blood.** H. Kraut, E. K. Frey and E. Werle. *Z. physiol. Chem.* 222, 73-80(1933); cf. *C. A.* 26, 3551.—Callicrein forms an inert compd. with a pharmacologically inactive substance present in the blood. The behavior of this compd. toward acid reveals 2 distinct forms of inactivation. In one the liberation of callicrein occurs rapidly (2 min.) and in the other only slowly and incompletely (hrs. or days). When free callicrein is mixed with blood or serum, the labile inactivation form is first produced, and this is gradually converted into the more stable form. The former is therefore encountered only rarely and in small quantity in the blood. The stable form, on the other hand, is found regularly and abundantly in the blood. By treatment of serum or plasma with  $\text{AcMe}$  a reaction, probably enzymic, liberates all of the callicrein in 24 hrs. The velocity of this liberation is dependent on temp., substrate concn. and H-ion concn., being greatest between  $\text{pH}$  7 and 9. The inactivator present in the lymphatic and parotid glands of ruminants is different from that contained in the blood of all animals examd. The callicrein combined with the glandular inactivator can be liberated only by acidifying and not by the  $\text{MeAc}$  treatment. In the blood of ruminants the glandular inactivator often occurs in small amt. along with the serum inactivator. The quantity of inactive callicrein in the blood varies greatly with different mammals. In man the av. was 2.6 callicrein units per cc. of serum, more in hog sera, but less in the ape, steer, horse and dog. A. W. Dox

**Kinetics of ester hydrolysis by enzymes. V. The behavior of esterases toward ester anhydrides of the lactide and lactylactic acid type. The cause of the relative specificity of lipases.** Eugen Bamann, Ernst Schweizer and Maria Schmeller. *Z. physiol. Chem.* 222, 121-30 (1933); cf. *C. A.* 25, 1268.—The amenability of ester-like anhydrides of the lactylactic acid and lactide type, as contrasted to lactones and esters, to enzymic cleavage depends on their ability to form intermediate compds. with the enzyme. This ability to form an enzyme-substrate addn. product is detd. by the electrochem. character of the groupings in proximity to the ester group. Electroneg. groups like carboxyl or phenyl are inhibitory. Acid esters such as lactylactic acid have no affinity for the enzyme and are not cleavable unless the influence of the carboxyl is diminished by greater distance from the ester group. Lactide, and to a lesser extent glycolide, are hydrolyzed by lipase, while diphenylglycolide, benzilide, tetrasalicylide and polysalicylide are resistant. With lactide and glycolide the reaction stops at 50% hydrolysis because the resulting lactylactic and glycolylglycolic acids contain an electroneg. carboxyl which blocks hydrolysis of the 2nd ester grouping. The resistance of lactones to enzymic hydrolysis is due to an entirely different cause, the failure of the substrate-enzyme addn. product to break down. A. W. Dox

**Preparation of protaminase.** Ernst Waldschmidt-Leitz and Ernst Kofranyi. *Z. physiol. Chem.* 222, 148-50 (1933); cf. *C. A.* 25, 3673.—Protaminase, the pancreatic enzyme which splits off basic amino acids from the carboxyl end of protamines, has not previously been sepd. from protease but is demonstrated in the mixt. by means of the specific inhibition of protease by albumin. A sepn. has now been effected by means of the specific adsorption of

protease on ovalbumin. The enzyme mixt., after removal of peptidases by  $\text{Al}(\text{OH})_3$  adsorption, is treated with  $\frac{1}{4}$  vol. of 5% ovalbumin, then pptd. with  $\text{MeAc}$  (to 37%) and centrifuged. The mother liquor is acrated to remove  $\text{MeAc}$ . It contains protaminase free from protease. Lnterukinase does not activate protaminase. A. W. D.

Comment on the paper of Alfred Herzog: "The prosthetic group of the blood pigment, its crystalline isolation and its synthesis with native globin to hemoglobin." Hans Fischer and Karl Zeile. *Z. physiol. Chem.* 222, 151-4(1933); cf. *C. A.* 27, 5764.—The "hematoprostheticin" on which Herzog bases his contention that hemin contains 33 and not 34 C atoms is shown to be an  $\text{NH}_4$  salt. Contrary to H.'s claim it is readily converted into the typical Teichmann crystals of chlorohemin. Further identification was obtained by the prepn. of mesoporphyrin ester which gave no m.-p. depression with a synthetic product. There is no occasion to shorten the accepted formulas of the porphyrins by 1 C atom. A. W. Dox

Recent investigations on the laws of action of enzymes. Victor Henri. *Ann. physiol. physicochim. biol.* 9, 685-706(1933).—A review. Harry Eagle

The effect of temperature upon the digestion of starch by amylase. S. Trautmann and L. Ambard. *Ann. physiol. physicochim. biol.* 9, 707-12(1933).—The temp. coeff. of the action of amylase upon starch paste involves 2 distinct reactions: (1) the activation of the enzyme by the coenzyme, in this case an anion and a  $\text{H}^+$ , and (2) the hydrolysis of the starch by the activated enzyme. Harry Eagle

The effect of very high pressures upon enzymes. Michel A. Macheboul, James Basset and Georgette Levy. *Ann. physiol. physicochim. biol.* 9, 713-22(1933).—The activity of enzymes is not affected by pressures <5000 or 6000 atm. At higher pressures (up to 17,000 atm.), the degree of inactivation varies with the particular enzyme, its biol. origin, the  $p_{\text{H}}$ , the duration of exposure, the chem. nature of the soln., etc. The rate at which the pressure is increased or decreased has no significant effect. In general, the enzymes are less resistant than bacterial spores, more resistant than the non-spored forms, viruses or bacteriophage and approx. as resistant as bacterial toxins. Harry Eagle

[Spectrum absorption] studies of the oxidized form of yeast cytochrome. E. J. Bigwood, J. Ansay and J. Thomas. *Ann. physiol. physicochim. biol.* 9, 837-42(1933); cf. *C. A.* 27, 3726-7. Harry Eagle

The conditions for the oxidation of iron in the blood. Franz Hendrych and Shigeharu Mori. *Arch. expul. Path. Pharmacol.* 172, 1-4(1933).— $\text{Fe}^{++}$  salts are not oxidized to  $\text{Fe}^{+++}$  in reduced blood or in blood completely satd. with CO in the absence of O. Such oxidation does take place, with the formation of a ferric globulin complex, when O is added to completely reduced or to CO-satd. blood, but not in proportion to the amt. of O added. Less is formed at low O tensions, presumably because the affinity of the reduced hemoglobin for the O is greater than that of the  $\text{Fe}^{++}$ . Neither HCN nor quinine inhibits this Fe oxidation by hemoglobin. H. Eagle

The conditions for the formation of lipid-soluble salts in dissolved chloride-sulfate mixtures. Emil Starkenstein and Gerhard Hahnel. *Arch. expul. Path. Pharmacol.* 172, 55-74(1933).—A study of the amt. of lipid-sol.  $\text{MgCl}_2$  formed upon adding  $\text{NaCl}$  to  $\text{MgSO}_4$  soln.,  $\text{Na}_2\text{SO}_4$  to  $\text{MgCl}_2$  soln. and  $\text{HCl}$  to  $\text{MgSO}_4$ . Harry Eagle

The effect of very small doses of therapeutic agents and chemicals upon enzymes: urease, diastase and trypsin. W. M. Persson. *Arch. intern. pharmacodynamie* 46, 240-67(1933). Harry Eagle

Enzyme studies in cases of disturbed glycogen storage. W. Hertz. *Klin. Wochschr.* 12, 1725-7(1933); cf. *C. A.* 27, 5401.—In these cases, the blood and organs contain diastase, the glycogen is not abnormal and glucolysis in the blood proceeds normally. In a few cases the serum lipase was increased, because of the appearance of quinine-resistant liver lipase. The true serum lipase was not significantly affected. Harry Eagle

Post-mortem changes in fat tissue, and sex differences. Takeshi Inoue. *Tôhoku J. Exptl. Med.* 21, 532-41(1933).—The I no. and % of tissue fat are lower in male than in female pigs. Castration causes an increase in both factors, exceeding the values observed in female animals. As the fatty tissue ages at 25°, its acid no. rapidly increases, the % falls, and the I no. at first increases and then decreases. The changes in the acid no. can be used in detg. the time since the animal was killed. Harry Eagle

Vegetable proteins. Some properties of purified edestin and edestan. G. Florence, J. Renselme and M. Pozzi. *Bull. soc. chim. biol.* 15, 1113-16(1933); cf. *C. A.* 27, 1808.—Edestin contg. 18.71% N yielded edestan contg. 17.92% N. No change in phenol groups was found. Spectral absorption curves of edestin and edestan in various acid and alk. solns. are given. L. E. Gilson

Comparative hydrolysis of the polysaccharides acted upon by invertase. A. Chaudun. *Bull. soc. chim. biol.* 15, 1117-20(1933).—The action of invertase on sucrose, raffinose and stachyose is discussed. L. E. Gilson

Influence of  $p_{\text{H}}$  on the rate of diffusion of the chloride ion through collodion membranes. K. Hrynakowski. *Bull. soc. chim. biol.* 15, 1146-53(1933).—The rate of diffusion through collodion membranes of Cl ions in dil. solns. of  $\text{NaCl}$ ,  $\text{KCl}$ ,  $\text{CaCl}_2$  or their mixts. decreases with decrease in H-ion concn. The presence of Ca ions also decreases the rate. Numerous graphs and tables of exptl. data are given. L. E. Gilson

Action at a distance of oxidation reactions on rabbit bone marrow. Appearance of atypical karyokineses. R. Branner and Eugénie Soru. *Compt. rend. soc. biol.* 114, 297-9(1933); cf. *C. A.* 27, 2706.—The oxidation of glucose by  $\text{KMnO}_4$  soln. in a quartz tube produced mitogenetic rays, which stimulated karyokinesis in exposed rabbit bone marrow. Numerous atypical mitoses were also observed. L. E. Gilson

Action of radon on amino acids. J. Loiseleur. *Compt. rend. soc. biol.* 114, 589-91(1933).—Radon causes the liberation of more or less  $\text{NH}_3$  from all amino acids, and, in addn., urea from arginine and a little  $\text{H}_2\text{S}$  from cystine. L. E. Gilson

Comparison of the choline-esterase activities of the blood serums from various species. Edgar Stedman, Ellen Stedman and Adam C. White. *Biochem. J.* 27, 1055-60(1933).—Choline esterase and esterase are present in many serums. Lipase is probably present in some serums. In addn. to hydrolyzing esters of choline, choline esterase exerts some slight action on Me butyrate and possibly on tributyrin. The serum esterase may similarly hydrolyze esters of choline to a very small extent. Benjamin Harrow

The excretion of urine in the dog. VII. Inorganic phosphate in relation to plasma phosphate level. R. F. Pitts. *Am. J. Physiol.* 106, 1-8(1933).—In normal dogs the urine is phosphate-free when the plasma concn. of phosphate is low, 1.1-1.5 millimols. per l. As the plasma concn. is raised the phosphate clearance rises and approaches the xylose or sucrose clearance but never exceeds the latter. J. F. Lyman

The reversible heat shortening of elastic connective tissue, and an examination of the possible effects of certain factors on the heat shortening of connective tissues. G. D. Shafer. *Am. J. Physiol.* 106, 125-33(1933).—Yellow elastic tissues shorten with increased temp. up to 47° and lengthen with falling temp. down to 8°. White connective tissue does not change in length with temp. changes until a permanent contraction is obtained at about 62° for mammalian tendons and 48° for frog tendons. J. F. Lyman

The water of the cerebrospinal fluid, variations of its rate of flow with variation of ventricular pressure. L. B. Flexner. *Am. J. Physiol.* 106, 170-4(1933).—The rate of formation of  $\text{H}_2\text{O}$  of the cerebrospinal fluid appears to be a linear function of the difference between the effective hydrostatic pressure in the capillaries of the choroid plexus and the hydrostatic pressure in the ventricles. J. F. Lyman

**Heavy metal catalysis in smooth muscle contracture.** J. O. Schmitt and P. A. Nicoll. *Am. J. Physiol.* 106, 225-37(1933).—Contractions of smooth muscle, normally caused by drugs and chem. stimulants, are inhibited by NaCN, H<sub>2</sub>S and CO. The inhibition caused by CO is reversed during illumination, provided sufficient O is present. Sustained tonic contraction of smooth muscle requires a hemin-like catalytic oxidative mechanism.

J. F. Lyman

**The alleged occurrence of acetylcholine in ox blood.** H. W. Dudley. *J. Physiol.* 79, 249-54(1933).—Two specimens of ox blood examed. at Freiburg yielded 25 and 27 mg. of acetylcholine per l. of blood. Four specimens of ox blood obtained at Hampstead, Eng., contained not more than a trace.

J. F. Lyman

**The renal elimination of injected urea and creatinine.** W. W. Kay and H. L. Sheehan. *J. Physiol.* 79, 359-415 (1933).—After intravenous injections of creatinine or urea into rabbits, comparisons between the amts. of these substances reaching the kidneys in the arterial blood and leaving it in the venous blood permit the calcn. of extn. ratios for the compds. concerned. If it is assumed that creatinine is not directly absorbed from the blood, about 40% of the plasma is filtered off in the glomeruli and 66% of the filtered urea is reabsorbed and returned to the blood. Either the filtration or secretion theory of urinary secretion or a combination of both is compatible with the results.

J. F. Lyman

**A revised analysis of the initial heat production of muscle.** W. Hartree. *J. Physiol.* 79, 492-9(1933).—A modified arrangement of the thermopile makes it possible to eliminate disturbances in heat measurement in the initial phase of muscle contraction, because of shifting of the position of the thermopile on the muscle, etc. When this is done the heat production of a single twitch occurs in 2 phases only—contraction and relaxation. J. F. L.

**The effect of ions on the cutaneous sensory endings of the frog.** M. Talbot. *J. Physiol.* 79, 500-7(1933).—Action currents were measured in nerve attached to an isolated piece of frog skin. When Ca ions are absent from the soln. bathing the skin, there is a much less rapid adaptation of the sensory endings to a prolonged stimulus.

J. F. Lyman

**Actual and apparent amylase quantities in different cereals before and during germination.** T. Chrzaszcz and J. Janicki. *Biochem. Z.* 265, 260-81(1933).—The amylase content of aq. exts. is only apparent, the actual quantity being detd. only in the presence of peptone. The difference between these 2 detns. represents the sistaamylase. The latter is found in the ungerminated seed, but its amt. varies with the kind of cereal. During germination the sistaamylase increases, slowly at first but very rapidly once the seedling has been formed. The smallest amt. is found in oats, the largest in buckwheat. Not only are there quant. differences in the amylase in various cereals and at different stages of germination but the relative strength of the liquefying, dextrinizing and the saccharifying properties vary likewise. The max. effectiveness is attained first by the saccharifying and last by the liquefying properties in all malts, except that of buckwheat where the situation is just the reverse.

S. Morgulis

**The action of organ extracts on adrenaline.** Frauz Schultz. *Biochem. Z.* 265, 282-90(1933); cf. C. A. 27, 316. The ext. of fresh liver from rats contains an active substance which stimulates the oxidative decompn. of adrenaline. This substance is thermolabile and very active even in relatively small amts., reddening *l*-adrenaline most vigorously within a *pH* range 0.1-0.4. It reddens *d*-adrenaline more vigorously but the difference in reaction of the 2 forms becomes equalized in 16-24 hrs. This substance has no effect on *l*-tyrosine and on *l*-dihydroxyphenylalanine (Dopa) it has a slight effect in stimulating the development of the black pigment but not nearly to the same extent as it stimulates the development of the red coloration in adrenaline solns. S. Morgulis

**Studies on the respiration of *Diphyllobothrium latum* L.). Study of the respiratory enzymes.** E. A. H.

Friedheim and J. G. Baer. *Biochem. Z.* 265, 320-37 (1933).—The respiration of the intestinal parasitic worm *Diphyllobothrium* (of its eggs and different developmental forms) cannot be inhibited by CO in the presence of 8% O<sub>2</sub>, and in this respect there is no difference between the anaerobic worm or its aerobically developing eggs. However, KCN suppresses the respiratory activity of the egg completely but that of the adult worms only partially. The CO-resistant respiratory activity inhibits at least partly the enzymic reaction. Both the worms and the larvae must be regarded as facultative anaerobes and the eggs as obligate aerobes. The presence of cytochrome C has been demonstrated by its characteristic double-banded spectrum which is not displaced by pyridine, but this is not the respiratory enzyme. In the reduced condition it does not form CO complexes but requires for its oxidation a CO- and KCN-sensitive oxidase, which corresponds to the respiratory activity of the worms, which is affected not only by CO but also to some extent by KCN. Although a no. of instances are known of respiratory activity which is only partially inhibited by KCN, the CO-resistant type of respiration is a rarer occurrence, and has hitherto been observed only with avian erythrocytes and with Rous sarcoma.

S. Morgulis

**The applicability of the mass action law to the reaction of proteins with acids and bases.** G. Ettisch and Günter V. Schulz. *Biochem. Z.* 265, 338-69(1933); cf. C. A. 27, 4151. The combination of serum globulin or albumin with bases presents a momentary primary reaction followed by a secondary reaction requiring several hrs. for its completion. The secondary reaction seems of no consequence in the combination reaction with acid. The primary reaction is regarded as an ionic reaction, in accordance with Bjerrum's scheme:  $R-COO + H^+ \rightarrow R-COOH$ , or  $R-NH_3^+ + OH^- \rightarrow R-NH_2 + H_2O$ . The equil. between the free and bound  $H^+$  or  $OH^-$  follows the law of mass action. In accordance with their dissoen. consts. 3 alkali-binding and 2 acid-binding groups can be differentiated, and the isoelec. point of the albumin can be detd. from these data. On the basis of their consts. the 5 different base- or acid-binding groups can be identified as definite amino acids. It is suggested that acid and base titration curves may serve to identify and to characterize different proteins.

S. Morgulis

**The secondary reaction between ovalbumin and acid.** G. Ettisch and Günter V. Schulz. *Biochem. Z.* 265, 370-4(1933).—With increasing temp. the secondary phase of the acid-binding reaction of ovalbumin is greatly increased.

S. Morgulis

**Mitogenetic spectrum analysis of polyglucide decomposition.** I. S. Klenitzkil and E. G. Prokovieva. *Biochem. Z.* 265, 375-9(1933).—A study of the spectra of hydrolysis of sucrose (by acid or yeast sucrose) and of salicin or starch shows that soln. of different mol. structures are assocd. with specific mitogenetic spectra which are characteristic for that structural arrangement. S. M.

**Mutual effect between amino acid and nicotine.** I. S. Yaichnikov. *Biochem. Z.* 265, 426-8(1933); cf. C. A. 27, 2702. Nicotine and glycine do not react upon each other, but 5 cc. 0.02 N hippuric acid combines with 1 cc. 0.1 N nicotine. Leucine does not react with nicotine. With glutamic acid nicotine combines in practically equimol. amts., whereby a H<sub>2</sub>O-sol. but alc.-, ether- or CHCl<sub>3</sub>-insol. substance is formed. Similar results were obtained with aspartic acid. Asparagine does not react with nicotine.

S. Morgulis

**Influence of mitogenetic rays on enzymic processes.** S. Mardashev and M. Mogilevskii. *Biochem. Z.* 265, 429-36(1933).—The system: enzyme + substrate is employed as a detector of mitogenetic radiation, to which it gives a definite response, most generally an inhibition of the enzymic activity.

S. Morgulis

**Aminosulfonic acids. II. Synthesis of some taurine derivatives.** Rertil Josephson. *Biochem. Z.* 265, 448-55(1933); cf. C. A. 27, 5732. The following derivs. were prepd.: ethylenechlorobromide, chloroethylenethiocyanate,  $\beta$ -chloroethane- $\alpha$ -sulfonic acid, methyltaurine, di-

methyltaurine, propyltaurine, heptyltaurine, phenyltaurine and benzyltaurine. All these substances differ markedly from taurocholic acid. They are difficultly sol. in alc. and have high m. ps. III. The dissociation constants of taurine derivatives. *Ibid* 266, 9 17.—Even in taurine derivs. with an alkyl-substituted  $\text{NH}_2$  group the const. for the sulfonic acid radical is high, while the const. for the  $\text{NH}_2$  group depend upon type and no. of substituents but are all low. In benzyltaurine 2 dissoci. const. are discernible but in taurodeoxycholic acid only, the sulfonic acid group is effective, the  $\text{CO}_2\text{H}$  group apparently not being free. S. Morgulis

**Spectroscopic demonstration of the oxygen-transferring enzyme in the presence of cytochrome.** Otto Warburg, Erwin Negelein and Erwin Haas. *Biochem. Z.* 266, 1 8 (1933); cf. *C. A.* 27, 4268.—In a proposed mechanism of the respiration of aerobic cells the reaction consists of alternate oxidation and reduction of Fe in a series of compds. Only the first of these, the  $\text{O}_2$ -carrying enzyme, can absorb  $\text{O}_2$  which, in turn, oxidizes the first of three cytochrome components. The oxidation-reduction process then proceeds through these components and through a series of unknown enzymes and coenzymes. CO inhibits the oxidation of the  $\text{O}_2$ -carrying enzyme; KCN inhibits its reduction.  $\text{Fe}^{++}$  bands in the spectrum of respiring cells must belong to the respiratory enzyme if they are shifted by CO and fade out entirely on satn. with  $\text{O}_2$ , even on complete suspension of respiration by KCN. The  $\text{Fe}^{++}$  bands of cytochrome are unaffected under the same conditions. In an 8 vol. % concn. suspensions of *AcOH* bacteria show 3 cytochrome bands: 550, 553 and 563  $\text{m}\mu$ . Under anaerobic conditions a suspension of the bacteria (in alc. NaCl) shows an addnl. band in the yellow at 589  $\text{m}\mu$  which disappears with the 2 other bands of cytochrome when the suspension, free from KCN, is shaken with  $\text{O}_2$ , but reappear as soon as this is discontinued. If shaken in the presence of KCN only the band at 589  $\text{m}\mu$  disappears and on discontinuing the shaking it slowly comes back. The band in the yellow behaves like that of a respiratory enzyme. When the respiration of the bacteria is suppressed by KCN a band appears in the red portion of the spectrum at 639  $\text{m}\mu$ , which coincides with the position of the  $\text{Fe}^{+++}$  form of a hemin compd. A theory is developed to account for this newly discovered band (639  $\text{m}\mu$ , which assumes that 2 hemins of different oxidation potentials are involved. S. Morgulis

**The amide-splitting ability of *Torula utilis*, a study of the dependence of the formation of plant enzymes upon the nitrogenous food.** Gunther Gorr and Joachim Wagner. *Biochem. Z.* 266, 96 101 (1933).—*Torula utilis* grown on nutritive media with different N sources,  $(\text{NH}_4)_2\text{SO}_4$ , urea,  $\text{AcNH}_2$ , glycine, alanine, aspartic acid or malt ext.), possesses varying concns. of the asparaginase and acetamidase. On an  $(\text{NH}_4)_2\text{SO}_4$  medium the organism is practically free from these enzymes. These expts. illustrate the extreme ease with which the enzyme app. of an organism may be altered by the nature of its nutrients. S. Morgulis

**Nucleoproteins. IV. Native nucleoproteins.** St. J. Przylecki, S. Frajberger and W. Giedroyć. *Biochem. Z.* 266, 107-27 (1933); cf. *C. A.* 27, 5769.—The nucleins are regarded as a well-defined class of substances. The ratio of nucleic acid to protein is, however, variable. Even in cases where this ratio is known it is impossible to judge the structure unless the different groups are also known. The constitution does not tally with the simple formula (nucleic acid) $_m$ (protein) $_n$ , because in systems contg. much nucleic acid and salt not all the valences are satisfied by the proteins. The nuclein would therefore behave more like a polycomponent micelle of the constitution:  $A_x - P_n \text{NA}_m K_n$ , where A and K are salt ions, P is protein and NA nucleic acid. S. Morgulis

**Colloidal behavior of muscle proteins. V. Quantitative relationship between muscle proteins and its significance for the structure of striated rabbit muscle.** H. H. Weber and Klaus Meyer. *Biochem. Z.* 266, 137-52 (1933).—About 85% of the total N of white muscle and 75% of the N of red muscle can be extd. if finely ground

rabbit muscle is treated at  $10^\circ$  with 0.6 M KCl of  $pH$  8-9 five times followed 3-5 times by treatment with KCl of  $pH$  9.5. The yield is less at  $pH$  7-8. The KCl can be replaced by  $\text{NH}_4\text{Cl}$ . Myosin, myogen and globulin X can be sepd. from such muscle exts., whereas in muscle juice obtained by mech. pressure only myogen and globulin X are present, but these are identical with the substances in the salt ext. These proteins are sepd. on the basis of their solubilities. Myosin is pptd. completely at  $pH$  above 7 in 0.03-0.04 M KCl; globulin X begins to ppt. at  $pH$  7 in 0.005 M KCl and is pptd. completely at  $pH$  5-5.5 in 0.016 M KCl-acetate; the myogen remains in soln. under all these conditions. These proteins are identified by the viscosity of 1% soln., their ability to form characteristic strands and by their isoelec. point. Myosin obtained from the muscle previously extd. still has all the characteristic properties of myosin. The white muscle contains 22% myogen, 22% globulin X and about 40% myosin; red muscle contains 17% myogen, 17% globulin X and 40% myosin. The nonprotein N is about 12-13% of the total. Myogen and part of the globulin X constitute the proteins of the fluid sarcoplasm, the myogen making a concn. of 7% but the concn. of the globulin X is not yet definitely known. The stroma certainly contains no globulin X nor myogen and only very little myosin. S. Morgulis

**Protein systems. II. Rapidity of freezing and the form of the particles in protein solutions.** H. H. Weber and Carl Pullen. *Biochem. Z.* 266, 153 61 (1933); cf. *C. A.* 25, 4015.—Protein sols with spherical particles in a concn. of 0.01-0.10% block the rate of freezing by 10-20°, independently of the  $pH$  or degree of undercooling, but this phenomenon is not observed with protein sols with rod-like particles. S. Morgulis

**Influence of cell lipids on the nature and degree of swelling of gelatin.** Philipp Bamberger. *Biochem. Z.* 266, 175 89 (1933).—The proportion of bound water in the total swelling of gelatin is increased by  $\text{K}_2\text{SO}_4$ ,  $\text{Na}$  taurocholate <  $\text{OII}^-$ , and is decreased by KI, and lecithin. Cholesterol, Na oleate, triolein, glycogen and  $\text{H}^+$  are without influence. At low temp. the conditions are complicated by the formation of  $\text{H}_2\text{O}$  crystals, but at the true equil. the relation between frozen and non-frozen  $\text{H}_2\text{O}$  is const. from  $-4$  to  $-35^\circ$ . The biol. significance of these facts as regards the resistance of seedlings to freezing is discussed. S. Morgulis

**Cytoflav.** K. Laki. *Biochem. Z.* 266, 202 (1933).—Cytoflav, a reversible oxidation-reduction pigment obtained by Banga and Szent-Gyorgyi (*C. A.* 26, 3559) from various tissues, yeast or milk, gives a fairly sharp absorption band in the visible spectrum between 450 and 460  $\text{m}\mu$  which identifies it with Warburg's yellow enzyme. S. Morgulis

**Adsorption of  $\alpha$ -amylase.** Oskar Holmbergh. *Biochem. Z.* 266, 203 15 (1933); cf. *C. A.* 27, 2464.— $\alpha$ -Amylase is adsorbed by starch, about a third becoming adsorbed within 5 min., but the process goes much slower subsequently (53% adsorbed after 2 hrs.). Temp. below  $0^\circ$  increases the adsorption. At room temp. the rate of adsorption does not vary over a  $pH$  range 4.7 to 7.7, at  $1^\circ$  the percentage of adsorption diminishes from 73 to 35 within this  $pH$  range, but that is due to differences in the rate of adsorption at low temp. and is equalized, if sufficient time is given for adsorption. The opt. activity of the  $\alpha$ -amylase is between  $pH$  4.7 and 5.2. S. M.

**Preparation of glycyl-L-proline according to Emil Fischer's procedure.** Emil Abderhalden and Wilhelm Nussler. *Biochem. Z.* 266, 216 20 (1933).—Good yields of glycyl-L-proline are obtained by coupling L-proline with  $\text{ClCH}_2\text{COCl}$  and subsequent amination. However, alanylproline could not be prepd. in satisfactory yield by a similar procedure. S. Morgulis

**Analysis of serum by means of the ultracentrifuge.** Paul v. Mutenbecher. *Biochem. Z.* 266, 225-49 (1933); cf. *C. A.* 27, 4823.—Serum albumin and globulin can be sepd. by means of the ultracentrifuge and their quant. relation also detd. Horse serum was found to

have 4 different mols. whose sedimentation consts. at infinite diln. are 4.5, 6.8, 9 and 17. The first 2 are identical with the pure albumin or globulin fractions; they constitute the largest components of the serum proteins, and are in a ratio of 2:1. With increasing concn. of the serum the sedimentation consts. diminish, more in the case of human than of horse serum. In undil. serum it is possible to demonstrate easily mols. half the size of albumin. These smaller mols. are not present in fresh horse serum but appear as the serum ages. Under pathol. conditions very striking deviations in the amt. of protein are observed. In one instance, a protein which ordinarily is found only in traces increased to 50% of the total protein content. S. Morgulis

**Dissociations and associations of serum proteins.** Paul v. Mutzenbecher. *Biochem. Z.* 266, 2A 65 (1933).—On adding increasing amts. of  $(\text{NH}_4)_2\text{SO}_4$  to serum smaller and smaller mols. appear until they almost cease to form a sediment. The sedimentation const. of the albumin fraction diminishes.  $(\text{NH}_4)_2\text{SO}_4$  causes the breakdown of the albumin mol. Electrodialysis of the serum causes partial assocn. of the mols. remaining in soln. which may be reversible or irreversible. Within a  $p_{\text{H}}$  range from 3.5 to 11.5 the serum proteins show definite stability as far as the sedimentation const. is concerned. S. Morgulis

**The serum fractions.** Paul v. Mutzenbecher. *Biochem. Z.* 266, 250 8 (1933).—Serum globulin obtained by means of 1% satn. with  $(\text{NH}_4)_2\text{SO}_4$  is a polydisperse substance with the mol. of  $7.1 \times 10^{11}$  sedimentation const. predominating. The mol. wt. of this predominant mol. is probably 138,000. The serum albumin contains a variable admixt. of smaller or larger mols. depending upon the method of its prepn. Cryst. serum albumin contains an impurity which is not sepd. by the ultracentrifuge. The conalbumin obtained from the mother liquor as albumin pptd. by satn. with  $(\text{NH}_4)_2\text{SO}_4$  contains assocns. of several albumin mols. The principal mol. of albumin has a sedimentation const.  $4.5 \times 10^{11}$ . S. Morgulis

**Differences in the autolysis of skin from pigmented and unpigmented animals.** S. Blarso. *Biochem. Z.* 266, 203 1 (1933). Unpigmented rabbit skins autolyze at about the same rate at  $p_{\text{H}}$  3.8 to 7.3, but the skins from pigmented rabbits frequently show a three-fold greater autolysis at  $p_{\text{H}}$  3.8. This difference in autolyzing capacity is not only observed in skins from different rabbits but also in the unpigmented and pigmented portions of skin from the same animal. The skins from young rabbits, because of the higher water content, have a lower total N content, but their autolysis is not different from that of skins from older animals, on the basis of the same wt. S. Morgulis

**Physicochemical studies on the colloidal state of cholesterol, cholesterol esters and lecithin. VIII. Further studies on the catalytic properties of cholesterol.** Igor Kucuzov and Olga Sepalova. *Biochem. Z.* 266, 330 6 (1933). cf. C. A. 26, 3530.—Catalytic dehydrogenation of diamines as well as of pyrogallol, phenol or naphthol by cholesterol does not occur under strictly anaerobic conditions, so that atm.  $\text{O}_2$  must take part in these reactions. But this reaction takes place at once in a system cholesterol + diamine +  $\text{H}_2\text{O}$  in a pure  $\text{N}_2$  atm. This reaction inhibited by such narcotics as the alc. In certain concns. cholesterol sols produce a "catalase" action as shown by decomp.  $\text{H}_2\text{O}_2$  which must also be in a proper concn. S. Morgulis

**Increase of yeast fermentation by urine from healthy and diseased individuals. IX.** Heinrich Zeller. *Biochem. Z.* 266, 300 6 (1933); cf. C. A. 21, 925. The addition of midnight urine from healthy adults to yeast increases the fermentation up to 100%, but the increase caused by midday urine is not so great. Urines from various patients (rheumatism, pyelitis, lymphogranuloma) had a much smaller stimulating action on the fermentative process and in some instances there was an obvious toxic effect in the great concns. of urine. Neither oxidation by  $\text{KMnO}_4$  nor by  $\text{I}_2$  diminishes the effectiveness of the urine, but boiling does diminish it. S. Morgulis

**The yellow enzyme and its functions.** Otto Warburg and Walter Christian. *Biochem. Z.* 266, 377-411 (1933).—The yellow enzyme consists of a colloidal carrier and an active group, the reversible yellow pigment, which can be split off from its colloidal anchorage when aq.  $\text{MeOH}$  acts upon the enzyme for days at  $38^\circ$ . The nature of the colloidal portion is not known but the active group, when illumined in an alk. soln., gives a cryst. deriv., closely related to the original pigment by its spectrum, of the compn.  $\text{C}_{12}\text{H}_{12}\text{N}_4\text{O}_2$ . On heating this with  $\text{Ba}(\text{OH})_2$ , urea and a compd.  $\text{C}_9\text{H}_{10}\text{N}_2\text{O}_2$  are formed. The leuco form of the yellow enzyme reacts with  $\text{O}_2$  to form yellow pigment and water; with methylene blue to form yellow pigment and leuco methylene blue. Thus, it is not only an  $\text{O}_2$  transferer but an enzyme for respiration without  $\text{O}_2$ . The yellow enzyme, which has no physiol. function in the anaerobic cells, is ubiquitous in distribution; in the aerobic cells it does not exercise its purely chem. property of  $\text{O}_2$  transfer but reacts physiologically with bound  $\text{O}_2$ . The coenzymes I and II have been prepd. from horse red blood cells, and the intermediary enzyme from rat cells. Coenzyme I is easily destroyed by 0.1  $N$   $\text{NaOH}$  at room temp. but much less so at  $0^\circ$ ; by 0.1  $N$   $\text{HCl}$  it is destroyed quickly at boiling temp. but not at room temp. The activity of the purified coenzyme II is inhibited by  $\text{HCN}$  but not by  $\text{CO}$ . Coenzyme II is more easily adsorbed than coenzyme I (for instance by Paserton, Merck). S. Morgulis

**The membrane potentials of peroxidases and oxidases in equilibrium with metal ions.** M. Padoa and G. Fedeschi. *Biochem. Z.* 266, 452 7 (1933).—Since peroxidase and oxidase are Fe- and Mn-contg. enzymes, detn. of the membrane potential of these in contact with an ionizable salt of the same ions was attempted according to Donnan's theory. So far no satisfactory method was found for studying peroxidase, but better success was obtained with Bertrand's oxidase prepn. and a 0.001  $M$  soln. of  $\text{MnSO}_4$ . At  $p_{\text{H}}$  6.2 the enzyme manifests no membrane potential, the potential, however, increases to 40 mv. at  $p_{\text{H}}$  7. The enzymic activity was checked up by the color reaction with  $\alpha$ -naphthol and  $p$ - $\text{C}_6\text{H}_4(\text{NH}_2)_2$ . Under proper exptl. conditions it is possible to det. at which  $p_{\text{H}}$  the  $\text{Mn}^{++}$  ceases to act as a catalyst; it is between  $p_{\text{H}}$  6.2 and 6.4. S. Morgulis

**Studies on alcohol oxidase.** Hiroshi Mizusawa. *J. Biochem. (Japan)* 18, 243 58 (1933).—The alc. oxidase which brings about the reaction  $\text{EtOH} \rightarrow \text{AcH}$  is found almost exclusively in the liver. The reaction proceeds at an opt. rate with a concn. of 0.04  $M$  alc. The alc. oxidase acts not only on  $\text{EtOH}$ , but also on  $\text{MeOH}$ ,  $\text{PrOH}$ , as well as glycol, glycerol, erythritol, sorbitol and sugar. On the addn. of methylene blue to the enzyme-substrate system there is a sharp fall in the reduction potential. The alc. oxidase is inhibited by  $\text{KCN}$ , pyrrole, adrenaline, also by ultra-violet or x-ray radiation, but is activated by the adrenal cortex ext. The enzyme can be prepd. as a dry powder or in a more stable form as an ether ext. Animals which have been treated with alc. have a higher alc. oxidase activity. S. Morgulis

**Effect of pepsin preparations of varying activities on muscle globulins and collagen.** I. A. Smorodintzev and A. N. Adova. *J. Biochem. (Japan)* 18, 325-32 (1933).—Pepsin digests the acid muscle globulin more easily than the basic collagen. During peptic digestion of collagen, unlike that of gelatin, the viscosity of the mixt. increases but there is no increase in the amt. of alkali used. However, as the viscosity of the digestion mixt. decreases there is an increase in alkali used. The first stage of the digestion is therefore marked by an aggregation of protein micelles without hydrolysis of peptide linkages resulting in an increased viscosity. S. Morgulis

**Influence of temperature of protein metabolism. II. Nitrogenous extractives of the toad liver during the winter.** Hiroshi Makino. *J. Biochem. (Japan)* 18, 387-93 (1933).—The liver of hibernating toads contains more leucine, alanine and valine, and this is thought to furnish the material for the greater glycogen formation in the

liver during the winter. The tyrosine content of the winter liver is practically negligible while in the summer liver it is the most abundant (0.48%) amino acid.

S. Morgulis

**Deamination of amino acids in the animal organism.** Y. Kotake, Sr., Y. Kotake, Jr., and I. Taniguchi. *J. Biochem.* (Japan) 18, 395 415(1933).—The investigation was carried out with the aid of a micro method for detg. hydroxyphenylpyruvic acid in urine. Ext. 2 cc. of filtered urine acidified with 4 drops 15%  $H_2SO_4$ , 3 times with 10 cc. ether (distd. several times over Na) in a separatory funnel. Filter the exts. through a small paper, wash with ether, evap. to dryness, dissolve the residue in 10 cc. warm water and filter again. Pipet 5 cc. of the aq. soln., add 2 cc. 0.005  $N$   $KIO_3$  and heat 15 min. on a vigorously boiling water bath. Acidify with 2 cc. 10%  $H_2SO_4$  and submerge in water at 15° for 15 min., then add 5%  $KI$  soln. and after 5 min. titrate with 0.005  $N$   $Na_2S_2O_3$ . To the residue obtained from the ether ext. of another 2 cc. urine sample add 10 cc. satd.  $NaHSO_3$  and heat for a while at 70°. On cooling, ext. the soln. 3 times with 10 cc. ether, filter the exts. and wash with ether. Wash the combined ether exts. twice with a little water, evap. and titrate the residue as before. The difference between the 2 titrations corresponds to the keto acid value. The  $KIO_3$  value for concns. ranging from 0.004 to 0.040% can be calcd. with the aid of the formula  $y = 105.1 x^{1.4}$ , where  $x$  = concn. and  $y$  =  $KIO_3$  value. Feeding expts. with tyrosine show that under physiol. conditions this substance is converted in the organism chiefly to hydroxyphenyllactic acid, so that the deamination is partly hydrolytic and partly oxidative.

S. Morgulis

**The effect of water containing the isotope of hydrogen upon fresh-water organisms.** H. S. Taylor, W. W. Swingle, H. Eyring and A. H. Frost. *J. Chem. Physics* 1, 751(1933).—Expts. on the action of heavy water upon the vital activities of fresh-water organisms have led to the following results: water contg. the isotope of H in high concn. (92%) is toxic for the animals tested; (a) tadpoles of the green frog, *Rana clamitans*, died within an hr. after being placed in the water; (b) the fish, *Lebistes reticulatus*, died within 2 hrs. and (c) flatworms, *Planaria maculata*, were destroyed in 3 hrs.; (d) the protozoan, *Paramecium caudatum*, was killed in 48 hrs. Water contg. 30% heavy water had no effect in 24 hrs. in cases (a) and (b) or in 3 days in case (c); 15-20% of the heavy isotope had no effect in case (d) within 3 days.

Morris Muskat

**Effect of iron on the establishment of the oxidation-reduction potential of alloxantin.** Edgar S. Hill and Leonor Michaelis. *Science* 78, 485-6(1933).—Oxidation-reduction potentials in dil. solns. of alloxantin are rapidly established if 4-40 mg. Fe as  $FeSO_4$  is added per l. The Fe is unnecessary in concd. solns. The effect is most evident at  $pH$  4-6. Fe cannot be replaced by Cu, Mn, Co, Ni or org. dyestuffs. The effect is due to a complex compd. of Fe and dialuric acid (which is present in solns. of alloxantin).

Gerald M. Petty

**Heparin. II. Heparin in various tissues.** A. F. Charles and D. A. Scott. *J. Biol. Chem.* 102, 431 5(1933).—The highest concns. of heparin, as detd. by the method described in C. A. 28, 801<sup>7</sup>, were in muscle, liver and lung (about 2 units per g.), but anticoagulant was also present in heart, thymus, spleen and blood.

K. V. Thimann

**Further experiments on the physiological effect of heavy water and of ice water.** T. Cunliffe Barnes and R. J. Larson. *J. Am. Chem. Soc.* 55, 5059-60(1933); cf. C. A. 27, 578<sup>3</sup>.—Data are given for short lengths of a filament of *Spargyria nitida* and *Oscillatoria*. The heavy water effect may be due to its influence on enzyme.

C. J. West

## B- METHIONS AND APPARATUS

STANLEY R. BENEDICT

**A micro method for determination of histidine, especially a procedure for separation of histidine and tyrosine.** Konrad Lang. *Z. physiol. Chem.* 222, 3-5(1933).—The

method, which consists essentially in pptg. the histidine as a Hg complex and measuring the color intensity of its diazo reaction, is applicable to 30-40 mg. of hydrolyzed protein. To 1 cc. of the HCl hydrolyzate in a centrifuge tube add satd.  $Na_2CO_3$  to exact neutrality, then 1 drop of  $N$  HCl. Add 1 cc. of the Hg reagent (150 cc. satd.  $HgCl_2$  + 70 g. crystd.  $NaOAc$  + 10 g.  $NaCl$ ) and 2 cc. of 4%  $Na_2B_4O_7$  and mix thoroughly. Centrifuge the ppt. and wash twice with  $H_2O$ . Dissolve the residue in 2-3 drops of 5%  $NaCN$  and rinse into a 50 cc. graduated flask. Add 4 cc. of the diazo reagent (20 cc. of 0.5% sulfanilic acid in 1.75% HCl + 6 cc. of 2%  $NaNO_2$ , dild. to 50 cc. and kept in ice-water), dil. to the mark and observe the max. color intensity in a photometer with an S 53 filter interposed. Compare with the calibration curve. Tyrosine, which also gives the diazo reaction, is not pptd. by the Hg reagent.

A. W. Dorr

**Oxygen prepared electrolytically and furnished at a constant rate of supply for the maintenance of surviving isolated organs.** Jean La Barre and Jules Ledrut. *Ann. physiol. physicochim. biol.* 9, 733-4(1933). H. Eagle

**The biological determination of Callicrein.** H. Weese. *Arch. expil. Path. Pharmacol.* 173, 36-41(1933).—The difference in the blood depressor action of urine injected into dogs before and after heating is an accurate index of its callicrein content. Rabbits and cats are not suitable for the detn.

Harry Eagle

**Determination of the thyrotropic action of the anterior pituitary lobe by means of the effect upon the basal metabolism [of guinea pigs].** Wolf Schoedel. *Arch. expil. Path. Pharmacol.* 173, 314-32(1933). Harry Eagle

**The diagnostic value of determinations of ammonia in the blood.** Heinz Fuld. *Klin. Wochschr.* 12, 1304 6(1933).—The detn. is of diagnostic and prognostic value in evaluating hepatic insufficiency.

Harry Eagle

**The determination of indican in blood serum without the use of a standard solution.** P. Schlierbach. *Klin. Wochschr.* 12, 1569-70(1933).—Instead of colorimetric comparison with a standard, which is difficult to prep. and is unstable, S. uses the extinction coeff. as measured in a photometer as a quant. index, calibrating the instrument once with a known soln. of indican treated in the same manner as the unknown serum.

Harry Eagle

**A simple method for the demonstration of spirochetes in single sections.** D. Nieto. *Klin. Wochschr.* 12, 1775-6(1933).—A preliminary report. Frozen sections of material fixed in formalin 15-20 $\mu$  thick (or paraffin or celloidin sections after removal of the imbedding substance) are placed for 10 min. in concd. pyridine, washed 3 times in distd.  $H_2O$ , placed in a 1% aq. soln. of uranium nitrate for 15 min. at 37°, washed twice in distd.  $H_2O$ , and then heated in 0.2%  $AgNO_3$  until the fluid forms very small bubbles. It is then cooled for 2 min., and placed in 10 cc. fresh 1%  $AgNO_3$ , and 2 cc. of 5% tartaric acid is added. After thorough mixing, 10 cc. of a 1% aq. soln. of pyrogallol acid is added. As soon as the sections have become yellowish brown, they are placed in distd.  $H_2O$ , dried in increasing concns. of EtOH and xylene in the usual manner, and mounted in Canada balsam.

Harry Eagle

**A paper test for the detection of mastitis.** B. E. Horrell. Indiana (Purdue) Agr. Expt. Sta., *Bull.* 377, 3 5(1933).—Dissolve 0.4 g. of bromothymol blue in 25 cc. of approx. 98% EtOH and dil. to 100 cc. with distd.  $H_2O$ . Adjust the  $pH$  to 6.8 by the addn. of NaOH. Saturate strips of paper with this indicator and dry. Milk 1 strain of milk from the cow's teat, then milk 1-2 drops on the end of the test paper. Note the color of the strip both while wet and after drying. Max. blue color appears after 1-1½ min. The paper test detected 94.6% of the normal samples from the abnormal samples of milk as shown by leucocyte counts. The test is likewise fully as accurate as the usual bromothymol test for mastitis.

C. R. Fellers

**The determination of bile acids in the blood by the spectrophotometric method.** N. Scheinfinkel. *Biochem. Z.* 265, 380-5(1933).—The blood is extd. twice with alk.,

the first extn. lasting 24 hrs. A further modification of the Aldrich-Bledsoe procedure (C. A. 22, 2762) consists in the omission of the Norit treatment, and after the addn. of a soln. of  $\text{Ba}(\text{OH})_2$ , the filtration is made after 24 hrs., and repeated again after a long time. The soln. contg. the Ba salt of the bile acids is clear and colorless because the ppt. of  $\text{BaCO}_3$  forming on standing adsorbs the coloring substances. Furthermore, the Pettenkofer color is examd. spectrophotometrically, which insures its specificity. By this modified procedure dog blood was found to contain 0.8 mg. % bile acid.

S. Morgulis

**Studies in microanalysis of urine and blood with the step photometer. X. Determination of blood sugar.** Carl (rbach. *Biochem. Z.* 265, 390-400(1933); cf. C. A. 27, 2705.—Both a macro and a micro procedure are described for the Benedict modification of the Folin-Wu sugar method. For the micro method, however, for which 0.1 cc. blood is used, a dil. tungstic-molybdic reagent is employed; it is made by adding 5 cc. of the 0.62  $N$   $\text{H}_2\text{SO}_4$  to 5 cc. of the reagent previously dild. with about 150 cc.  $\text{H}_2\text{O}$  and making the vol. to 250 cc. This soln. should be freshly prepd. every few days. To 5 cc. of this soln. 0.1 cc. blood is added in a centrifuge tube, well shaken and centrifuged. To 2 cc. of the clear ext. 1 cc. of the copper reagent, contg. 2 drops of the bisulfite per cc., is added. The rest of the procedure is the same as in the original method, the colors being examd. in the step photometer with the aid of filter S 91.

S. Morgulis

**A new micro method for the determination of glycogen.** Stefan Simonovits. *Biochem. Z.* 265, 437-43(1933).—Saliyun's procedure is criticized because of the losses occasioned through the use of charcoal. The new procedure requires 1-4 g. fresh tissue; add to this 3 times the amt. of hot 6% KOH in a 15-cc. centrifuge tube. Keep in a boiling bath until soln. is completed. Cool, add 0.5 cc. satd. NaCl soln., 2 vols. 96% alc., mix well, let stand 1 hr. and centrifuge for  $\frac{1}{2}$  hr. Dissolve the pptd. glycogen in 3 cc. hot  $\text{H}_2\text{O}$ , add 0.5 cc. satd. NaCl, and again ppt. with 2 vols. of alc. Dissolve the glycogen ppt. in 1 cc. hot  $\text{H}_2\text{O}$ , neutralize to litmus with 1%  $\text{H}_2\text{SO}_4$ , transfer to a volumetric flask and dil. to vol. Filter off the ppt. of alkali metaproteins. Transfer 13 cc. of filtrate to a centrifuge tube, add 1.5 cc. satd. NaCl and ppt. the glycogen with 2 vols. alc. Mix thoroughly, let stand at least 5 hrs., centrifuge  $\frac{1}{2}$  hr., and dissolve the glycogen in 5 cc. hot  $\text{H}_2\text{O}$ . Add 5 cc. 2  $N$   $\text{H}_2\text{SO}_4$  and heat for 2 hrs. in a boiling water bath. Cool, neutralize with 2  $N$  NaOH, transfer to a volumetric flask and det. the sugar by reduction. A little as 0.6 mg. glycogen can thus be detd.

S. M.

**Titrimetric microdetermination of cholesterol.** Gabriel Monasterio. *Biochem. Z.* 265, 444-7(1933).—Add 1 cc. 1% digitonin in 80% alc. to 2 cc. cholesterol in  $\text{CHCl}_3$ , leave in the water bath until the vol. is reduced to about 1 cc., let stand 6 hrs. and centrifuge. Wash the ppt. 3 times with 3 cc. 95% alc., and free the ppt. from alc. in the water bath. Add 5 cc.  $\text{Ag-K}_2\text{Cr}_2\text{O}_7\text{-H}_2\text{SO}_4$  reagent (dissolve 5 g.  $\text{AgNO}_3$  in 25 cc.  $\text{H}_2\text{O}$  and mix with 5 g.  $\text{K}_2\text{Cr}_2\text{O}_7$  dissolved in 50 cc.  $\text{H}_2\text{O}$ . Wash the ppt. 2 times with  $\text{H}_2\text{O}$ , using the centrifuge. Dissolve the ppt. in 50 cc. concd.  $\text{H}_2\text{SO}_4$ . Heat 15 min. at  $160^\circ$  on a sand bath. Transfer to a larger test tube (18  $\times$  3) and continue the oxidation for another 45 min., adding more reagent if necessary. Heat a similar tube contg. 5 cc. reagent on the sand bath. Transfer the contents of each to a 200 cc. flask and wash the tubes repeatedly with  $\text{H}_2\text{O}$ . Cool, add 10 cc. 10% KI to each flask and titrate with 0.1  $N$   $\text{Na}_2\text{S}_2\text{O}_3$ . The difference in titration between the reagent and the digitonin cholesterolide gives the cc. of 0.1  $N$  chromic acid reduced, and this divided by 10.48 gives the wt. of the cholesterol. In the case of blood, serum or plasma ext. 2 cc. with boiling alc. and ether mixt. (21 and 7 cc., resp.); reext. the ppt. after filtration with the alc.-ether mixt. Evap. the filtrate to dryness, dissolve in small quantities of  $\text{CHCl}_3$ , filter into a 10 cc. volumetric flask and dil. with  $\text{CHCl}_3$  to the mark. The analysis is carried out on 2 cc. aliquots. For the total cholesterol detn. saponify 4 cc. of the ext. at  $70^\circ$  for 2 hrs. in a stoppered tube with 2 cc. 3% Na alcoholate. Add 1 cc. 6% HCl in alc., evap.

to dryness, ext. the cholesterol with  $\text{CHCl}_3$  on the boiling water bath, repeating this 4 times. Evap. the extracts to 4 cc., of which 2 cc. is used for the detn. as previously described.

S. Morgulis

**Photometric method for the determination of carbon monoxide in blood.** I. J. K. Parnas and J. Sienlowski. *Biochem. Z.* 266, 101-6(1933).—The detn. of CO in blood by means of a Pulfrich photometer is described.

S. Morgulis

**A simple method for the preparation of ultrafiltration collodion sacs and a new ultrafiltration outfit.** Paul Kallos and Gunter Hoffmann. *Biochem. Z.* 266, 128-31(1933).—Suitable objects (glass rod, test tube) are immersed in melted caramel at  $200^\circ$  with which they should be evenly coated. The caramel is allowed to harden for about 2 hrs., and the form is dipped in the collodion soln. The latter gives membranes impermeable to protein or Congo red if it is made in 6% concn. in alc.-ether with the addn. of 3%  $N$  Bu alc. The dipped form is rotated for 3 min. and is then dried 6 hrs. at  $37^\circ$  in an upright position. This is repeated 3 times. The forms are then placed in 30% alc. at  $80^\circ$  and the sepd. sacs are washed free from sugar in running warm water and can be preserved indefinitely in 70% alc. covered with toluene. These membranes will sustain 1 atm. pressure; at 600 mm. Hg pressure 100 cc. distd. water will filter in 10 min.; they allow electrolytes and compds. with mol. size up to that of Congo red to pass. These membranes cannot be used for filtering alc.-ether solns. or strong acid and alkali solns.

S. Morgulis

**A new micro method for the determination of pyrocatechol and its application to the determination of phenolase.** S. Blazso. *Biochem. Z.* 266, 281-6(1933); cf. C. A. 27, 746.—Essentially this is an application of the Hagedorn-Jensen sugar method to the detn. of pyrocatechol. With 0.25 mg. in a 1:10000 soln. it was found necessary to boil at least 25 min., but by increasing the  $\text{Na}_2\text{CO}_3$  concn., boiling 15-20 min. is sufficient. A reagent is therefore prepd. contg. 162 g. cryst.  $\text{Na}_2\text{CO}_3$  per l. 0.01  $N$   $\text{K}_3\text{Fe}(\text{CN})_6$  soln. A table gives the mg. pyrocatechol directly from the cc.  $\text{Na}_2\text{S}_2\text{O}_3$  used in the titration. The method is employed for detg. phenolase activity. Equal amts. of skin ext. and pyrocatechol soln. are mixed and incubated. From time to time a 0.5-cc. sample is removed for the detn.

S. Morgulis

**A new method for determining the residual nitrogen and its fractions in organs.** I. Liver. H. Elias and H. Kaunitz. *Biochem. Z.* 266, 323-8(1933).—Quickly freeze in  $\text{CO}_2$  snow a weighed sample (about 20 g.) of thinly sliced liver. Det. the sp. vol. of liver on another sample by placing in a 50-cc. volumetric flask and measuring from a buret the vol. of water required to fill the flask to the mark. Rub up the frozen sections quickly with quartz sand, then with 40 cc.  $\text{H}_2\text{O}$ , to a fine sludge. The vol. of the aq. suspension of the liver is the vol. of liver tissue (calcd. from its wt. and its sp. vol.) plus 40 cc. On an aliquot of the suspension det. residual  $N$  according to Folin-Wu.

S. Morgulis

**Extraction of a hemin from heart muscle which is different from blood hemin.** E. Negelein. *Biochem. Z.* 266, 412-16(1933).—A hemin was extd. with acetone-HCl from horse heart muscle which dissolved in aq. pyridine gives an absorption band at 587  $m\mu$ , which corresponds to the hemochromogen bands of pheohemin b and *Spirographis* hemin (584  $m\mu$ ) but is different from ordinary blood hemin (557  $m\mu$ ). This hemin was obtained as cryst. pyridine hemochromogen, but the chlorohemin could be obtained only in the amorphous state. The amorphous compd. contains 6.5% Fe and 4 N to 1 Fe. The absorption spectrum of the hemin dissolved in 25% pyridine and reduced by alk. hyposulfite is reproduced. Method of prepn. of the hemin: Wash 5 kg. of finely ground fresh horse heart free from blood in running water, and press dry. The final wt. should be 85% of the original. Ext. the material with acetone, 4.25 l. + 35 cc., 37% HCl being employed per kg. material. Shake this for 15 min. and filter. Evap. the acetone ext. at room temp. in *vacuo*

until the soln. foams strongly, and reduce the acetone vol. to  $\frac{1}{2}$ . Filter the combined concentrates. Adsorb the hemin on Merck's "Faserton," using 1.0 g. washed with  $H_2O$  per kg. heart muscle. Reduce the acidity by adding 92 cc. of a soln. of 40 g. NaOAc in 100 cc. Shake the mixt. 15 min. and collect the Faserton by centrifuging. Wash the Faserton with the adsorbate by shaking for 30 min. each time with a mixt. of 750 cc. acetone, 150 cc.  $H_2O$ , 60 cc. 2 N AcOH and 40 cc. 2 N NaOH, until about  $\frac{1}{4}$  of a l. has been used. Finally wash the Faserton by shaking successively with 75% acetone, pure acetone and benzene. Wash the Faserton (filtered dry) with  $CHCl_3$ . Ext. the dry Faserton with 120 cc. acetone + 3 cc. 2 N HCl by brief shaking and centrifuging. Repeat the elution 4 times, diminishing the HCl so that altogether only 10 cc. 2 N is used. Reduce the filtered exts. at  $30^\circ$  in *vacuo* to  $\frac{1}{2}$  vol., add part of  $H_2O$  for every 2 parts of acetone and keep the soln. on ice 1 hr. Filter off the colorless ppt. Amorphous hemin forms a fine ppt. on the addn. of 2 cc. of the NaOAc soln. which is centrifuged off after keeping the soln. 1 hr. on ice. Rub up the dry ppt. twice with 10 cc. acetone and centrifuge, take up the residue in 4 cc. acetone acidified with 2 drops 2 N HCl and again centrifuge. Evap. the soln. to dryness in *vacuo*; 163 mg. is obtained from 5 kg. heart muscle. From the spectroscopic examn. of its pyridine soln. this quantity (163 mg.) is shown to contain  $1.07 \times 10^{-4}$  mol. hemin. Sep. this hemin from protohemin by the soln. of the chloridric compd. in 5 cc. neutral acetone, filtering and keeping in the cold with 45 cc. benzene. This treatment causes some more of the protohemin to crystallize and is removed by strong centrifuging. Evap. the soln. to dryness in *vacuo*. S. M.

**Method of electrodialysis. Serum electrodialysis with glycine membranes.** G. Ettisch and J. A. de Lencastre. *Biochem. Z.* 266, 422-35(1933).—Membranes are prep'd from collodion contg. glycine, 1:20,000, which decreases the viscosity. Add 2 mg. powd. glycine to 50 cc. collodion, shake for a few min. and pour on a glass plate after standing about  $\frac{1}{2}$  hr. The glycine suspension should be preferably fresh. Electrodialysis proceeds very rapidly with these membranes because they are permeable to anions, and after 35 min. the  $pH$  reaches a definitive value. Because of the shortness of time during which the  $pH$  drops from 7.8 to 6.8, usually about 10 min., a large part of the globulin is pptd. quickly. If a dry glycine-collodion membrane is used at the anode the end  $pH$  value is not attained so rapidly. It does not affect the results whether a parchment or cellulose membrane is used at the cathode.

S. Morgulis

**The fractionation of serum by electrodialysis.** G. Ettisch. *Biochem. Z.* 266, 436-40(1933).—The advantages of fractionating the serum proteins by electrodialysis over that by the salting-out process are shown.

S. Morgulis

**Preparation of pure hemoglobin solutions by electrodialysis.** G. Ettisch and G. Groscurth. *Biochem. Z.* 266, 441-7(1933).—The conditions essential for the prepn. of hemoglobin solns. for definite purposes are defined. The prepn. of hemoglobin solns. by electrodialysis is the most practical. By use of a glycine-collodion membrane at the anode and a parchment membrane at the cathode hemoglobin soln. is obtained from a red blood cell pulp which is electrolyte-free and has a 100% O<sub>2</sub>-binding capacity.

S. Morgulis

**Studies on cholesterol determination in blood. I. Criticism of some extraction methods and a simplified gravimetric method.** Kenzo Kusui. *J. Biochem. (Japan)* 18, 227-36(1933).—The extn. must precede sapon. Ext. 5 cc. oxalate blood with 125 cc. of 3:1 alc-ether mixt., filter after a few hrs. and wash the residue with the alc-ether mixt. Evap. the ext. to dryness, ext. the residue with ether, evap. and reext. the residue 3 times with 3 cc. quantities of alc. Make up the alc. ext. to 10 cc. Transfer 5 cc. to a small beaker, warm, add 2 cc. hot 1% alc. soln. of digitonin, and leave over night. Filter through a small Gooch crucible, wash the ppt. once with 1 cc. alc. and twice with ether, dry the crucible at  $100^\circ$  to const. wt. Since the wt. multiplied by 0.25 gives the chole-

sterol in 2.5 cc. blood, multiplying the wt. by 10 gives mg. % of free cholesterol. Transfer the remaining 5 cc. of the alc. ext. to a 50 cc. flask and wash twice with 5 cc. alc. Add about 0.6 g. Na and heat 4 hrs. on a sand bath under a reflux. Wash the soln. with 30 cc. ether in a separatory funnel, then add 10 cc.  $H_2O$ , shake and let stand until the soln. is clear. Transfer the aq. alc. layer to another funnel, wash the ether once more with water and add to the second funnel and again shake the contents of the latter with 50 cc. ether. Repeatedly wash the combined ether exts. with small amts. of dil. NaOH, then with  $H_2O$  until no reaction is given with phenolphthalein. Evap. the ether, dissolve the residue in 5 cc. hot alc., add 4 cc. 1% alc. digitonin and carry out the detn. as before. II. A combination of the colorimetric with the digitonin method. *Ibid.* 237-44.—Ext. 2.5 cc. oxalated blood or serum with 60 cc. of 3:1 alc-ether mixt., filter and wash with alc. ether. Ext. with ether the residue left after evapn., then, after evapn., with 5 cc. alc. Det. the free cholesterol in this soln. by digitonin pptn. as described in the previous paper. Evap. the filtrate from the digitonin-cholesterol and ext. the cholesterol esters twice with 20 cc. ether. Evap. the ext. partly, transfer to a 25 cc. flask and adjust the vol. with ether. Evap. 5 cc. in a small beaker, dissolve the residue in 3 cc.  $CHCl_3$ , transfer to a 10 cc. stoppered graduate, add 5 cc.  $CHCl_3$ , 2 cc.  $Ac_2O$  and 0.1 cc.  $H_2SO_4$ , and match the color against a standard.

S. Morgulis

**Biochemical studies on carbohydrates. I. Micro method for determining menthol, borneol and  $\beta$ -naphtholglucuronic acid in blood.** Hajime Masamune. *J. Biochem. (Japan)* 18, 259-76(1933).—Take 1 cc. blood

with 1 cc.  $H_2O$ , dil. with abs. alc. to 10 cc., shake and filter. Evap. gently 5 cc. of filtrate, dissolve the dry residue in 3 cc. 0.1 N NaOH and add 1 cc. 4%  $CdSO_4$ . The mixt. should be neutral to litmus. Filter into a Kumagawa-Suto extn. app., wash twice with 3.7 cc.  $H_2O$  then add 1 cc. 2 N  $H_2SO_4$ . Ext. with 20 cc. ether at a temp.  $50-70^\circ$  for 1 hr., but continue for 3 hrs. if  $\beta$ -naphtholglucuronic acid is present. Evap. ether, add 6 cc.  $H_2O$  and place in a boiling water bath to expel volatile products, cool, acidify with 2 cc. 4 N HCl, dil to 8 cc. with water and hydrolyze under a reflux on a water bath. Menthol- and borneol-glucuronic acid are hydrolyzed in 30 min. and  $\beta$ -naphtholglucuronic acid in 3 hrs. Cool, neutralize exactly with 2 N NaOH, then add 4 cc. 0.005 N  $K_2Fe(CN)_6$  soln. Heat again in the water bath for 15 min., add 3 cc. salt mixt. (2.5 g. KI, 5 g.  $ZnSO_4 \cdot 7H_2O$  and 25 g. NaCl in 100 cc. soln.), followed by 4 cc. 6.2% HCl and titrate with 0.005 N  $Na_2S_2O_4$ . Calc. the amt. of glucuronic acid in mg. per 100 cc. blood by the formula:  $200/5.6$ ,  $200/5.6 \times 0.989$  and  $200/5.6 \times 0.983$  for the borneol-, menthol- and  $\beta$ -naphtholglucuronates, resp.

II. Microcolorimetric method for the determination of free and conjugated menthol in blood and tissues. *Ibid.* 277-83.—Mix 1 g. tissue pulp with 1 cc.  $H_2O$ , deproteinize with enough abs. alc. to give 6 cc. vol. and filter. Place 3 cc. filtrate together with a teaspoonful of anhyd.  $Na_2SO_4$  in a special distn. app., the condenser of which is in a cooling mixt. at  $-10^\circ$ . Suck air (washed in  $H_2SO_4$ ) slowly through the app. while filling the jacket about the distn. tube with water at  $70^\circ$ . Introduce into the distn. tube 1 cc. abs. alc. at the end of 15 and 20 min. and after 30 min. discontinue the aeration. Note the vol. of distillate. Measure 1 cc. into a test tube, add 5 cc. of the color reagent, place for 2 min. in boiling water, closing the tube with a cork provided with a  $CaCl_2$  tube, then cool under running water. To make the reagent dissolve 0.5 g. dimethylaminobenzaldehyde in 100 cc. of a mixt. consisting of 1.6 vols. concd.  $H_2SO_4$  and 1 vol.  $H_2O$ . Match the unknown against a standard which is made from an aq. soln. of 0.1 g. phenol red and 5.7 cc. 0.05 N NaOH in 100 cc. Pipet 0.3 cc. of this soln. into 10 cc. of a borate-HCl soln. of  $pH$  7.93, add 10 cc.  $H_2O$  and set in a colorimeter at 8.2 mm. This equals the color produced by 0.1 mg. menthol at 10 mm. The detn. on blood is made the same way, except that the total vol. is made up to 8 cc. with abs. alc. and 4 cc. filtrate is used. Det. the conjugated

menthol in the remaining portion of the filtrate, following the preliminary treatment described in the previous paper.

S. Morgulis

**The Hammarsten cholic acid reaction.** Kazumi Yamasaki. *J. Biochem. (Japan)* 18, 311-22(1933); cf. C. A. 28, 169.—The Hammarsten reaction has been modified so that it can be employed with pure as well as impure cholic acid. Add to about 2 mg. cholic acid 0.5 cc. 37% fuming HCl, in a small test tube and heat carefully for 3 min. in a water bath. Let it stand at room temp. when the soln. assumes an intense violet color changing soon to a beautiful blue-violet, and on diln. either with concd. HCl or alc. analyze in the spectroscope where the distinct adsorption band 560-400 m $\mu$  appears. This reaction is much more sensitive than the original Hammarsten reaction, and is obtained in mixts. of cholic acid which by the original method give only neg. results. S. M.

**Studies on the determination of bile acids in blood. II. A new and easy method for determining the bile acids in blood serum.** Kenzo Kusui. *J. Biochem. (Japan)* 18, 345-68(1933); cf. C. A. 26, 5598.—Prep. standard solns. from recrystd. glycocholic acid by dilg. a stock 0.08% in alc. by further addn. of alc. (0.08, 0.04, 0.02, 0.01, 0.005, 0.0025 and 0.00125%). Measure 2 cc. of each diln. into a test tube, add 0.2 cc. 1% sucrose soln. and 2 cc. concd. H<sub>2</sub>SO<sub>4</sub>, shake the contents for 1/2 min. and cool in ice water 1 min. The color scale ranges from a beautiful yellow, through orange and red to purple red (0.8 mg. glycocholic acid), depending upon the glycocholic acid content. A table has been worked up empirically which gives the glycocholic acid content of the unknown when this is matched in the colorimeter against a standard of known concn. set at 15 min. The standard solns. do not keep and must be prepd. fresh. Add to 1 cc. serum, drop by drop, and with const. shaking 25 cc. alc., leave for 30 min. and filter. Ext. the residue 3 times with 5-cc. quantities of alc. Quickly evap. the alc. ext., ext. the residue 3 times with 2 cc. ether to remove cholesterol and fats. The ether ext. should be centrifuged. Take up the residue undissolved in 3 cc. alc. in ether and add the soln. to the residue in the tube in which the ether ext. was centrifuged, measure 2 cc. of the clear (centrifuged) soln. into a test tube and develop the color just as in the case of the standard. Calc. the bile acid content with the aid of the table. The av. bile acid content of human and dog serum is 8.78 and 7.31 mg. %. The method was also applied to lymph. S. Morgulis

**Heparin. I. The preparation of heparin.** A. F. Charles and D. A. Scott. *J. Biol. Chem.* 102, 425-9 (1933); cf. Howell, C. A. 17, 3349.—After autolysis for 4 hrs., 100 lb. of beef liver is extd. with 62 l. 0.5 N NaOH and 7.5 l. satd. (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> for 1 hr. at 50°. If heated to 70° the protein is coagulated, and the heparin is pptd. by acidifying the filtrate to pH 2. The ppt. is washed with hot dil. H<sub>2</sub>SO<sub>4</sub>, suspended in 95% EtOH for 20 hrs., centrifuged, dissolved in 6 l. water, and treated for 36 hrs. with 25 g. trypsin at pH 8 and 30 in presence of xylene. The heparin is pptd. with 12 l. 95% EtOH and a little HCl, redissolved in alkalized water, heated to 70° and reprecip. with Me<sub>2</sub>CO. Finally the product is suspended in 0.8% (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> at pH 4.3 and heated at 70° for 1 hr., filtered and again pptd. with Me<sub>2</sub>CO. The water-sol. ppt. contains 5 units anticoagulant per mg. III. **The purification of heparin.** D. A. Scott and A. F. Charles. *Ibid.* 437-48; cf. C. A. 28, 7957.—Heparin is largely destroyed by HCl at pH 2.5, or by 0.25 N NaOH, in 4-5 hrs. at 80°. By fractionation of the crude product described above with Lloyd's reagent, CdCl<sub>2</sub> and finally with Me<sub>2</sub>CO, a microcryst. prepn. contg. about 30% ash was obtained. It contained 460 units per mg., contained N, lost its activity on treatment with HNO<sub>3</sub>, and appeared to form salts with both acids and bases. It gave no color with naphthoresorcinol and seems quite different from the product of Schmitz and Fischer (C. A. 27, 3227). K. V. Thimann

**Formalin titration of proteins (Struait) 7.** Colorimetric detn. of P (van der Lingen) 7.

**Baker, John R.: Cytological Technique.** London: Methuen & Co. 131 pp. 3s. 6d. Reviewed in *Stain Tech.* 8, 118(1933).

## C—BACTERIOLOGY

CHARLES B. MORREY

**Pertussis toxin or antigen.** John A. Toomey and Joseph E. McClelland. *Proc. Soc. Exptl. Biol. Med.* 31, 34-5(1933).—Whooping cough bacillus No. 778 of the American Culture Collection was grown for 19 days on a medium consisting of veal infusion 250 cc., brain infusion 80 cc., peptone 3.3 g., NaCl 1.6 g. and Na phosphate 1.6 g. The culture was strained, passed through an N or V and then through a W Berkefeld filter and preserved with 0.2% tricesol. Intradermal injections of 0.1 cc. of the filtrate caused a local skin reaction in 6-24 hrs. in all of 680 individuals. Filtrates of the unplanted medium caused reactions in less than 1% of the subjects tested. C. V. B.

**The chemical properties of an E. coli bacteriophage.** W. L. Dulière and M. Adant. *Ann. physiol. physicochim. biol.* 9, 777-9(1933).—Oxidation of a soln. contg. bacteriophage with H<sub>2</sub>O<sub>2</sub> destroys the former; subsequent reduction with hyposulfite has no effect. Bacteriophage does not dialyze through a parchment membrane, even with the aid of electrodialysis. As soon as the concn. of Cl falls below 0.01%, the bacteriophage activity disappears irreversibly. Thymol used as preservative does not affect the phage. Dialyzed, but active, preps. are inactivated by extn. with CHCl<sub>3</sub> at 56°, despite the fact that the latter has no effect when added to the original soln. Harry Eagle

**The differentiation between whooping cough and influenza bacilli.** Michio Kasahara. *Klin. Wochschr.* 12, 1609-11(1933).—*Haemophilus influenzae* inoculated into rabbits or guinea pigs subcutaneously causes a sharply circumscribed inflammatory edema reaching a max. in 24-48 hrs. and never resulting in necrosis. *H. pertussis* similarly inoculated causes a more severe inflammatory reaction which always necrotizes. Another point of differentiation is the fact that live pertussis bacilli are more readily stained by Nile blue sulfate than live influenza bacilli. The former are stained by as little as a 0.00001-0.000005% soln., while the latter stain very slightly with a 0.0003% soln., and require 0.001% for definite strong coloration. A 0.0001% soln. is a convenient practical method of differentiation. Harry Eagle

**Preparation and chemical properties of a biologically active substance ( $\beta$ -tuberculin) isolated from the nutritive medium of tubercle cultures.** Paul Kallos and Gunter Hoffmann. *Biochem. Z.* 266, 132-6(1933).—By pptn. with alc. (ther. mixt.) a highly active substance ( $\beta$ -tuberculin) is obtained from an ultrafiltrate of the media in which tubercle cultures have been grown. This substance was also obtained from tuberculous skin, as well as from the serum and urine of tuberculous patients. The prepn. is entirely protein-free. The tryptophan reaction bears a direct relation to the biol. activity of the prepn. and serves as a colorimetric method for estg. the  $\beta$ -tuberculin content. S. Morgulis

**Bacteria destroy pipe line in California (Beckwith, Bovard) 13.** Rept. of the director of the Dairy Research Inst. [on bacteria and gas-producing organisms] (Davel) 12.

**Test tube for bacteriological experiments.** Arnold Renshaw. *Ger.* 578,807, June 17, 1933.

## D—BOTANY

THOMAS G. PHILLIPS

**Root knots and mycorrhiza.** Johannes Richter. *Pharm. Zentralhalle* 74, 653-60(1933).—The function of the knotty excrescences long observed on certain plant rootlets, their relation to N assimilation by the plant and to mycorrhiza are discussed. W. O. E.

**Three species of *Zygadenus* (death camas).** O. A. Beal, H. F. Eppson, J. H. Draize and R. S. Justice.

- Wyo. Agr. Expt. Sta., *Bull.* 194, 3-39(1933).—Chem. analyses show the distribution of the alkaloid, *sydadenine* in *Z. gramineus*, *Z. paniculatus* and *Z. elegans* at representative stages of growth. The alkaloidal potency did not vary appreciably with altitude. All 3 species had similar seasonal alkaloidal trends. *Z. elegans* is only  $\frac{1}{3}$  as toxic as the other 2 species. The M. I. D. of *Z. gramineus* and *Z. paniculatus* to sheep was 15-20 oz. of plant per 100 lb. of sheep. Apparently the ramos alkaloid is not transmitted to the milk as nursing lambs of poisoned ewes showed no symptoms of poisoning. The seed heads and leaves normally contained a higher content of the alkaloid than the stems or bulbs. C. R. Fellers
- The nature of the causative agent of the mosaic disease of tomatoes. S. V. Desai. *Indian J. Agr. Sci.* 3, 626-38 (1933).—Cultures of the organism fermented glucose, sucrose and lactose without the formation of gas; the reaction of the medium changed from  $pH$  7.2 to 5.6-5.9 in 48 hrs. and then to  $pH$  7.9 after 1 week. The organism rapidly peptized litmus milk. K. D. Jacob
- A soft rot of apple. P. K. Dey and B. S. Nigam. *Indian J. Agr. Sci.* 3, 603-72(1933).—*Aspergillus niger* was isolated from apples affected with a type of rot which changes the entire apple into a soft pulpy mass within a few days, sour varieties of apples being the most susceptible to attack. When the fungus was grown in Czapek's soln., adjusted to different degrees of acidity by the addition of malic acid, the greatest mycelial development occurred at  $pH$  3.4-3.8. The fungus did not grow in the absence of O. K. D. Jacob
- Physiological factors associated with the productiveness of pecan shoots. A. H. Finch and H. L. Crane. National Pecan Assoc., *Rept. Proc. 30th Ann. Conv.* 1931, 98-107. In the early spring, starch is present in all shoots formed during the previous season. With the formation of new growth the starch is depleted more rapidly from the old wood at the base of strong fruiting shoots than from the wood at the base of weak fruiting shoots. The rate and completeness with which starch disappears from the 1-yr.-old wood appear to be related to the no. and rate of growth of the new shoots formed; later, starch begins to reappear in the old wood at the base of new shoots. Starch appears earlier in the bases and tips of new weak fruiting shoots than in those of new strong fruiting shoots. The young kernels of nuts from strong shoots are higher in reducing sugars than are those of nuts from weak shoots. K. D. Jacob
- Etiology of the chocolate spot disease of broad beans C. J. Magee. N. S. Wales Dept. Agr., *Sci. Bull.* 43, 8 pp.(1933).—The disease is caused by the deposition of honey dew by aphids on the leaves of the plants. Lesions similar to those produced by honey dew were formed when droplets of sucrose and glucose (which are constituents of honey dew) and bees' honey were applied to the foliage. Species of *Saccharomyces* and *Cladosporium* were the only organisms found in honey dew. K. D. Jacob
- Blue panic grass (*Panicum antidotale*). Anon. *Queensland Agr. J.* 40, 327-8(1933).—The crude protein content of moisture-free samples of the grass grown in Queensland ranged from 11.5% in old growth to 20.6% in stemmy leafy growth up to 2.5 ft. in height. The plant does not contain HCN. K. D. Jacob
- Foot-rot diseases of cereals. T. A. Russell. *Trans. British Mycol. Soc.* 16, 253-69(1932).—Results of pot expts. indicated that wheat seedlings growing in soil with a high ratio of N to K may be specially liable to foot-rot, which is caused by *Fusarium culmorum* and *Helmintosporium sativum*. K. D. Jacob
- A study of some Phoma species. M. Grimes, M. O'Connor and H. A. Cummins. *Trans. Brit. Mycol. Soc.* 17, 97-111(1932).—A new species, *P. hibernica*, was isolated from milk, cream, butter and water, and its cultural characteristics were studied. The fungus made good growth on nutrient lactose agar at  $pH$  7.0 and, in contrast to other species of *Phoma*, also at  $pH$  3.5. Good growth, without apparent action, was obtained on calcified milk and it rendered litmus milk slightly alk. in 6 days. A very slight liquefaction of gelatin was produced in 3 weeks. The fungus had no diastatic action on starch in nutrient lactose agar, potato agar or mineral salt glucose agar cultures and it caused no production of gas from glucose, lactose, mannitol, dextrin and glycerol. K. D. Jacob
- Measuring germination [of fungus spores]. R. G. Tomkins. *Trans. Brit. Mycol. Soc.* 17, 147-9(1932).—The latent period of germination is slightly prolonged in the presence of narcotics ( $Et_2O$ ,  $CHCl_3$ , acetone, etc.),  $SO_2$  and certain acids; it is noticeably prolonged in the presence of  $AcH$ ,  $HCN$ ,  $H_2S$ ,  $NH_3$  and the salts of heavy metals. K. D. Jacob
- Measuring growth [of fungi] by the Petri dish method R. G. Tomkins. *Trans. Brit. Mycol. Soc.* 17, 150-6 (1932).—In the presence of growth inhibitors, such as  $CO_2$ ,  $CHCl_3$ ,  $Et_2O$ , etc., the rate of spread, though reduced, suffers no marked change of phase sequence and comparisons of size at various time intervals give approximately the same relative values. The retarding effect of acetaldehyde,  $H_2S$  and  $HCN$  is considerable in the early stages of growth. When  $NH_3$  and  $H_2S$  are introduced into the culture atm. considerable time is required for the gas to dissolve in the agar and come into equil. with the pressure of gas in the air, thus delaying the effect of the gas on growth. When growing colonies are taken from an atm. and placed in an atm. contg. acetaldehyde,  $HCN$  or  $H_2S$  the spread of the colony is immediately checked or reduced; later the growth begins again or increases in rate and finally attains a const. value. K. D. Jacob
- Bacterial diseases of stone-fruit trees in Britain. IV. The organism causing bacterial canker of plum trees H. Wormald. *Trans. Brit. Mycol. Soc.* 17, 157-69 (1932). The causal organism is *Pseudomonas mors prunorum*; its cultural characteristics and reactions in a wide variety of media are given in detail. The organism has no diastatic action on starch, does not produce gas from dextrose, lactose, sucrose or glycerol and does not reduce nitrate to nitrite or produce indole from tryptophan; it produces an acid reaction in 2% lactose nutrient agar contg. bromocresol purple and is thus distinguished from *P. prunicola*. K. D. Jacob
- Effect of cultural conditions on the growth and sporulation of an organism belonging to the group species *Aspergillus glaucus*. B. L. Chona. *Trans. Brit. Mycol. Soc.* 17, 221-8(1932).—The amt. of growth and sporulation (both conidial and perithecial) increase with the concentration of sugar in the medium up to about 3%; beyond this concentration conidial formation decreases, whereas growth and formation of perithecia continue to increase. Omission of  $MgSO_4$ ,  $KCl$  and  $FeSO_4$  from Czapek's medium does not alter the type of growth, but growth is definitely reduced in the absence of  $K_2PO_4$ . Growth and perithecial formation are slightly increased when either  $KH_2PO_4$  or  $K_2HPO_4$  is substituted for  $K_3PO_4$ . The cultures are extremely thin in the absence of  $NaNO_3$  and the growth is poor when  $NaNO_3$  is replaced by  $NH_4Cl$ . Replacement of sugar by peptone (in Richards' soln.) produces a markedly fluffy type of growth; formation of conidia is much intensified and there is a corresponding reduction in the no. of perithecia. Only a slight effect was produced by varying Czapek's soln. from 0.16% alk. ( $NaHCO_3$ ) to 0.16% acid (as malic acid). K. D. Jacob
- Germination of the spores of *Merulius lacrymans* (Wulf) Fr. W. P. K. Findlay. *Trans. Brit. Mycol. Soc.* 17, 334-5(1933).—No germination was observed in dist. water, malt agar, prune agar or in malt agar plus 0.4%  $KOH$ . Approx. 25% germination was obtained on 8% malt agar plus 1% malic acid or 1%  $H_3PO_4$ . K. D. Jacob
- The action of various stimulants upon plant organisms, with special consideration of gaseous substances. Werner Liebisch. *Angew. Chem.* 46, 635-8(1933).—The action of a no. of stimulating processes and stimulants upon the life functions of plants are discussed. Thirty-one references. Karl Kammermeyer
- Soluble sugars in *Mercurialis perennis* L. Mme. M. Bouillenne and Ray Bouillenne. *Bull. sci. acad.* 101

Belg. 19, 840-66(1933).—Methods for the extn. and detn. of sol. sugars and the technics employed to assure accuracy are discussed in detail. Extns. were made with boiling  $H_2O$  plus  $CaCO_3$ . Neutral Pb acetate was used for defecation.  $Na_2HPO_4$  and  $Na_2CO_3$  are recommended for decoloring. Preference is given to  $H_2SO_4$  over  $HCl$ , as a hydrolyzing agent. The Folin-Wu and the Shaffer-Hartman methods of sugar detn. gave sufficiently accurate results. F. W. Marsh

**Destruction and utilization of protein by molds.** T. Chraszcz and F. Pisula. *Biochem. Z.* 266, 29-45(1933).—Expts. were carried out with 77 species of mold. Growth on milk these show a very variable capacity for development because they do not possess equal ability to assimilate the nourishment of milk. They all can decompose the milk protein even to  $NH_3$ , but the rate of decompn. as well as the nature of the end products differs greatly for different species. Frequently the acidity of the milk decreases, and in some instances the reaction becomes neutral, when molds are grown on milk, because of the  $NH_3$  production. Molds grown on milk generate a variety of odors, such as foul, skatole, esters, ammoniacal, but some are not odorless. S. Morgulis

**Methods for the study of the metabolism of molds.** A. J. Kluyver and L. H. C. Perquin. *Biochem. Z.* 266, 81(1933).—As a general principle in such studies it is stated that a homogeneous material is required under homogeneous conditions which are unfavorable to growth. This is best attained by using large quantities of material and greatly reducing the time. The procedures for securing these conditions are discussed. S. Morgulis

**Conditions for the formation of kojic acid by *Aspergillus flavus* Link.** A. J. Kluyver and L. H. C. Perquin. *Biochem. Z.* 266, 82-95(1933).—The formation of kojic acid from glucose has been studied by the procedures outlined in the preceding paper. The yield of acid is very much affected by the conditions under which the mycelium has been grown, the best yields being obtained from cells grown on a mineral-sugar nutritive medium. The optimum results were obtained at  $pH$  2.2, with a sugar concn. of  $10^4$ , a lack of assimilable N compds., and a rich supply of O. Under favorable conditions the yield of kojic acid reached 67% of the theoretical. S. Morgulis

**A contribution to the biochemistry of seed germination with particular reference to *Zea mays*.** R. C. Malhotra. *Biochem. (Japan)* 18, 173-97(1933).—A study of germinating peas, maize and wheat shows that starch and hemicelluloses are utilized most, fats somewhat, while protein is used only by peas. The accumulation of sugar during germination is due to the fact that its utilization fails to keep pace with its formation from polysaccharides. During germination the greatest decrease in fats and glucose value is in the embryo, while in the endosperm the greatest loss is in the starch and hemicelluloses. The wt. of the whole seedling is less than that of the seeds and it contains a higher percentage of N and ash which is not used up by the growing seedling. Maize embryos, separated from the endosperm, show a decrease in fat, starch, hemicelluloses as well as in caloric content during germination, but the isolated endosperm showed only a decrease in sugar and starch content, probably due to enzymic hydrolysis. S. Morgulis

**The effect of human tissue fluids on germinating plants.** Gustav Papp. *Magyar Orvosi Arch.* 24, 455-8(1933).—Human serum or spinal fluid, whether normal or pathological, retards germination of plants. Normal human milk or colostrum is without influence, while menstrual milk retards growth. Parathyroid hormone has a beneficial effect; other hormones have none. Henry Tauber

**Concentration of inorganic ions as related to growth of excised root-tips of wheat seedlings.** Philip R. White. *Plant Physiol.* 8, 489-508(1933).—The effect upon growth of varying the concns. of Ca, K, Mg, Fe,  $NO_3^-$ ,  $SO_4^{--}$ ,  $Zn^{++}$ ,  $Cl^-$  and Na in Uspenski's standard nutrient soln. *Z. Botan.* 17, 273(1925) is described. The omission of  $NO_3^-$  and also of  $CO_3^{--}$  exerted no significant effect on growth in these two-week tests.  $Fe_2(SO_4)_3$  is a better

source of Fe than either  $Fe_2Cl_3$  or the citrate. The exptl. conditions were identical with the earlier preliminary expts. (C. A. 27, 326). Walter Thomas

**Coloring matter on the stems of the tomato.** B. H. Blount. *J. Chem. Soc.* 1933, 1528-9.—The coloring matter on the stems of the tomato (*Lycopersicon esculentum*) is rutin. C. J. West

**Influence of the [culture] medium on the baking value of wheats (Chopin) 12.**

## E—NUTRITION

PHILIP B. HAWK

**Relation of milk ingestion to calcium metabolism in children.** A. L. Daniels, M. K. Hutton, E. Knott, G. Everson and O. Wright. *Proc. Soc. Exptl. Biol. Med.* 30, 1062-3(1933).—Poorly nourished children retained more Ca, P and N during metabolism periods when 1 pint of milk and sufficient vitamin D were included in the diet, than in succeeding periods when they were better nourished and twice the amt. of milk was given. C. V. B.

**Oxidation-reduction potential of ascorbic acid (vitamin C).** Henry Borsook and Geoffrey Keighley. *Proc. Natl. Acad. Sci.* 19, 875-8(1933).—Data regarding the thermodynamically reversible reduction potentials of ascorbic acid are presented. Rachel Brown

**The effect of dicalcium phosphate, without vitamin D, in the nutrition of chicks.** Geo. M. Higgins and Charles Sheard. *Anal. Record* 56, 395-408(1933).—Dicalcium phosphate, without vitamin D, is not adequate to maintain growing chicks and will not protect them against leg weakness and other skeletal deficiencies which arise as a result of a disturbed Ca metabolism. B. C. Brunstetter

**Vitamin therapy in pulmonary tuberculosis. III. The effect of viosterol on the absorption, retention and excretion of calcium.** Paul D. Cramm, J. W. Strayer, H. L. Watson and G. Heimann. *Am. Rev. Tuberc.* 28, 202-16(1933); cf. C. A. 27, 774.—There is a direct correlation between the amt. of Ca intake and the fecal Ca output in man. During the early administration of viosterol there is a decrease in urinary and fecal Ca. Continued administration increases the urinary Ca and decreases the fecal Ca. Viosterol increases the absorption of Ca, as indicated by the elevation of serum and urinary Ca. Increased dosage of vitamin D increases the absorption and the retention of Ca in the tissue fluids to effect a state of hypercalcemia. Intravenous saline soln. is a sp. antagonist to a state of hypercalcemia effected by vitamin D. H. J. Corper

**The dietetics of apple pulp and fruit flour.** Camillo Borgnino. *Ind. sacchar. ital.* 26, 528-30(1933).—The beneficial effects of these products are discussed. L. Cusachs

**The vitamin A content of rat liver after feeding with  $\alpha$ -,  $\beta$ - and  $\gamma$ -carotene, and the antimony trichloride reaction of vitamin A preparations.** Hans Brockmann and Maria-Luise Tecklenburg. *Z. physiol. Chem.* 221, 117-28(1933).—Rats previously deprived of vitamin A were given daily doses of 1 mg. of  $\alpha$ - and  $\beta$ -carotene during a 19-day period and the liver oil was then examd. for vitamin A by the  $SbCl_3$  reaction and by its growth-promoting action. A much greater yield of vitamin A was obtained from  $\beta$ -than from  $\alpha$ -carotene. This was to be expected from the sym. structure of  $\beta$ -carotene which should enable it to form 2 mols. of vitamin A by addn. of  $2H_2O$ . The actual yield, however, was only 8%. Either the transformation is inefficient or loss of carotene occurs during absorption and transportation. On the basis of the relative protective doses of  $\beta$ -carotene and vitamin A the yield should be 20%. Both  $\alpha$ - and  $\gamma$ -carotene undergo transformation into vitamin A but the yields here are much smaller. Theoretically they should be half as great as the yield from  $\beta$ -carotene, but were actually less than half for  $\alpha$ -, and not detd. for  $\gamma$ -carotene because of scarcity of material. The biologically inert carotenoids, lutein, zeaxanthin and lycopin, did not form vitamin A. Spectroscopic study of the  $SbCl_3$  color reaction of the liver oils showed the

characteristic absorption band of vitamin A at 620 m $\mu$  in both series ( $\alpha$  and  $\beta$ ), and a transient band at 540 m $\mu$  in the  $\alpha$ -series. This difference in spectrum may indicate the existence of 2 colorless vitamins or may be due to some other substance. The rat liver oils differ from fish liver oils in that they show the 620 band before as well as after sapon. A displacement of the 620 band to 573 m $\mu$  results from oxidation and is accompanied by loss of vitamin activity. A. W. Dox

The growth action of carotenes and xanthophylls. Richard Kuhn, Hans Brockmann, A. Scheunert and M. Schieblich. *Z. physiol. Chem.* 221, 129-36(1933); cf. *C. A.* 27, 5818.— $\beta$ -Carotene, which can yield 2 mols. of vitamin A, is twice as effective in growth promotion as  $\alpha$ - and  $\gamma$ -carotenes which yield only one. If the liminal dose is defined as that quantity which, fed daily to rats deprived of vitamin A, causes a 10 g. increase in wt. in 70% of the animals in 35 days, then the liminal doses are 5, 2.5 and 5  $\gamma$ , resp., for  $\alpha$ -,  $\beta$ - and  $\gamma$ -carotene. Lutein, zeaxanthin and violaxanthin, even in 60  $\gamma$  doses, exert no growth-promoting action. Azafurin Me ester, dihydrocrocin and chlorophyll are also inert. A. W. Dox

A study of canned shrimp with reference to the presence of vitamins A, B and D. Margaret C. Moore and Hal W. Mosley. *Science* 78, 368-9(1933). Feeding tests with shrimp fat showed the presence of vitamins A and D, but B is absent or present in very small quantities. F. L. D.

Digestive mineral equilibria and their effects on the mineral composition of the rat. Lise Emerique. *Ann. physiol. physiol. chim. biol.* 9, 765-8(1933). H. Eagle

The results of a 25 month feeding experiment with low protein intake. B. Zuskind. *Arch. Verdauungskrankh.* 54, 197-225(1933). Analysis of a single case. H. E.

Vitamin A in Indian fish-liver oils. A. R. Ghosh, P. N. Chakravorty and B. C. Guha. *Indian J. Med. Research* 21, 141-6(1933). Harry Eagle

The nutritive values of Indian foodstuffs. I. A. R. Ghosh and B. C. Guha. *Indian J. Med. Research* 21, 447-50(1933). Harry Eagle

Poultry feeding experiments II. B. Hinds. *Ariz. Agr. Expt. Sta., Bull.* 143, 79-120(1933).—Dried butter-milk was the most economical protein supplement for egg production. Meat scraps also gave good results. No mortality resulted from feeding cottonseed meal. It is a mistake to feed a ration with a wide nutritive ratio if quick max. growth in young chickens is desired. The contention that the development of feathers, muscle, blood, bone, tissue, etc., calls for a narrow nutritive ratio, is correct. The efficiencies for growth promotion for nutritive ratios are: 1:3.6, 100%; 1:4.8, 88%; 1:6, 82%; 1:7.7, 72%. The rations with the narrower nutritive ratios contg. a greater proportion of concentrates are more palatable as evidenced by a greater feed consumption. C. R. F.

Biochemistry and pathology of avitaminosis. I. Hematopoietic function in deficiency disease. Barnett Sure, M. C. Kik, Dorothy J. Walker and Margaret Elizabeth Smith. *Ark. Agr. Expt. Sta., Bull.* 286, 3-39(1933).—No connection was found between avitaminosis and pernicious anemia in rats. However, in vitamin G deficiency, a dermatitis develops together with secondary anemia, and the condition is characterized by a marked reduction in the concn. of hemoglobin in the blood. No definite anemia was found in vitamin B deficiency, though a reduction in the concn. of the serum proteins does occur along with large wt. losses. In vitamin B deficiency, particularly in the last stages, there is a marked rise in both the erythrocytes and hemoglobin. The rise is accompanied by a marked loss of water from the blood produced by pronounced inanition. The avitaminosis has no sp. effect on the total leucocyte count. In polyneuritis there is a slight edema of the tissues to the extent of about 6.5%. Mothers whose young are developing uncomplicated vitamin B deficiency, because of sub-optimum amts. of vitamin B for normal lactation, show no change in the concn. of the hemoglobin, slight reduction in the concn. of erythrocytes, but a notable concn. of serum proteins. Forty-two references. C. R. Fellers

Continual cornified vaginal cells as an index of avitaminosis in rats. S. B. D. Aberle. *J. Nutrition* 6, 1-10(1933).—Continual cornified vaginal cells appeared in 100% of the rats on diets deficient in vitamin A, where the animals lived to show avitaminosis. Cornification invariably preceded other symptoms of avitaminosis; the time elapsing was positively correlated with the amt. of vitamin contained in the diet or stored in the animal. C. R. Fellers

Comparison of apricots and their carotene equivalent as sources of vitamin A. Agnes Fay Morgan and Evelyn O. Madsen. *J. Nutrition* 6, 83-93(1933).—The carotene content of fresh frozen, sulfured sun-dried, and unsulfured sun-dried apricots was detd. by pyridine and by acetone-RtO<sub>2</sub> extn. followed by colorimetric estn. The pyridine gave better yields of carotene. The loss of carotene in the dried fruit was 36-41%. The vitamin A activity was detd. biologically and was 50-75% of the original. The vitamin A activity of crude carotene, m. 162-4°, was less than that of the cryst. carotene, m. 180°, made from it. A close correlation exists between carotene content and vitamin A in apricots. C. R. Fellers

Vitamin A content of yellow-tissued and white-tissued apples. Myra T. Potter. *J. Nutrition* 6, 99-102(1933).—Essentially no differences were noted in vitamin A content of McIntosh, a white-meated variety, and Red Delicious or Golden Delicious, yellow-meated varieties. The unit for vitamin A as defd. for these varieties is approx. at the 1.5 g. level. C. R. Fellers

Fish meal versus cottonseed meal as a feed for dairy cows. L. W. Ingham. *Md. Agr. Expt. Sta., Bull.* 342, 413-22(1932).—The total digestible protein in the ration being the same, there was practically no difference in feeding value between the ration contg. cottonseed meal and the ration contg. fish meal whether compared on the basis of total milk and total butter fat, or on the basis of butter fat test. C. R. Fellers

Phosphorus deficiency in the rations of cattle. C. H. Fekkes, T. W. Gullickson and L. S. Palmer. *Minn. Agr. Expt. Sta. Tech. Bull.* 91, 5-118(1932); cf. *C. A.* 26, 3008.—Serious P deficiencies exist in Minn. and in many other parts of the West. Induced exptl. aphosphorosis in cattle is identical with the naturally occurring condition. Low P content in feeds, particularly roughages, produces aphosphorosis which varies in severity in proportion to the P deficiency. A copious milk flow in lactating cows may seriously deplete the body store of P. All stages of aphosphorosis in cattle were produced experimentally. The concn. of inorg. P in the blood plasma in cattle suffering from P deficiency is an important index of the severity of the disease. Blood compn. may thus be employed in the rapid field diagnosis of aphosphorosis. The daily fluctuations of P concn. in the blood plasma of cattle are relatively large. Though inorg. forms of P showed slight superiority over org. sources in curing aphosphorosis in cattle, little difference was noted among various sources of P. The addn. of P to the rations of cattle suffering from aphosphorosis brings about an immediate stimulation of the appetite and a more efficient utilization of the food consumed; in mature animals, milk production increased 50-146%. The presence of MgSO<sub>4</sub> in the drinking water had little or no significant effect in producing P deficiency. P deficiency reduces the ash content of the bones and increases the lipide content. An abnormally low Ca:(PO<sub>4</sub>)<sub>2</sub>:CaCO<sub>3</sub> ratio, similar to a rachitic condition, in the fat-free and moisture-free bones was characteristic of P deficiency. Analytical methods and complete data are given. Fifty-one references. C. R. Fellers

Effect of storage and canning upon the vitamin content of carrots. Dorothy D. Lafigley, Jessie E. Richardson and Erlene J. Andes. *Mont. Agr. Expt. Sta., Bull.* 276, 3-32(1933).—Carrots are an excellent source of vitamin A, a good source of vitamin B<sub>1</sub>, and a fair source of vitamin C. Winter storage of carrots for 4 months in either cool, damp or warm, dry cellars has no deteriorating effect on vitamins A, B<sub>1</sub> and C. However, there appears to be a slight increase in the vitamin C potency during storage.

When carrots are cooked in the fall, there is a noticeable loss in vitamins A and B<sub>1</sub> but none in vitamin C. When carrots are cooked, after being stored for 4 months in either cool, damp or warm, dry cellars, the loss in vitamin B<sub>1</sub> is the same as in the cooked carrot in the fall; vitamin C shows some loss; while with vitamin A, its potency appears to be slightly greater than in the raw carrot. When carrots are canned in the fall by either the pressure cooker or oven method and are tested at once for their vitamin content, there seems to be no loss in vitamin A, slight evidence of loss in vitamin B<sub>1</sub>, but a decided loss in vitamin C. When canned carrots are kept for a period of 6 months a noticeable loss occurred in vitamin A, a decided loss in vitamin B<sub>1</sub>, and vitamin C reduced to about one-third of its initial potency. Storage is a better method of preserving the vitamin content of carrots than canning.

C. R. Fellers

**Nutritional requirements of the chick.** Albert G. Hugan and Robert V. Boucher. *Mo. Agr. Expt. Sta., Research Bull.* 198, 3-24(1933).—Simplified diets adequate for rats are grossly inadequate for young chicks. A synthetic diet contg. the usual percentage of yeast proved inadequate, and was improved only by the addn. of more yeast. The addn. of vitamins A and D had no effect. Various sol. supplements were examd. in an attempt to discover the factor in which yeast is deficient. The B<sub>12</sub>O ext. of egg yolk, tiki tiki ext., acid-hydrolyzed yeast and liver ext. contain the factor in varying amts. However, 10% of liver ext. was required in the ration to render the latter adequate for chicks. It is believed that each of the vitamin carriers contains an essential factor which is not present in the others in large amts. A successful ration was formulated which contains all the vitamins in sol. form. The carriers are acid-hydrolyzed yeast, the B<sub>12</sub>O ext. of egg yolk, a liver ext., and tiki tiki. This ration was adequate for 1, and probably for 2, generations.

C. R. Fellers

**Factors influencing the vitamin B and vitamin G contents of hays.** Charles H. Hunt, P. R. Record, W. Wilder and K. M. Bethke. *Ohio Agr. Expt. Sta., Bimonthly Bull.* 18, 104 6(1933).—As the hays mature, the protein and vitamin G contents decrease and the quality becomes poorer. A high protein content and a good green color are correlated with a high vitamin G content, provided all other factors are the same during curing. Rain removes more vitamin G and color than protein. Colorado alfalfa meals did not have a higher protein or vitamin G content than Ohio products.

C. R. Fellers

**Should the mineralization and vitaminization of milk become general?** W. E. Krauss. *Ohio Agr. Expt. Sta., Bimonthly Bull.* 18, 126 9(1933).—The question is answered in the negative, though the desirability of adding vitamin D to milk to help lower the present high incidence of rickets in children is granted.

C. R. Fellers

**Sorghum silage as a source of vitamin A for dairy cows.** C. C. Copeland and G. S. Fraps. *Tex. Agr. Expt. Sta., Bull.* 473, 12 pp.(1932).—Butter fat from a cow fed only cottonseed meal and hulls for a long period contained only 2.5 units of vitamin A per g. Cows restricted to cottonseed meal and hulls became ill and suffered from night blindness. The disease was cured by adding either fresh green grass or cod-liver oil to the ration, showing the animals were suffering from vitamin A deficiency. When sorghum silage was fed in large quantity there was scarcely sufficient vitamin A to maintain health or to produce butter fat of normal vitamin A potency. Cows receiving pasture in addn. to cottonseed meal, hulls and sorghum silage gave milk 9 times as rich in vitamin A as cows not receiving pasture. An est. that the cow received 106,000 units a day of vitamin A but produced only 1900 units a day indicates that the dairy cow has a high requirement for vitamin A, either on account of destruction during the process of digestion or high maintenance requirements during lactation, or both.

C. R. Fellers

**Studies on the nutritive value of oysters.** E. J. Coulson. U. S. Dept. Commerce, Bur. Fisheries, *Investigational Rept.* 17, 30 pp.(1933); cf. *C. A.* 27, 123.—Hemato-

poiesis progressed at the same rate when the rats were fed either dried oysters, an acid soln. of oyster ash, or a soln. contg. only Fe, Cu and Mn. The inorg. elements present in the oyster are responsible for its antianemic potency. The effectiveness of the oyster in nutritional anemia can be accounted for on the basis of its Fe, Cu and Mn contents and these metals are in a form easily available for blood-building purposes. The oyster is equaled or exceeded only by liver in the amts. of Fe and Cu that it furnishes to the diet in an av. serving. These metals in the oyster are readily used by animals for hemoglobin production. The antianemic potency of oysters is correlated with their Fe content. Green oysters are not better sources of Fe. The Fe and Cu contents of oysters are correlated with the Fe and Cu contents of the food they consume.

**Inactivity of "nuoc-mam" in experimental beriberi.** H. Violle and E. R. Rosé. *Compt. rend. soc. biol.* 114, 255-7(1933).—Nuoc-mam, a hydrolyzed protein product used as a food in the Orient, had no effect on exptl. polyneuritis in pigeons.

L. E. Gilson

**Determination of the vitamin C value of ascorbic acid.** Kathleen Mary Key and Barbara Gwyneth Emily Morgan. *Biochem. J.* 27, 1030-5(1933).—On the assumption that lemon juice contains a const. amt. of vitamin C (and there is no conclusive evidence that it has) the ascorbic acid appears to have about 1/2 the antiscorbutic potency of most of the samples examd. by other workers.

Benjamin Harrow

**The potentials of ascorbic acid.** David F. Green. *Biochem. J.* 27, 1044-8(1933).—The potentials of ascorbic acid, like those of glutathione, do not depend upon the concn. of oxidant. Addn. of oxidant to a soln. of reductant is without effect on the final potential. However, the potentials of glutathione, unlike those of ascorbic acid, depend upon the abs. concn. of reductant. The colorimetric measure of glutathione potentials is more pos. than the potentiometric measure. The reverse is true for ascorbic acid. Between  $pH$  3 and 8, the empirical equation,  $E_A = +0.375 - 0.000 pH$ , holds for ascorbic acid. G. has confirmed the presence of ascorbic acid in lemon juice by potentiometric measurements.

B. Harrow

**Influence of fat-soluble vitamin upon the amounts of cholesterol bodies in the bile in rabbits.** Senji Kusaka. *Japan. J. Gastroenterol.* 5, 31-5(1933); cf. *C. A.* 27, 1384.—From very limited data Kusaka claims the liver excretes the excess cholesterol from the blood of rabbits.

C. M. McCay

**Protein and vitamin B. I. Vitamin B and the alimentary equilibrium in the utilization of proteins in the organism.** Raoul Leroq. *Bull. sci. pharmacol.* 40, 470-8(1933); cf. *C. A.* 27, 2714.—Diets high in carbohydrates accelerate the appearance of symptoms of B deficiency, whereas lipoids delay it. Polyneuritis appears still later, when proteins are given, which are as rapidly assimilated as sugar (peptones). The addn. of yeast and peptone and absence of sugars cure the avitaminosis; however, this is permanent only if a strict alimentary equil. is obtained. Avitaminosis developed with a large supply of peptone is relieved when the latter is substituted by non-peptonized protein. II. The development of avitaminosis B in the pigeon in relation to the digestibility and nature of the proteins in the diet. *Ibid.* 527-31.—Fibrin, muscle protein and egg albumin have been investigated, both in natural and peptonized form. A definite influence on the development of avitaminosis B has been observed. The quantity of B required for the utilization of the proteins is in relation to the rapidity of intestinal absorption and the structure of the protein. The natural proteins have a vitamin-B-saving action, but not the peptones.

A. E. Meyer

**Carotene and vitamin A.** Luis N. Pizzorno. *Rev.*

farm. (Buenos Aires) 75, 281-93(1933).—A review.

**Fundamental food requirements for the growth of the rat. VII. An experimental study of inheritance as a factor influencing food utilization in the rat.** H. P. Morris, L. S. Palmer and Cornelia Kennedy. *Minn. Agr. Expt. Sta. Tech. Bull.* 92, 56 pp.(1933); cf. *C. A.* 25, 2408.—Two lines of inbred rats, descendants of a single pair of animals, were selected for different levels of efficiency of food utilization; diet and environment were kept const. through 9 generations. At that point the lower efficiency line was more variable and about 40% less efficient than the high efficiency line. Complex heritable factors influence efficiency of food utilization. The female rat consumes more dry matter per unit of gain per unit of body wt. than does the male. The efficiency quotient (cf. Palmer and Kennedy, *C. A.* 25, 2408) of the female was 1.7 times that of the male. The female carcass was higher in dry matter, fat and ash, and lower in N and fat-free dry matter than the male. No significant relationship was found between length of intestine and amt. of dry matter consumed. The correlation coeff. between gain and dry matter consumed was  $+0.68 \pm 0.03$ , and  $+0.64 \pm 0.03$  for males and females, resp. The efficiency quotients of the males were higher and less variable than the females in 2 three-week periods. Conclusion: The male rat is more desirable than the female for use in growth studies, and selection and in breeding may be useful in securing a more uniform lab. animal.

**Comparative study of the paired and ad libitum feeding methods for determining amino acid deficiencies of feeds.** C. L. Shewsbury and J. W. Bratzler. *J. Assoc. Official Agr. Chem.* 16, 582-4(1933).—Data culcd. statistically according to the method of Student (*Biometrika* 6, 1 (1908)), from nutrition expts. with rats in which the paired and ad libitum feeding methods were employed, indicate that the paired feeding method, in which feed consumption was equalized, gives the more trustworthy results.

A. Papineau-Couture

**Experimental scurvy. XVI. Purine metabolism of guinea pigs fed on a vitamin C free diet.** Kozo Tomita. *Sei-i-kwai Med. J.* 51, No. 7, 1-12(1932) (English Abstract 1).—The animals were fed Sherman's vitamin-C-free diet plus raw white radish for 6 days, the urine from each 2 days being analyzed for total N,  $\text{NH}_3$  N, urea N, uric acid, allantoin and purine bases. From the 7th day on, raw radish was replaced by boiled, and a similar urinary analysis made. The results show that total N, purine bases, including uric acid and allantoin, gradually decrease in the course of scurvy, but increase at the terminal state, except uric acid. Urea runs parallel with total N, but  $\text{NH}_3$  increases with the progress of the disease. The uricolytic index and the purine base coeff. are gradually decreased, but return to normal at the end. Since changes of purine metabolism in scurvy are similar to those in the case of inanition, these results may not necessarily indicate specific metabolism in scurvy. S. T.

**Elementary composition and caloric value of the fatty acids of the phospholipins of human skeletal muscle.** David P. Cuthbertson. *Biochem. J.* 27, 1099-1102(1933).—The av. values given in percentage were C 76.03, H 11.98, O 11.99. The R. Q. was 0.709; the calorific value was 9.521 per g. at const. pressure; and the caloric equiv. of 1 l. of O at const. pressure was 4.75 cal. The av. I value was 111.

**The degree of unsaturation of the fats of human adipose tissue in relation to depth from skin surface.** David P. Cuthbertson and Sidney L. Tompsett. *Biochem. J.* 27, 1103-6(1933).—The av. I values of the fats of the panniculus adiposus abdominalis, omental, perinephric, epicardial and liver tissues of normal men are 70, 63.5, 63, 61.5 and 127, resp. In obese women the av. I values for the fats of the outer and inner layers of the panniculus adiposus abdominalis, the omentum, the perinephric and liver fats are 70, 70, 69, 63 and 89, resp.

**Inorganic constituents of cerebrospinal fluid IV. The potassium in serum, serum-ultrafiltrate and cerebrospinal fluid.** Elsie Watchorn and Robert A. McCance. *Biochem. J.* 27, 1107-12(1933); cf. *C. A.* 26, 3558.—The whole of the K of serum is found to be ultrafiltrable and the level of K found in hydrocele, pleural and ascitic fluids may be explained in this way. The K in cerebrospinal fluid is lower than that in serum.

**A comparison of the clearances of creatinine and of various sugars.** H. L. White and Betty Monaghan. *Am. J. Physiol.* 106, 16-27(1933).—In unanesthetized dogs without phlorhizin the clearance of xylose is less than that of sucrose, which is less than that of creatinine. The effect of phlorhizin on the rates of excretion is best interpreted as an action on glomerular circulation and on tubular reabsorption of xylose rather than as an effect on tubular secretion of creatinine. The clearance, either of glucose under phlorhizin, or of creatinine represents a better measure of glomerular filtration than does either sucrose or xylose, which give figures 15 to 45% too low.

**Surface area in a monkey, *Macacus rhesus*.** M. O. Liss and P. L. Liss. *Am. J. Physiol.* 106, 91-4(1933).—Measured skin areas of 6 monkeys conform to the formula  $S = 11.7 W^{.667}$ , in which S = surface in sq. cm. and W = wt. in g.

**Absorption of water by fatigued or otherwise impaired skeletal muscle cells in relation to heat rigor.** G. D. Shaver. *Am. J. Physiol.* 106, 115-24(1933).—Fatigued skeletal muscle cells have an increased osmotic pressure; they take up water from their tissue fluids and go into heat rigor at a lower temp. than do normal non-fatigued muscles.

**The excretion of cesium by the albino mouse.** C. F. Graham and A. W. Wright. *Am. J. Physiol.* 106, 314-17(1933).—In the 24-hr. period following the subcutaneous injection of 0.026 mg. CsCl, albino mice excrete 17.5-20% of the Cs, and in the second 24-hr. period a further 3% is excreted. The urine contains 84-85% of the excreted Cs and the feces 15-16%.

**Lactic acid formation in medullated nerve.** F. O.

Schmitt and C. F. Cori. *Am. J. Physiol.* 106, 339-49(1933).—Frog nerve, freshly removed or kept in air, contains about 33 mg. of lactic acid per 100 g. tissue. In H or in a mixt. of CO and O, 94:6, the nerve forms lactic acid at a rate of about 20 mg. per 100 g. per hr. Lactic acid which has accumulated in H or CO may be partially removed upon readmission of O. Stimulation of the nerve in CO:O mixt. results in the formation of no excess lactic acid as compared with the unstimulated control.

**Blood lactic acid in man during rest.** L. C. Cook and R. H. Hurst. *J. Physiol.* 79, 443-54(1933).—Wide variations in blood lactic acid at rest were observed. These variations are due to stimulation or depression of glycolytic activity and assist the organism to maintain a const. blood reaction.

**Adrenaline in the suprarenal medulla.** H. Schild. *J. Physiol.* 79, 455-69(1933).—The existence of adrenaline in the adrenal gland as a complex, novadrenine, of enhanced activity, is not confirmed.

**The respiratory quotient of the eviscerate cat.** J. M. Peterson. *J. Physiol.* 79, 508-18(1933).—In the decerebrate-eviscerate cat, the loss of CO<sub>2</sub> from the blood and the accumulation of lactate therein are stoichiometric. High respiratory quotients, obtained with such animals, are elevated above the true value by the CO<sub>2</sub> displaced from the tissues.

**Physicochemical theory of growth.** Ludwig v. Bertalanffy. *Biol. Zentr.* 53, 639-45(1933).

**Problem of the terminology of vitamins.** Joachim Kuhnau. *Z. Vitaminforschung* 1, 184(1932); *Bull. soc. chim. hyp. aliment.* 21, 294. —A review.

## G - PATHOLOGY

H. GIDRON WELLS

**Effect of irradiating nongoitrogenic cabbage.** J. J. Westra and Viola Hunter. *Proc. Soc. Exptl. Biol. Med.* 30, 1157-8(1933).—Finely hashed nongoitrogenic cabbage was exposed in thin layers 50 cm. from a Cooper-Hewitt Hg vapor lamp for 30-120 min.; rabbits fed exclusively on this cabbage for 12 weeks did not develop goiter.

**Lipolytic activity of rat lepromas during treatment with various antileprotics.** George Emerson, H. H. Anderson and C. D. Leake. *Proc. Soc. Exptl. Biol. Med.* 31, 18-20(1933).—The low lipase content of rat lepromas and of other tissues of infected rats (cf. *C. A.* 27, 4293) is probably due to the invasion of normal tissue by great nos. of *Mycobacterium leprae muris*, organisms which seem to be devoid of lipase. The lipolytic activity of lepromas was unchanged after treatment for 6 months with each of the following antileprotic drugs: ethyl chaulmoograte, "alepol," ethyl diheptylacetate, Na dihydrochaulmoogryl-p-phenetidine-sulfonate and Na chaulmoogryl-p-phenetidine-sulfonate.

**The chemical nature of the toxin in intoxications due to protein decomposition.** H. Lieb and E. Schadendorff. *Arch. exptl. Path. Pharmacol.* 172, 343-58(1933).

**Carbohydrate metabolism in Addison's disease.** O. Porges and D. Adlersberg. *Arch. exptl. Path. Pharmacol.* 172, 433-43(1933).—The blood-sugar level in most cases of Addison's disease is at the lower limits of normal. The hypoglycemic phase of the alimentary hyperglucemia was accentuated in 1 case. A carbohydrate-poor diet causes hypoglycemia in these patients. Cortical adrenal hormone causes the carbohydrate metabolism to return toward normal.

**Conductivity measurements upon normal and pathological serums.** Felix Steiger-Waldt and Bruno Reiser. *Arch. exptl. Path. Pharmacol.* 173, 15-25(1933).—The sp. cond. of normal serum is 0.0146-0.0155, largely detd. by the NaCl concn. The serum of carcinomatous patients shows a decreased cond. in 75% of the cases. The effect of various factors upon the sp. cond. of serum is discussed.

Harry Eagle

**The chlorine metabolism in Basedow's disease.** Franz Heermann. *Arch Verdauungskrankh* 54, 176-82(1933) — In severe Basedow's disease there occurs achylia, which does not disappear upon the administration of histamine. The Cl concn of the gastric contents is low, and varies irregularly after the administration of a test drink or of histamine. The blood Cl never rises after the test drink or histamine, but occasionally falls to very low values.

Harry Eagle

**The diagnostic value of serum protein changes in kala-azar.** M. R. Guruswami Mudaliyar, S. K. Sundaram and A. S. Ramachandran. *Indian J Med Research* 21, 361-78(1933) — In kala-azar the serum globulin increases, the albumin decreases and the proportion of euglobulin to total globulin increases. The ratio of serum protein and the albumin/globulin ratio is of value but is not absolutely diagnostic, as similar changes are observed in other diseases.

Harry Eagle

**Studies on the antigenic structure of vibrio cholerae.** III. Further analyses of specific carbohydrates. Richard W. Linton and D. L. Shrivastava. *Indian J Med Research* 21, 349-84(1933). cf. *C A* 27, 5400. — Of the carbohydrates prep'd from the 10 strains of vibrios so far exam'd, 5 yielded galactose upon hydrolysis and 5 yielded arabinose. It is significant that with only 2 exceptions, the vibrios derived from cases of cholera yielded galactose, and the strains obtained from water yielded arabinose. IV. A preliminary examination of carbohydrates in the rice water stools of cholera patients. Richard W. Linton, D. L. Shrivastava and B. N. Mitra. *Ibid* 385-8. Polysaccharides were isolated which upon hydrolysis yielded reducing sugars tentatively identified as galactose and arabinose.

Harry Eagle

**Disturbances in the lipid metabolism in hereditary diseases of the central nervous system.** W. Spulmeyer. *Klin Wochschr* 12, 1273-6(1933). A review. H. I.

**The adsorption, elution and adsorptive separation of haptens.** Hermann Rudy. *Klin Wochschr* 12, 1273-4(1933). — A review. Harry Eagle

**The serodiagnosis of tuberculosis.** Adolf Beck and Otto Schiedtler. *Klin Wochschr* 12, 1280-2(1933). Seventy % of cases of pulmonary tuberculosis and 5% of extrapulmonary tuberculo- give pos complement fixation tests with the Witbsky-Klingenstein-Kuhn antigen, 45% of non-tuberculous controls also reacting pos. The pptn test of Ichimann-Lam-Feschke is more sensitive but gives 11% false pos reactions.

Harry Eagle

**Iodine metabolism in thyroid disease.** I. Schefter. *Klin Wochschr* 12, 1285-6(1933). — A preliminary report. In Basedow's disease the excretion of I daily exceeds the intake, while normally they are in approx balance. In simple goiter, the normal excretion of I in the urine and skin is reduced, while the fecal excretion is somewhat increased. Whether the I is actually retained in the body in such cases or is excreted in the expired air is as yet unknown.

Harry Eagle

**A new substrate for a blood test for syphilis.** Hans J. Fuchs, M. v. Lilkenhausen and H. Kowatzky. *Klin Wochschr* 12, 1288(1933). A preliminary report.

Harry Eagle

**The blood-sugar level in experimental hypertension.** Erwin Netter. *Klin Wochschr* 12, 1317-18(1933). — Removal of the nerves from the aortic and carotid sinus in dogs and rabbits causes a lasting hypertension. The blood sugar in these animals is not increased, and they show normal endogenous adrenaline hyperglucemia upon the injection of morphine. The hypertension is, therefore, not due to an increased secretion of adrenaline.

Harry Eagle

**The pathogenesis of hypertension.** H. Marx and K. Hefke. *Klin Wochschr* 12, 1318-22(1933). — Autx of the blood of patients with acute nephritis and secondarily contracted kidneys have a pressor effect when injected intravenously into dogs. There is no parallelism between the efficacy of the ext and the degree of hypertension. Similar exts from patients with essential hypertension were ineffective.

Harry Eagle

**The production of specific tumor antibodies after the injection of serum containing tumor antigen.** Hans J. Fuchs and Hugon Kowatzky. *Klin Wochschr* 12, 1334-5(1933). — A preliminary report. Harry Eagle

**Hepatic insufficiency and amino acid metabolism.** K. Hirsch and Ch. Suveret. *Klin Wochschr* 12, 1357-8(1933). In hepatic insufficiency, the intravenous injection of 1 g glycine is not followed by an increase in the urine urea content, the rise in the blood amino N persists for more than 2 hrs instead of 20 min, and the bound amino N in the blood initially high, falls over a period of hrs instead of increasing as in normal subjects.

Harry Eagle

**The alkali reserve of the blood and local acidosis in bone tuberculosis.** B. Koldayev and M. Akhuker. *Klin Wochschr* 12, 1375(1933). In cases of bone tuberculosis without secondary infection, the alkali reserve of the blood is high and the  $pH$  of the exudate does not differ from that of normal tissue fluid. In cases with mixed infection, the local exudate is distinctly acid ( $pH$  as low as 7.8) and the alkali reserve of the blood is correspondingly low.

Harry Eagle

**The significance of the posterior pituitary lobe for the appearance of eclampsia.** H. Ohligsmacher. *Klin Wochschr* 12, 1401-5(1933).

Harry Eagle

**Complement fixing antibodies in human organs.** Alexandra Stöhl and Alfred Waisitzky. *Klin Wochschr* 12, 1433-4(1933). — In children dying of diphtheria at various intervals after the therapeutic administration of horse antitoxin complement fixing antibodies against horse serum were most often demonstrated, and in the highest amt in the spleen and thymus. The liver contained less antibody and the skin least of the 4.

H. L.

**The pathogenesis of the experimental acute and erosive gastritis caused by the parenteral administration of various pharmaceutical agents (morphine, pilocarpine, caffeine).** Ilan Hanke. *Klin Wochschr* 12, 1524-6(1933). — The subcutaneous injection of large quantities of morphine, caffeine and pilocarpine into rats causes the appearance of erosive lesions in the stomach duodenum and esophagus which seem peptic in origin and are ascribed to the sudden liberation of very acid gastric juice.

Harry Eagle

**Post splenectomy polycythemia in hemolytic jaundice.** M. Netousck. *Klin Wochschr* 12, 1529-31(1933). A case report.

Harry Eagle

**The significance of the examination of the gastric contents for the diagnosis of duodenal ulcer.** Reply to Heinz Kalk. G. C. Loria. *Klin Wochschr* 12, 1531(1933). cf. *C A* 27, 5100.

Harry Eagle

**The effect of a high protein diet in nephrosis.** G. C. Meyer and St. Weber. *Klin Wochschr* 12, 1566-9(1933). A high protein diet (180 g animal protein daily) given to patient with nephrosis over a period of 4 to 10 days does not affect the low serum albumin, but does increase the daily urinary excretion of protein by 40 to 100%. Diuresis increased, and body wt therefore falls.

Harry Eagle

**The effect of cephalin and heparin upon the formation of antibodies.** K. Pickar. *Klin Wochschr* 12, 1674-8(1933).

Harry Eagle

**The appearance of an estrogenous substance in the blood and tissues under pathological conditions.** VI. Comparison of the estrogenous substances demonstrable in the blood and organs. F. Silberstein, P. Ingel and K. Mohr. *Klin Wochschr* 12, 1693-4(1933). cf. *C A* 26, 2745-2748. The estrogenous substance sol in 10% NaOH and acetone which appears in the blood of male dogs after ka irradiation is more conc'd in the blood than it is in the liver, lungs, kidney, adrenals or heart. VII. The destruction of menformone in the blood and organs. *Ibid* 1691-5. Blood or an emulsion of liver tissue from male dogs renders relatively large quantities of menformone inactive.

Harry Eagle

**The lactic acid metabolism in disturbed thyroid function.** I. Variations of the blood lactic acid level after injections of lactate. Katsutaka Kato. *Tôhoku J Exptl Med* 21, 24-30(1933). — The oxidation and re-synthesis of Na lactate injected intravenously are

disturbed in hyperthyroid and thyroidectomized rabbits, and in cases of Basedow's disease. II. Lactic acid and gas metabolism during muscular work. *Ibid.* 257-79.—The increase in the blood lactic acid level and O consumption caused by muscular contraction is more pronounced in hyperthyroid rabbits than in normal animals. Resynthesis of lactic acid is delayed, and the O debt incurred by exercise correspondingly greater. The R. Q. is decreased in these animals by exercise. In thyroidectomized animals the effect of exercise upon the blood lactic acid level, O consumption and CO<sub>2</sub> output is not significantly abnormal. III. The lactic acid metabolism in the liver after the injection of lactate. *Ibid.* 280-97.—The lactic acid content of arterial, portal and venous (hepatic vein) blood normally decreases in the order named, indicating that it is resynthesized to glycogen during its passage through the liver. The intravenous injection of Na lactate causes all 3 values to increase without affecting their relative magnitude. In hyperthyroid rabbits the order is reversed (venous > portal > arterial) and the injection of lactate again does not affect their relative magnitude, evidence that glycogen is being mobilized more rapidly than it is resynthesized. Thyroidectomized animals behave like normal rabbits except for a particularly large increase in the lactic acid content of the hepatic vein after the injection of the lactate, because of its slow resynthesis in the liver. Harry Eagle

**Organ-specificity.** Tetsurō Ishikawa and Hiroyuki Yamamoto. *Tōhoku J. Exptl. Med.* 21, 524-31 (1933).—As detd. by pptn. tests, with rabbit antiserum vs. cross red cell nuclei as antibody, the lens, vitreous humor and cornea of fish, the lens and vitreous humor of fowl and the naked nuclei of fowl red cells contain a common antigenic factor. The nuclei of the hepatic cells, freed of protoplasm by peptic digestion, are organ-specific; that is, upon injection into rabbits an antibody is formed which reacts specifically with similar nuclei of dog, rabbit or fowl liver cells, but not with the intact cells of any of these species. Harry Eagle

**The organic-specificity of a hemoglobin-precipitating antiserum.** Kahoru Yorimitsu. *Tōhoku J. Exptl. Med.* 22, 1-6 (1933).—Exts. of rabbit or guinea-pig leucocytes, or exts. of rabbit testicle carefully freed of hemoglobin and injected intravenously into rabbits, guinea pigs or ducks, cause the appearance of pptg. antibodies reacting with aq. exts. of the homologous red cell. Harry Eagle

**The peculiarity of thyroid extracts in cases of Basedow's disease with respect to the increase in oxygen consumption.** I. The increased oxygen consumption in rabbits following the injection of thyroid extracts from cases of Basedow's disease, [commercial] thyroid preparations and extracts of normal glands. Kenji Saito. *Tōhoku J. Exptl. Med.* 22, 85-104 (1933).—The subcutaneous injection of 1/2 0.3 mg. thyroxine into rabbits causes a 20% increase in the rate of O consumption in 8-24 hrs. The injection of "Thyreoglandol" and of aq. or EtOH beef thyroid exts. had similar but less pronounced effects. Exts. of the goiter of patients with Basedow's disease were less active than normal exts. but much more toxic, causing loss of appetite, diarrhea, loss in weight, restlessness, etc. There seemed to be some parallelism between the increased basal metabolism in the patient and the increased O consumption caused by exts. of the gland in rabbits. II. Variations in the oxygen consumption of rabbits after the injection of splenic extracts, spleen preparations and solutions of potassium iodide. *Ibid.* 105-15 (1933).—All cause a decreased rate of O consumption. Large doses of KI (70-100 mg./kg.) cause a slight increase, while even larger doses are toxic. Harry Eagle

**Serum proteins in pulmonary tuberculosis.** Iwao Sato. *Tōhoku J. Exptl. Med.* 22, 116-25 (1933).—The globulin-albumin ratio increases in pulmonary tuberculosis in proportion to the extent and severity of the inflammatory process. There is no quant. correlation between this ratio and either the sedimentation rate of the red blood cells or the complement-fixation reaction. Harry Eagle

**The carbohydrate metabolism in pulmonary tuberculosis.** Seisuke Shimizu. *Tōhoku J. Exptl. Med.* 22, 132-48 (1933). Harry Eagle

**Studies on the colloid-osmotic pressure of the blood in normal and pathological conditions.** VIII. The colloid-osmotic pressure in experimental ileus. Jiro Izumi. *Tōhoku J. Exptl. Med.* 22, 149-58 (1933).—In exptl. ileus in rabbits, produced by artificial closure of the pylorus, ileum, duodenum or rectum, the serum protein concn. increases, but the colloid-osmotic pressure per unit protein decreases. Harry Eagle

**The quantity of the glomerular filtrate.** II. Glomerular filtrate in cardiac insufficiency and hypertension. Fusakichi Nakazawa, Jiro Izumi and Ichiya Seki. *Tōhoku J. Exptl. Med.* 22, 159-66 (1933).—The quantity of glomerular filtrate and creatinine excretion decrease in cardiac decompensation in proportion to the degree of decompensation. Cases of hypertension fall into 2 groups: those without kidney involvement (essential hypertension) have only a slight decrease in glomerular filtrate and creatinine secretion; those associated with kidney disease have a const. decrease in both factors. In the latter group, there may be a decreased tubular reabsorption, with resultant polyuria, despite the decreased glomerular filtration. Harry Eagle

**Changes in glucemia provoked by surgical operations.** J. P. Lamarque, M. Larget, F. Darnis and R. Lecoq. *Bull. soc. chim. biol.* 15, 1124-45 (1933); cf. C. A. 26, 5143.—Operations under anesthesia are often followed by hyperglucemia, especially if the sympathetic nerves are excited. In the cases reported good results were obtained by giving 15 units of insulin. L. E. Gilson

**Action of metallic nickel on normal human blood serum.** Adeline Siegler. *Compt. rend. soc. biol.* 114, 282-3 (1933).

Normal human serum which has been in contact with metallic Ni for several hrs. shows a pos. complement-fixation reaction with syphilitic and other antigens. Horse serum is much less affected by Ni, and the action of Ni on human serum is very slight at 0° or *in vacuo*. Physicochemical determinations on human serum left in contact with metallic nickel. Adeline Siegler and Eugénie Soru. *Ibid.* 283-5. The physicochem. consts. of the treated serum were detd. In time the Ni reacts with the euglobulin, forming a ppt. Action of metallic nickel on ultrafiltrate of normal human serum and solutions of its components in respect to the modified Hecht reaction. *Ibid.* 310-12.—The protein-free ultrafiltrate, after several hrs. contact with Ni, gave a positive modified Hecht reaction. Other expts. are mentioned. L. E. Gilson

**Influence of the antagonism of ions on hemolysis.** Edward Falik. *Compt. rend. soc. biol.* 114, 355-7 (1933); cf. C. A. 27, 333.—The effects of various mixts. of the chlorides of Ca, Ba, Sr, Mg, Co, Ni and Mn on hemolysis were studied. L. E. Gilson

**The polysaccharides from cultures of Proteus X.** H. Meisel and E. Mikulaszek. *Compt. rend. soc. biol.* 114, 364-8 (1933).—Polysaccharides were isolated from cultures of diverse strains of *Proteus X* and used as antigens in complement-deviation reactions. In some cases the reactions were very specific. L. E. Gilson

**Action of lecithin on the fractionation of antitoxic serums and the transformation of pseudoglobulin into euglobulin.** I. Pirotsky and F. Modern. *Compt. rend. soc. biol.* 114, 387-9 (1933). L. E. Gilson

**Bile secretion in experimental uremia.** Etienne Chabrol, R. Charonnat, M. Maximin and Jean Cottet. *Compt. rend. soc. biol.* 114, 464-6 (1933).—Normal dogs and dogs with ligated ureters were used. The urea content of the bile varied with that of the blood and was usually the same or slightly lower. L. E. Gilson

**Influence of ligation of the portal vein and its branches on glucemia in the dog.** Noël Ficssinger and R. Cattau. *Compt. rend. soc. biol.* 114, 483-6 (1933).—Ligation of the veins causes a marked hyperglucemia. The several factors involved are briefly discussed. L. E. Gilson

**Blood calcium during consolidation of fractures.** J. Perves. *Compt. rend. soc. biol.* 114, 526-8 (1933); cf.

C. A. 26, 5642.—Blood Ca is normally increased during consolidation but in cases of infected fractures it undergoes wide and irregular fluctuations. Numerous graphs are shown.

L. E. Gilson

Uranium nephritis. Polyuria and vasodilation of the kidneys. L. Brull and C. Roersch. *Compt. rend. soc. biol.* 114, 919-20(1933); cf. C. A. 27, 1400.—Previous conclusions were confirmed.

L. E. Gilson

Studies on staphylolysin. J. Forssman. *Biochem. Z.* 265, 291-319(1933).—The staphylolysin activity diminishes directly with diln. and with the increase in the number of red blood cells. Generally its max. effect is exerted upon the cells by preliminary incubation at 37° followed by a low temp. though some cells are hemolyzed almost equally well at 0°. The lysin is adsorbed by the cells if these are in contact for a very long time, but the degree of adsorption is very variable. Even lysin-resistant cells adsorb lysin strongly, while sensitive blood cells, as sheep corpuscles, do not adsorb the lysin at all. There is obviously no relation between the adsorption and hemolysis. At 0° in the case of certain of the lysin-sensitive blood corpuscles there is very rapid adsorption of lysin but the combination is also easily broken.

S. Morgulis

Metabolism of heterotransplanted tumors. Otto Rosenthal. *Biochem. Z.* 265, 413-21(1933).—The carbohydrate metabolism of mouse sarcoma S 37 transplanted into rats is like that of the Jensen rat sarcoma and not like that of the original tumor. This may be interpreted as showing that transplantation is possible either only when the metabolism of the transplant can adjust itself to that of the host, or that the heterotransplant is really made up of host cells which were changed to tumor cells under the influence of the transplanted tumor. S. M.

Potentiometric method for the determination of an antibody-hapten equilibrium. H. Erlenmeyer, E. Berger and M. Leo. *Biochem. Z.* 266, 355-9(1933). The detn. depends upon the reduction-oxidation potential between  $H_2NC_6H_4AsO_3H_2$  and  $H_2NC_6H_4AsO_2H_2$ . Atoxy anti-serum affects only the oxidized phase, leaving the concn. of the reduced phase const., so that addn. of the antibody alters the potential.

S. Morgulis

The diazo compound in typhoid urine. Masaki Miyazaki. *J. Biochem. (Japan)* 18, 379-85(1933).—The diazo reaction of urine is due to antoxyproteinic acid, which though a normal constituent of urine is present in large amts. in certain pathological conditions. Injected intravenously into rabbits, antoxyproteinic acid to a very large degree disappears rapidly from the blood, but only an insignificant amt. is eliminated in the urine. The ext. of feces of typhoid patients as well as of normal persons or those with other diseases gives a strong diazo reaction, so that there is no relationship between a diazo-positive or diazo-neg. urinary reaction and the diazo-positive reaction of feces extract.

S. Morgulis

Is there any relationship between the function of the liver and the decrease in the amount of the complement of the blood in anaphylactic and histamine shock? B. Paul and H. Popper. *Magyar Orvosi Arch.* 34, 371-80(1933).—A decrease in the amt. of complement, resembling that in anaphylactic shock, may be observed during histamine shock. An analogy between histamine shock and anaphylaxis is suggested.

Henry Tauber

Lipids in the liver and blood of rabbits in normal and pathological conditions. Sándor Lajos. *Magyar Orvosi Arch.* 34, 381-401(1933).—Insulin caused a decrease in neutral fats and an increase in phosphatides, of the liver, and the blood. Adrenaline produced a decrease in neutral fats of the blood and an increase in phosphatides. Insulin increased the cholesterol while thyroxine produced a decrease. In P poisoning adrenaline caused an initial decrease with a subsequent rise in total fat of the liver but it was not as marked in the diseased animals as in normals. Insulin produced a more marked decrease in the total fat of the pathol. animals. Thyroxine diminished the liver fat and increased cholesterol and phosphatides, but the lipoids of the blood decreased. The posterior lobe of the pituitary caused a slight increase in

liver fat with a decrease in blood cholesterol and increase in blood phosphatides. Genital hormones are without effect.

Henry Tauber

Chemoimmunological studies on the soluble specific substance of pneumococcus. I. The isolation and properties of the acetyl polysaccharide of pneumococcus Type I. Oswald T. Avery and Walther F. Goebel. *J. Exptl. Med.* 58, 731-55(1933).—Details are given for the isolation of the acetyl polysaccharide (I), the principal difference from other methods being the avoidance of the use of an excess of alkali. I gives solns. of high viscosity; aq. solns. have a sp. rotation of about 270°; I contains 4.85% N, 45% of which is liberated in the  $NH_3$  form with  $HNO_3$  in the cold; alk. hydrolysis gives  $AcOH$ ; I is pptd. by tannic acid but not by  $UO_3(NH_4)_2$ ; hydrolysis of I gives a polysaccharide identical with that hitherto known as the sol. sp. substance. I in highly purified form adsorbs from Type I antipneumococcus serum all demonstrable type-sp. precipitins, agglutinins and protective antibodies. Mice injected intraperitoneally with minute quantities of I develop active immunity to subsequent infection with pneumococcus Type I. The immunity thus induced is type-sp. No type-sp. precipitins, agglutinins or protective antibodies were demonstrable in the serum of rabbits after repeated intravenous injections of the Type I I. The treated rabbits were not immune to subsequent infection with pneumococcus Type I. The immunological significance of I and its possible relationship to the sp. substances isolated from pneumococcus Type I by other workers are discussed.

C. J. West

Serum. Josef Vorschütz. *Ger.* 582,558, Aug. 17, 1933. Immunizing serum is prepd. by introducing the desired microorganisms into a culture medium contg. blood, adding a physiol. NaCl soln. at 37° and leaving for 24-48 hrs. The organisms are then removed by filtration.

## II—PHARMACOLOGY

A. N. RICHARDS

Effect of Antuitrin "S" on weights of the pituitary, adrenal and thyroid. George M. Leiby. *Proc. Soc. Exptl. Biol. Med.* 31, 14-15(1933).—In the oophorectomized rat, the daily injection of 25-50 rat units of Antuitrin "S" (Parke Davis & Co.) for 5-9 days caused an increase in wt. of the pituitary gland 29.7%, of the adrenals 37.5% and of the thyroid 8.4% as compared with controls. Effect of theelin on weights of pituitary, adrenal and thyroid. *Ibid.* 15-17. In the oophorectomized rat the daily injection of 100 rat units of theelin (Parke Davis & Co.) for 6 days caused an increase in wt. of the pituitary 91%, of the adrenals 112.5% and of the thyroids 25%. Combined effect of Antuitrin "S" and theelin on weights of pituitary, adrenal and thyroid in the normal rat. *Ibid.* 17-18. Normal adult albino rats were injected with 2 rat units of Antuitrin "S" and 20 rat units of theelin (Parke Davis & Co.) daily for 9 days, the pituitary glands increased in wt. 22% and the adrenals 27.5% as compared with the controls. Antuitrin "S" alone had a greater effect than when injected along with theelin.

C. V. Bailey

Diuretics and their uses. D. Murray Lyon. *Brit. Med. J.* 1933, II, 853-7.

J. B. Brown

Antagonism in curarization. L. Lapicque and M. Lapicque. *Ann. physiol. physicochim. biol.* 9, 887-96(1933).

Harry Eagle

The effect of adrenaline upon the blood-sugar level in adrenalectomized dogs. R. Carrasco-Forniguera. *Ann. physiol. physicochim. biol.* 9, 905-11(1933).—In adrenalectomized dogs, the injection of adrenaline in pressor doses causes no hyperglucemia; instead, there is a slow fall over a period of 24 hrs., which is probably not related to the adrenaline injection.

Harry Eagle

The action of adrenaline upon the isolated horn of an infantile guinea-pig uterus. L. Launoy. *Ann. physiol. physicochim. biol.* 9, 913-22(1933).

Harry Eagle

The effect of 1,2,4-dinitrophenol in pigeons. J. Cotte. *Ann. physiol. physicochim. biol.* 9, 961-4(1933).—Pri-

marily, dinitrophenol is an excitatory substance. It causes increased cellular oxidation, motor stimulation, peripheral vasoconstriction and central vasodilatation, and a disturbance in the thermoregulatory app. H. E.

Polypnea in pigeons intoxicated with 1,2,4-dinitrophenol. J. Cotte. *Ann. physiol. physicochim. biol.* 9, 965-7(1933).

Chronaximetric studies on the effect of local anesthetics upon motor nerves. Walther Laubender and Magda Saum. *Arch. expl. Path. Pharmacol.* 171, 619-49(1933).

The pharmacology of inflammation. IX. The effect of water- and salt-mobilizing agents upon the inflammatory reaction. Werner Lipschitz and Else Reuter. *Arch. expl. Path. Pharmacol.* 171, 650-67(1933); cf. *C. A.* 26, 3298.—The intravenous injection of NaCl (0.5 g./kg.) into white rabbits inhibits the inflammatory response to mustard oil applied as late as 16 hrs. after the injection. Both NaCl and H<sub>2</sub>O are retained for 24 hrs. after the injection, and although the blood Cl has returned to approx. normal values in 48 hrs., the Cl injected has not been excreted quantitatively at that time. Glucose (7.5 g./kg.) injected as a 25% soln. also inhibits the inflammatory response; this inhibition is observed even if the oil is applied 16 hrs. after the injection, at a time when the body contains less water and salt than before the injection. Salyrgan has no definite effect. The antiphlogistic action of hypertonic crystalloid solns. is not due to the substance as such, but to changes in the water and ion economy of the tissues caused by the injection.

The production of a tonic dilatation and hypertrophy of the right side of the heart in animals by the injection of large quantities of histamine. Eugen Kirch. *Arch. expl. Path. Pharmacol.* 171, 691-715(1933).

The cause of the varying intervals between the intravenous injection of hypnotics and their effects. Karl Klimesch. *Arch. expl. Path. Pharmacol.* 172, 10-17(1933).—Most hypnotics are immediately effective upon intravenous injection; others, e. g., Na barbital and Na phenobarbital, show a variable latent period. This is due to the fact that the effective hypnotic is the free acid; and the Na salts differ in the ease of dissociation within the body.

The effect of mineral waters upon the composition of the blood. I. The effect of Karlsbad water upon the serum calcium level. Emil Stransky. *Arch. expl. Path. Pharmacol.* 172, 149-60(1933).—Rabbits given Karlsbad water instead of cond. water for a 25-day period, the diet being otherwise the same, showed a considerably greater increase in weight and serum solids. The serum Ca was also increased by at least 1 mg. %, the free Ca and the total/free Ca ratio were not significantly affected, the variations being within the physiol. range.

Changes in the electrostatic charge of the tissues as a cause of the so-called vascular permeability. Hans Weden. *Arch. expl. Path. Pharmacol.* 172, 161-9(1933).

Inflamed rabbits' ears perfused with various dyes show an increased vascular permeability only for those with a neg. charge, indicating that the inflamed tissue is more positively charged than normal tissue. This charge contributes to the exudation, increased metabolism and leucocytic infiltration. The action of cinchophen in inhibiting inflammation is ascribed to a decrease in the positivity of the inflamed tissue; and that of Ca is believed to be due to the fact that it prevents the passage of pos. and neg. substances alike.

The effect of various vegetative nerve toxins upon bioelectric processes in isolated ovarian tubes of pigs. Run-ichi Hasama. *Arch. expl. Path. Pharmacol.* 172, 213-26(1933).

Pharmacological studies with derivatives of aminocaffeine. Alfred Fröhlich and Susi Kann. *Arch. expl. Path. Pharmacol.* 172, 272-84(1933).

The effect of tobacco smoking upon dog heart-lung preparations. G. Mansfeld and Katharina Hecht. *Arch. expl. Path. Pharmacol.* 172, 362-72(1933).—Dog heart-lung preps. allowed to "smoke" cigars and cigarettes by

means of a Starling pump show the max. nicotine effects within a few min. The diastolic vol. increases, but the performance of the cardiac muscle is not affected even by large quantities. The most pronounced and invariable effect of the tobacco smoke, appearing almost immediately, is coronary vasodilatation, increasing the rate of flow through the heart as much as 7-fold, an effect which can be reproduced by pure nicotine. The rhythm of the cardiac contractions is not affected.

The reactions of some inhibitors of blood coagulation with calcium ion in aqueous solutions. I. K. Mulli, T. Pillewizer and W. Laves. *Arch. expl. Path. Pharmacol.* 172, 384-8(1933).—Na citrate, "germanin," "liquoid" and "novirudin" all inhibit blood coagulation by combining with Ca<sup>++</sup> to form non-ionizing complexes.

Can one change the concentration of alkali and alkaline earths in the hepatic bile experimentally? Ernst Neubauer. *Arch. expl. Path. Pharmacol.* 172, 393-401(1933).—The concn. of K, Ca and Mg in rabbit bile is approx. const. Na dehydrocholate depresses the Ca and Mg; the Mg salt depresses the Ca concn., but increases that of Mg. The K salt depresses the Ca and Mg and increases the K. Since inorg. salts have no effect upon the cation concns. it seems probable that the dehydrocholates pass through the liver directly into the bile.

The mineral metabolism during salyrgan diuresis. M. Nothmann. *Arch. expl. Path. Pharmacol.* 172, 402-6(1933).—The injection of salyrgan into human beings regularly causes an increased blood K, reaching a max. in 24 hrs., and an increased urinary excretion of K. The blood P does not increase.

The effect of insulin, adrenaline and thyroxine upon galactose assimilation. Leo Pollak and Gabriele Fehér. *Arch. expl. Path. Pharmacol.* 172, 407-28(1933).—Insulin promotes the assimilation of galactose administered by mouth or intravenously. Adrenaline injections promote the assimilation of peroral galactose without affecting that of intravenous galactose. Hyperglucemia caused by the peroral or intravenous administration of glucose has the same effect as adrenaline. Thyroxine inhibits the assimilation of peroral galactose.

The pungent principle of *Polygonum hydropiper* L. W. R. Witanowski and H. P. Krynska. *Arch. expl. Path. Pharmacol.* 172, 463-70(1933).—The ether ext. of the plant contains an ethereal oil with a pungent taste contg. a ketone (polygenon). This ketone forms a cryst. thio-semicarbazone, m. 194-195°, and forms a solid but amorphous Ag salt. The oil causes a fall in blood pressure because of vasodilatation and cardiac insufficiency. It paralyzes and decreases the tension of isolated sections of intestine and uterus.

The action of tonephin and the antagonistic effect of narcotics. M. Haferkorn and L. Lendle. *Arch. expl. Path. Pharmacol.* 172, 501-24(1933).—Tonephin, the pressor fraction of the posterior pituitary ext., is not "sympathicomimetic" like ephedrine, insofar as its action is accentuated by cocaine. Pharmacologically, it lies between ephedrine and adrenaline, acting more directly upon the muscle than the latter. As in the case of adrenaline, its effect upon a frog vessel prep. is decreased by local anesthetics (procaine). Unlike adrenaline, the tonephin effect is also impaired by deep anesthesia (permocton). The mechanism of this antagonism is obscure.

The effect of ammonium chloride upon [salyrgan] diuresis. H. Marx and D. Storch-de Grazia. *Arch. expl. Path. Pharmacol.* 172, 525-34(1933).—Despite large individual variations, NH<sub>4</sub>Cl (3 g. by mouth) approx. doubles the diuretic action of salyrgan in patients with cardiac decompensation.

The cardiac output per beat and per minute of cardiac patients under digitalis (strophanthin) therapy. A. Böger and F. Diehl. *Arch. expl. Path. Pharmacol.* 172, 551-67(1933).

The gas metabolism of the decompensated heart. I. Cardiac insufficiency by histamine. A. Rühl. *Arch. expl. Path. Pharmacol.* 172, 568-85(1933).—In cardiac decompensation caused by histamine (Starling dog heart-

lung prepn.) the O consumption decreases despite the marked cardiac dilatation. The R. Q. increases. There is no relationship between the diastolic vol. and O consumption. The efficiency (cardiac work in proportion to the O consumption) increases, evidence that some of the energy is furnished by anoxic reactions. The O deficiency is ascribed to edematous changes in the capillary walls. Similar changes in the O consumption, R. Q. and capillary walls were observed in spontaneous decompensation.

Harry Eagle

**The pharmacology of optically active secondary butyl alcohol.** Friedrich Viditz. *Arch. expl. Path. Pharmacol.* 172, 608-80(1933).—The isomers of BuOH do not differ with respect to their anesthetic (tadpoles), muscle excitatory or cardiac (frog heart) action. They do differ in enzymic processes. The sapon. of BuOAc by sheep liver esterase is more strongly inhibited by the l-rotatory than by the d-rotatory form; the latter is more readily oxidized aerobically by yeast.

Harry Eagle

**The harmful effect of liquid paraffin and fatty oils upon frogs.** H. Fuhrer and E. Schwarz. *Arch. expl. Path. Pharmacol.* 172, 681-92(1933).—The injection of liquid paraffin, olive oil or "Lebertran" into the abdominal lymph sac of frogs causes vascular emboli and hemorrhages in the lungs, brain, liver and skin.

Harry Eagle

**The causes of the cumulation phenomena of digitalis glucosides. I. Results of physiological methods.** Hellmut Bauer. *Arch. expl. Path. Pharmacol.* 172, 699-736(1933); cf. C. A. 28, 209.—Cumulation phenomena with digitoxin are not due to a prolonged storage and cumulation of the substance in the heart muscle, but are due to a summation of effects. Citalm-Kraft is much less cumulative in its effect than digitoxin, and digalen lies between the 2.

Harry Eagle

**The excretion of barbital and Quadronox.** Hans Schlossmann. *Arch. expl. Path. Pharmacol.* 173, 32(1933). Approx. 70-80% of barbital taken by mouth is excreted in 72 hrs., and 45-50% in 24 hrs. Combination with small doses of antipyretic drugs (Quadronox) does not affect excretion.

Harry Eagle

**The effect of pitressin upon circulation and respiration.** Karl Hartl. *Arch. expl. Path. Pharmacol.* 173, 133-45(1933).—Pitressin causes an increased diastolic pressure and a decreased cardiac min. vol. because of increased peripheral resistance. Because of decreased tissue permeability, there is an increase in the O debt and ventilation vol.

Harry Eagle

**Cholesterol metabolism and chlorophyll.** C. Blumer, T. Gordonoff and L. Reznikoff. *Arch. expl. Path. Pharmacol.* 173, 42-61(1933).—The administration of chlorophyll ("Chlorosan") to rabbits has a favorable therapeutic effect upon the arteriosclerosis induced by the ingestion of a large quantity of cholesterol. Its action is most pronounced when given prophylactically, along with the cholesterol.

Harry Eagle

**The peripheral paralytic action of hypnotics, in particular of the amide and ureide group.** K. Fromherz. *Arch. expl. Path. Pharmacol.* 173, 78-85(1933). II. E.

**The inhibitory action upon parasympathetic nerve endings of compounds resembling atropine structurally.** K. Fromherz. *Arch. expl. Path. Pharmacol.* 173, 86-128(1933). Sixteen substances (the tropic acid ester and other esters of 3-diethylamino-2,2-dimethyl-1-propanol and their deriv.) were examd. for their pharmacol. properties.

Harry Eagle

**Temperature and sensitivity to toxin.** H. Fuhrer and W. Breipohl. *Arch. expl. Path. Pharmacol.* 173, 146-58(1933).—Unlike eulethime, which is 400 times as toxic for frogs at 30° as it is for frogs kept in the cold, physostigmine, adrenaline, sympathol, ephedrine, strophanthin, cymarin, MeOH, EtOH and strychnine do not differ in their toxicity for frogs at 30° and 19°. Picrotoxin is 3 times as toxic for the former as it is for the latter.

Harry Eagle

**Glycogen formation in the liver without insulin, and a theory of substituting carbohydrate.** H. Kosterlitz. *Arch. expl. Path. Pharmacol.* 173, 159-72(1933).—The administration of glucose to pancreatectomized dogs causes

no significant formation of glycogen in the liver in the absence of insulin. Levulose and d-sorbitol do, however, cause the deposition of significant quantities even without insulin. The glycogen content of the heart muscle of diabetic dogs is 1-1 1/2%, unaffected by the administration of glucose.

Harry Eagle

**The effect of arsenic upon the course of gastric digestion.** Richard Frank. *Arch. expl. Path. Pharmacol.* 173, 180-6(1933).—Peroral As (Fowler's soln.) does not cause gastric secretion, but does transiently intensify secretion already in progress. This increased secretion is more pronounced after the absorption of As from the skin, and causes an increased emptying time.

Harry Eagle

**The effects of very small quantities of copper upon the mammalian organism. III. The effect of feeding copper compounds upon the phenylhydrazine anemia of dogs.** Hans Handovsky and Daisy v. Cotzhausen. *Arch. expl. Path. Pharmacol.* 173, 187-91(1933); cf. C. A. 28, 211.—A Cu-tyrosine compd. has a favorable effect, prophylactic and therapeutic, upon phenylhydrazine anemia in dogs.

Harry Eagle

**Detoxication of the thyroid hormone. II.** Frich Hesse, Hans Vonderlinn and Liesbeth Zeppmeisel. *Arch. expl. Path. Pharmacol.* 173, 192-204(1933). Cu acetate, FeSO<sub>4</sub>, As<sub>2</sub>O<sub>3</sub>, Ni(NO<sub>3</sub>)<sub>2</sub> and mineral water protect against and cure the otherwise fatal intoxication of dogs with powd. thyroid and throxine. Ca, I, B, Al, Si, Sr, Fe and NH<sub>4</sub> are ineffective.

Harry Eagle

**The combination of morphine with some local anesthetics for the testing of the participation of the analgesic action of morphine in the total anesthesia.** H. Killian and G. Schworer. *Arch. expl. Path. Pharmacol.* 173, 242-7(1933).—A threshold dose of morphine (barely insufficient to affect the corneal reflex or cause general narcosis) contributes 5, 9 and 25% to the local analgesic action of percaïne, cocaine and procaine, resp., as tested on the rabbit cornea.

Harry Eagle

**The central action of adrenaline upon the blood pressure.** Hans Heller. *Arch. expl. Path. Pharmacol.* 173, 291-300(1933).—The intracisternal injection of 1.5 mg. adrenaline into dogs has very little effect upon the blood pressure. Similar injection into cats causes a definite fall in blood pressure, the degree depending upon the quantity injected. This effect is not prevented by section of the cervical vagus or by atropine. The intracisternal injection of pituitrin into cats protects them from otherwise fatal doses of intracisternal adrenaline, and reverses the adrenaline effect upon blood pressure from depressor to pressor. Adrenaline is not absorbed from the spinal fluid into the blood in cats or dogs.

Harry Eagle

**Experimental changes in the toxicity of digitalis. IV. Experiments with isolated frog hearts and cat heart-lung preparations.** Richard Kohn. *Arch. expl. Path. Pharmacol.* 173, 341-56(1933); cf. C. A. 27, 5814-15.—Concns. of cardiazole, caffeine and theophyllin ineffective *per se* accelerate strophanthin intoxication in frogs. Hypertonic Ringer or urea soln. also accelerates the strophanthin effect. The purines in doses of 0.03-0.2 g. cause a 25% decrease in the amt. of glucosides necessary to cause cardiac cessation in the cat heart-lung prepn. Cardiazole causes a 25% increase in the min. lethal dose in cats, but accelerates the glucoside action in frogs.

H. I.

**Studies on intestinal motility. VI. Total analysis of the alkaloids of the morphine group.** W. Straub and Maxamich Ozaki. *Arch. expl. Path. Pharmacol.* 173, 374-80(1933).—The intestinal action of opium is due largely to its morphine content. None of the opium alkaloids paralyzes intestinal contractions. There is no basic difference in the effect of the isoquinoline and phenanthrene alkaloids.

Harry Eagle

**The effect of urotropine. V. The effect of urotropine upon uterus and intestine.** Ernst Ruickoldt. *Arch. expl. Path. Pharmacol.* 173, 357-62(1933); cf. C. A. 27, 5815.—Uterine tonus and contraction are increased; intestinal tonus is decreased by low concns.; high concns. stimulate contraction. VI. The effect of urotropine upon the blood pressure and isolated frog heart. *Ibid.* 363-9.—The blood pressure increases in warm-blooded animals, and the

performance of isolated frog heart is improved. The effects of ion antagonism,  $\text{CHCl}_3$ , and aconite upon the heart are not affected. In an isolated intestinal prep. it is an antagonist to pilocarpine. VII. The effect of urotropine upon skeletal muscle. *Ibid.* 370 3.—The fatigue time of frog striated muscle is prolonged by urotropine. Harry Eagle

The inhibition of diuresis by hypnotics. Robt. P. Walton. *Arch. intern. pharmacodynamie* 46, 97-104 (1933).—Paraldehyde and Na phenobarbital inhibit diuresis in dogs. The former is a safe anesthetic; the latter is un-safe. "Metrazol" effectively counteracts the depressant action of paraldehyde; picrotoxin is not suitable because effective doses are convulsive. Stimulants do not effectively counteract Na barbital or similar hypnotics which act over a long period and cause motor excitation. Harry Eagle

II. E. The vasomotor and vascular action of ergotamine. C. Hymans and J. J. Bouckaert. *Arch. intern. pharmacodynamie* 45, 129 36(1933). Harry Eagle

Oxygen consumption, respiration, circulation and carbohydrate distribution during pentobarbital anesthesia in dogs. Victor E. Hall and Melville Sahyun. *Arch. intern. pharmacodynamie* 46, 160 8(1933). Pentobarbital anesthesia in dogs does not affect the body temp., O consumption, the glucose or lactate concn. of the blood or glycogen or lactate concn. of the muscle. The respiratory rate and min. vol. increase; the arterial pressure and liver glycogen decrease. The total carbohydrate content of the body decreases approx. 0.25 g./kg. H. E.

The action of urethan and urea on the intestine. Friedrich Beinlein. *Arch. intern. pharmacodynamie* 46, 169-73(1933). Urethan and urea added to guinea-pig intestine in 1:100 or 1:200 concn. cause immediate relaxation due to a direct action on the parasympathetic nerve endings. Harry Eagle

The "sympatholytic" action of a new derivative of dioxane. E. Fournieu and D. Bovet. *Arch. intern. pharmacodynamie* 46, 178 91(1933). cf. *C. A.* 27, 1300. Diethylaminomethylbenzodioxane resembles ergotamine and yohimbine in its pharmacol. properties. Harry Eagle

Comparative actions of sympathomimetic compounds: phenyl and substituted phenyl derivatives, non-phenylic ring compounds and aliphatic amines. M. L. Tainter. *Arch. intern. pharmacodynamie* 46, 192-232(1933); cf. *C. A.* 27, 1400.—A pharmacol. study of 44 compds. There is an extensive bibliography. Harry Eagle

Comparative studies on the toxicity of respiratory stimulants for fish. R. H. Behrens and Kogoro Hiki. *Arch. intern. pharmacodynamie* 46, 233 8(1933).—Although there is no strict parallelism, central respiratory stimulants (cardiazole, camphor, picrotoxin, lobeline, totonine) are generally toxic for fish. Harry Eagle

Pharmacology of potassium permanganate. III. Effect upon blood pressure and heart. S. K. de Jongh. *Arch. intern. pharmacodynamie* 46, 239-48(1933); cf. *C. A.* 27, 5816.—Both  $\text{KMnO}_4$  and  $\text{MnSO}_4$  cause a fall in blood pressure in anesthetized rabbits because of a direct action upon the heart. The active agent is probably a manganous salt formed in the body. Harry Eagle

Comparative actions of various alcohols upon the nervous and muscular excitability. R. Bonnet and Paul Lelu. *Arch. intern. pharmacodynamie* 46, 13-31(1933). Harry Eagle

The pharmacological effect of squill upon the heart. S. de Boer. *Arch. intern. pharmacodynamie* 46, 32-44 (1933).—Toxic doses of squill decrease the contraction rate of frog hearts, the height of systole and the tonus of the ventricles. The ventricular latent period is prolonged. There may be pulsus alternans in either the ventricle or auricle, or a 1:2 ventricular:auricular rhythm. Luciani periods could be demonstrated prior to the final cessation. In general, the toxic manifestations resemble those of digitalis and antiarin. Harry Eagle

The effects of acapnia, anoxemia, carbon dioxide, eserine, prostigmine and numal upon the cardioinhibitory reflexes of the carotid sinus. P. vander Linden. *Arch.*

*intern. pharmacodynamie* 46, 63-75(1933).—Pulmonary hyperventilation and numal inhibit the cardioinhibitory reflexes of the carotid sinus;  $\text{CO}_2$  inhaled in large quantities, eserine, and to a less extent, prostigmine, intensify the reflexes. There is a large bibliography. H. E.

Studies on barbiturates. Theodore Koppany, Wm. S. Murphy and Stephen Krop. *Arch. intern. pharmacodynamie* 46, 76-96(1933).—Barbiturates can be detd. colorimetrically by adding  $\text{Co}(\text{AcO})_2$  and  $\text{Ba}(\text{OH})_2$  dissolved in abs. MeOH to a  $\text{CHCl}_3$  ext. of the unknown. Human beings, dogs and cats excrete 40-90% of barbital taken by mouth in the urine; fowls excrete approx. 30%. The rate and degree of excretion are not affected by diuretics. The excretion of the other barbiturates (dial, neonal, phenobarbital, pernoston and amytal) is less than that of barbital, decreasing in the order named. The blood concn. of barbital in the first 2 hrs. after its administration decreases sharply (fixation by the tissues), followed by a slow decrease (renal excretion). Barbital added to blood *in vivo* or *in vitro* is changed to diethylbarbituric acid. The ratio of plasma:erythrocyte concn. is 3:1. The brain does not store more barbital than other organs. Harry Eagle

Neuromuscular action of some substances of the aniline group. R. Bonnet, F. Faye and G. Mourou. *Arch. intern. pharmacodynamie* 46, 277-84(1933).—Aniline and its Me derivs. (toluidines and xylydines) have a very slight neural and a very pronounced muscular action and must be considered curare-like muscular poisons. With increasing no. of Me groups the slight toxicity for nerves disappears. There does not seem to be any relationship between the toxicity for muscles and the position or no. of the Me groups. Harry Eagle

Comparative action of some substances of the aniline group (aniline, toluidines and xylydines) on cardiac excitability. R. Bonnet and Paul Lelu. *Arch. intern. pharmacodynamie* 46, 285-99(1933).—Aniline and its methylated deriv. are cardiac poisons, decreasing the excitability of the heart muscle. Substitution of a Me group for a H in the benzene nucleus increases the toxicity. *m*-Substituted derivs. are the most toxic of the toluidines, and *m*- or *p*-substituted are the most toxic of the xylydines. Harry Eagle

The action of ephedrine and adrenaline upon diuresis by water, sodium chloride and urea. Edgard Zunz, Olga Vessclovsky and Simon Iagnov. *Arch. intern. pharmacodynamie* 46, 315 46(1933); cf. *C. A.* 27, 3525.—Adrenaline and ephedrine inhibit all 3 types of diuresis. They increase the uric output in fasting dogs and decrease that of Cl. The ingestion of urea tends to increase the Cl output in animals with a previously low Cl excretion due to water diuresis. Adrenaline and ephedrine inhibit this action of urea. They also accelerate the increased uric output following its ingestion, and ephedrine may cause an increased excretion. Harry Eagle

The pharmacology of the Caspian lotus blossom. I. A. Lerman. *Arch. intern. pharmacodynamie* 46, 347-61 (1933).—The EtOH ext. inhibits the contractions of isolated cat intestine and uterus, causes mydriasis in frogs, strengthens systolic contraction in isolated frog hearts, causes a fall in blood pressure in cats, and is a central nervous system stimulant in frogs. H. E.

The tolerance to the parenteral atabrin-plasmochin treatment in malaria. A. E. Eckhardt. *Arch. Schiff-Tropen-Hyg.* 37, 475-9(1933); cf. *C. A.* 27, 778.—The advantage of the intramuscular combined injection of atabrin (0.1-0.3 g.) and plasmochin (0.01-0.03 g.) is the fact that the entire daily dose may be safely given at one time. Harry Eagle

The treatment of malaria with intravenous atabrin. Martin Mayer. *Arch. Schiff-Tropen-Hyg.* 37, 470-84 (1933).—Good results were obtained with the daily injection of 0.3 g. in 9 cc. water for 3 successive days. Harry Eagle

The diagnostic significance of an increase in the blood reticulocyte count following the intramuscular administration of quinine in malaria. Niko Machwladze and M.

**Kurpanova.** *Arch. Schiffs- Tropen-Hyg.* 37, 499-504 (1933).—The intramuscular injection of quinine dihydrochloride into malaria patients causes a markedly increased reticulocyte count, a sp. reaction in malaria not observed in other patients similarly treated. The max. increase is reached 4-5 days after the administration of the drug, and is at least 300-400%. **Harry Eagle**

**The fuadin treatment of schistosomiasis.** **Werner Frégonneau.** *Arch. Schiffs- Tropen-Hyg.* 37, 515-28 (1933).—Report of 124 cases, with excellent results. **Harry Eagle**

**The effect of adsorbents upon gastric secretion.** **R. Pfaffenberg.** *Arch. Verdauungskrankh.* 54, 191-6 (1933).—The effect of adsorbents taken by mouth upon the total and free acids in the gastric juice is very transitory, and is not the explanation of their therapeutic value. **H. E.**

**Anatomical changes of the pancreas after toxic doses of dodeca- and decamethylenediguanidine and the effect of feeding pancreas.** **Zacharias Dische and Helene Goldhammer.** *Arch. Verdauungskrankh.* 54, 319-27 (1933).

Although the administration of dried pancreas by mouth does not protect dogs from fatal doses of the compounds, it does prevent the appearance of widespread histological changes in the pancreas. **Harry Eagle**

**Pharmacological action of certain derivatives of cotarnine.** **Khem Singh Grewal, Bhasheshwar Das Kochhar and Jnanendra Nath Ray.** *Indian J. Med. Research* 21, 249-53 (1933). **Harry Eagle**

**The pharmacological action and antimalarial properties of anhydrocotarnineresorcinol hydrochloride (a derivative of narcotine).** **R. N. Chopra, B. Mukherjee and H. G. M. Campbell.** *Indian J. Med. Research* 21, 255-60 (1933).—The substance has no antimalarial action. **Harry Eagle**

**The pharmacological action of an alkaloid obtained from Rauwolfia serpentina. A preliminary note.** **R. N. Chopra, J. C. Gupta and B. Mukherjee.** *Indian J. Med. Research* 21, 261-71 (1933).—A cryst. alkaloid was prepd. which stimulates intestinal and uterine contractions, causes a fall in blood pressure, and is a cerebral depressant. Its use in folk medicine is thus justified by its pharmacol. properties. **Harry Eagle**

**The pharmacological action of Kurchicine (an alkaloid of Holarrhena antidysenterica).** **R. N. Chopra, J. C. Gupta and G. S. Chopra.** *Indian J. Med. Research* 21, 277-81 (1933).—The alkaloid is a protoplasmic poison like emetine. It stimulates intestinal and uterine contraction, causes a fall in blood pressure, and has a direct depressant action on the heart, in particular, the auricular-ventricular bundle of His. **Harry Eagle**

**The effects of quinine, atabrin and plasmochin on experimentally induced malaria in the Macacus and on some of the pathological changes observed.** **R. Row, N. P. Dalal and G. V. Gollerkeri.** *Indian J. Med. Research* 21, 205-8 (1933). **Harry Eagle**

**The mode of action of quinine in malaria.** **K. V. Krishnan.** *Indian J. Med. Research* 21, 331-42 (1933).—K. concludes that quinine accelerates the multiplication and activity of phagocytic cells, increases the susceptibility of the parasites and infected red cells to phagocytosis by altering their elec. charge, slows down asexual reproduction, increases the output of young red cells and causes the removal of old cells, and finally promotes the formation of humoral antibodies. **Harry Eagle**

**Atabrin, a new therapeutic agent against malaria.** **H. Mauss and F. Mietsch.** *Klin. Wochschr.* 12, 1276-8 (1933).—A review of the chem., pharmacol. and therapeutic properties of atabrin. **Harry Eagle**

**The treatment of thyrotoxic auricular fibrillation with dilitodotyrosine.** **G. W. Parade.** *Klin. Wochschr.* 12, 1320-32 (1933).—Case reports with beneficial results. **Harry Eagle**

**The physiological and therapeutic effect of skin extract A preliminary report.** **Wilhelm Milbradt.** *Klin. Wochschr.* 12, 1335-6 (1933). **Harry Eagle**

**Coramine as a stimulant in experimental intoxications with narcotics.** **Otto Gessner and Adolf Behrends.** *Klin. Wochschr.* 12, 1450-2 (1933).—With salamander

larvae as test objects, coramine was found to be an efficient stimulant in terminating anesthesia by EtOH, chloral hydrate, avertin and veronal. It is also prophylactic, retarding paralysis and accelerating recovery if given before the narcotic. **Harry Eagle**

**The cardiac action of the purine bodies.** **E. Flaum and R. Rössler.** *Klin. Wochschr.* 12, 1489-91 (1933).—Caffeine, theobromine and theophylline increase the cardiac output per beat of dog hearts (Starlinger heart-lung prepn.) experimentally damaged with CO<sub>2</sub>, CHCl<sub>3</sub>, and barbituric acid derivs. Their effects are not due to increased coronary blood flow, but to a direct action on the heart muscle. **Harry Eagle**

**The treatment of heart-block and the Adam-Stokes disease with ephetonine.** **Franz Seebew.** *Klin. Wochschr.* 12, 1648-50 (1933).—Good results are reported in 2 of 3 cases. **Harry Eagle**

**The storage of thorotrast and iron metabolism.** **Georg Barkan.** *Klin. Wochschr.* 12, 1658 (1933).—The injection of thorotrast into rabbits, with the resultant storage of the particles by the cells of the reticulo-endothelial system, does not affect the serum bilirubin or the concn. of readily split or acid-sol Fe in the blood. **Harry Eagle**

**The use of the timing principle for prolonging the action of hypnotics.** **Siegmund Hermann.** *Klin. Wochschr.* 12, 1689-90 (1933).—Allylbutylbarbituric acid is an efficient hypnotic, with no demonstrable cumulative action in rabbits, with a wide therapeutic range, causing prolonged sleep, but only after a long latent period. Attempol, a condensation product of bromodiethylacetylurea with citric acid, acts rapidly, but only for a short period. By administering 0.25 g. Attempol together with 0.015 g. allylbarbituric acid one obtains a considerably prolonged normal sleep in rabbits. If one adds to the foregoing mixt. 0.015 g. of the barbituric acid deriv. specially treated with fatty acids (method not described) so as to prevent gastric absorption, this third portion is acted upon only by the alk. intestinal juices and begins to exert a hypnotic action just as the effect of the other 2 components is wearing off, thus resulting in a considerable prolongation of sleep. **Harry Eagle**

**Clinical experiences with the timed hypnotic agent "Profundol."** **Ed. Gamber and Hedwig Horn.** *Klin. Wochschr.* 12, 1690-2 (1933).—Given to patients in doses of 0.5 g., this compd. (a mixt. of Attempol, allylbutylbarbituric acid and some of the latter protected against gastric absorption by treatment with some fatty acids (see preceding abstr.) induces sleep within 1 hr., lasting for 7 hrs. It is especially valuable in psychiatric sleep disturbances. **Harry Eagle**

**Does radium emanation pass through human skin? Preliminary report.** **A. Janitzky, W. Kaschig, O. Steinke and W. Wichmann.** *Klin. Wochschr.* 12, 1692-3 (1933).—Contrary to previous reports, when human beings bathe in water contg. Rn, the latter passed through the skin, to reach the circulation and be demonstrable in the expired air. **Harry Eagle**

**The effect of heparin upon the Takata-Ara reaction.** **Konrad L. Zirm.** *Klin. Wochschr.* 12, 1695-6 (1933).—Heparin added to serum or ascitic fluid giving a pos. Takata-Ara reaction makes it react negatively. **H. E.**

**The effect of a sarsaparilla preparation (renotrat) in chronic nephritis, with particular reference to the uric acid content of blood and urine.** **Fritz Humpert.** *Klin. Wochschr.* 12, 1696 (1933).—Besides causing subjective improvement, "renotrat" causes an increased urinary excretion of uric acid, with a corresponding fall in the blood uric acid concn. averaging 30%. **H. E.**

**Late harmful effects of thorium dioxide in lymph glands, three years after the intravenous injection.** **Th. Naegeli and A. Lauche.** *Klin. Wochschr.* 12, 1730-1 (1933); cf. C. A. 27, 780.—As late as 3 years after the injection there is no evidence for the excretion of ThO<sub>2</sub> in significant quantities. It is gradually shifted from the original site of deposition to the lymph glands, where it causes widespread necrosis upon reaching sufficiently high concn. Its diagnostic use is contraindicated. **Harry Eagle**

**The absorbability of salicyl compounds through the skin.** 1 H. Benzinger and R. Wyrsh. *Klin. Wochschr.* 12, 1734-5(1933).—After the percutaneous administration of free salicylic acid,  $\frac{9}{10}$  of that excreted in the urine is present in a bound form. In testing the degree of percutaneous absorption of any salicylic compd. by urinary excretion the ester in the urine must therefore be completely hydrolyzed.

Harry Eagle

**The effect of removal of various parts of the central nervous system upon the hyperglucemia caused by pyramidone and magnesium.** Fr. Hogler and F. Zell. *Klin. Wochschr.* 12, 1735-6(1933).—A preliminary report.

Harry Eagle

**The effect of the exclusion of various sections of the central nervous system upon the fasting blood sugar and the alimentary hyperglucemia after the administration of sugar.** Fr. Hogler and F. Zell. *Klin. Wochschr.* 12, 1736(1933).

Harry Eagle

**The effect of various pharmacological agents upon the alimentary hyperglucemia caused by the administration of galactose.** Fr. Hogler and F. Zell. *Klin. Wochschr.* 12, 1736 7(1933).

Harry Eagle

**The hyperglucemic and insulin-antagonistic action of tonephin, pitressin and orasthin.** Hermann Schroeder. *Klin. Wochschr.* 12, 1766 8(1933).—The pressor fractions of posterior pituitary ext. (pitressin and tonephin) are hyperglucemic, explaining the antagonism of the ext. to insulin. The uterus-active principle (orasthin) is inactive in this respect.

Harry Eagle

**The hypoglucemic action of insulin in rabbits after bilateral adrenalectomy or splanchnicotomy.** Fumio Ohmi. *Tôhoku J. Exptl. Med.* 21, 211-20(1933); cf. *C. A.* 27, 4588.—Bilateral adrenalectomy or splanchnicotomy in rabbits increases their susceptibility to the hypoglucemic action of insulin, and increases the incidence of insulin convulsions.

Harry Eagle

**The effect of adrenaline and insulin upon the lactic acid metabolism in the liver.** Katsutaka Kato and Kotaro Kimura. *Tôhoku J. Exptl. Med.* 21, 298-313 (1933).—Adrenaline increases the formation of lactic acid in the musculature and in the organs drained by the portal vein, with a corresponding increase in the lactic acid content of arterial and portal blood; but the mobilization of glycogen from the liver and the attendant liberation of lactic acid are accelerated to an even greater degree, causing the lactic acid content of the hepatic vein to exceed that in the arteries and portal vein. Splanchnicotomy significantly decreases this adrenaline effect. Insulin does not greatly affect the lactic acid level in arterial or portal blood, but causes a definite increase in that of the hepatic vein. The hypoglucemia caused by insulin depends largely upon the transformation of glucose to lactic acid, and the mobilization of glycogen in an attempt to counteract the hypoglucemia causes a further increase in the venous lactic acid content. Splanchnicotomy does not affect this insulin effect.

Harry Eagle

**The [hypo] glucemic action of histamine in rabbits.** Fumio Ohmi. *Tôhoku J. Exptl. Med.* 21, 314 22(1933).

Harry Eagle

**Effect of histamine upon the blood pressure in adrenalectomized rabbits.** Fumio Ohmi. *Tôhoku J. Exptl. Med.* 21, 323-8(1933).—The normal depressor response was obtained.

Harry Eagle

**Action of morphine on the adrenaline output, blood-sugar content and blood pressure in dogs.** Hiroshi Sato and Fumio Ohmi. *Tôhoku J. Exptl. Med.* 21, 411-32 (1933).—The subcutaneous injection of morphine into dogs (10-40 mg./kg.) causes a 5-25 fold increase in the secretion of adrenaline and a somewhat retarded hyperglucemia. Blood pressure was not regularly affected.

Harry Eagle

**Adrenaline secretion and blood-sugar content in dogs after chloralose.** Hiroshi Sato and Fumio Ohmi. *Tôhoku J. Exptl. Med.* 21, 433-43(1933).—Chloralose causes hypoglucemia, a decreased secretion of adrenaline because of the decreased blood supply to the adrenal glands, and does not increase the blood pressure.

Harry Eagle

**The effect of pyrrole upon frogs.** Mamoru Tomimaga.

*Tôhoku J. Exptl. Med.* 21, 444-57(1933).—Pyrrole stimulates the intramedullary motor component of the reflex arc in summer frogs, but inhibits the sensory component. Reflexes to central stimulation (sound) are thus increased, but those to, e. g., pin-prick are inhibited. Large doses paralyze the central nervous system. The secretory activity of the skin glands is inhibited, there is vasoconstriction, and with large doses, muscular rigidity.

Harry Eagle

**The effect of pyrrole upon the general behavior of mice.** Mamoru Tomimaga. *Tôhoku J. Exptl. Med.* 21, 458 65 (1933).

Harry Eagle

**Adrenaline liberation during insulin hypoglucemia.** Teh-Jun Yen, Tetsutaro Aomura and Tatsusaburo Inaba. *Tôhoku J. Exptl. Med.* 21, 542 55(1933).—The intravenous injection of insulin (0.25 10 units/kg.) into dogs causes an increased secretion of adrenaline. Usually the mean arterial blood pressure falls somewhat, body temp. increases, and respiratory rate increases.

Harry Eagle

**The effect of an increased concentration of the perfusion fluid upon the isolated frog heart.** Hiraku Takahashi. *Tôhoku J. Exptl. Med.* 21, 592-600(1933).—The effect observed upon increasing the concn. of the Ringer soln. used as perfusion fluid depends largely upon the rate at which the concn. is increased.

Harry Eagle

**The effect upon the isolated frog heart of increasing the concentration of the perfusion fluid by the addition of nonelectrolytes.** Hiraku Takahashi. *Tôhoku J. Exptl. Med.* 21, 601 12(1933).—Dextrose and urea added to Ringer soln. exert not only an osmotic, but also a sp., effect upon isolated frog hearts.

Harry Eagle

**The effect of insulin in accelerating the discharge of adrenaline.** Hiroshi Sato, Fumio Ohmi and Shimpei Kanowaka. *Tôhoku J. Exptl. Med.* 22, 53-64(1933).

Harry Eagle

**The effect upon the isolated frog heart of increasing the concentrations of the individual components of Ringer solution.** Hiraku Takahashi. *Tôhoku J. Exptl. Med.* 22, 65 73(1933). The effects of increasing the concns. of NaCl, CaCl<sub>2</sub>, KCl and NaHCO<sub>3</sub> were detd. The effect upon the isolated frog heart of decreasing the concentration of Ringer solution. *Ibid.* 71 84.

Harry Eagle

**The effect of benzene and its nuclear homologs upon lumbricalis muscle.** Shizuka Uchimi. *Tôhoku J. Exptl. Med.* 22, 126 31(1933).—Naphthalene, benzene and phenanthrene all increase the tonus and stimulate the contraction of lumbricalis muscle, their efficacy decreasing in that order. Anthracene is ineffective, possibly because of the difficulty of soln. The stimulating action of santonin, and possibly its anthelmintic action, are due to its naphthalene ring, rather than its lactone group.

H. E.

**Studies in fluid exchange. XVIII. The effect of hydrocyanic acid upon the formation of urine.** Takeshi Kikuta and Jiro Izumi. *Tôhoku J. Exptl. Med.* 22, 167-73 (1933).—NaCN perfused through toad kidney temporarily decreases urine excretion, because of a direct action upon the kidney epithelium.

Harry Eagle

**The effect of morphine upon rabbit pupils.** Chikao Kinukawa. *Tôhoku J. Exptl. Med.* 22, 174-95(1933).—Morphine in small doses causes miosis in rabbits acting through the parasympathetic system. The site of action of the morphine is the cortical substance of the cerebrum. Larger doses cause mydriasis due in part to subcortical stimulation of the sympathetic centers.

H. E.

**Action of folliculin on the development of the ovary.** Zulema Biale-Laprida. *Compt. rend. soc. biol.* 114, 376-80(1933).—Action of folliculin on the adult ovary. *Ibid.* 381-2. Action of folliculin on the compensatory

**hypertrophy of the ovary [after partial removal].** *Ibid.* 383-4.—In all the above cases injections of folliculin hindered development of the ovary.

L. E. Gilson

**Some physiological effects of mitraphylline.** Raymond-Hamet. *Compt. rend. soc. biol.* 114, 692-4(1933).—In dogs mitraphylline (cf. Michiels, *C. A.* 26, 3070) has a hypotensive action but does not counteract the hypertensive and renal vasoconstrictive action of adrenaline.

L. E. Gilson

**Action of histamine on the glands of the gall bladder.** J. H. Cascao de Anciaes. *Compt. rend. soc. biol.* 114, 853-5(1933). L. E. Gilson

**Blood concentration under the influences of amytal and urethan.** E. F. Adolph and M. J. Gerbasi. *Am. J. Physiol.* 106, 35-45(1933).—The circulating blood of dogs is greatly diluted after Na amytal is administered intraperitoneally and greatly coned. after ethylurethan is given in the same way. The compn. of the blood is changed relatively little when the anesthetics are given by stomach. J. F. Lyman

**Lactic acid in blood and tissues following intravenous injection of sodium bicarbonate.** John Haldi. *Am. J. Physiol.* 106, 136-41(1933).—NaHCO<sub>3</sub> injected into the blood of dogs, produces a marked rise in blood lactic acid. Increased blood lactic acid occurred before there was any change in the lactic acid of the brain. Lactic acid in the muscle of the injected animals increased from 58.2 mg. per 100 cc. of tissue before injection to 68.5 mg. after injection. J. F. Lyman

**A study of blood calcium after the administration of sodium oxalate to normal and thyroparathyroidectomized cats.** Wm. Salant, Wm. M. Parkin and Lillian L. Sheppard. *J. Lab. Clin. Med.* 19, 142-52(1933).—The reduction in the Ca content of the serum of normal cats after repeated subcutaneous injections of small amts. of Na oxalate or single injections of large amts. appears to be due to injury to the parathyroid gland. The wide range in the reduction in Ca after intravenous injections of oxalate may be caused by variations in the concn. of diffusible Ca resulting from differences in the amt. of parathyroid hormone present. The decrease in serum Ca caused by the intravenous injection of 30-40 mg. per kg. after extirpation of the thyroid and parathyroid glands is about 0.25 as great as that produced by injection of the same amts. into normal cats. The reduction produced by injection of large amts. is less than 0.5 as great. The small decrease in Ca observed in thyroparathyroidectomized cats may be attributed to the low concn. of diffusible Ca. E. R. Mann

**Influence of amino acids on the alcohol content of the**

**blood.** Erik M. P. Widmark. *Biochem. Z.* 265, 237-40(1933).—Neither fat nor carbohydrate has any marked effect on the disappearance of alc. from the blood; however, it is increased by proteins. Expts. with glycine and alanine show that when a few g. is administered with the alc. the blood alc. level is lowered and the alc. disappears more rapidly. S. Morgulis

**Effect of the rare earths on metabolism.** A. Bickel and M. Kojima. *Biochem. Z.* 266, 18-24(1933).—Administration of the water-sol. chloride salts of Th, Ce, Sm, Pr, Nd, La, U and Zr has a variable influence on the oxidative processes in the organism. Sm, Pr, Nd, Zr and Y exert practically no action while CeCl<sub>3</sub> and LaCl<sub>3</sub> have an inhibiting effect, and ThCl<sub>3</sub> has a somewhat similar stimulating effect. S. Morgulis

**Physiological action of (-) and (+) derivatives of morphine alkaloids.** Kakuji Goto and Toraichi Takebe. *Proc. Imp. Acad. (Tokyo)* 9, 390-3(1933).—The physiol. actions of 6 pairs of morphine derivs. prepd. from sinomenine (I) were studied. The (-) and (+) forms of dihydrocodeinone (II), dihydrothebainone (III),  $\beta$ -tetrahydrodesoxycodeine (V), dihydrothebainol (V), 1-bromosinomenine (VI), and  $\alpha$ -dihydrosinomenine (VII) were tested for toxicity, tail reaction, analgesic action, convulsant action, and influence on respiration and blood pressure. The *d*-derivs. of I are chiefly convulsive poisons and show no tail response, analgesic action or respiratory depression. In the *l*-derivs. II, III and IV display all these properties, but V has no convulsant action, VI shows only weak analgesic effects and VII provokes no tail reaction although the other characteristic reactions are pos. Conclusion: These properties of morphine derivs. depend on configuration as well as constitution. E. W. Scott

**Genuine glucosides of *Digitalis lanata* (Stoll, Kreis) 10.** Arsonic acids of the fluorenone and the fluorenol series (Morgan, Stewart) 10. Physiological activity of onium compounds (Renshaw, Searle) 10.

**Poulsson, E.: Lehrbuch der Pharmakologie. Fur Ärzte und Studierende 10th ed., enlarged. Leipzig: S. Hirzel. 602 pp. M. 14, bound, M. 16.50.**

## 12 -FOODS

F. C. BLANCK AND H. A. LEPPEL

**Proposed federal food and drugs act: Its public health features.** Walter S. Frisbie. *Am. J. Pub. Health* 23, 1232-6(1933). J. A. Kennedy

**The chemical composition of certain foods.** Joseph S. Hepburn, N. Albert Fegley, Keum Sung Sohn, John R. Cox, Emerson A. Read and Richard F. Wallace. *Am. J. Pharm.* 105, 547-9(1933).—Results of analyses including detns. of total solids, moisture, crude fat, crude fiber, crude protein, ash and N-free extractives of the following foods are tabulated: apple butter, a "Pennsylvania Dutch" product; dried ale yeast, manufd. by a Canadian brewery; breakfast foods (prepd. products requiring no cooking), (I and II) some derived primarily from rice, (III) some from wheat and (IV) some from malted barley; 3 samples of cashew nut kernels: (1) a raw sample consisted of kernels as imported; (2) a fried sample consisted of kernels which had been prepd. for the market by frying in coconut oil (a fried and salted sample was examd. for its ash content only); diabetic bread prepd. from casuin, palm-nut flour and eggs; *gefüllter fisch*; pidan or Chinese pickled egg; pineapple (slices and sirup), a diabetic food, canned without the addn. of sugar; prunes (these were cooked as usual, the pits removed and discarded; the juice was permitted to drain from the meat and each was analyzed separately); red banana; soy-bean milk prepd. in the Korean fashion. The caloric value and the wt. of a 100 cal portion of each food were calcd. and the results are tabulated. W. G. Gaessler

**Oxalic acid content of vegetable foodstuffs.** Erik M. P. Widmark and Gosta Ahludin. *Biochem. Z.* 265, 241-4(1933).—The edible portions only were analyzed, 15-25 g.

of the finely ground substance being first extd. with 50-100 cc. 10% HCl. The mixt. is warmed, left over night, filtered and the residue washed until a neutral reaction was obtained. The filtrate and wash water are dild. to 1 l. The oxalic acid is detd. in an aliquot by Holmberg's procedure (*C. A.* 21, 2486). Results obtained by the authors are higher than those given by Esbach. The oxalic acid content of a large variety of vegetable foodstuffs is tabulated. S. Morgulis

**Results of general interest obtained by the investigations of the Danish Home-Grown-Wheat Committee, 1929-1933.** Holger Jørgensen. *J. Soc. Chem. Ind.* 52, 383-91(1933).—The baking test formula used by the Comm. is discussed. The most important point in detg. the dough compr. and baking procedure is to have the dough compn. (especially percentage of yeast) and the dough time well balanced against each other. This balancing must be done in such a way that starvation of the yeast does not occur even if the flour is very low in diastatic power. The A. A. C. C. basic method was found very unsatisfactory with respect to keeping the "strength" sepd. from the diastatic activity, the amt. of yeast prescribed being far too great relatively to the dough time. A study was made of the N content of wheat and its influence on baking strength. Larmour's results of the effect of bromate on baking have been confirmed, namely that it enhances the baking capacity of high N wheat flours. This strong correlation between the N content of the wheat and ability of the flour to acquire improved baking strength through the addn. of bromate holds good also for Danish wheat. F. L. Dunlap

The quality of the 1933 German wheat crop. Paul Pelschenke. *Mühlentab.* 3, 169-78(1933).—Detns. of moist gluten, gluten quality (by the gluten-swelling method of Berliner and Koopman) and test weight were made on 3000 wheat samples from various German districts. Moist gluten exceeded 22.5% in 46.3% of the samples, as compared with 24.1% in 1932 and 35.3% in 1931. Distribution of wheat according to gluten content is shown on a map. The gluten quality of the 1933 crop was better than in the 2 preceding years. Test weight bears no relation to flour yield and baking quality and is not a satisfactory index of wheat quality. C. L. B.

Fundamentals of the determination of quality of wheat flours by mechanical means. C. W. Brabender. *J. Soc. Chem. Ind.* 52, 395-400(1933).—A description of the fundamental principles of the Brabender Farinograph and Fermentograph. Diagrams from these machines are given to show how the requirements for a complete detn. of the baking value of wheat flour are satisfied by a mech. testing of its properties. The properties studied are the changes in the phys. condition of the dough and the rate of CO<sub>2</sub> production. F. L. Dunlap

Influence of the [culture] medium on the baking value of wheats. M. Chopin. *J. agr. prat.* 97, 326-7(1933).—The ratio of the sp. work of deformation of dough from the massive state up to the rupture of the membrane for a variety of wheat grown on one medium to that for the same variety grown on a second medium has been detd. for a no. of varieties. This ratio is sensibly const. and seems to indicate that the modifications brought about in the compn. of the proteins by the medium in which the plant develops are, in general, the same for all varieties. J. R. Adams

Gluten formation. H. L. Bungenberg de Jong. *J. Soc. Chem. Ind.* 52, 391-5(1933).—Gluten is not a simple phys. mixt. of gliadin and glutenin, but its existence is dependent on an interaction between its components. This interaction is caused by the opposition of charges on the 2 components of the complex. In the region of the complex formation, gliadin is always the pos. and glutenin the neg. component. The result of this is that the gliadin as well as the glutenin particles in the complex is hydrated quite differently from the hydration that each of the components would show independently in that medium. The gliadin-glutenin ratio can influence to a large extent the phys. properties of a gluten, but this factor is not the only cause of the difference in properties between strong and weak glutes. It is possible that the particle size may be an important factor in the strength problem. The presence in the flour of other proteins—albumin, globulin and peptones—can alter to a large extent the phys. properties of the gluten system. A study was made of the "consistency" of doughs at various  $pH$  values, with a Brabender farinograph. The max. was found at a  $pH$  of about 6.1. This decreases on both sides to  $pH$  7 and  $pH$  5. Beyond  $pH$  7 and  $pH$  5 the height of the max. gradually increases. According to the theory of complex formation such a max. in the farinogram would be expected, because somewhere between  $pH$  7 and  $pH$  5 the total protein system must have a max. coherence. The author gives his views of the influence of charge on a protein system. Without the opposition of charge the proteins of flour would not show the special properties necessary for the formation of a well-developed loaf. F. L. Dunlap

Bleaching and improving of flour. D. W. Kent-Jones. *J. Soc. Chem. Ind.* 52, 409-11(1933).—A general discussion of some of the problems connected with the bleaching and improving of flour. F. L. Dunlap

Baking value of flours. de Conde and Heudebert. *Compt. rend.* 197, 1150-3(1933).—The quality of flour gluten is given by the value of the coeff.  $K = 100(P - p)/p$ , where  $P$  and  $p$  are the percentage contents of moist and dry gluten, resp. The value of  $P - p$  should be about 22% while for a good flour  $K$  should be between 180 and 200. K. V. Thimann

The phosphorus of potato flour. Theodore Posternak. *Compt. rend.* 197, 1157-8(1933).—The potato flour was hydrolyzed with pancreatin or malt ext., the filtrate pptd.

with Pb(OAc)<sub>2</sub> and NH<sub>3</sub>; the resulting ppt. was redissolved, pptd. first with alc. and then again with Pb(OAc)<sub>2</sub>, decompd. and converted to Ba salts. The product contained 1.8-2.5% of P and consisted of a Ba polyglutemonomophosphate; after hydrolysis with 2% H<sub>2</sub>SO<sub>4</sub> dextrose was set free and alc. pptn. yielded a Ba bisglutemonomophosphate, C<sub>12</sub>H<sub>21</sub>O<sub>14</sub>P<sub>2</sub>Ba,  $[\alpha]_D^{25}$  65.1°. In this compd. the ratio P: reducing groups was 1; it is probably a maltose deriv. On subsequent prolonged hydrolysis an undetd. hexosemonophosphoric acid was isolated. K. V. T.

Pearl barley infected with smut. P. H. Jones. *Analyst* 58, 754(1933).—Some samples of com. barley were found to have dark grains caused by the action of a fungus. W. T. H.

Annual report of the director of the Dairy Research Institute, 1929-1930. H. H. Davel. Union S. Africa Dept. Agr., *Sci. Bull.* 98, 23 pp.(1931).—Neutralization of cream with 5% NaHCO<sub>3</sub> soln. to 0.08-0.10% acidity (calcd. as lactic acid), followed by deodorization by the Murray process, caused a 98.4-99.9% reduction in the bacterial count. Red colorations on butter and cheese: Butter contg. 0.5% or less of NaCl is a suitable medium for the growth of *Torula glutinis* which causes the appearance of pink or reddish patches that may penetrate 2-3 cm. below the surface of the butter. The organism decomposes proteins, carbohydrates and certain org. acids, giving rise to objectionable by-products; it does not withstand pasteurization temps. *Actinomyces ruber* causes red spots on butter wrappers and liners but does not grow to any extent on butter itself. Growth of the organism is prevented by soaking the papers in 15% NaCl or in formalin (1:500) or by boiling in water for 10 min. Growth of *A. ruber* on cheese is prevented by rubbing the surface of the cheese with NaCl or wiping with formalin (1:500). The *E. coli* and *A. aerogenes* groups of bacteria and the *Torula cremoris* group of yeasts were the most common gas-producing organisms isolated from numerous samples of milk, cream and cheese. Studies with pure cultures indicated that *S. lactis* has a decided inhibitive action on *E. coli* and *T. cremoris*, the effectiveness depending on the initial H-ion concn. of the media, the temp. of incubation and the presence of carbohydrates. K. D. Jacob

The effects of hand and machine milking on the milk yield, its composition and purity. H. B. Davel and H. L. Neethling. Union S. Africa Dept. Agr., *Sci. Bull.* 111, 23 pp.(1932).—Milk produced by hand was somewhat higher in butter fat and milk solids-not-fat than that produced by machine. K. D. Jacob

Milk yield and iodine content of the milk from cows fed on iodine-fertilized pastures. K. Scharrer, W. Schropp and J. Schwaibold. *Biedermanns Zentr. B. Tierernähr.* 5, 676-700(1933).—Favorable effects on the estrous cycle were noted, a higher milk yield was obtained, the lactation period was prolonged, but the effect on the fat content and sp. gr. of the milk was negligible. The I level of the milk was considerably higher, though subject to much fluctuation. This level showed two maxima, one corresponding to the time of the addn. of the I to the pastures, the other to the max. I content of the feed itself. F. L. Dunlap

Readjustment of salts in milk by base-exchange treatment. J. F. Lyman, E. H. Browne and H. E. Otting. *Ind. Eng. Chem.* 25, 1297-8(1933).—Passage of raw milk through zeolite removes more Ca and P when the milk has been acidified. Milk of artificially increased acidity (0.3% as lactic) lost 22% each of its Ca and P. After this treatment rennin fails to produce a curd unless the milk is first boiled. On boiling, the tendency to coagulate is greater when HCl has been used previously to acidify the milk than when citric acid has been used. The Na:K ratio or content need not be disturbed if the zeolite is revived with the proper salt combination. Revival with NaOH is necessary to affect P removal. Previous treatment with HCl lowers the alk. of the ash obtained from zeolite-treated milk but treatment with lactic or citric acid raises it. Butter fat does not interfere with base exchange and the milk is not appreciably changed in taste. H. K. Salzberg

**Colorimetric method for the determination of milk proteins.** A. D. Stewart and Durga Das Mitra. *Indian Med. Gaz.* 68, 558-8(1933).—The method is based on the estn. of color given by Folin's phenol reagent (*C. A.* 16, 1790; 21, 3210) with tyrosine and tryptophan and gives accurately the total protein content of those milks having a reasonably const. proportion of tyrosine and tryptophan to total protein. Application of the method to fresh cow and buffalo milks, but not always to human milk, was found possible. To a sample of 0.2 cc. of the milk and to 4 cc. of standard tyrosine soln. (0.02% in 0.1 N HCl) are added 25 cc. of  $H_2O$ , 2 cc. of 5 N NaOH and 3 cc. of the reagent, the soln. is made up to 100 cc., shaken and kept 10 min., filtered and the liquids are compared colorimetrically after 5 min. of filtration. If the tyrosine standard be set arbitrarily at 20 in the colorimeter then protein percentage by vol. in cow milk is given by the formula  $96/x$  and in buffalo milk by  $121.6/x$ , where  $x$  is the colorimeter reading of the milk sample when balanced against the standard at 20. In a no. of samples of cow milk  $x$  varied from 23.0 to 32.0. H. K. Salzberg

**Raw versus pasteurized milk, with special reference to the vitamins.** Chalmers Watson. *Scottish J. Agr.* 16, 394-404(1933).—A review of the literature dealing with the value of raw milk as a source of vitamins. The compulsory pasteurization of milk is inherently unsound and retrograde. K. D. Jacob

**Disease-producing organisms in milk.** F. C. Minett and E. J. Pullinger. *J. Soc. Chem. Ind.* 52, 379-83T (1933).—Data are given as to the incidence and distribution in different classes of raw milk of 3 kinds of disease-producing bacteria: *M. tuberculosis*, *Br. abortus* and the streptococci of mastitis in cows. A study has been made of the effect of pasteurization by the holding method on these organisms, as practiced commercially at a no. of plants. F. L. Dunlap

**Metals and condensed milk.** R. C. Thompson, R. P. Mears, H. E. Searle and F. L. Laque. *Ind. Eng. Chem.* 25, 1311-16(1933). Cu, Ni, Sn, bronze, Inconel, Monel, soft solder, Ag solder, Cr-Fe and Cr-Ni-Fe were exposed in the form of insulated disks in units of evapd. and sweetened condensed milk manuf. during actual operation. Corrosion was measured by wt. decrease. In evapd. milk manuf. greatest corrosion occurred in the preheater, hot well, evaporator and drip tank, and less in storage tanks. Corrosion was generally less in condensed milk manuf. and likewise was greatest in the above-named units though even in these units several of the metals, notably Cr-Ni-Fe, showed no corrosion. All other metals showed an advantage over Cu in the hot wells and evaporators. Condensed milk picks up about 1.6 and evapd. milk 2.5 p. p. m. of Cu from evaporators of this metal. In time, film forms on specimens in the preheater and evaporator which exerts a protective action against further corrosion in all cases except Cu. H. K. S.

**Legal standards for butter fat and solids-not-fat.** John Houston. *J. Ministry Agr. Northern Ireland* 4, 47-61 (1933).—Data are given on the factors affecting the fat and solids-not-fat contents of milk. Detn. of the percentage of solids-not-fat is not a reliable test for the adulteration of milk with water; the cryoscopic method should be used. K. D. Jacob

**Biacetyl in butter.** W. L. Davies. *Food Manuf.* 8, 346-8(1933).—Lactose on fermentation yields acetoin which is readily oxidized by air to biacetyl (I), to which butter largely owes its aroma and flavor. I is probably not formed until butter is churned and stored. One disadvantage of acetoin in butter is that it acts as an oxidation catalyst accelerating deterioration of the fat. Butter from ripened cream may contain 0.05-0.5 p. p. m. of I. I is not stable but is subject to reduction to acetoin through absorption of  $O$  by bacteria or fat and to loss by evapn. It is lost more rapidly from butters of higher acidity. A relatively high I content assoc. with low acidity should indicate that I has been added artificially. The Voges-Proskauer color reaction for I is discussed and details of the dimethylglyoxime method for its detn. are given. H. K. Salzberg

**A brief guide to the manufacture of sour-cream butter.** E. Haglund and E. Samuelsson. *Medd. Kgl. Lantbrukshögskolan*, No. 295, 1-26(1933).—Directions are given for the pasteurizing, souring and ripening of the cream, the churning, washing, working and packing of the butter and the control analysis of milk and other dairy products. Clinton L. Brooke

**Some remarks on the metabolism of the lactic acid bacteria and on their role in butter making.** A. J. Kluyver. *J. Soc. Chem. Ind.* 52, 367-73T(1933).—A general review with 34 references to the literature. F. L. Dunlap

**Humidity control in cheese-curing rooms.** G. M. Moir. *New Zealand J. Agr.* 47, 280-4(1933).—The humidity should be maintained at 80-85%. K. D. J.

**Bacteriological examination of canned meat.** Thomas McLachlan and Margaret Ida Stern. *Food Manuf.* 8, 378-80(1933).—The bacteriol. examn. of canned meat is necessary in tracing causes for spoilage. The cans are incubated at blood heat for 1 month. The gas formed is collected by a special app. over brine satd. with  $CO_2$ . Any liquid in the can or pieces of fat-free meat obtained with a sterile cork-borer are placed in an egg-meat medium for the isolation of the bacteria. Amy LeVesconte

**Occurrence and origin of lead in canned sardines.** L. H. Lampitt. *Analyst* 58, 733-8(1933).—From 0 to 150 parts per million of Pb were found in canned sardines. The source of Pb was proved to be the metal used in turning the grills over which the fish were cooked. The methods used in the analysis are outlined. W. T. H.

**Color in tomato products.** M. B. Matlack and Charles E. Sando. *Fruit Products J.* 13, 81-2, 90(1933). Lycopene, the red pigment of tomato, forms a yellow oxidation product, but this alone cannot explain all the browning that occurs in tomato products. Washing the solids, including lycopene, with 50-85% alc. prevents browning. Possible causes of browning are: coagulation of protein or other colloidal matter, adsorption of chlorophyll or its decompn. products on the colloids, soln. of lycopene in the fatty matter, caramelization, polymerization of fural derivatives, reaction between amino acids and sugars, oxidation of lecithin or changes in phenolic bodies. Methods used to prevent browning will also protect the carotene present. Also in *Canning Age* 14, 481-2(1933). Amy LeVesconte

**Bacterial studies of defrosted peas, spinach and lima beans.** Elizabeth B. Brown. *J. Home Econ.* 25, 887-92 (1933).—Defrosted vegetables deteriorate in about one-half the time of fresh vegetables. Spinach was the most affected and peas were least affected. Amy LeVesconte

**Large-scale experiments in sulfuring apricots. II Effect of dehydrating, shade-drying and blanching.** E. M. Chace, C. G. Church and D. G. Sorber. *Ind. Eng. Chem.* 25, 1366-70(1933); cf. *C. A.* 25, 1006. Blanching as a pre-treatment of apricots intended for drying does not improve the quality of the dried fruit or affect the quantity of  $SO_2$  that is retained. While dehydration has some advantage over sun-drying, results did not show that the fruit retained less  $SO_2$  or was of better grade. Drying in the shade shows no material advantage and requires more time and equipment. The extent of the penetration of  $SO_2$  shown by freshly sulfured fruit is not a satisfactory guide for estg. either the amt. of  $SO_2$  which will be retained in the dried fruit or its grade. J. R. Adam

**Sooty blotch on citrus fruits.** J. E. van der Plank. Union S. Africa Dept. Agr. *Sci. Bull.* 121, 12 pp.(1933); cf. *C. A.* 27, 4870. When oranges were treated by the bleaching-powder process and thoroughly washed the fruit showed no alteration in the sugar:acid ratio or the general flavor during storage for 5 weeks. The treatment caused no increase in the Cl content of the fruit rind. Spraying the trees with lime-S solns. greatly reduced the incidence of sooty blotch, but the spray residue rendered the fruit unsightly. K. D. Jacob

**Examining jams by the spectroscope.** S. Judd Lewis. *Food Manuf.* 8, 421-4(1933).—A study was made of the

absorption spectra of strawberry and other jams, pure and after the addn. of artificial color, other fruit juices, or preservatives as benzoic acid. The difference was great enough to suggest this as an improved method for the detection of adulteration. Amy LeVesconte

The presence of reducing sugars in soda waters sweetened with sucrose. B. Ricca and P. Meduri. *Ann. chim. applicata* 23, 450-4 (1933).—In the presence of small quantities of org. acids, such as citric, sucrose is inverted to a marked degree, i. e., up to 2% in 9 days in the presence of 0.20% citric acid. The Italian laws specify that addn. of glucose to soda waters shall be stated. Therefore, the above reaction must be watched or samples may be wrongly condemned. A. W. Contieri

Composition of bees' honey. Th. v. Fellenberg and J. Ruffy. *Mitt. Lebensm. Hyg.* 24, 367-92 (1933).—On account of the presence of melezitose and dextrin in honey, the detns. of sucrose and invert sugar as usually carried out are in error. Sucrose must therefore be detd. in the filtrate left after detn. of acids and proteins by heating 75 cc. (contg. 10 mg. honey per cc.) with 3.75 cc. 4 N NaOH for 1.5 hrs. at 100°, neutralizing with HCl and pptg. by the addn. of 2.5 cc. standard Pb(OAc)<sub>2</sub> soln. The filtrate is freed from Pb with excess Na<sub>2</sub>HPO<sub>4</sub>, and the reducing sugars are then detd. before and after inversion in 0.02 N HCl, the difference between the 2 values being the sucrose. Results of complete analyses of 16 samples of honey show that 2-14% of the honey is still unaccounted for; on the av., titrable acids total 0.2%, of which about one-tenth is volatile, ash 0.5%, sucrose 0.9%, dextrose 24.42% and levulose 30.37%. By pptg. with alc., purifying with Pb(OAc)<sub>2</sub> and NH<sub>3</sub>, and finally pptg. the MeOH soln. with HCl and Et<sub>2</sub>O, a dextrin free from ash and dextrose was obtained. Two samples of this, prepd. from conifer and flower honey, resp., had  $[\alpha]_D^{20}$  160.7° and 163.5°, resp., and both gave 100% reducing sugar on hydrolysis; hence they were probably identical. K. V. Thimann

Tannin in tea. D. B. Dott. *Pharm. J.* 131, 627 (1933).—The Cu(OAc)<sub>2</sub> method (cf. C. A. 10, 540) gives more const. and quicker results than the hide-powder method. To 4 g. of the sample add 400 cc. boiling H<sub>2</sub>O, digest for 30 min. on the water bath, filter through cloth, wash with about 150 cc. hot water and press. To the infusion add a soln. of 2 g. Cu(OAc)<sub>2</sub>·H<sub>2</sub>O in 25 cc. H<sub>2</sub>O with 5 cc. of 30% AcOH. Filter the ppt. through a tared filter, wash and dry at 105° to const. wt. Incinerate the ppt. and weigh the ash as CuO. Two samples of Indian tea gave, resp., 19.43, 16.81% tannin; 2 samples of China tea, 10.82 and 9.36%. These results are a measure of the relative astringencies of the samples. S. Waldbott

Determination of chlorogenic acid in coffee. W. Plucker and W. Keilholz. *Chem.-Ztg.* 57, 875-6 (1933); cf. Grubel and also Plucker and Keilholz, C. A. 27, 5838.—Tests were made of the method proposed by G. The results were found unsatisfactory because of the fact that chlorogenic acid is not very stable. W. T. H.

Chemistry of cider. V. L. S. Charley. *Chemistry & Industry* 1933, 743-5.—Apple pulp contains water 83, invert sugar 17, sucrose 1.5, malic acid 0.2-1.2, tannin 0.07-0.5, N 0.01-0.07, pectin 0.3, ash 0.2-0.4, and starch 0.5%. Cider should contain 0.5% malic acid to stabilize the tannin and prevent bacterial decompn. Pectin gives body to the juice, but makes clarification difficult. High N content, causing too rapid fermentation, occurs in fruit grown on plowed land. The type of yeast on the apples varies with the variety. Added yeast cultures have not been successful. Centrifuged ciders have more flavor than filtered ciders but are less clear. Amy LeVesconte

Problems of the cider maker. Pickford. *Chemistry & Industry* 1933, 742-3.—Problems in cider making include: the best variety of fruit trees, the proper blending of culls, storage of fruits while ripening, methods of washing, milling, and pressing the fruit, and storing the cider. The rate of fermentation is governed by the variety of the fruit, the soil conditions of the orchard, and the temp. Filtration checks fermentation more effectively than centrifuging or pasteurization. Amy LeVesconte

Animal nutrition research. M. H. French. Tanganyika Territory Dept. Vet. Sci., *Ann. Rept.* 1931, 32-46 (1932).—Compn. of grasses near Amani.—Detailed analyses are given of samples of *Amphilophis insculpta* Stapf., *Cymbopogon giganteus* Stapf., *Digitaria minusiflora* Stapf., *Panicum trichotladum* Haek., *Melinis minusiflora* Beauv., *Panicum maximum* Jacq., *Brachiaria mutica* Stapf., *Cynodon dactylo* Pers., *Sorghum verticilliflorum* Stapf., *Pennisetum purpureum* Schum., *Paspalum dilatatum* Pers., *Paspalum conjugatum* Berg., *Paspalum scrobiculatum* Stapf., *Chloris gayana* Kunth, *Desmodium adscendens* and *Ipomoea batatas*, cut at different stages of growth and maturity. In general, the grasses are very deficient in N and sol. ash constituents and the mineral elements, particularly P and K, are below the normal values for natural English pastures. Feeding stuffs.—Analyses are given of peanut, simsim and coconut cakes, oats, beans, linseed, red mtama bran and dried mtama grains produced in Tanganyika. Dried mtama grain is characterized by a very high SiO<sub>2</sub> content (29.75%). A sample of coffee berry pulp contained a considerable amt. of caffeine. The results of digestibility expts. with Tanganyika kays are given. *Ibid.* 1932, 20-71 (1933).—Compn. and digestibility of feeding stuffs available in Tanganyika Territory.—Extensive data are given on "Muharagi" beans (*Phaseolus vulgaris*), "Kundi" cowpeas (*Vigna sinensis*), peanut cake, blue-lupine seed, lucerne hay, cotton seed, dried locusts, peanut tops, leaves of *Disperma trachphyllum*, pods of *Acacia sprocarpa* and *A. albidia*, corn and millet brans, corn silages, cassava roots, grass silages and hays. K. D. Jacob

Field curing of hay as influenced by plant physiological reactions. II. The role of leaves in the dehydration of hay plants. T. N. Jones and L. O. Palmer. *Agr. Eng.* 14, 156-8 (1933). K. D. Jacob

Fodder from wood. Carl G. Schwalbe. *Angew. Chem.* 46, 707-11 (1933).—The raw fiber of wood can be made more digestible even without sepg. the lignin. A digestibility of the raw fiber of 60% can be obtained for the ruminant, which corresponds to that of good meadow hay. This can be accomplished by alk. hydrolysis combined with swelling by means of a swelling agent like carbohydrates and simultaneous or subsequent mech. treatment. A digestibility of 63% can be reached by swelling with carbohydrates and subsequent lactic acid fermentation, while it can be raised to 77% by swelling or by maceration with lactic acid only. The digestibility of the N-free exts. can be raised to 100% with lactic acid fermentation or maceration. Exptl. results are presented. Eleven references. Karl Kammermeyer

Detg. amino acid deficiencies of feeds (Shrewsbury, Bratzler) 11E. Njombe stock farm [pasture grasses] (Hornby, et al.) 15. Eliminating foam in the treatment of milk (U. S. pat. 1,935,235) 13.

Sherman, Henry C.: Food Products. 3rd ed., rewritten. New York: Macmillan Co. 674 pp. \$3.00.

Food preservation. Hermann Tautz. Ger. 579,952, July 3, 1933. Flesh, fish, grain, cheese, etc., is preserved by embedding it in a gelatin mass contg. 10% glycerol, 2-3% AcOK and a little CH<sub>2</sub>O.

Protein-free infants' cereal foods, etc. Lazar Rosenthal (to Mead Johnson & Co.). U. S. 1,935,890, Nov. 21. Cereal or milk foods, etc., substantially free from protein and contg. lysozyme are prepd. by use of lysozyme from egg white, etc.

Flour. Jean Mayor. Fr. 752,201, Sept. 20, 1933. The germs are sepd. from the rest of cereal grain, roasted and mixed with the ground kernel of the same or other cereal. The germs may be treated with ultra-violet rays or mixed with NaCl before roasting.

Milk. Chemische Fabrik Joh. A. Benckiser G. m. b. H. and Fritz Draibach. Ger. 578,608, June 15, 1933. Water-sol. alkali m-phosphates are added to milk before evapg. the latter.

Dried milk. Hanseatische-Mühlenwerke A.-G. Fr.

completely coated in the ordinary way and the completed material may be impregnated with insulating material, e. g., oil, paraffin, varnish, rosin.

**Insulation for electrical apparatus.** Alexander Meissner (to Telefunken Ges. für drahtlose Telegraphie m. b. H.). U. S. 1,935,885, Nov. 21. In devices such as transformers subject to heating from the effect of an elec. field, an insulating and heat-conducting layer is used comprising quartz granules held together with a binder having an asphalt base, the layer having a breakdown strength of substantially 100,000 v. and being of a thickness of about

15-20 mm. to insure rapid abduction of heat from a transformer winding or the like.

**Insulating compound for electric cables.** Derby Cables, Ltd. and Richard Johnston. Brit. 397,263, Aug. 24, 1933. The polarity of different strands of a multicore elec. cable is identified by using as insulating material a rubber compd. that contains mineral rubber and (or) vulcanized bitumen and has its dark color suppressed by the addn. of pigments or dyes, e. g., crimson Sb sulfide, ultramarine. In an example the compd. contains mineral rubber 10, crimson Sb sulfide 10 and a non-bleeding dye 2%.

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

**Ground water in crystalline rocks.** Richard Stappenbeck. *Gas u. Wasserfach* 76, 769-72, 789-91, 805-7 (1933).—A review of literature relative to the occurrence and flow of ground water in cryst. rocks, with extensive bibliography.

R. W. Ryan

**The trend of water purification and treatment during the year 1933.** Norman J. Howard. *Eng. Contract Record* 47, 1193-5, 1198 (1933).—Activities during 1933 centered chiefly around the conditioning of water for filtration and the use of activated C for taste removal. The use of  $O_3$  for sterilization is increasing somewhat.  $O_3$  was found to be just as effective as chlorination, with the added advantages of freedom from taste troubles and marked reduction in color.

R. E. Thompson

**New type of silt sampler developed for water studies.** A. H. Frazier. *Eng. News-Record* 111, 491 (1933).—An illustrated description of a device suitable for collection of pint samples from any point in the cross-section of a stream to a depth within less than 1 ft. of the bottom.

R. E. Thompson

**Magnesium metal for water treatment.** II. Bach. *Gesundh.-Ing.* 56, 545-7 (1933).—Filters of Mg turnings are efficient for the removal of excess  $Cl_2$  and for decreasing the acidity of a water. The completeness of reaction may be controlled by controlling the rate of flow. A Mg filter is both simple in operation and economical, and requires less space than a marble filter. As the  $MgCl_2$  formed is sol. no coating is formed to decrease the efficiency. When used to remove  $CO_2$  the rate of flow should be such that the Mg goes into soln. as bicarbonate and no carbonate is formed. The Mg filter may be used to give a water an alk. reaction; a  $p_H$  as high as 8 can be obtained.

M. G. Moore

**Electrically produced ozone offers promising results for water sterilization.** T. Rich. *Eng. Contract Record* 47, 847-8 (1933).—The use of  $O_3$  for water sterilization is rapidly increasing in France. The  $O_3$  generator consists of 2 parallel plates a few mm. apart, sepd. by 2 dielec. sheets to prevent sparking. A high-voltage, high-frequency current discharge ozonizes air drawn through the app. which is mixed with the water by means of an injector, the water subsequently flowing over cascades to remove excess gases. Intimate mixing is essential. The power consumption is about 0.0125 kw. hr. per cu. m., i. e., 18,000 gals. per kw. hr. A modified app. has been developed for domestic use.

R. E. Thompson

**New rapid filter plant at the Breslau municipal water works.** Erwin Kirchner. *Gas u. Wasserfach* 76, 749-53 (1933).—From exptl. studies the new Breslau rapid filter was designed with a 1.5 m. layer of 1 mm. diam. sand. No layer of coarser material was used at the base of this filter and the spray heads had a slit opening 0.75 mm. wide. The filter is cleaned by washing 1 min. with air 6 min. with air and water together and 1 min. with water. This method of washing the filter gave better Fe and Mn removal. Under normal conditions a filtration velocity of about 4 m. per hr. was used, although this could be approx. doubled in emergency.

R. W. Ryan

**Adsorption of copper sulfate by aluminum floc.** C. J. Brockman. *Ind. Eng. Chem.* 25, 1402-3 (1933); cf. *C. A.* 28, 2374.—Tabular results of lab. expts. using

buffered solns. indicate that when the residual  $p_H$  is 6.3 or above, Cu ions are completely removed by the Al floc even when the  $CuSO_4$  dosage is high (25 p. p. m. Cu). At  $p_H$  6.0-6.4 there is an av. of 90% removal; at  $p_H$  5-6 there is better than 50% removal.

W. A. Moore

**Deterioration in metal pipes and their avoidance.** L. W. Haase. *Z. Gesundheitstech. Stadtehyg.* 25, 25-34 (1933).—A review. H. considers corrosion injuries, injuries caused by plants and animals after the pipes are installed in water works, and defects of manuf. Pipes of different materials are discussed.

B. C. Brunstetter

**Sewage-treatment costs at thirty Illinois plants.** W. Horner Wisely and Harry F. Ferguson. *Eng. News-Record* 111, 780-2 (1933).—Technical supervision does not appreciably increase operating costs.

R. E. T.

**Designing and operating a small sewage plant.** Lynn J. Arthur. *Eng. News-Record* 111, 645-8 (1933).—The plant at the Indiana Girls' School, housing 500 persons, includes an Imhoff tank, dosing chamber, trickling filter, secondary settling tank and a glass-covered sludge-drying bed. The effluent is chlorinated during the summer months for protection of bathing beaches. The total cost of the plant was \$13,900 or slightly less than \$20 per capita on the basis of designed capacity (700 persons).

R. E. Thompson

**Statistics on city drainage or sewage systems.** Moller-Ing. *Arch. Gemeindeblatt* 36, 257-9 (1933).—Tables give the length of sewage mains of the various materials (concrete, stoneware, etc.) in use in 94 German cities of over 50,000 population for the years 1926-7 and 1927-8.

M. G. Moore

**Collection and use of gases arising from the digestion of sewage.** Franz Fries. *Gesundh.-Ing.* 56, 533-7 (1933); cf. *C. A.* 27, 4905.—Such gas contains  $CH_4$  70-85,  $CO_2$  9-30 and  $N_2$  1.5-7.5%. Gas from 2-stage units is poorer in  $CO_2$  than that from 1-stage units. Methods of collecting the gas are discussed. Floating conical covers for the purpose minimize the danger of explosion, since the internal pressure prevents the entrance of air to form an explosive mixt. Such gas may be pumped into the municipal gas lines for use as fuel or may be used as a power fuel. The heat value of the gas is 6000-7500 Cal. When used for power 400-500 l. supply 1 h. p. Under normal conditions the gas collected from an activated sludge plant should be sufficient to supply all power demands of the plant.

M. G. Moore

**The chemical point of view in the selection of concrete or stoneware sewage pipes.** Kruger. *Gesundh.-Ing.* 56, 521-5 (1933).—Concrete pipes are attacked by free acids, sulfates, Mg salts and to a lesser extent by other salts. The compn. of various types of cements and concretes and the action of these agents on them are discussed. Purely domestic sewage, in general, does not attack concrete pipes, but such pipes are attacked externally by ground waters. They should be protected by a resistant coating and should generally not be exposed to waters of  $p_H$  under 6 or those high in sulfates. Stoneware pipes are resistant to both acids and alkalis.

M. G. Moore

**The ecology of sewage fungus.** R. W. Butcher. *Trans. Brit. Mycol. Soc.* 17, 112-24 (1932).—*Sphaerotilus natans* and its varieties are widely distributed, in the

waters of polluted rivers in England; they may be found in either soft or hard waters contg. a large amt. of org. matter (particularly effluents from beet-sugar factories), with a  $pH$  of 6-8, a low NaCl content and a current not less than 20 cm./sec. *Carchesium* spp. are always present when the source of org. matter is sewage. *Leptomitus lacteus* occurs rarely and then usually where an org. effluent enters a river and becomes immediately dild. *Fusarium aqueductum* was observed in (1) the settling pit of a beet-sugar factory where the water had a  $pH$  of 3.5 due to lactic and butyric acid fermentations; (2) in a river below a rayon factory where the acetate process was being used and the  $pH$  was 5.0; (3) in a channel conveying effluent from a sewage works where fat was extd. from the sewage by means of  $H_2SO_4$ . *Beggiatoa alba* has been observed in the outlets of sewers in the Tees and Clyde estuaries. Thirty-three references. K. D. J.

Studies on the ecology of rivers. I. The distribution of macrophytic vegetation in the rivers of Britain. R. W. Butcher. *J. Ecology* 21, 58-61(1933).—Data are given on the distribution of macrophytic vegetation in non-calcareous and acid rivers (total hardness < 2 parts  $CaCO_3$  per 100,000 and av.  $pH$  < 6.5), slightly calcareous and almost neutral rivers (hardness 2-10 and  $pH$  7.0-7.5), moderately calcareous and alk. rivers (hardness 10-20 and  $pH$  7-8) and highly calcareous and alk. rivers (hardness > 20 and  $pH$  7.5-8.0). The species of vegetation occurring in each group of rivers varies somewhat with the velocity of the current and the original source of the water. The increased N and adsorbed O contents of rivers, resulting from contamination with sewage, favor the growth of *Cladophora*. Forty-one references. K. D. Jacob

Sanitary improvement program solves pollution problem. [Sewage-treatment plant at Findlay, O.] T. B. Henry. *Eng. News-Record* 111, 703 5(1933).—The recently completed plant, serving a population of 19,000, was constructed to correct pollution of the Blanchard River. It consists of bar screens, screenings incinerator, chlorination equipment (for odor control), grit chamber, settling tanks, digestion tank and glass-covered drying bed. Provision was made for addn. of activated sludge treatment at a later date. The cost of the plant was \$198,000. R. E. Thompson

Modern mechanical layout for a swimming pool. James M. Forsyth and J. A. Zeller. *Eng. News-Record* 111, 535 6(1933).—A new 280,000-gal. pool at the Agricultural and Mechanical College of Texas has a recirculation system consisting of a surge tank, pressure filters and a heat exchanger. The water is treated with alum,  $H_2SO_4$  (because of high alk.),  $NH_3$  and  $Cl_2$ . Overflow occurs around the entire periphery of the pool and the purified water is introduced at 10 points in the bottom. R. E. Thompson

Reducing the toxicity of cyanide wastes. E. F. Eldridge. *Eng. News-Record* 111, 677(1933).—See C. A. 27, 1741. R. E. Thompson

Carbon monoxide surveys of two garages. A. H. Sluss, R. K. Campbell and Louis M. Farber. *Heating, Piping, Air Conditioning* 5, 626 9(1933).—Test conditions and results of cooperative studies are tabulated and discussed. In most garages there is no CO hazard except in cold weather when it is necessary to close the doors and windows. A. W. Furbank

App. for aerating sewage (U. S. pat. 1,936,305) 1.

Whyte, Wm. E., et al.: Third Report of the Scottish Advisory Committee on Rivers Pollution Prevention. Rivers, Leven and Ore (Fife). Edinburgh: H. M. Stationery Office. 46 pp.

Purifying water. Karl Glaessner and Emanuel Klausner. Fr. 750,538, Aug. 11, 1933. Water is first treated to remove hardness, then salts and acids are removed by electrochem. means, gas is removed and the water distd. Addns. are made according to the use to which the water is put.

Apparatus for controlling the flow of water through filter beds, etc. Walter J. Hughes (to General Zeolite Co.). U. S. 1,934,713, Nov. 14. Structural and mech. features.

Apparatus suitable for controlling the flow of water in filtration and treating plants, etc. Samuel L. Adelson (to General Zeolite Co.). U. S. 1,936,373, Nov. 21. Various structural, mech. and operative details are described.

Device for automatic control of the flow of water in filtration plants. Samuel L. Adelson (to General Zeolite Co.). U. S. 1,934,759, Nov. 14. Structural and mech. features.

Liquid-flow control valve, particularly adapted for use with water-softening apparatus. Aktiebolaget Filtrum. Brit. 397,344, Aug. 24, 1933.

Electrolytic system for removing and preventing boiler incrustation. Anton Schirmer. Brit. 397,941, Sept. 7, 1933. See Austrian 131,390 (C. A. 27, 2514).

Electrical means for preventing scale formation on evaporation apparatus, etc. Ludwig Krenyi. Fr. 751,908, Sept. 12, 1933.

Apparatus for clarifying sewage, etc., by sedimentation and use of clarifier material. Wm. C. Laughlin (to Filtration Equipment Corp.). U. S. 1,935,642, Nov. 21. Various structural and operative details are described.

Purifying sewage water. Heinrich Blunk and Max Prüss. Ger. 582,965, Aug. 25, 1933. A process for treating sewage water in stages with biol. purifying agents is described.

Purifying polluted water such as various industrial wastes. Oliver M. Urbain (to Charles H. Lewis). U. S. 1,935,963, Nov. 21. For removing carboxylic acids from water, it is treated with a thionylaniline to react with the carboxylic acids and ppt. insol. anilides.

Purifying polluted water. Oliver M. Urbain (to Charles H. Lewis). U. S. 1,935,964, Nov. 21. For eliminating O-consuming org. compds. including org. acids, mercaptans, alcs. and amines from waste waters in which such compds. are present in true soln., the waste water is treated with a reagent such as a (thionylamino)-acylhalide capable of reacting with at least one of such compds. to produce a reaction product capable of reaction with each of the remaining compds. Cf. C. A. 27, 5855.

Purifying waste water from tanneries, etc. Otto Kammann. Ger. 582,662, Aug. 19, 1933. Water contg. microorganisms is purified by treatment with slurry contg. Cu salts and a small amt. of O-carrying catalyst such as Ni salts, and filtering through sand.

## 15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND K. D. JACOB

The Wolf centrifuge in the mechanical analysis of soils. I. Peyrot. *Ann. chim. applicata* 23, 435-8(1933); cf. C. A. 25, 370.—The Wolf method for classifying soils is improved by agitating 50 g. of sample  $1/2$  hr. in 100-200 cc. water, allowing to settle 1 min., and pouring off into the centrifuge, leaving the heavier sludge behind. Centrifuge this liquid, washing the sides of the centrifuge to avoid caking onto the partitions. Again shake the sludge with water, and repeat the above operation 10 times. In this

way, blocking the centrifuge with heavy particles at the start is avoided. A. W. Contieri

Modified dry combustion method for the determination of organic carbon in soils. T. R. Seshadri. *Madras Agr. J.* 21, 413-21(1933).—The chief characteristics of the modification are (1) sufficient 100-mesh soil to give approx. 0.1 g.  $CO_2$  is mixed with 10 g. of specially ignited  $CuO$  and burned at red heat in a current of air; (2) to retain oxides of S, the tube is filled with a mixt. of wall-

ignited CuO (wire form) and PbCrO<sub>4</sub> (hempseed size); (3) halogens are removed by a 15-cm. length of closely packed fine Ag wire or wool maintained at red heat; and (4) oxides of N are removed by passing the combustion gases through a U-tube contg. pumice soaked in concd. H<sub>2</sub>SO<sub>4</sub>. Detns. on 14 samples of soil contg. different amts. of carbonates indicated that combustion of the org. matter and decompn. of the carbonates (other than alkali carbonates) are complete in approx. 30 min.; excellent results were also obtained on pure org. compds. contg. different amts. of N, S, C and halogens. The method is inaccurate on soils contg. Na<sub>2</sub>CO<sub>3</sub> because of slow and incomplete decompn. of the carbonate. K. D. Jacob

**Njombe stock farm. Development of an experimental farm in the southern portion of Tanganyika Territory.** H. E. Hornby, R. R. Staples and M. H. French. *Tanganyika Territory Dept. Vet. Sci., Ann. Rept. 1932*, 78-91 (1933).—The soils are of granitic origin and consist of 3 main types, (1) a very deep reddish brown loam, (2) a brownish black top soil with yellow clay subsoil and (3) an almost black top soil gradually changing through chocolate-brown to red loam. The soils are slightly acid, contain no free CaCO<sub>3</sub>, are very low in citric-sol. P and are definitely deficient in K and Ca, the greatest Ca deficiency occurring in the brownish black soils and the greatest K deficiency in the red loam. The red loam is deficient in N. The brownish black soils are comparatively high in Na. Detailed analyses of dry and green pasture grasses from the district are given. The grasses are deficient in protein and inorg. elements, particularly K, Ca, Na and Cl; grazing increased the percentages of inorg. constituents and lowered the fiber content, but had no effect on the protein. Stock grazed on the pastures showed a low content of inorg. P in the blood. In expts. with sheep, the hay showed low digestibility coeffs., particularly that of the protein fraction. A natural "salt" lick, which consisted of a soft pink earth with thin layers of small quartz crystals, contained only 0.0186% H<sub>2</sub>O-sol. material; the aq. ext. contained traces of Cl, Na, Fe, Ca and Al. K. D. Jacob

**Waste products of agriculture; their utilization as humus.** Albert Howard. *Fertilizer, Feeding Stuff, Farm Supplies J.* 18, 403-4 (1933).—The prepn. of artificial manure from farm wastes is briefly discussed, with particular reference to the Indore process. K. D. Jacob

**The nitrogen hunger of the world** Frederick Keeble. *Scottish J. Agr.* 16, 381-93 (1933).—An address dealing with the relation of N to plant life. K. D. Jacob

**Nitrogen optimum and border effect in sugar cane.** C. van Dillewijn and L. Levert. *Arch. Suikerind.* 41, 509-82 (1933).—The optimum effect on sugar cane was obtained with 4 quintals per hectare of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>. Beyond this, the no. of stalks did not increase; the no. of suckers, and infection by *Fusarium* increased up to 8 quintals, and then became const. The ripening process is retarded by N. With increasing quantities of N the cane yield first rises sharply, then more slowly; the rendement is highest without N, and slowly falls with increased quantities of N. The sugar yield rises rapidly to the optimum and then gradually decreases. The frequency curve of stalk lengths is regular when N is not added, but shows 2 maxima at 16 quintals (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>. The border effect is very pronounced between adjacent plots, untreated and treated with the largest amt. of N fertilizer. F. W. Zerban

**Summary of results of field tests on sugar cane in Java. Results of potash experiments, 1908-1932.** I. E. Demandt. *Arch. Suikerind.* 41, 111, *Mededeel. Proefsta. Java-Suikerind.* 885-983, plus 229 pp. of tables (1933).—This 1st part of the comprehensive summary gives only the results of the tests themselves, with a statistical analysis, but not their practical application. In Java as a whole, K is, like P, of much smaller importance than N. KCl is preferable to other forms, an application of 3 quintals per hectare being generally sufficient. Addn. of org. materials or of lime, to stimulate the effect of K, has not given any results. K has a larger effect when combined with either too low or too high doses of N and P. K

increases the rendement, but only slightly when the proper amts. of N and P are given. Nitrophoska or Ammophoska is not any more effective than the single constituents. The effect of K on the sugar yield increases regularly as the percentage of available K in the soil decreases. On the soils of east Java K has little or no value, but in central and west Java there are soils that respond to it, especially in east Pekalongan. Further K expts. should be initiated only after consulting the exact genetic soil maps which have been prepd. F. W. Z.

**Conservation of farmyard manure at Lyallpur.** S. Labh Singh and Ch. Karam Rasul. *Agr. Live-stock India* 3, 352-3 (1933).—Conservation of the N in excrement from bullocks fed and worked under exactly comparable conditions was increased 100% by absorbing the urine in a 6-in. layer of canal silt and earth and by storing the solid manure in covered pits, as compared with storage of the manure in open heaps and allowing the urine to go to waste. The N content of the solid manure alone was increased approx. 30% by storage in covered pits as compared with storage in open heaps. K. D. Jacob

**The acidity or basicity of fertilizers and their action on soils and soil acidity.** H. P. Cooper and W. R. Paden. *Am. Fertilizer* 47, No. 13, 9, 22 (1933).—Analyses of 1374 samples of cultivated Piedmont soils and of 1999 Coastal Plain soils in S. C. showed that 18% of the former and 51% of the latter are strongly or extremely acid. The toxicity of such elements as Al, Mn and Fe is very probably an important factor in the lack of satisfactory growth of crops on certain Piedmont soils. Since the Coastal Plain soils contain much less Al, Mn and Fe, they may grow satisfactory crops in the presence of high soil acidity. Soils that have become unproductive as a result of soil acidity may be restored to their original fertility by addn. of liming materials either mixed with the fertilizer or as a sep. application. High soil acidity favors the loss of such elements as Mg and Mn and these must be supplied if satisfactory response is to be secured from applications of com. fertilizers. On some of the strongly acid soils a basic fertilizer may produce a satisfactory crop whereas an acid fertilizer mixt. on the same soil may result in an almost complete crop failure. W. H. Ross

**Fineness and distribution of natural phosphate used as fertilizer.** G. H. A. Leijenaar. *Dissertation, Wageningen, Arch. Suikerind.* 41, 676-8 (1933).—The soly. of Algerian phosphate in 2% citric acid increases with the fineness of the particles, but in Nubaner tests it was found that the fraction between 0.05 and 0.03 mm. gave the best results. The still finer particles have a tendency to form aggregates which, like the grains larger than 0.05 mm., are less effective. (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> and other NH<sub>4</sub> salts increase the availability of the phosphate, because they are physiologically acid. F. W. Zerban

**Metals that we eat.** Lee Van Derlinden. *Am. Fertilizer* 79, No. 13, 5, 24, 26, 27 (1933).—A discourse reviewing the role of the minor metals in the metabolism of plants and animals, and emphasizing the importance of including an adequate supply of these metals in the prepn. of mixed fertilizers. W. H. Ross

**Mineral deficiency in the southern coastal belt of New South Wales. A preliminary survey.** Max Henry and M. S. Benjamin. *N. S. Wales Dept. Agr., Sci. Bull.* 42, 21 pp. (1933).—See *C. A.* 27, 2518, 3276. K. D. J.

**Tea yellows disease.** H. H. Storey and R. Leach. Nyasaland Protectorate Dept. Agr., *Bull.* [N. S.] 3, 12 pp. (1932); cf. *C. A.* 27, 3282. —The results of numerous field expts. showed that tea yellows can be largely controlled by the application of S or sulfate-contg. fertilizers to the soil. NaNO<sub>3</sub> increased the severity of the disease and plants fertilized with urea or Nitrophoska showed but little improvement. When tea seedlings were grown in nutrient soln. serious scorching of the leaves occurred in the absence of K, Cl or Mg, but the exact symptoms of yellows disease were produced only in the absence of S. As compared with the leaves and stems of healthy plants, those from diseased plants were markedly low in S. K. D. Jacob

**Wetting, spreading and emulsifying agents for use with**

spray fluids. VI. The effect of varying proportions of water and aid to solution on miscible oil formation and on the character of the emulsions subsequently formed from these miscible oils. R. M. Woodman. *J. Soc. Chem. Ind.* 52, 351-2T(1933); cf. *C. A.* 27, 4869.—The system emulsifier—aid to soln.—water appears to be the logical starting point in the prepn. of miscible oils contg. any toxic oil. In this particular example it is possible to select a ternary soln. in the isotropic soap phase of optimum compn. for incorporating any toxic oil. Addn. of excess of water up to a certain amt. before incorporation of the toxic oil does not seem to influence markedly the stable and non-creaming characteristics of the oil-in-water emulsions subsequently formed by addn. of water in bulk; similar addns. of the aid to soln. (phenol) before incorporation of the toxic oil cause undesirable instability and rapidity of creaming in the emulsions so obtained. There appears to be no reason why a turbid miscible oil should not form good spraying emulsions. VII. The effect of gelatin on water losses from leaves. R. M. Woodman and H. R. Barnell. *Ibid.* 352-4T.—Gelatin films on leaves exert practically a negligible effect on water losses. Thus the inclusion of glue or gelatin in a spray fluid is not likely to prove dangerous by clogging the stomata or by interfering with cuticular water losses. J. R. Adams

The method of action of copper mixtures at the moment of use. J. Branas and J. Dulac. *Compt. rend.* 197, 938-41(1933).—The ordinary means of applying acid, neutral or alk. Bordeaux or Burgundy mixt. deposits enough Cu in soln. (at least 1/20,000) to assure, at the moment of their use, a certain protection to vineyards. The quantity of dissolved Cu in these solns. lessens in proportion as the addns. of  $\text{Na}_2\text{CO}_3$  or CaO increase. J. R. Adams

The changes in calcium cyanamide in storage. A. I. Akhromeiko. *Trans. Sci. Inst. Fertilizers (Moscow)* No. 92, 149-63(1932).—In storage,  $\text{CaCN}_2$  increased in wt 60%. The time of such a wt. increase varied with the humidity. No loss of N takes place.  $\text{H}_2\text{O}$  and  $\text{CO}_2$  are responsible for the wt. increase. In a moist atm.  $\text{CaCN}_2$  is converted chiefly into dicyanodiamide and only slightly into urea. In dry air only a small portion of the  $\text{CaCN}_2$  is converted into dicyanodiamide. The poor results obtained with  $\text{CaCN}_2$  are ascribed to the formation of the unavailable dicyanodiamide. For the best results,  $\text{CaCN}_2$  should not be kept long in storage. J. S. Joffe

Spray value of nicotine supplements for aphids. H. C. Hockett. N. Y. Agr. Expt. Sta., *Tech. Bull.* 210 3-20 (1933).—Soaps and mineral oils served in a marked degree to improve the aphicidal properties of nicotine sulfate and aq. sprays. With Bordeaux mixt. the improvements were not so significant. In general, a 1:800 soln. of nicotine sulfate was required for max. kills. At 1/2 this concn., the results were variable and sometimes unsatisfactory. The lower concns. were most effective against potato and melon aphids. Soaps, miscible oils, mineral and vegetable oils and a gum, when used as nicotine supplements in sprays, enhanced the effectiveness of the sprays against aphids. C. R. Fellers

Arsenic in spray residue on apples grown in New Mexico. Anco. N. M. Agr. Expt. Sta., *3rd Annual Rept.* 51-2(1932).—Right varieties of apples and 1 of pears were sprayed 2-5 times with As sprays during the growing season and sampled for As content. The  $\text{As}_2\text{O}_3$  was less than 0.01 grain per lb. at harvest time on apples sprayed twice. Samples taken on Aug 15th showed 0.015 grain per lb.; on Aug. 30th, 0.006; and on Oct. 10th, 0.005. The decrease resulted more from the increase in size of the fruit than from rain washing. Apples receiving more than 2 As sprays exceeded the tolerance of 0.01 grain per lb. C. R. Fellers

The insecticidal action of some furan compounds. Henry Gilman, L. C. Heckert, A. P. Hewlett and J. B. Dickey. *Iowa State Coll. J. Sci.* 7, 419-28(1933).—A no. of furan compds. have been examd. for correlations between constitution and insecticidal action, the method of Peet and Grady on flies being used. Counts were made at intervals of 10 min., 30 min. and 24 hrs., and the range of effectiveness was extended from 85 downs with 2-

benzoylfuran to 5 downs with *p*-hydroxyphenyl furylacrylate, at 30 min. Some correlations are indicated between constitution and insecticidal action of the 31 compds. studied. *Tetrahydrofurfuryl trimethylacetate*,  $b_p$  137-8°,  $d_4^{20}$  0.9704, odor pleasant; *m*-cresyl furoate, m. 39.5°,  $b_p$  155°; *guaiacol furoate*, m. 76°,  $b_p$  175°; *p*-cresyl furoate, m. 55°,  $b_p$  152°; *resorcinol difuroate*, m. 130°; *hydroquinone difuroate*, m. 200°; *phenyl furylacrylate*,  $b_p$  185°; *guaiacol furylacrylate*, m. 105°,  $b_p$  210°; *p*-cresyl furylacrylate, m. 75°,  $b_p$  195°; *m*-cresyl furylacrylate,  $b_p$  185°,  $d_4^{20}$  1.0728,  $n_D^{20}$  1.5980; *p*-hydroxyphenyl furylacrylate, m. 173°; *resorcinol difurylacrylate*, m. 112°; *catechol difuroate*, m. 116°; *m*-hydroxyphenyl furylacrylate, m. 128°; *o*-hydroxyphenyl furylacrylate, m. 132°; *tetrahydrofurfuryl oxalate*,  $b_p$  203°,  $d_4^{20}$  1.1835,  $n_D^{20}$  1.4650; *tetrahydrofurfurylpropyl oxalate*,  $d_4^{20}$  1.1045,  $n_D^{20}$  1.4675, decomposed on attempted distn. at 4 mm.; *tetrahydrofurfuryl salicylate*,  $b_p$  166°, pleasant odor,  $d_4^{20}$  1.1831,  $n_D^{20}$  1.5217; *tetrahydrofurfuryl dichloroacetate*,  $b_p$  106 8°,  $d_4^{20}$  1.3095, odorless; *2-chloroethyl furoate*,  $b_p$  116 17°, d. 1.2962, pungent taste; *tetrahydrofurfuryl  $\beta$ -furylacrylate*,  $b_p$  163 7°,  $d_4^{20}$  1.1450; *tetrahydrofurfuryl cinnamate*,  $b_p$  180-1°, d. 1.120; *2-chloroethyl  $\beta$ -furylacrylate*,  $b_p$  130-2°,  $d_4^{20}$  1.2343. F. E. Brown

Codling-moth investigations. John Ryer and R. F. Crawford. New Mex. Agr. Expt. Sta., *43rd Annual Rept.* 38-42(1932); cf. *C. A.* 27, 799.—The most attractive baits for codling moths in summer bait pan tests were cane sirup, malt sirup and isobutylphenyl acetate. The sugar sirups are dild. with water 1:10 and contain 0.2%  $\text{BzONA}$  as a preservative. In an effort to avoid As residues, the usual  $\beta$ -spray Pb arsenate program was modified by the use of oil-nicotine,  $\text{NaF-ALF}$ , nicotine tannate and oil-pyrethrum in the last 3 sprays of the season. Of these the  $\text{NaF-ALF}$ , nicotine tannate and oil-pyrethrum showed promise in codling moth control and the sprayed fruit contained only 0.001-0.004 grain of  $\text{As}_2\text{O}_3$  per lb. as against 0.043 for the fruit sprayed with Pb arsenate. C. R. Fellers

The effect of seed disinfection upon the oat crop. Arthur E. Muskett and Hugh Cairns. *J. Ministry Agr. Northern Ireland* 4, 105-15(1933).—Dusting the seed grain with org. Hg compds. was nearly as effective as treatment with formaldehyde in controlling smut diseases of oats. Cu compds. were of some value as fungicides but caused definite crop injury; S had no fungicidal value for oat smuts. As general seed disinfectants the org. Hg compds. were more effective and caused greater increases in crop yields than formaldehyde. K. D. Jacob

Control of rose rust by summer spraying. Arthur E. Muskett and J. C. Taylor. *J. Ministry Agr. Northern Ireland* 4, 62-6(1933).—The effectiveness of sprays in controlling rose rust was in the descending order (1) Sulsol, a proprietary colloidal S prepn., plus soft soap, (2) Bordeaux mixt., (3) Bouisul, a colloidal Cu prepn., plus soft soap, and (4) liver of S plus soft soap. Bordeaux mixt. and Bouisul caused either severe leaf marking or leaf discoloration. K. D. Jacob

Control of finger and toe [disease] of broccoli in County Down. D. W. Baillie and A. E. Muskett. *J. Ministry Agr. Northern Ireland* 4, 44-6(1933).—Good control of the disease was obtained by treating the soil with a 0.1%  $\text{HgCl}_2$  soln. applied at the rate of 0.5 pint per plant at time of planting. Treating the soil with air-slaked lime and dipping the roots of the plants in powd.  $\text{HgCl}_2$  were ineffective. K. D. Jacob

Sooty blotch on citrus fruits (van der Plank) 12. Fertilizers (Ger. pat. 582,924) 18.

Annuaire Lambert (Statistique des engrais et produits chimiques destinés à l'agriculture). 12th ed. years 1930, 1931, 1932. Paris: Bur. d'études économiques, industrielles et agricoles, 16 rue de Miromesnil (8e). 74 pp. F. 20. Reviewed in *Chem. Trade J.* 93, 274(1933); cf. *C. A.* 26, 796.

Fertilizer. Herman L. Hartenstein. U. S. 1,934,707,

Nov. 14. Cornstalks or similar plant residues are cut or shredded, mixed with pyrophoric iron, phosphate rock and water, and the mixt. is allowed to age in the presence of air and moisture.

**Fertilizer.** I. G. Farbenind. A.-G. (Hermann Klippel and Ernst Jaenecke, inventors). Ger. 582,552, Aug. 28, 1933. See U. S. 1,916,841 (C. A. 27, 4622).

**Fertilizers.** Eisen- und Stahl-A.-G. Fr. 751,724, Sept. 8, 1933. Hot Martin slags having a high Mn content are treated with crude phosphate from acid slags and silicic acid, the mixt. being afterward ground as fine as possible.

**Treatment of phosphatic slag.** Hoesch-Köln Neuessen A.-G. für Bergbau und Hüttenbetrieb. (Friedrich Heinrich, inventor). Ger. 583,856, Sept. 11, 1933. Addn. to 577,342 (C. A. 27, 4340). The process of Ger. 577,342 is modified by using  $H_2SO_4$  or HF in the first stage in place of  $HNO_3$ .

**Treating ores such as in producing phosphatic fertilizers.** Isaac N. Waggoner and Arthur E. Skeats. U. S. 1,936,002, Nov. 21. Gypsum is mixed with a plurality of unaggregated ores such as amblyonite mixts. contg. alumina and metals of the alkali group in certain proportions, the mixt. is heated and lixiviated with water, the soln. is drawn off and solubles such as Al and alkali metal compds. are recovered from the soln.

**Insecticides.** Antoine C. Gillet. Fr. 751,827, Sept. 11, 1933. Liquid insecticides are obtained in a colloidal form by emulsification in a medium contg. a Na or K resinates or soap, an appropriate protective colloid (e. g., casein) and an excess of resin or fat. The medium is prepd. by energetic grinding at 60–80°.

**Insecticide, etc.** I. G. Farbenind. A.-G. (Adolf Steindorf and Kaspar Pfaff, inventors). Ger. 582,702, Aug. 21, 1933. See Fr. 746,268 (C. A. 27, 4623).

**Fungicide, etc.** I. G. Farbenind. A.-G. (Kaspar Pfaff and Michael Erlenbach, inventors). Ger. 578,972, June 19, 1933. A wet or dry preserving agent for fruit trees, vines, cereals, etc., is prepd. by treating  $CuCl_2$  soln. with alkylene oxide and removing the excess of the latter.

**Disinfecting seeds.** Morris S. Kharasch (to E. I. du Pont de Nemours & Co.). U. S. 1,934,803, Nov. 14. A mercurized deriv. of a thiophene compd. such as  $\alpha$ -chloromercurithiophene or the like is used as active agent in seed-disinfecting compns. U. S. 1,934,804 relates to the similar use of a Hg compd. of the type R-Hg-OH, in which R is a hydrocarbon radical, such as an alkyl or aryl mercuric hydroxide.

**Plant preservation.** Joseph Bader. Ger. 578,685, June 16, 1933. Diseases of trees, especially elm trees, are prevented by introducing a benzene contg. a mixt. of mineral oil and naphthalene into the tree.

**Protecting vegetables.** Samuel Miaulet. Fr. 750,227, Aug. 7, 1933. Vegetables are protected by a fungicide such as cupric mud mixed with a colloidal emulsion of resin.

**Herbicides.** Paul L'aurquin. Fr. 751,644, Sept. 7, 1933. A herbicide consists of a finely ground natural salt of K (kainite, sylvinit, etc.) and anhyd.  $CaO$ , approx. in the proportion of 4 to 1.

**Herbicides.** Georges Truffaut and Isaac Pastac. Fr. 751,842, Sept. 11, 1933. Solns. of nitrites with or without sol. salts of uni- or bi-valent metals are used as herbicides.

## 16—THE FERMENTATION INDUSTRIES

C. N. FREY

**Alcohol from potatoes—technical methods on the Continent.** A. E. Williams. *Chem. Trade J.* 93, 335-6 (1933).—A discussion of the sources of supply of potatoes in England, prepn. of the wort, fermentation and distn. and the by-products of the industry. W. H. Boynton

**The vitamin contents of potato residues.** A. Scheunert and M. Schieblich. *Biedermanns Zentr. B. Tierernuhr.* 5, 653-6 (1933).—The residues of potatoes from the distn. of spirits showed  $1/10$ – $1/100$  the B and G vitamin contents of dried yeast. B was somewhat higher than G.

F. L. Dunlap

**Effect of light on the carbon monoxide inhibition of butyric acid fermentation.** Walter Kempner and Fritz Kuhowitz. *Biochem. Z.* 265, 245-52 (1933).—Butyric acid fermentation is an anaerobic process which is reversibly inhibited by  $CO$ . But the sensitivity to light could be demonstrated only at low temp and with illumination of very great intensity. Under these conditions the fermentation can be completely and reversibly inhibited, but even then the light sensitivity is very much smaller than that of the respiration. The  $CO$  compd. of the butyric acid enzyme absorbs light within the spectrum range of 650 to 306  $m\mu$ .

S. Morgulis

**The preparation and importance of glyceric acid-monophosphoric acid.** Carl Neuberg and Maria Kolbe. *Angew. Chem.* 46, 711-13 (1933).—A method for the prepn. of the acid is described, based upon the action of yeast on hexoses. A detailed account of the exptl. work is presented. Thirteen references. Karl Kammermeyer

**Formation of glucuronic acid by *Aspergillus niger*.** E. Kardo-Susoeva. *Biochem. Z.* 266, 337-51 (1933).—The fermentative processes are affected by decreasing the normal salt content of the nutritive medium. A nutritive salt content of only  $1/30$  concn. is most favorable to the production of glucuronic acid, which is further increased through the addn. of  $CaCO_3$ . The excess of N-contg. salts has a stimulating effect on the accumulation of glucuronic acid only in an acid medium. The glucuronic acid yield is also increased by cultivating the molds on changing media. At 33–35° the development of the mold

in one nutritive soln. should proceed 3 days, then 5 days in the second soln.

S. Morgulis

**Kinetics of the accumulation of organic substances in cultures containing two species of yeast.** G. F. Gause. *Biochem. Z.* 266, 352-4 (1933).—Theoretical. S. M.

**Yeast-growth stimulants in white sugars (Hall, et al.) 28.**

**Acetone and alcohols.** Maschinenbau-A.-G. Gölzern-Grimma. Fr. 751,623, Sept. 7, 1933. Acetone, EtOH and BuOH are obtained in a continuous manner from worts or other aq. solns. The distillate enriched in a distn. column, in acetone, EtOH and BuOH from a wort or aq. soln. is submitted immediately after condensation and removal of non-condensable gases to a continuous rectification comprising several steps. In the first step acetone and EtOH are sep'd. from BuOH and water, from which the constituents are then sep'd.

**Propionic acid.** Hugh R. Stiles (to Commercial Solvents Corp.). Brit. 396,968, Aug. 17, 1933. Carbohydrates are fermented in presence of bentonite, or a hydrated  $Al_2O_3$  such as activated  $Al_2O_3$ , by means of various strains of *B. acidi propionici*, with or without other bacteria such as those that produce lactic acid, hydrolyze nitrogenous substances, e. g., the *Proteus* group, ferment salts of org. acids, e. g., the *Alkaligenes* group, and form mannitol, e. g., *B. mannitolpocum*, *B. gayoni* and *Lactobacillus fermentum*. The inoculation with the different bacteria may be successive or simultaneous. The process may be effected at 30–1° with an acidity of  $pH$  5.4–6, maintained by an excess of  $CaCO_3$ . Cf. C. A. 28, 565<sup>2</sup>.

**Vinegar generator.** Alfred W. Hinchliffe (to Buffalo Foundry and Machine Co.). U. S. 1,934,712, Nov. 14. Structural features of sparge arms, etc.

**Fermentation glycerol.** Wallace H. Carothers, Julian W. Hill and Frank J. L. Van Natta (to E. I. du Pont de Nemours & Co.). U. S. 1,936,497, Nov. 21. Sugar is fermented in an alk. medium, the glycerol formed is distd. from other fermentation products, the distd. glycerol is

rendered alk. with lime, and the liquid is blown with air to destroy phenols.

**Fermentation processes.** Frédéric Lévi. *Fr.* 753,152, Oct. 9, 1933. The  $\text{CO}_2$  evolved is purified by adsorbents, particularly active charcoal. The alc. carried over by the  $\text{CO}_2$  is also recovered thereby. Adsorbents are also used for purifying *pyroligneous acid*.

**Plant for distilling fermented wort and mash.** Wilhelm

Vogelbusch. *Ger.* 582,609, Aug. 17, 1933. Addn. to 564,876 (*C. A.* 27, 1085).

**Device for extracting hops.** Wilhelm Greiner. *Ger.* 578,559, June 15, 1933.

**Yeast.** Hans Braasch and Arnold Braasch. *Fr.* 750,158, Aug. 5, 1933. The air introduced during the period of multiplication of the yeast contains about 1-3% of  $\text{CO}_2$ . Cf. *C. A.* 27, 5471.

## 17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

**Fougère types of perfumes.** Alfons M. Burger. *Riechstoff Ind. u. Kosmetik* 8, 175-6(1933).—A discussion and formulas.

**Raw materials of cosmetics.** Karl Pfaff. *Riechstoff Ind. u. Kosmetik* 8, 177-9(1933); cf. *C. A.* 27, 565.—A discussion of (1) *beeswax*, its properties and uses in water-free cerates and cerates contg.  $\text{H}_2\text{O}$  and cold creams, (2) *wax soaps*, (3) *artificial waxes* and their compn. and (4) *spermaceti*. Formulas are included. H. M. B.

**Microchemistry of the opium alkaloids.** L. Kosler. *Pharm. Monatsh.* 14, 220-2(1933).—Different cryst. forms (all belonging to the rhombic system) of morphine are prepared: (a) one contg. water of crystn. and (b) two anhyd. forms (metastable, m.  $197^\circ$ , and stable, m. with decompn.  $240^\circ$ ). The stable form upon microsublimation yields crystals of three types ( $\alpha$ ,  $\beta$ ,  $\gamma$ ) with  $n = 1.653$ , 1.657 and 1.671, resp. The metastable modification upon the same treatment yields crystals with  $n = 1.573$ , 1.625 and 1.630; (a) yields crystals with  $n = 1.582$ , 1.623 and 1.644. *Codeine* in a micro melting pt. app. shows crystals contg. water of crystn. (m.  $63^\circ$  and  $68^\circ$ ) and water-free cryst. (m.  $155^\circ$ ). Similar detns. are reported for morphine-HCl.

**Sulfur-containing remedies and their analysis.** E. Schuele. *Pharm. Monatsh.* 14, 228 9(1933).—To det. elementary S weigh in a 30-cc. beaker a quantity of substance equiv. to 1-2 mg. S. Scatter 0.2 g. KCN upon the sample, add 8-10 drops  $\text{H}_2\text{O}$  and 15 cc.  $\text{Me}_2\text{CO}$ , and evap. to dryness. To the residue add 5 cc.  $\text{Me}_2\text{CO}$  and again evap. to dryness. Dissolve the residue in a little  $\text{H}_2\text{O}$ , filter if necessary and dil. to 50-60 cc. To the soln. contained in a 100-cc. flask add 1 g. boric acid and coarse pumice, and boil for 10 min. By Schuele's method det. the thiocyanate formed. Slight modifications of the usual methods for organically bound S in the presence and absence of N as well as total S are discussed. H. M. B.

**Microchemistry of antipyrine.** C. van Zijp. *Pharm. Weekblad* 70, 1243-8(1933).—The color reaction of antipyrine with  $\text{HNO}_3$  is described in detail. The nitro deriv. obtained in white crystals by evapg. the reaction mixt. has characteristic appearance, soly. and optical properties. Crystallographic data are given.

**Communications from the laboratory of the Dutch society for the promotion of pharmacy.** Nos. 36-40. **Examination of tablets.** H. J. van Giffen. *Pharm. Weekblad* 70, 1270-8(1933); cf. *C. A.* 27, 4344.—Methods of examn. and reports of analyses are given for the following tablets manufd. by European pharmaceutical houses: dicodid bitartrate, eucodal, dilaudid, ephedrine, ephedron and ephetonine.

**Variations in the strength of cardiac-active glucosides as determined by means of frogs.** S. Rosenkranz. *Arch. expl. Path. Pharmacol.* 172, 18-25(1933).—The sensitivity of frogs to glucosides derived from digitalis, scylla, convallaria and strophanthus may vary as much as 43% when tested daily over a period of a month. The sensitivity is min. in the first months of the year. H. Eagle

**The standardization of digitalis infusion and tincture with respect to their therapeutic use.** S. Rosenkranz. *Arch. expl. Path. Pharmacol.* 172, 26-35(1933).—Although infusion exhausts the leaves of the active glucosides, the infusion is less active than the tincture, and does not keep. Tinctures prepd. with 50-70% EtOH are most active, but do not keep as well as those prepd. with 96-

9% EtOH which are significantly less active. The opt. procedure is to use 70% EtOH and keep the tincture in the ice chest. It should be replaced every 3 months.

Harry Eagle

**The catalytic effect of iron salts upon the decomposition of nicotine during smoking.** Emil Starkenstein and Wilhelm Stejskal. *Arch. expl. Path. Pharmacol.* 172, 119 36(1933).—The addn. of Fe salts to cigars decreases the amt. of nicotine in the smoke by 25%. This is not due to combination of the nicotine with the Fe, but to a catalytic increase in the decompn. of nicotine at the C-Fe surface.

Harry Eagle

**The standardization of digitalis by means of cats.** H. Bauer and K. Fromherz. *Arch. expl. Path. Pharmacol.* 172, 693-8(1933).—The type of anesthesia has only a slight effect upon the standardization of digitalis alkaloids by means of cats. The Magnus method of detg. digitoxin and digitoxin-contg. glucosides gives lower values than the original method of Hatcher and Brody. The term cat unit has no abs. significance; the method used must be exactly described.

Harry Eagle

**Estimation of essential oil in camomile flowers.** R. Hofmann and R. Brachvogel. *Apoth. Ztg.* 48, 1394 (1933).—Until a better method is available, the D. A. B. 6 procedure should be followed.

W. O. E.

**Pinene from Nectandra olacophora Bar. Rod. N. Botafogo Gonsalves.** *Arch. Pharm.* 271, 461-2(1933).—The reddish yellow crude oil obtained from the tree by tapping had  $d_4^{20}$  0.8960,  $n_D^{20}$  1.471,  $[\alpha]_D^{20}$   $58^\circ 22'$ , and gave on fractionation a pinene having  $d_4^{20}$  0.8656,  $n_D^{20}$  1.466,  $[\alpha]_D^{20}$   $66^\circ 32'$ .

W. O. E.

**Detection of local anesthetics.** R. Fischer. *Arch. Pharm.* 271, 460-70(1933).—A procedure is described by means of which cocaine and 12 synthetic local anesthetics can be quickly and definite detected. The alkaloid is pptd. on the object glass by means of a suitable reagent. The resulting crystals are thereupon washed, dried and then subjected to a micro m.-p. detn. whereby a positive identification can be effected in from 20 to 30 min.

W. O. E.

**Characterization and testing of tinctures.** A. Mayrhofer and Anatol Beck. *Pharm. Presse, Wiss.-prakt. Heft* 1933, 129 37.—A review is given of procedures previously suggested for the characterization and evaluation of tinctures, notably those involving factors of color. The present paper reports the results obtained in the examn. of a series of tinctures with respect to their color tone and relation of the latter to quality. The color measurements were based on the Ostwald color theory and carried out with the aid of a simple app. (illustrated) specially constructed for this line of work.

W. O. E.

**Present status of our chemical knowledge of plant laxatives.** L. Rosenthaler. *Pharm. Presse, Wiss.-prakt. Heft* 1933, 137-9.

W. O. E.

**Pharmacopeia Helvetica Editio Quinta.** L. Rosenthaler. *Pharm. Zentralhalle* 74, 670-4, 701-5(1933).—A digest.

W. O. E.

**Recovery of nicotine from the steam-distillation residues of tobacco.** Constantin Pyriki. *Pharm. Zentralhalle* 74, 717-21(1933); cf. *C. A.* 27, 3287.—From tobacco residues completely exhausted of nicotine by alk. (NaOH) steam distn. a positive test with silicotungstic acid resulted on further distn. of such residues after they had stood for some time. The dipicrate obtained with the 2nd distn. was

identified as that of nicotine. The sepn. of nicotine takes place slowly and hence requires a long time for its complete elimination; even boiling before a reflux did not hasten the operation. Contact of the residues with MgO failed to promote sepn. of the alkaloid. The quantities of nicotine obtained from cigar and cigaret tobaccos were 0.139-0.153 and 0.072-0.081, resp. The reason for the above phenomena is probably the fact that tabacin, a glucoside of tobacco, by the action of strong alkali releases nicotine.

W. O. E.

**Change in certain pharmaceutical tinctures and alkaloidal salt solutions on exposure to sun and ultra-violet light. II.** With especial reference to optical rotation. C. A. Rojahn and Edgar Haase. *Pharm. Zentralhalle* 74, 625-31(1933); cf. *C. A.* 26, 5173. —This paper is a continuation of R. and Herzog's investigations in the same field. A year's exposure to sunlight produced changes in tinct. hydrastis (about 25%) and in tinct. capsici (35%); while the tincts. aconiti, arcaeae, belladonnae, granati (?) and strophanthi were relatively stable (losses under 5%). With ultra-violet light the changes were: tinct. arcaeae 28, hydrastis 23.6 and capsici 35.1%, the tincts. aconiti, belladonnae, granati and strophanthi being stable. Alkaloidal and alkaloidal salt soln., after 24-hr. exposure to ultra-violet light, suffered losses in content up to 31.3% (cinchonidine), cocaine being least affected. The optical rotation also is lessened. The color content of tinct. capsici is decreased by daylight exposure; it is increased, however, with tincts. granati, hydrastis and arcaeae; it is retained after temporarily fading in the case of tincts. aconiti and strophanthi. On exposure to ultra-violet light for 48 hrs. the color of tincts. aconiti, belladonnae and capsici fades, but increases, however, in the case of tincts. arcaeae, hydrastis and strophanthi, while that of tinct. granati remains practically unchanged.

W. O. E.

**Viscosity measurement in evaluating tinctures.** Hellmuth Schrader. *Pharm. Ztg.* 78, 1159 61(1933). —The results obtained in the examn. of a series of tinctures with the Hoppler viscometer are presented in the form of a graph and numerical values.

W. O. E.

**Iodine and iodized surgical dressings.** Max Sido. *Pharm. Ztg.* 78, 1188-9(1933). —The conditions under which I was discovered, as also the use of I-carrying products several centuries earlier, are discussed.

W. O. E.

**Natural and synthetic menthol.** Fritz Unger. *Pharm. Ztg.* 78, 1203 4(1933). —Certain criteria are suggested for the evaluation and use of these two products in pharmacy and medicine.

W. O. E.

**Sterilization of urotropine solutions.** A. Pfister. *Pharm. Ztg.* 78, 1228 9(1933). —In order to dissipate certain contradictory statements relative to sterilization of urotropine solns., and on the assumption that the amt. of  $\text{CH}_2\text{O}$  liberated at a fixed temp. suffices to sterilize the soln., expts. were carried out with 10 and 25% solns. of urotropine in glass ampoules at room temp. over varying periods. While 25% solns. were found to be sterile at the end of 48 hrs., it appears that those of 10% strength should be heated  $\frac{1}{4}$  hr. at  $40^\circ$  in order to acquire sterility.

W. O. E.

**Evaluation of white petrolatums.** V. O. Schmatolla. *Pharm. Ztg.* 78, 1214-15(1933). —The conception and importance of viscosity in petrolatum are discussed notably the many erroneous views still pertaining thereto. The following procedure is suggested as affording a satisfactory method of evaluation: On a relatively large watch glass weigh out 1 g. of the sample, spreading it to a uniform depth of 1 mm. and over an area of  $40 \times 40$  mm. Cover with 3 g. concd.  $\text{H}_2\text{SO}_4$  and rub the petrolatum layer by short quick movements with the dry round base of a wide test tube. A genuine, sufficiently pure pharmaceutical petrolatum will under this treatment become at the most brownish and never after 5 min. quick rubbing form a fine flaked, emulsion, but remain coherent or possibly develop into larger agglomerated adherent flakes. A tech. "white" petrolatum becomes rapidly brown or acquires a red rusty tone under these circumstances, thereby forming an emulsion and on account of the finer distribution ap-

pears to become again lighter in color, a phenomenon that may deceive.

W. O. E.

**Comparative study of the assays of cinchona bark.** Margarethe Oakley. *Am. J. Pharm.* 105, 535-46 (1933). —The 1 titration method of Dubreuil and the silicotungstic procedure of Beal and North were employed on the mixts. of the pure alkaloids successfully and are compared with the U. S. P. method. The official method of removing the alkaloids from the crude drug was found to be capable of a high degree of accuracy. In this comparison it is pointed out that by evapn. of the ethereal solvent without effort to purify, much extraneous material is weighed with the alkaloids. The shaking out process removes some of this impurity, but not by any means all of it. The 1 titration gives low results on residues obtained in the assay. The silicotungstic acid pptn. gives concordant results and may be employed without subjecting the alkaloid to the shaking out process. The following procedure is recommended: Weigh 5 g. of the powd. (No. 60 fineness) bark into a 500-cc. Erlenmeyer flask. Add 15 cc. of 3% HCl. Mix so that the bark is evenly wet. Digest on a water bath for 1 hr. Cool. Add 200 cc. ether-chloroform (3 parts ether and 1 part  $\text{CHCl}_3$ ) and 10 cc. strong ammonia. Stopper and shake in a mech. shaker 1 hr. Allow to stand overnight. Shake for an addnl. 30 min. Decant 100 cc. of the ethereal solvent (representing 4 g. of bark) and evap. to dryness. Dissolve the crude alkaloids in 10 cc. of ether and add 100 cc. of approx. 0.6 N HCl. Warm on a water bath until the ether has evapd., transfer to a 200-cc. vol. flask and make up to the mark with 0.6 N acid. To a 50-cc. aliquot of this soln. add 50 cc. of the 0.6 N acid and 15 cc. of 6% silicotungstic acid. Stir vigorously and then allow to settle. Decant the supernatant liquid through a weighed Gooch crucible, add the ppt. to the crucible and wash with 1% HCl. Dry at  $100^\circ$  and ignite at a bright red heat. Cool in a desiccator and weigh. The wt. of the anhydride multiplied by 21.72 equals the percentage of alkaloid in the drug. ( $2 \times \text{av. mol. wt. of cinchona alkaloids} \times 100$ )/mol. wt. of  $\text{SiO}_2 \cdot 12\text{WO}_3 = 21.72$ . A bibliography is appended.

W. G. Gaessler

**Achillea Millefolium, Linne. Constituents of the petroleum ether extract of the blossoms.** R. L. McMur-ray. *Am. J. Pharm.* 105, 573 82(1933). —The percentage of extractive sol. in petr. ether amounted to 2.019% with 100 lb. of air-dried, ground blossoms in a Lloyd extractor. Org. compds. isolated from this ext. and not previously reported in the literature are: (a) satd. fatty acids myristic acid, palmitic acid, undetd. acid, cerotic acid; (b) unsatd. fatty acids—linoleic acid, oleic acid; (c) satd. alc.—cetyl alc.; (d) unsatd. alc.—sterol; (e) satd. hydrocarbon tricacontane.

W. G. Gaessler

**Recent developments in pharmacopoeial vitamin standardization.** E. Fullerton Cook. *Am. J. Pharm.* 105, 583 7(1933). —The U. S. P. Vitamin Advisory Board recommend the following standards for the official cod-liver oil: the min. standard for vitamin A for U. S. P. cod-liver oil shall be not less than 600 international units. The min. vitamin D standard for U. S. P. cod-liver oil shall be not less than 85 international units. One U. S. P. X. Sherman or A. D. M. A. unit of vitamin A equals 1.4 international or new U. S. P. units. One Steenbock unit of vitamin D equals 2.7 international or new U. S. P. units. One international or U. S. P. unit of vitamin D equals 3.25 A. D. M. A. units.

W. G. Gaessler

**A study of fluidextract of cinchona.** Zdeněk Rektorič. *Časopis Českoslov. Lékárnictva* 13, 249-58(1933). —In the extn. of cinchona bark the yield of alkaloids in the fluidext. was 40% of the total alkaloids present using 90% alcohol as specified by the British pharmacopeia and 55% using water-glycerin mixt. acidulated with HCl as proposed for the next Czechoslovakian pharmacopeia. Volumetric detns. of the alkaloids in the preps. by the methods of Frerichs-Mannheim and the British pharmacopeia were in good accord but the latter gave slightly higher results for the bark.

William J. Husa

**Fowler's arsenical solution, Ph. A. VIII.** B. Rakušan

and J. Fanta. *Časopis Českoslov. Lékárnictva* 13, 277-80 (1933).—Discrepancies between the  $As^{III}$  content required in Fowler's soln. and the values found in recently prepd. solns. are not due to oxidation, which is very slow.

William J. Husa

The preservation of preparations of coca. A. and C. Chalmers. *Bull. sci. pharmacol.* 40, 577-81 (1933).—The fluidexts. of coca leaves show the same characteristics of stability as solns. of cocaine base in  $H_2O$ -EtOH: the higher the EtOH content, the less hydrolysis occurs. Acidification also improves the stability of dil. solns.

A. E. Meyer

Retamine. M. H. Wunschendorff and P. Valier. *Bull. sci. pharmacol.* 40, 601-4 (1933).—For the prepn. of the alkaloid, ext. the dried branches of *Retama sphaerocarpa* Boiss with 90% EtOH, slightly acidified with  $H_2SO_4$ . Evap. *in vacuo*, redissolve in 95% EtOH, filter, evap., dissolve the residue in  $H_2O$  and ext. with  $Et_2O$ . Alkalinize the aq. liquid with NaOH and ext. again with  $Et_2O$ . The white alkaloid crystallizes after evapn. of the  $Et_2O$ . The yield is 5 g. per kg. of the drug. It is a strong base, sol. in  $CHCl_3$ , petr. ether and EtOH, almost insol. in  $H_2O$ . It m.  $168^\circ$ , is dextrorotatory and has the compn.: C 72.0, H 10.40, N 11.20 and O 6.40% corresponding to the formula  $C_{14}H_{15}N_2O$ .

A. E. Meyer

A new method for the determination of stovaine. Juan A. Sánchez. *Semana méd.* (Buenos Aires) 1933, 11, 1419-20.—See C. A. 27, 1985.

A. E. Meyer

Biochemical studies on tobacco drying and fermentation. III. Are ammonia, methylamine and pyridine produced from nicotine during fermentation? J. Bodnár and Ladislav Barta. *Biochem. Z.* 265, 386 9 (1933); cf. C. A. 27, 1986.—Of the various Hungarian tobaccos the Kopa loses most nicotine during fermentation. This diminution is probably due to an oxidation as it cannot be accounted for by  $NH_3$ ,  $MeNH_2$ , or pyridine formation. The higher the H-ion concn. of the tobacco the less is the loss of its nicotine content.

S. Morgulis

Analysis of Spanish digitalis. Francisco Giral. *Anales soc. espan. fis. quim.* 31, 746 9 (1933).—Samples of Spanish digitalis were analyzed by the Perrot and Bourcet method (C. A. 22, 2437); 0.52 g. of cryst. digitalis was found per kg. of dried leaf of pharmaceutical grade, or 0.85 g. from a com. grade from Salamanca.

E. M. Symmes

Sterilization of solutions of sodium bicarbonate. Ar. Mihalovici. *J. pharm. chim.* 18, 418 21 (1933); cf. C. A. 28, 2561.—Pure sterile  $NaHCO_3$  is pptd. from aq. sterile soln. of crystd.  $Na_2CO_3$  by excess of gaseous  $CO_2$  under strictly sterile conditions, which are extended to the filtration and soln. of  $NaHCO_3$  in  $H_2O$ .

S. Waldbott

Liquor cresolis saponatus, British Pharmacopeia 1932. J. C. Roberts and R. V. Lloyd. *J. Pharm. J.* 131, 677 (1933).—Sapon. of linseed oil is difficult when its acid no. is low, e. g., 2.5 instead of the max. of 5.0 (Brit. Pharm.), but is rendered easy when oleic acid is added to the oil before sapon. To make 100 cc. of pale brown lysol, mix linseed oil 17 g. with oleic acid 1 g., heat the mixt. on the water bath and add a heated soln. of 4.2 g. KOH in 25 cc.  $H_2O$ . Heat and stir until sapon. is complete, replacing the evapg.  $H_2O$ . Cool, then add 50 cc. cresol and  $H_2O$  to bring the vol. to 100 cc. (cf. Berry, C. A. 27, 2532).

S. Waldbott

Detn. of elemental S (Allport) 7. Detn. of Fe (Ben-nett, Campbell) 7. Antimalarials (Miki, Robinson) 10. Phenol ketones of diphenylmethane, -ethane, -propane and their reduction products (Wojahn) 10. Intermediates and dyes [with bactericidal properties] (Fr. pat. 751,711) 25. Purifying ether (U. S. pat. 1,935,658) 10. Resin acid derivs. [products used for therapeutic purposes] (Ger. pat. 578,927) 26.

Zamarini, Guido: Formulario experimentado para perfumes, cosméticos, jabones, licores, vinos y jarabes. 2nd ed. Mexico, D.F.: Imprenta F. E. Graue. 347 pp.

Therapeutic preparations. Salomo Gerhard Tekla Budien. *Brit.* 397,516, Aug. 23, 1933. The elec.

charge of a therapeutic serum is adjusted by addn. of substances which influence the lability of the albumins contained in the serum, e. g.,  $CaCl_2$ ,  $MgCl_2$ , Ca gluconate and lactate, colloidal S. The charge is so adjusted that on adding 0.0-1.3 parts 0.1 N  $Na_2VO_4$  and 8.7-10 parts N AcOH to a test sample contg. 1 part treated serum and 1 part  $H_2O$  the albumin seps. in flocks.

Therapeutic preparations. I. G. Farbenind. A.-G. (Willy Ludwig and Otto Schaumann, inventors). Ger. 578,996, June 20, 1933. Pulverized cardiac muscles are extd. with water or aq.-org. solvent and filtered. The lipids, etc., in the filtrate are used for treating heart diseases.

Therapeutically active preparations. Pharmaceutische Werke "Norgine" A.-G. and Siegwart Hermann. Ger. 578,594, June 15, 1933. Nutritive solns. contg. carbohydrates are subjected to the action of pure cultures of *bacterium gluconum*. The resulting gluconic acid is converted into Ca salt and used for treating illnesses due to senile decay.

Detoxicant therapeutic compound. Winford P. Larson and Mortimer Bye (to Wm. S. Merrell Co.). U. S. 1,936,456, Nov. 21. For neutralizing and combating toxins in body cavities, as in treating infections of the lower intestine, a salt such as Na ricinoleate is used (suitably together also with other substances such as an aq. or oleaginous vehicle and antiseptic substances). Various details and examples are given. U. S. 1,936,457 relates to the treatment of disorders of the colon, etc., or exposed tissues such as those of wounds by use of ricinoleates such as those of Na, K, Li,  $NH_4$ , Rb or Cs.

Magnesium citrate solution suitable for medicinal use. Richard Pasternack and Clinton P. Ammerman (to Charles Pfizer & Co.). U. S. 1,936,304, Nov. 21. A stable soln. is formed contg. Mg citrate and gluconic acid with substantially no excess of citric acid.

Camphoric acid preparations. Carl A. Rojahn. Ger. 582,805, Aug. 23, 1933. Addn. to 571,501 (C. A. 27, 4349). Sol. preps. of the above character for therapeutic purposes are made by treating camphoric acid with mono- or diethanolamine under conditions in which no esterification of the OH group of the ethanolamine, or acid amide formation occurs, but only neutralization of the COOH group. The diethanolamine may be replaced by hydroxyethylbromoethylamine. Examples are given.

1-Methoxy-2-hydroxy-3-aminobenzene-5-sulfonic acids. Karl Streitwolf, Alfrid Fehle and Hans Hilmer (to Winthrop Chemical Co.). U. S. 1,935,960, Nov. 21. 1-Methoxy-2-hydroxy-3-amino-benzene-4- and -5-sulfonic acids are obtained, e. g., by reducing the corresponding 3-nitro compds. (various details being given) and are suitable for therapeutic use in combating protozoa diseases.

Bismuth salts of organic carboxylic acids. Rudolf Berendes and Ludwig Schütz (to Winthrop Chemical Co.). U. S. 1,934,785, Nov. 14. Bi salts generally sol. in fatty oils, sol. in org. solvents and very difficultly sol. in water, and which are suitable for therapeutic use, are obtained by heating Bi oxide or hydroxide on the water bath (and if desired with a solvent such as water) with acids such as dimethylacetic acid, methylallylacetic acid, diallylacetic acid, crotylpropylacetic acid, ethylisoamylacetic acid, isopropylphenylacetic acid, methylcyclohexylacetic acid, ethylbenzylacetic acid, isobutyltolylacetic acid, ethylanisylacetic acid, dicyclopentylacetic acid, heptylcyclohexenylacetic acid, etc. Several examples with details of procedure are given. Cf. C. A. 26, 3623.

Nitrogen-containing compounds of the pyridine and quinoline series. Max Bockmühl, Walter Krohs and Gustav Ehrhart (to Winthrop Chemical Co.). U. S. 1,936,547, Nov. 21. Details are given of the production of various therapeutic compds. which form water-sol. hydrochlorides, such as 1-dicyclohexylaminoethylpyridine-2-imide, 1-dicyclohexylaminoethylquinoline-2-imide, 2-dicyclohexylaminoethylaminopyridine, b<sub>2</sub> 190-5° and forming a dihydrobromide m.  $198^\circ$ , 1-dihexahydrobenzylaminoethylpyridine-2-imide, 1-(1'-dicyclohexylamino-pentyl-4')pyridine-2-imide, di-p-methylcyclohexylaminoethylpyridine-2-imide, 1-dicyclohexylaminoethyl-5-

hydroxypyridine-2-imide and 1-dicyclohexylaminoethyl-5-ethoxypyridine-2-imide.

**Asymmetrical arseno compounds.** I. G. Farbenind. A.-G. (Karl Streitwolf, Alfred Fehrlé and Walter Herrmann, inventors). Ger. 578,312, June 12, 1933. Addn. to 554,951 (C. A. 26, 6071). The method of 554,951 for prep. the above by reducing phenoxyacetic acid-arsonic acid or arylarsonic acids contg. a nitrogenous heterocyclic ring, is modified by carrying out the reduction in the presence of pyridine- or quinoline-arsonic acids. Thus, 4-acetyl-amino-2-phenoxyacetic acid-1-arsonic acid is mixed with 2-pyridonecarsonic acid and reduced with  $H_2PO_4$ . Other examples are given. The products have therapeutic uses.

**Metallic mercapto compounds.** Schering Kahlbaum A.-G. Brit. 397,293, Aug. 24, 1933. See Ger. 573,629 (C. A. 27, 4349).

**Salicylates.** Carl A. Rojahn. Ger. 582,148, Aug. 9, 1933. Addn. to 561,523 (C. A. 27, 1093). Salicylic acid or its 1 substitution products are treated in the cold with mono- or diethanolamine or a mixt. of both to give salts useful in therapy. Examples are given.

**Carvacrol.** Chemische Fabrik von Heyden A.-G. (Curt Philipp, inventor). Ger. 582,968, Aug. 25, 1933. Carvacrol is iodinated in the nucleus by treatment with alkali and agents used for the nuclear iodination of PhOH, up to 2 mols. of alkali being used to each mol. of carvacrol. Thus, carvacrol is treated with NaOH, NaI and  $NaIO_3$  to give an iodinated product. These products are useful as disinfectants.

**Santonin derivatives.** Schering-Kahlbaum A.-G. (Erwin Schwenk and Hans Goebel, inventors). Ger. 578,941, June 19, 1933. Basic solns. of santonin acid or solns. obtained by treating santonin with basic substances, are treated with an acylating agent under conditions which cause the soln. to remain basic. The resulting acyl deriv. is sepd. by acidification. In an example, 1 mol. of santonin is shaken with 2 mols. of NaOH.  $AcCl$  or  $Ac_2O$  is then added. On acidification of the soln. with  $HCl$ , the acetyl deriv., m. 143°, seps. The prepn. of the benzoyl and stearyl derivs. is also described.

**Ointments.** Firma Johann Trimmel and Hugo Weil. Ger. 587,142, Oct. 30, 1933. Ointment bases are prepd. by treating alkali silicate solns. with aliphatic or hydroaromatic monocarboxylic acids contg. more than 9 C atoms. Examples are given.

**Dealbuminizing therapeutic serums or other liquids.** Salomo Gerhard Tekla Rendien. Brit. 397,515, Aug. 23, 1933. See Ger. 571,404 (C. A. 27, 2974).

**Hormones.** Schering-Kahlbaum A.-G. Brit. 396,581, Aug. 10, 1933. A thyreotropic hormone which causes development of the parenchyma and shrinkage of the colloid of the thyroid gland is obtained from aq. exts. of the anterior lobe of the hypophysis by treatment thereof with an albumin precipitant and sepn. of the active substance from the ppt. The mother liquors from the pptn. contain the gonadotropic hormone. Suitable pptg. agents are picric, sulfosalicylic and trichloroacetic acids, heavy metal salts, e. g.,  $Pb(OAc)_2$ , or colloids, e. g., hydroxides of Fe or Al.

**Hormone extract.** Schering-Kahlbaum A.-G. (Johann Plesch, inventor). Ger. 582,593, Aug. 17, 1933. Hormone exts. with an action on the heart are obtained by extg. the auricles of the heart with  $MeOH$ , etc.

**Cystographic medium.** Arnold E. Osterberg (to Chemical Foundation, Inc.). U. S. 1,635,661, Nov. 21. A medium for cystography comprises a cold-water-sol. alk. Bi tartrate contg. at least about 65% Bi, forming non-irritating and freely flowing non-viscous solns.

**X-ray examinations.** Béla Moskovits. Fr. 750,173, Aug. 5, 1933. Aq. suspensions of  $BaSO_4$  for x-ray ex-

aminations are prepd. by agitating  $BaSO_4$  with water in the presence of artificial  $SiO_2$ -gels or natural silicates forming gels. Neutral substances such as kaolin may also be present.

**Antiseptic compositions.** Soc. nouvelle des mines de Saint-Champ. Fr. 750,342, Aug. 8, 1933. Oils contg. org. S compds. obtained, e. g., by distg. certain bituminous rocks, are mixed with fatty substances and used for antiseptic and insecticide purposes. Cf. C. A. 27, 805.

**Antiseptic absorbent material.** Regina J. Woody and McIlver Woody. U. S. 1,935,170, Nov. 14. Cellulosic fibers such as those of paper pulp stock are formed into a web which is transferred to a drying roll and while the web is in contact with this roll antiseptic material such as  $H_2BO_3$  is distributed over its exposed surface in the presence of sufficient moisture to cause the antiseptic to cement itself directly to the fibers of the web. App. is described.

**Disinfectant.** Peter Schestakoff. Ger. 578,663, June 10, 1933. Prepns. contg. 1 salts and O, for liberating free I for application to the skin, etc., are made by mixing water-sol. stable salts of HI with neutral mineral salts which liberate I from the I salts in acid soln. These are fused or pressed into tablets and used with acid in tablet form. Thus, a mixt. of  $KNO_3$ ,  $KNO_2$  and KI is made into tablets. When I is required, these tablets are mixed with tablets of  $Al_2(SO_4)_3$  and water.

**Disinfectants.** I. G. Farbenind. A.-G. Fr. 750,306, Aug. 8, 1933. An actin. product of  $HCOOH$  with a formate, e. g.,  $HCOOH$ ,  $HCOONa$ , is used with or without a support or fillers for disinfecting and preserving perishable substances.

**Disinfecting, etc., agents.** I. G. Farbenind. A.-G. Fr. 753,149, Oct. 7, 1933. Products of the formula  $R.X.R_1SO_3H$  (R is an aliphatic or cycloaliphatic radical or a radical of an acid of high mol. wt. and may contain substituents, X is O, N or S and  $R_1$  is a hydrocarbon radical which may contain substituents and contains less C atoms than R) or salts thereof are used alone or with other agents for disinfecting, deodorizing, etc. Such compds. include  $\gamma$ -cresoxy- $\beta$ -hydroxyoleylpropanesulfonic acid, Na acylcyclohexanol-sulfonate, Na oleylphenyl-iminoethanesulfonate, butyltauride of stearic acid, methyltauride of dichlorostearic acid, etc.

**Rambiazina oil.** Jean J. F. Trovalet. Fr. 752,093, Sept. 15, 1933. An essential oil, called Rambiazina oil, is obtained by steam-distg. green leaves of Rambiazina. The product is of use in perfumery, soap making, therapeutics and photography.

**Perfumes.** I. G. Farbenind. A.-G. Ger. 582,051, Aug. 7, 1933. Addn. to 566,994 (C. A. 27, 2534). The employment of monoalkyl or monoaryl ethers of glycol or its homologs as solvents or fixatives for perfumes as described in 566,994 is extended by using also org. acid esters of monoalkyl or monoaryl ethers of glycol or its homologs. Thus, oil of lavender is dissolved in an equal amt. of the salicylic acid ester of the monomethyl ether of glycol. Other examples are given.

**Cosmetic creams, etc.** Ludwig Konstandt. Fr. 751,939, Sept. 12, 1933. Pastes of alkali stearates prepd. by sapon. of stearin (e. g., to 36%) by means of a concd. alk. lye and preferably contg. substances such as oils or fats which have no wetting power in themselves are used for making cosmetic creams, etc. Only water formed by the sapon. is present.

**Hair dye.** Eugen Basch. Ger. 582,521, Aug. 16, 1933. A dye for living hair consists of aromatic diamines, (except *p*-phenylenediamine), aminophenols, hydroxyalkylamine, soap and org. solvent. Thus, the dye may contain triethanolamine, ethylene glycol monoethyl ether, distd. water, stearic acid, sulfonated dinitrophenol, *m*-phenylene-diamine, alc. and resorcinol.

## 18 -ACIDS, ALKALIES, SALTS AND SUNDRIES

I. M. SYMMES

**Sulfuric acid production by the lead chamber method.** P. Guareschi. *Industria chimica* 8, 1227-31 (1933), cf

C. A. 27, 5890. Math. The classical chamber method is compared with the more intensive tower system. The

chamber acid consumes less  $\text{HNO}_3$ , the tower system is less costly to install, but consumes more  $\text{HNO}_3$  and, because of the high temps., corrodes the lead chambers rapidly.

A. W. Contieri

"Blue acid." A reply to W. Manchot. E. Berl, K. Winnacker and H. H. Saenger. *Z. anorg. allgem. Chem.* 214, 354(1933); cf. *C. A.* 27, 1839, 5153.—Polemical.

E. M. Symmes

The lead chamber process. V. The mechanism of oxygen transfer by nitrosylsulfuric acid to sulfurous acid. E. Berl, H. Hillebrandt, and K. Winnacker. *Z. anorg. allgem. Chem.* 214, 369-79(1933); cf. *C. A.* 27, 4351.—(Oxidation of  $\text{SO}_2$  by residual  $\text{O}_2$  in the burner gas is a reaction proceeding under the catalytic effect of the intermediate products  $\text{SO}_2\text{NH}$  and violet acid ( $\text{SO}_2\text{NH}_2$ ) (*Z. angew. Chem.* 19, 881(1906)). This was tested on a lab. scale, and again showed the great influence of these intermediate compds. To obtain the highest possible reaction velocity, the dissolved  $\text{SO}_2\text{NH}$  must have a max. lability without complete decompn. If  $\text{HNO}_3$  were the catalyst, greater hydrolysis of  $\text{SO}_2\text{NH}$ , leading to  $\text{HNO}_2$  formation, would be most favorable, but the contrary is true. Tests with addn. of  $\text{HNO}_3$ , instead of  $\text{SO}_2\text{NH}$ , show that the N in the stable  $\text{HNO}_3$  hardly catalyzes  $\text{O}_2$  transfer. During a clearly observed induction period, with strong acid concns., the  $\text{HNO}_3$  is reduced to the labile, reactive  $\text{SO}_2\text{NH}$ , which then transfers  $\text{O}_2$ .

E. M. Symmes

The production of alumina from aluminum silicates. Yagoro Kato. *J. Electrochem. Assoc. (Japan)* 1, 154-9 (1933).—Upon standing for 2 or 3 hrs. a mixt. of Al silicates and concd.  $\text{H}_2\text{SO}_4$  at  $200^\circ$  showed 95% conversion into  $\text{Al}_2(\text{SO}_4)_3$ . No stirring under high pressure is required but slight heating is necessary in some cases. Upon extrn. pure cryst.  $\text{Al}_2(\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$  free from Fe and Ti was obtained with but 0.1% of FeO based upon  $\text{Al}_2\text{O}_3$  even from the aq. soln. contg. 10% of ferric salt. Action of  $\text{NH}_3$  gas on  $\text{Al}_2(\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$  in aq. soln. gives easily washable, cryst.  $\text{Al}(\text{OH})_3$ . Ferric salt is pptd. before the  $\text{Al}(\text{OH})_3$ ; upon igniting the  $\text{Al}(\text{OH})_3$ , very pure alumina is obtained.

K. Konda

Three and a quarter centuries of the potash industry in America. H. I. Smith. *Eng. Mining J.* 134, 514-18 (1933).—Historical.

W. H. Boynton

Recovery of potassium and aluminum salts, and silicic acid, from natural alkali-clay silicates. B. Granigg. *Monat. Rundschau* 25, No. 21, 1-9(1933).—The literature on methods of production of potash and Al salts is reviewed, and cost calcs. are made for the various raw materials found in quantity in various countries.

E. M. Symmes

Agar, its iodine content. Arai Itano. *Proc. Imp. Acad. (Tokyo)* 9, 398-401(1933).—The seaweeds from which agar is made contain I in amts. of 430-790 p. p. m. depending on the variety. Agar from these materials contains 24.5-101.9 p. p. m. in proportion to the amt. originally present in the seaweeds. The amt. of I in agar is controlled somewhat by the mfg. process and can be reduced 40-50% by washing with  $\text{H}_2\text{O}$ .

E. W. Scott

Synthetic plastic materials. Herbert Chase. *Machinery* (New York) 40, 137-9, 203 6(1933).—A review of different types of plastic materials available, and an outline of the methods used in their production.

A. W. F.

Commercial conversion of feldspar to kaolin. Robert Schwarz and Georg Trageser. *Z. anorg. allgem. Chem.* 215, 190-200(1933); cf. *C. A.* 27, 1595.—Treatment of feldspar at  $330^\circ$  with  $\text{N HCl}$  for 250 hrs. gives a product which is identical with kaolin in rate of loss of  $\text{H}_2\text{O}$  and x-ray pattern. The same result was obtained at  $320^\circ$  with 0.5  $\text{N HCl}$  in 115 hrs. At  $250^\circ$  for 180 hrs. with 0.5  $\text{N HCl}$  kaolin was not formed; instead, unchanged feldspar and  $\text{H}_2\text{SiO}_3$  were present. Anorthite was converted at  $340^\circ$  with 0.5  $\text{N HCl}$  in 60 hrs. Lewzite also required  $320^\circ$  for conversion. Unlike Badger and Ally (cf. *C. A.* 27, 2114) conversion with  $\text{H}_2\text{SiF}_6$  was unsuccessful, even at  $320^\circ$ . Conversion with  $\text{H}_2\text{CO}_3$  was unsuccessful. Treatment of kaolin at  $320^\circ$  with 0.5  $\text{N HCl}$  for 50 hrs.

altered the rate of loss of  $\text{H}_2\text{O}$ , because of some formation of  $\text{H}_2\text{SiO}_3$ .

Foster Dee Snell

Passau graphite for technical use. Erich Buchholz. *Feuerfest Ofenbau* 9, 140-2(1933).—A short review.

B. J. C. van der Hoeved

Metasilicate, its detergent applications. T. K. Cleveland. *Soap* 9, 19-21(1933).—A discussion of the use of metasilicate in laundries, and for glassware, households and the metal industry.

E. Scherubel

App. for  $\text{NH}_4$  sulfate production (U. S. pat. 1,936,308) 1.

Hou, Te-Pang: Manufacture of Soda, with Special Reference to the Ammonia Process. A Practical Treatise. Am. Chem. Soc. Monograph Series No. 65. New York: The Chem. Catalog Co., Inc. 365 pp. \$8.00.

Dilute acids. I. G. Farbenind. A.-G. Fr. 753,097, Oct. 6, 1933. Dil. acids are prepd. by enclosing substances which will form the acid in contact with water, in hermetically closed containers, which are pierced and placed in water. The containers may be weighted so that the substance dissolves without danger.

Purifying hydrochloric acid gas. George P. Adamson (to General Chemical Co.). U. S. 1,936,078, Nov. 21. Arsenical impurities are removed from  $\text{HCl}$  gas by contacting it with an adsorbent such as activated C, silica gel, activated bauxite or charcoal. App. is described.

Hydrocyanic acid. Gesellschaft für Kohlentechnik m. b. H. Fr. 752,296, Sept. 20, 1933.  $\text{HCN}$  is obtained by treating compds., contg. a SCN radical, in the form of a gas or fine division at a high temp., separately or in the presence of other gases or vapors, by air in the presence or not of catalysts. The heat necessary for volatilization of the SCN compd., evapn. of the materials accompanying it and oxidation of the SCN radical is obtained by introducing the SCN compds., into hot combustion gases contg. an excess of air and causing the mixt. to pass through an oxidation chamber.

Nitric acid. Hermann Frischer. Fr. 750,655, Aug. 16, 1933.  $\text{HNO}_3$  of high concn. is obtained from oxides of N by interposing between the usual condensation and absorption app. oxidation chambers in which the heat produced by the reaction is dispersed by indirect cooling, while freeing as far as possible the gases introduced into the oxidation chambers of water which they contain or drying the gases as much as possible. Cf. *C. A.* 27, 813.

Nitric acid. Harry Pauling. Fr. 752,042, Sept. 15, 1933.  $\text{HNO}_3$  is made from N oxides by bringing N oxides at about  $250^\circ$  into direct heat exchange in countercurrent with  $\text{HNO}_3$ , without previous sepn. of the water of combustion, the gases being first satd. with  $\text{HNO}_3$  up to the dew point. The gases become oxidized and cooled with sepn. of the  $\text{HNO}_3$  they contain, after which their transformation to  $\text{HNO}_3$  takes place, while the  $\text{HNO}_3$  heated by exchange is sublimated to a vacuum evapn. or by blowing in inert gases. The vapors produced by the evapn. serve to conc. by rectification the  $\text{HNO}_3$  obtained by absorption of the N oxides.

Chlorosulfonic acid and sulfur dioxide. Soc. pour l'ind. chim. à Bâle. Fr. 750,258, Aug. 8, 1933. See Brit. 393,546 (*C. A.* 27, 5902).

Ammonia-synthesis apparatus with purifier systems for the gases used operating under pressure. Walter H. Kniskern (to Atmospheric Nitrogen Corp.). U. S. 1,936,167, Nov. 21. Various details of app. and operation are described.

Apparatus for the synthesis of ammonia. Lawaczek G. m. b. H. Ger. 579,987, July 4, 1933.

Products containing alkali cyanamides. Stickstoffwerke G. m. b. H. (H. Heinrich Franck and Fritz Hochwald, inventors). Ger. 582,025, Aug. 18, 1933.  $\text{NH}_3$  is caused to react on alkali carbonates at  $500-700^\circ$  with exclusion of reducing gases. Cf. *C. A.* 27, 4744.

Alkali hydroxides. Società italiana potassa. Fr. 751,093, Sept. 7, 1933. Silicates such as leucite are treated

with steam at a high temp. to form alkali hydroxides, the steam being condensed and re-evapd to sep the hydroxides and is used again.

**Alkali nitrate.** Alfred Mentzel Ger 578,777, June 16, 1933. App for producing alkali nitrate, especially  $\text{NaNO}_3$  and  $\text{HCl}$ , from  $\text{HNO}_3$  and alkali chloride is described.

**Alkali nitrates** Chemieverfahren G m b H Ger 579,649, July 4, 1933  $\text{KNO}_3$  or  $\text{NaNO}_3$  and  $\text{NH}_4\text{Cl}$  are produced by treatingylvine-like minerals with  $\text{HNO}_3$ ,  $\text{NH}_3$ ,  $\text{Na}$  and  $\text{CO}$ . The stages are as follows: a, the crude salt is treated with lye contg  $\text{NH}_4\text{NO}_3$ ,  $\text{NH}_4\text{Cl}$  and  $\text{NaCl}$ , to ppt solid  $\text{NH}_4\text{Cl}$ ; b, the lye contg  $\text{KNO}_3$ ,  $\text{NaNO}_3$ ,  $\text{NH}_4\text{Cl}$  and  $\text{NaCl}$  is heated with  $\text{NaHCO}_3$ , whereby  $\text{NH}_3$  and  $\text{CO}_2$  go off as gas, leaving  $\text{KNO}_3$ ,  $\text{NaNO}_3$ , and  $\text{NaCl}$  in soln. The  $\text{NaCl}$  is obtained by evapn and the  $\text{KNO}_3$  and  $\text{NaNO}_3$  crystallize out on cooling; c, the  $\text{NaCl}$  from b is treated with the  $\text{NH}_3$  and  $\text{CO}_2$  from b by the Solvay process to give  $\text{NaHCO}_3$  for further use in the stage b; d, the mother liquor from c is treated with  $\text{NH}_3$  and  $\text{HNO}_3$  to generate  $\text{CO}_2$  for the process c and gives the lye for stage a. Examples are given.

**Tri-alkali phosphate from ferro phosphorus** Nils C Lindberg (to Victor Chemical Works) U S 1,936,307, Nov 21. Ferro-P and an alkali metal carbonate such as  $\text{Na}_2\text{CO}_3$  are heated to a reacting temp below the fusion temp and the reacting materials are passed through a heating zone counter-current to the heated gases while gradually increasing the temp of the materials to a point above the fusion point of the initial mixt (the initial reaction temp being 550-700° and the final reaction temp being 1100-1250°).

**Alkali dichromates** Bozel Maltra (Société industrielle de produits chimiques) Ger 578,842, June 17, 1933. See Brit 376,661 (C A 27, 4035).

**Dichromates** Jules L. Demant (to Bozel Maltra (Société industrielle de produits chimiques)) U S 1,935,082, Nov 14. A monochromate such as that of  $\text{Na}$  in a proportion at most equal to that theoretically required to form dichromate is mixed with metallic  $\text{C}$  and (suitably after a chem reduction such as in a current of  $\text{H}_2$ ) the product obtained is subjected to an oxidizing disaggregation by the dry method above 300° under pressure. Cf C A 27, 5488.

**Chromates** Bozel-Maltra (Soc industrielle de produits chimiques) Fr 42,786, Oct 10, 1933. Addn to 710,771 (C A 26 1721). The alkali or monochromate necessary for the reaction of Fr 710,771 is replaced by substances capable of liberating then alk principle during the oxidation process. Substances such as nitrates, chlorates, persalts, ferricyanides, etc., which act as oxidizing agents at the same time are preferred, or these substances may be used along with alkalis or substance yielding alk substances. Fr 42,787, Oct 10, 1933. Addn to 683,604 (C A 24, 4593). The modification of Fr 42,786 is applied to the process of Fr 683,604.

**Carbamates** The Mathieson Alkali Works. Fr 751,699, Sept 7, 1933. Alkali metal carbamates are made by treating the bicarbonate with anhyd  $\text{NH}_3$  or in aq soln thereof of 35% or more, preferably 75-90%. Fr 751,700.  $\text{NH}_4\text{CO}_2\text{Na}$  is made by adding  $\text{NaCl}$  and  $\text{CO}_2$  to an  $\text{NH}_3$  until the liquid is approx satd with  $\text{NH}_4\text{Cl}$ , sep the pptd  $\text{NH}_4\text{CO}_2\text{Na}$ , carbonating again and sep the pptd  $\text{NH}_4\text{Cl}$ . The aq  $\text{NH}_3$  is used again.

**Rare earth chlorides** I G Irbekund A-G. Fr 752,255, Sept 20, 1933. Chlorides of metals of the Ce group free from  $\text{Th}$  are obtained by increasing the concn of  $\text{Cl}$  ions in an aq soln of rare earth chlorides until a sepn of hydrated chlorides of metals of the Ce group takes place.  $\text{HCl}$  gas may be used and the soln cooled to at least 0°, or  $\text{HCl}$  and  $\text{CaCl}_2$  or  $\text{MgCl}_2$  may be added without cooling.

**Peroxides and salts** Oesterrichische Chemische Werke Ges m b H. Fr 750,125, Aug 5, 1933. Peroxide and persalts having a high content of  $\text{O}$  are prepd by mixing dry metal oxides or salts free from water of crystn with a soln of  $\text{H}_2\text{O}_2$  limited in amt in such a manner and proceeding in such a fashion that a moist

mixt is not produced even momentarily and afterward diminishing, either by drying in vacuum or by dehydration in a current of air, the content of water of the product obtained. The  $\text{H}_2\text{O}_2$  soln may be added in several portions, a reduction of the water content being made between the addns.

**Phosphates** Aktiebolaget Kemiska Patentet. Fr 751,903, Sept 12, 1933. Crude phosphates are disaggregated by  $\text{H}_2\text{SO}_4$  or other mineral acids in the presence of  $\text{SO}_4$  radicals, the reaction mass during or after disaggregation being submitted to a vapor tension of the soln such that the  $\text{CaSO}_4$  formed, as semi-hydrate or having a lower water of crystn content or as anhydride, is stable enough to be submitted to washing by aq liquids or water, without appreciable modification of its water of crystn content. This is obtained by regulating the concn of the  $\text{H}_2\text{PO}_4$  during or after the reaction and by regulating the temp preferably according to the formula  $2P + t^\circ \geq 186$  ( $P$  is the concn of  $\text{H}_2\text{PO}_4$  expressed in percentages by wt of  $\text{P}_2\text{O}_5$  in the mother liquor and  $t$  is the temp).

**Thiosulfates** I tabissements Mirret, Bonnin, Lebel et C<sup>ie</sup> Fr 751,135, Sept 16, 1933. An alc instead of an aq soln of  $\text{AuCl}_3$  is added to a soln of  $\text{Na}_2\text{S}_2\text{O}_3$  to form a double thiosulfate of  $\text{Au}$  and  $\text{Na}$ ,  $\text{Au}(\text{S}_2\text{O}_3)_2\text{Na}$ .

**Cyanogen compounds** Georg Bridg and Leon Hlod. Ger 578,826, June 17, 1933.  $\text{HCN}$  and compds of  $\text{CN}$  are prepd by the action of  $\text{CO}$  on  $\text{NH}_3$  in the presence of catalysts consisting of oxides of the rare earths, especially  $\text{Ce}$ , or of  $\text{U}$ ,  $\text{Mo}$  or  $\text{V}$ . Non-metallic carriers and oxides of  $\text{Al}$ ,  $\text{Th}$ ,  $\text{I}$  or  $\text{Zr}$  may be present. Thus,  $\text{CO}$  is treated with  $\text{NH}_3$  in the presence of a catalyst consisting of granulated earthenware impregnated with  $\text{V}_2\text{O}_5$ . Other examples are given.

**Aluminum oxide** Gustav Schoenberg. Ger 578,917, June 19, 1933.  $\text{Al}_2\text{O}_3$  is prepd by reducing aluminiferous substances such as bauxite with  $\text{C}$  in the presence of sulfide, the latter constituting not more than 3% of the total charge.

**Diammonium phosphate** Markus Larsson (to Kunst- und Patent Verwertungs A-G.) U S 1,936,168, Nov 21. A soln contg mono- $\text{NH}_4$  phosphate is heated to about its b p, an excess of gaseous  $\text{NH}_3$  is introduced into the preheated soln until the latter is satd substantially to the stage of  $(\text{NH}_4)_2\text{HPO}_4$ , and the escaping  $\text{NH}_3$  and steam are supplied to a second soln contg free  $\text{H}_3\text{PO}_4$  and previously preheated to about its b p (steam escaping from the second soln being used for preheating the  $\text{H}_3\text{PO}_4$ ). An arrangement of app is described.

**Dibarium phosphate** Kali-Chemie A-G. Ger 582,923, Aug 23, 1933.  $\text{BaHPO}_4$  pptd during the manuf of  $\text{H}_2\text{O}$  from  $\text{BaO}$  and  $\text{H}_3\text{PO}_4$  is worked up by treatment with  $\text{HNO}_3$  or nitrates so that  $\text{Ba}(\text{NO}_3)_2$  is pptd and the  $\text{H}_3\text{PO}_4$  soln filtered off. Foreign acids are expelled by volatilization and the  $\text{H}_3\text{PO}_4$  sep'd for use in making more  $\text{H}_2\text{O}$ .  $\text{BaCl}_2$  may be used instead of  $\text{HNO}_3$ ,  $\text{BaCl}_2$  being then pptd. Examples are given.

**Beryllium fluoride** Comp de produits chimiques et métallurgiques Alais, Frogès et Camargue. Ger 583,581, Sept 7, 1933. Addn to 566,030 (C A 27, 1106). The method of Ger 566,030 is modified by using a mixt of  $\text{H}_2\text{SiF}_6$  and  $\text{SiO}_2$  produced *in situ* from  $\text{SiF}_4$  and  $\text{H}_2\text{O}$ . Cf C A 28, 546.

**Chlorine peroxide** Isaac Lévy. Fr 751,782, Sept 9, 1933. An app is described for making  $\text{ClO}_2$  by dry distn at 85° of a powd mixt of  $\text{KClO}_3$  and  $(\text{COOH})_2$ , with or without  $\text{H}_2\text{SO}_4$ .

**Copper sulfate** August Nussbaum. Fr 753,062, Oct 6, 1933. See Austrian 133,126 (C A 27, 3786).

**Iron chlorides and sulfur dioxide from iron pyrites and dilute chlorine** Carl F. Prutton (to Dow Chemical Co.) U S 1,936,543, Nov 21.  $\text{FeS}$  is caused to react with dil  $\text{Cl}$  contg  $\text{O}$  in at least as large a proportion as that of the  $\text{Cl}$  at temps of 210-315°. Various details of procedure are described.

**Colloidal manganese dioxide** R & O Weil Chemische Pharmazeutische Fabrik. Ger 578,035, June 9, 1933. Addn to 538,645 (C A 26 2284). Solns of the

above with increased stability are prepd. by oxidizing Mn compds. in aq. soln., the method of 538,645 being varied by causing the oxidation to take place in the presence of hydroxyaldehydes or ketols instead of salts of org. acids. Examples are given.

**Potash.** Alfred Mentzel. Ger. 582,504, Aug. 16, 1933.  $K_2CO_3$  or KOH is prepd. by heating  $K_2SO_4$  with C and treating the heated mixt. with steam and  $CO_2$ . The product is heated with N to give KCN. This is then treated with steam to give  $NH_3$ , KOH and  $K_2CO_3$ , the latter compds. being leached out of the reaction mass.

**Potassium sulfate.** Charles F. Ritchie and Grant E. Warren (to American Potash & Chemical Corp.). U. S. 1,936,070, Nov. 21. Glaserite and KCl are digested in insufficient aq. soln. to dissolve separately the glaserite, while pptg.  $K_2SO_4$ .

**Potassium sulfate.** Wintershall A.-G. and Curt Beil. Ger. 577,051, May 22, 1933. Addn. to 551,928 (C. A. 26, 1921). The method of 551,928 for obtaining  $K_2SO_4$  from kievite is varied by treating the latter with KCl and  $K_2SO_4$  mother liquor. The double salt  $K_2SO_4 \cdot MgSO_4$  is pptd.

**Silver permanganate.** Robert Winzer. Fr. 750,280, Aug. 8, 1933. Pure stable  $AgMnO_4$  is made by adding to sufficiently dil. solns. of alkali or alk. earth permanganates and Ag salts, an acid, e. g.,  $HNO_3$ , which does not react on the constituents of the solns.

**Caustic soda.** Elektrochemische Fabriken G. m. b. H. (Walter Zisch, inventor). Ger. 578,792, June 17, 1933. Addn. to 572,895 (C. A. 27, 4358). In prepg. NaOH by the continuous process described in 572,895, the  $Na_2SiF_6$  is replaced by  $BaSiF_6$ . The process is as follows: a,  $CaF_2$ ,  $SiO_2$  and  $BaF_2$  are allowed to react to give  $BaSiF_6$ ,  $CaCl_2$  and water; b,  $BaSiF_6$  is treated with  $NH_4OH$  to give  $NH_4F$ ,  $BaF_2$ ,  $SiO_2$  and water; c, NaCl is treated with  $NH_4F$  to give NaF and  $NH_4Cl$ ; d, NaF is treated with  $Ca(OH)_2$  to give NaOH and  $CaF_2$ ; e,  $NH_4Cl$  is treated with  $Ca(OH)_2$  to give  $NH_4OH$  and  $CaCl_2$ .

**Sodium carbonate.** Alfred Mentzel. Ger. 582,890, Aug. 24, 1933. Addn. to 558,750 (C. A. 27, 571). In making  $Na_2CO_3$  by the Leblanc method of 558,750, with  $NH_3$  and  $Na_2SO_4$  as by-products, the reaction mixt. is finely ground and briquetted before subjection to the cyanization process. Thus  $Na_2SO_4$ , coal and lime are mixed, finely ground and made into briquets. These are then cyanized by heating to  $1000^\circ$  with N. The product is then treated with steam, giving  $NH_3$  and  $Na_2CO_3$ .

**Sodium carbonate; fertilizers.** Chemieverfahren G. m. b. H. Ger. 582,924, Aug. 25, 1933. The process of Ger. 540,070 (C. A. 26, 1725) is modified to yield  $NaNO_3$ - $KNO_3$  mixts. in place of  $KNO_3$ . For this purpose, the proportions and conditions of the prior process are varied so that all the KCl present in the crude sylvinite is converted into glaserite, which is then treated directly with  $HNO_3$ . Details are given.

**Disodium carbimide.** The Mathieson Alkali Works. Fr. 753,038, Oct. 5, 1933.  $(NaCO_3)_2NH$ , which may be called *disodium carbimide*, is made by heating dry  $NH_3$ - $COONa$  to a high temp., though below  $200^\circ$  in a dry medium.

**Sodium dichromate.** I. G. Farbenind. A.-G. Fr. 750,468, Aug. 11, 1933.  $Na_2Cr_2O_7$  is made by causing  $O_2$  to act under high pressure on  $Na_2CrO_4$  at above  $50^\circ$ . The process may be carried out in 2 stages, the  $NaHCO_3$  formed in the 1st stage being eliminated before the 2nd is begun.

**Zinc oxide.** Eugène Sterkers and Louis C. Humbert. Fr. 750,529, Aug. 11, 1933. Pure ZnO, free from Pb, is obtained by introducing CO under pressure into the volatilization retort. Thus, an increased pressure of 5 mm. and a temp. of  $1,200^\circ$  may be maintained.

**Basic alum from normal alum solutions.** Kalunite Co. Fr. 753,225, Oct. 11, 1933. See U. S. 1,914,175 (C. A. 27, 4355).

**Removing arsenic from acids.** Metallges. A.-G. (Conway von Girsawald and Wolfhart Siecke, inventors). Ger. 587,036, Oct. 28, 1933. In removing As from strong acids by pptn. as  $As_2S_3$ , H is generated in the acid by

addn. of Al or Mg, preferably in powder form, before, during or after the pptn. The  $As_2S_3$  ppt. is entrained by the gas and collects on the surface of the acid. Cf. C. A. 27, 2540.

**Hydrogen.** George F. Jaubert. Fr. 42,776, Oct. 10, 1933. Addn. to 698,706 (C. A. 25, 3136). H is made by mixing Si in powder or its alloys with NaOH in powder or pieces and adding the dry mixt. to water or water to the mixt. or the Si and water may be mixed and added to powd. NaOH.

**Hydrogen and nitrogen.** Wintershall A.-G. and Carl T. Thorssell. Ger. 578,629, June 15, 1933. A process for producing a mixt. of H and N, especially suitable for the synthesis of  $NH_3$ , by passing steam and air over heated Fe is described.

**Pure iodine.** Coulter W. Jones (to Jones Chemical Co.). U. S. 1,936,553, Nov. 21. A soln. of NaI contg. some iodate is mixed with a  $CaCl_2$  soln. in substantially chem. equiv. proportion to the iodide and iodate; the  $Ca$  iodate is filtered off and the filtrate is evapd. to crystallize out NaCl and leave an approx. 60-65%  $CaI_2$  soln.; the latter is chlorinated to liberate I while the temp. of the reaction mixt. is raised above  $114^\circ$  and liquid I is sep'd. from the aq. soln. of  $CaCl_2$ .

**Furnace for sulfur ores with helicoidal hearth.** Paul Flajollet-Bracq. Fr. 752,168, Sept. 18, 1933.

**Producing and storing liquid oxygen.** Frank P. Kinson (to Linde Air Products Co.). U. S. 1,936,059, Nov. 21. Various details of app. and operation are described.

**Separating carbon dioxide.** I. G. Farbenind. A.-G. Fr. 753,253, Oct. 12, 1933.  $CO_2$  is sep'd. from gases contg. it by a soln. of an alkali monochromate under high pressure and a high temp. The  $CO_2$  is liberated by removing the pressure and, if desired, increasing the temp.

**Decomposing hydrocarbons.** I. G. Farbenind. A.-G. (Gustav Wietzel, Wilhelm Haller, and Wm. Hennicke, inventors). Ger. 578,824, June 17, 1933. In subjecting hydrocarbon gases to decompn. by treatment with steam,  $CO_2$  and O or air in the presence of a catalyst, to obtain a mixt. of H and  $CO$ , the hydrocarbons and the steam, etc., are pre-treated to remove inorg. or org. S compds. Examples are given.

**Solutions of titanium.** Verein für chemische und metallurgische Produktion. Ger. 578,791, June 17, 1933. HCl solns. of Ti are prepd. by introducing an aq. soln. of  $TiCl_4$  below the surface of dil. HCl. App. is described.

**Treating solutions obtained from phosphate rock by leaching with nitric acid.** Bengt Wadstedt (to Kunst- und Lager-Patent-Verwertungs-A.-G.). U. S. 1,936,316, Nov. 21. In treating solns. obtained in the leaching of phosphate rock with  $HNO_3$  and pptn. of the  $Ca$  dissolved by means of  $(NH_4)_2SO_4$ , the soln. is neutralized with  $NH_3$  to form a single  $NH_4$  phosphate, the main portion of the latter is sep'd. from the soln. by evapn. and subsequent cooling, the remaining mother liquor is purified from its content of  $NH_4$  phosphate by pptn. of the phosphate as an insol. phosphate such as that of  $Ca$ , and  $NH_4NO_3$  is recovered from the purified mother liquor by evapn.

**Working up crude salts.** Chemieverfahren G. m. b. H. Ger. 578,377, June 13, 1933. Addn. to 571,949 (C. A. 27, 4355). The method of 571,949 for working up kieserite and sylvinite is applied to crude K salts contg.  $MgSO_4$ .

**Synthetic yellow spinel.** Max Jaeger and Hermann Espig (to I. G. Farbenind. A.-G.). U. S. 1,935,717, Nov. 21. Mn oxide about 4% and Fe about 1% are incorporated in a synthetic yellow spinel contg. alumina and magnesia in suitable proportions, in order to serve as coloring agents. ZnO 1-2% also may be added to enhance the color.

**Fusing silica.** Henri George (to Société Quartz & Silice). U. S. 1,936,476, Nov. 21. In fusing silica in a carbon resistor furnace, a mass of moist silica particles is formed around the resistor, and an envelope of the products resulting from the dissociation of the moisture contained in the mass is maintained around the melting silica mass and serves to facilitate production of a white compact product. App. is described.

**Monazite sand.** I. G. Farbenind. A.-G. Fr. 753,023,

Oct. 5, 1933. The phosphate in monazite sand is reduced by adding oxide or carbonates of alk. earth metals or Mg in amt. of 3 mols. per mol. of earth oxide and an amt. of C just sufficient for the reduction. A temp. of 1650-1750° in an elec. furnace is used.

**Quartz.** Klinker- u. Steinzeugwerke Mertendorf G. m. b. H. Ger. 579,960, July 3, 1933. Quartz is converted to SiO<sub>2</sub> modifications such as tridymite, of lower sp. wt., by heating it in the presence of Cu, Sn, Sb, Pb, Cr, Mn, Ni, Co or their alloys or silicides, in a weakly reducing atm.

**Rare earths.** I. G. Farbenind. A.-G. Fr. 753,052, Oct. 6, 1933. H<sub>3</sub>PO<sub>4</sub> and H<sub>2</sub>SO<sub>4</sub> in excess are sepd. from sulfates of rare earths (obtained by treating monazite sand by means of concd. H<sub>2</sub>SO<sub>4</sub>) by introducing the paste of sulfates into ketones or aliphatic alics., preferably at a low temp., sepg., washing and drying the residue.

**Absorbent charcoals.** Compagnie française de produits organochimiques. Fr. 42,779, Oct. 10, 1933. Addn. to 742,153, (C. A. 27, 3508). Active charcoal is impregnated with a soln. of NaOH or KOH, dried and reheated to 600-700°. The product is moistened with water and is particularly useful in the catalytic hydrolysis of phosgene. Fr. 42,784, Oct. 10, 1933. Addn. to 745,987 (C. A. 27, 4325). Active charcoal treated with NaOH or KOH is used in gas masks, etc., as a protection against phosgene, chloropicrin and other gases.

**Increasing the efficiency of adsorbents such as waste dusts from cement manufacture.** Oliver M. Urbain (to Charles H. Lewis). U. S. 1,935,961, Nov. 21. Finely subdivided particles of the material are passed in a liquid carrier such as water through a shearing mill, the rotor and stator of which have been previously adjusted to the exact particle size of the material.

**Catalysts.** Soc. anon. française pour la fabrication des essences et pétroles. Fr. 750,443, Aug. 10, 1933. Al silicates, to be used as catalysts, are freed from impurities (Fe<sub>2</sub>O<sub>3</sub>, CaO, MgO, etc.) so as not to contain more than 10% of these, and particularly less than 3% of Fe<sub>2</sub>O<sub>3</sub>. The product is molded in the form of rods or tubes and cut up in small sections. No binding material is used.

**Catalysts.** The Goodyear Tire & Rubber Co. U. S. 750,648, Aug. 14, 1933. Catalysts are prepd. by pulverizing a suitable support in the presence of a salt of a metal whose at. wt. is 57-64, introducing a basic carbonate capable of reacting with the salt to give a ppt. of the metal carbonate and finally reducing the carbonate. Thus, a basic Ni carbonate is formed on kieselguhr and afterward reduced to Ni.

**Catalysts suitable for various purposes.** Maurice E. Barker. U. S. 1,936,563, Nov. 21. An alloy contg. Cu, Fe and Mn is treated with an acid such as HCl and the substances formed by reaction of the acid on the surface of the alloy are calcined to produce mixed oxides. U. S. 1,936,564 relates to similar catalysts in which the oxides are reduced to spongy metal. U. S. 1,936,565 also relates to generally similar catalysts which may be formed from ground particles of Cu, Fe and Mn alloys.

**Oxidizing catalyst suitable for treating exhaust gases from internal-combustion engines.** Joseph C. W. Frazer. U. S. 1,934,795, Nov. 14. Fe(OH)<sub>3</sub> is mixed with a chromic acid soln. and the resulting Fe chromate soln. is applied to a support such as a Monel metal screen and the wetted support is heated to convert the chromite which it carries to an Fe chromite coating which is strongly adherent and highly active at high temps.

**Catalytic masses such as those suitable for oxidizing sulfur dioxide to trioxide.** Gerald C. Connolly and Jeremiah A. Pierce (to Silica Gel Corp.). U. S. 1,935,177, Nov. 14. A batch of carrier material such as silica hydrogel is charged with a soln. of a reactant substance such as NaOH. Another bath of carrier material is charged with a metal compd. such as vanadyl sulfate capable of reacting with the reactant substance in the first-mentioned batch to form an active compd. of the metal, and the two batches are mixed and dried without washing.

**Cleaning catalytic material such as platinized asbestos used in sulfur trioxide production.** Bernard M. Carter (to

General Chemical Co.). U. S. 1,936,154, Nov. 21. The catalytic material is agitated by vibration without substantial disarrangement of its particles and a gas such as air is passed through the material to remove foreign substances. An app. is described.

**Catalytic gels.** Max Latshaw and Wm. L. Judefind (to Silica Gel Corp.). U. S. 1,935,188, Nov. 14. A reacting gas such as H<sub>2</sub>S is adsorbed in a highly adsorbent gel such as silica gel and the treated gel is then contacted with a soln. of a compd. of a catalytic metal such as Pt chloride capable of being converted by the adsorbed gas into a catalytically active substance.

**Gels such as those of silica.** Gerald C. Connolly (to Silica Gel Corp.). U. S. 1,935,176, Nov. 14. For making a hard porous gel of low apparent d., a washed hydrogel (such as one formed from Na silicate and HCl) is impregnated with a volatile salt such as NH<sub>4</sub>Cl and then dried to convert the gel into hard porous conditions and liberate the volatile salt.

**Hard porous gels such as those of silica, alumina or various metal compounds.** Gerald C. Connolly (to Silica Gel Corp.). U. S. 1,935,178, Nov. 14. For making a hard porous gel of low apparent d., an inorg. washed hydrous oxide gel is impregnated with a sol. salt such as CaCl<sub>2</sub>, dried, and leached to remove the sol. salt.

**Condensation products.** I. G. Farbenind. A.-G. Fr. 751,641, Sept. 7, 1933. Products which have wetting, dispersing, cleansing and emulsifying properties are made by condensing one mol. of an org. compd. contg. at least one radical with at least 8 C atoms directly joined and besides one or more of the groups —CON(R')R" or —SO<sub>2</sub>N(R')R" (R' is H, alkyl, aralkyl, aryl, cycloalkyl, hydroxyalkyl or polyhydroxyalkyl and R" is H, hydroxyalkyl or polyhydroxyalkyl) with at most 3 mols. of alkylene oxides for each of the atoms of H capable of reacting in the above groups. The products obtained may form with polybasic acids combinations having an acid function. Examples are given of the prepn. of products from ethylene oxide and dibutynaphthalenesulfamide or products prepd. according to Brit. 384,665.

**Films and foils of condensation products.** Wolff & Co., Komm.-Ges. auf Aktien und Richard Weingand. Ger. 578,873, June 17, 1933. Addn. to 536,839 (C. A. 26, 1077). The method of 536,839 for making the above from urea-CH<sub>2</sub>O condensation products by adding aq. softening agents such as glycerol or cyclohexanol is modified by arresting the hardening process so that the finished product still contains water.

**Artificial masses.** Allgemeine Elektrizitäts-Gesellschaft. Ger. 579,948, July 3, 1933. Molded masses are prepd. by treating sawdust, straw or other cellulosic materials with alkali, acidifying, washing, drying and hot-pressing with basic compds. such as alk. earth hydroxides. Synthetic resins may be added prior to pressing.

**Plastic materials.** Jean de Granville and Léopold Davion. Fr. 42,729, Sept. 14, 1933. Addn. to 749,733 (C. A. 28, 591). The solvents used for the extn. of proteins from vegetable materials are used only at the b. p. The b. p. is preferably below 76°.

**Adhesive.** Boston Blacking Co. G. m. b. H. (Hermann Hering, inventor). Ger. 578,958, June 19, 1933. An adhesive is prepd. by adding chromates or dichromates to an aq. dispersion of rubber. Size, glue, sugar, albumin, etc., may also be added.

**Adhesive.** Julien Rousseau. Fr. 750,403, Aug. 10, 1933. A glue suitable for veneering is made by dipping a light cloth into a bath contg. agar-agar 2%, sugar 12, CH<sub>2</sub>O 5 and water 9.3%, drying and dipping into a bath contg. phenol 0.5, glycerol 1.5, oxalic acid 1.5, kaolin 5% and glutin, and again drying. The required amt. is cut off and gluing is obtained by applying heat and pressure.

**Adhesive.** Yves Cornic. Fr. 750,477, Aug. 11, 1933. A compn. for glueing various materials is made by adding cement to an aq. dispersion of natural, vulcanized or synthetic rubber. Aluminous cement may be used directly, but with portland and other cements stabilization of the latex may be necessary.

**Wood adhesives.** Firma Gebr. Thalheimer. Fr.

751,658, Sept. 7, 1933. To a mixt. contg. water, dispersed rubber and glue materials (casein, vegetable protein, starch, etc.),  $\text{Ca}(\text{OH})_2$  is added within the limits of 0.1–8.5% with respect to the content of org. colloids, the total amt. of dry substance being 15–75%. The  $\text{Ca}(\text{OH})_2$  may be replaced by the equiv. amt. of  $\text{NaOH}$ . An example contains casein 100, concd. latex (33% water) 500,  $\text{NaOH}$  2 and water 750 parts.

**Adhesive paste.** Oscar H. Bahr. U. S. 1,936,152, Nov. 21. Clay 27,  $\text{ZnO}$  6.5 and "vegetable starch" 6.5 parts are used in prep. a paste which is suitable for uniting paper to enameled surfaces.

**Glue sizing suitable for use on ceilings, etc.** Charles le Bos d'Espinoz (to Malcolm C. Rorty). U. S. 1,935,789, Nov. 21. A sizing is prep. contg. water,  $\text{CaCO}_3$ , glue or gelatin, and sufficient infusorial or diatomaceous earth to retard coagulation of the glue or gelatin during application at ordinary temps.

**Dispersions of solids.** The International Latex Processes Ltd. Fr. 750,305, Aug. 8, 1933. Friable substances are dispersed by bringing them into the form of moderately small pellets and submitting them to mech. disaggregation in the presence of a dispersing fluid.

**Cores for electromagnets.** Jean Schneider. Fr. 753,151, Oct. 9, 1933. The cores are made by mixing  $\text{Fe}_2\text{O}_3$  of low sp. gr. and fine sulfurized Fe powder with a resinous or waxy binder. The Fe is prep. by wetting fine Fe powder with oil contg. S and heating. The oil evaps. and the S combined with the Fe on the surface gives it a high ohmic resistance.

**Working up fuel ash.** Wm. Guertler. Ger. 578,831, June 17, 1933. The magnetic constituent of furnace ash  $\text{Fe}_2\text{O}_3$  is removed and  $\text{Al}_2\text{O}_3$  is then removed by treatment with acid. The residue is treated with material contg.  $\text{CaO}$  to form *portland cement*.

**Furnace for making lime nitrogen.** Herbert Wittek. Ger. 578,841, June 17, 1933.

**Reflectors.** Irving S. Crocker (to The British Thomson Houston Co. Ltd.). Brit. 397,397, Aug. 24, 1933. A reflector which withstands high temps. for extended periods is made by cleaning a glass surface, silvering while wet, applying a coating of Ni, coating the Ni with a refractory paint comprising  $\text{ZnO}$ , talc and Na silicate and covering the paint with a coating of lacquer.

**Projection screens.** Trans-Lux Daylight Picture Screen Corp. Brit. 396,714, Aug. 8, 1933. The screen comprises a sheet of translucent material, e. g., gelatin, glycerol,  $\text{CH}_2\text{O}$  and  $\text{H}_2\text{O}$  together with other materials as described in Brit. 368,723 (C. A. 27, 2774), cellulose acetate, which is intimately assoc. with and adheres to a sheet of knit or net fabric, e. g., silk, and a light-diffusing material which permits of rear projection uniformly distributed through the translucent material.

**Polishing liquid.** Otto Mathiesen. Fr. 750,525, Aug. 11, 1933. A polishing liquid for cellulose lacquer contains liquid varnish 1, alc. 2.4, solvent liquid 0.5, thinning agent 0.2, filtered varnish 0.3 and powd. yeast 0.1 part.

**Composition for cleaning articles of aluminum, zinc and tin.** Fritz Drasbach (to Chemische Fabrik Joh. A. Beckman G. m. b. H.). U. S. 1,935,834, Nov. 21.

<sup>1</sup>  $\text{Na}_2\text{PO}_4$  is mixed with 15–20% of  $\text{Al}_2(\text{SO}_4)_3$  to prevent corrosion of the metal by the phosphate.

**Fish silver.** Vogt & Co. G. m. b. H. (Heinz Hundsdiecker, inventor). Ger. 582,816, Aug. 23, 1933. Fish scales are treated with a warm soln. of high mol. esters or ethers of cellulose, starch or rubber, to give a suspension of fish silver.

**Emulsifying, cleansing and other agents.** I. G. Farbenind. A.-G. Fr. 751,744, Sept. 8, 1933. Products which find application in the textile, leather, rubber, lacquer and paper industry and in dyeing, etc., are prep. by causing a glycidic to react with an org. compd. contg.  $\text{OH}$ , and(or)  $\text{COOH}$ , and(or) a carbonamide, and(or) a sulfonamide group, provided these compds. contain active H atoms. Examples are given of compds. prep. from glycidic and iso-BuOH, undecylamine, linseed oil fatty acid and hydroxyethylamide of the acids of coconut oil.

**Wetting and other agents.** Soc. pour l'ind. chim. à Bâle. Fr. 42,757, Oct. 10, 1933. Addn. to Fr. 713,082 (C. A. 26, 1733). Appropriate basic solvents or diluents, e. g., pyridine, are used for the production of the esters of Fr. 713,082.

**Wetting and other agents.** H. Th. Bohme A.-G. Fr. 753,189, Oct. 9, 1933. Quaternary  $\text{NH}_4$  salts having a relatively high mol. wt. are made by causing esters of alkylmonosulfonic acids or their salts to react with secondary or tertiary amines. An example is given of a product obtained from pyridine,  $\text{CH}_3\text{SO}_3$  and lauryl alc. The products may be used in ore flotation, purifying waste waters, prep. emulsions, mordanting cotton and in tanning, etc.

**Waterproofing composition.** Sylvania Industrial Corp. Fr. 750,281, Aug. 8, 1933. The compn. contains a cellulose deriv., e. g., nitrocellulose 50–75, a plastifying agent 20–50 and wax 0.8–2%.

**Brake lining.** Robert L. Herzinger and John S. Gabriel. U. S. 1,935,713, Nov. 21. Cast brake linings for vehicles are formed from Cu 80, Pb 19, Sn 1 part and carbonaceous shale about 1.5–5.0%.

**Blank for stencil sheets.** Louis E. Fuller. U. S. 1,935,875, Nov. 21. Open fibrous material such as Yoshino paper is impregnated with protein such as gelatin and a higher fatty acid anhydride such as stearic anhydride, and glycerol.

**Composition for dental fillings.** Friedrich Hauptmeyer. U. S. 1,935,266, Nov. 14. A dental cement is used with about an equal quantity of a powd. Cr-Ni steel or Fe alloy resistant to chem. reagents.

**Fire extinguishers.** The Pyrene Co. Ltd. and Richard Zieschang. Brit. 396,524, Aug. 10, 1933.

**Fire extinguishers.** Kommet Kompagnie für Optik Mechanik und Electro-Technik G. m. b. H. Fr. 750,554, Aug. 12, 1933.

**Fire-extinguishing installation for vehicles.** Job Arthur Neville. Brit. 395,826, July 27, 1933.

**Device for ejecting fluids under pressure, e. g., in fire-extinguishing apparatus.** Job A. Neville. Brit. 395,994, July 27, 1933. Divided on 395,826 (preceding abstr.).

**Method and apparatus for introducing foam-producing chemicals into a stream of water.** Cedric Morris. Brit. 396,835, Aug. 17, 1933.

## 19 GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

**Significance of scientific research in the technic of glass manufacture and the value of international cooperation.** Karl Quasehart. *Glastech. Ber.* 11, 349–91(1933).

**Old glass factories in the Böhmerwalde and Fichtelgebirge districts of upper Bohemia.** Herbert Kühnert. *Glastech. Ber.* 11, 368–73(1933).

**Effect of gases upon the properties of glass.** V. Effect of the heat treatment of glass upon its silver plating. K. Nakanishi. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding

595–6(1933); cf. C. A. 27, 4643.—On glasses which were heated in air below their softening temp., the reduction of Ag was found to proceed more slowly than on those which were not heat treated or those which were heated above their softening temp. and in the latter case the reduction of Ag was found to be the most rapid of the 3. In the first case, the heating temp. and the time were found to be inversely proportional to the reduction velocity of Ag, while in the latter case, they were found to be directly proportional. It was also found that, on glasses which

had been heated in O the reduction of Ag advances more rapidly than on those which had been heated in air or on those which had had no heat treatment K K

**Alumina glasses** G Keppeler and R Scholte *Glastech Ber* 11, 357-05, 392-7(1933) —The influence of  $Al_2O_3$  on the properties of glasses in the  $Na_2O$ - $CaO$ - $SiO_2$  field was systematically studied. Varying amounts of  $SiO_2$  were replaced by equiv amounts of  $Al_2O_3$  and the m. pt. detd on small samples under carefully controlled conditions. When the  $Al_2O_3$  content is increased up to a certain point for a particular glass, there is a marked lowering of the m. p. This min is reached with higher  $Al_2O_3$  content, the more the lime content is. The lowering of the m. p. is covered up in glasses rich in alkali by increased viscosities. The effect is therefore to broaden the glass field by suppressing devitrification, increasing the working range, and making it possible to cut down the alkali content. In all cases stability is increased. The effect of  $Al_2O_3$  on expansion is only slight. Bibliography of 30 references J I Hyde

**Roller plate glass from tanks** Gustav Keppeler *Glastech Ber* 11, 398-404(1933) J I Hyde

**Feeder machines for bottle leers** H Alt *Glastech Ber* 11, 405-7(1933) J I Hyde

**X-ray investigation of tridymite glass** M I Nahmias *Nature* 132, 857-8(1933) X-ray powder analysis of a devitrified glass of initial compn  $SiO_2$  75,  $CaO$  12,  $Na_2O$  10 (glass B) gives an unmistakable picture of tridymite. Thermal expansion curves for the identification of either tridymite or cristobalite are unreliable. Tridymite is found in artificial mullites (bauxites calcined at 1300°) containing free  $SiO_2$ . P S Roller

**X-ray examination of ceramic raw materials** V T Nakai and Y Iukami *J Soc Chem Ind, Japan* 36 Suppl. binding (611-6)(1933) cf C A 28 90 Results obtained on so called Mitsubishi rosaka silicate relatively high in  $Al_2O_3$  (35-40%), are presented. They were subjected to temps of 400-1500°. K K

**Applying enamel** R Aldinger *Glashutte* 63, 375-1(1933). M V Kondoidy

**Enameling sheet iron ware** R Manschke *Sheet Metal Ind* (London) 7, 239-40(1933) *Ironmaking Ind* 10, 312-13(1933) Compns are given also pigments employed for colors. M V Kondoidy

**Preparation [for enameling] of the surface of sheet iron by cleansing** A W Bruins *Maillierie* 1, 16-21(1933) M V Kondoidy

**Practice in the enamel shop, regenerative and recuperative heat recovery** Ludwig Stuckert *Ceram Age* 22, 163-5(1933), cf C A 27, 4645-28, 2761. H S W

**Grog for enameling kilns** Vukobrat *Ironmaking Ind* 10, 248-9(1933) M V Kondoidy

**Rotary furnaces [use for the glass industry]** (1 unit) 1

**Glass** Frederick Gelstharp and James H Sherts (to Pittsburgh Plate Glass Co) U S 1,936,231 Nov 21 A clear glass having a total visible incident light transmission through a sheet of 2 mm thickness of about 85-90% contains 14-0.2-1.0% as its sole coloring, oxide and

of such a compn to exhibit a dark green color when viewed edgewise

**Glass** Erich Heinz *Pr* 750,548, Aug. 11, 1933 *Sci Brit* 393,907 (C A 27, 5917)

**Glass** Jakob Dahter *Pr* 753,257, Oct 12, 1933 Means for transporting cut tubes to the blowing or forming molds

**Apparatus for feeding mold charges of molten glass** Wm J Miller U S 1,934,811, Nov 14 Structural and mech features

**Decolorizing glass** Deutsche Gasgluhlicht-Auer (in b H (Hans Löffler, inventor) Ger 578,866, Jun 20, 1933 Glass is decolorized by addn of oxides of Ca, Sr and other trivalent rare earths such as La, Nd and Li

**Apparatus for sheet-glass manufacture** John M Fisher (to Pittsburgh Plate Glass Co) U S 1,934,791 Nov 14 Structural and mech features

**Cooling reinforced glass sheets in autoclaves under pressure** Robert Delloye U S 1,934,642, Nov 14 A water spray is used for cooling while injecting air into the autoclave and the pressure is subsequently gradually diminished. App is described

**Apparatus for rolling reinforced glass** Pilkington Bros Ltd *Pr* 752,145, Sept 18, 1933

**Apparatus for rolling wire-netting glass** Soc unio des manufactures des glaces et produits chimiques de Saint Gobain, Chauny & Ciry *Ger* 578,865, June 17, 1933

**Apparatus for uniting glass sheets with intervening sheets of pyroxym composition or the like** James H Sherts (to Duplate Corp) U S 1,934,772, Nov 14 Structural and mech features

**Composite glass** Ioma (usines électriques et chimiques) (Soc anon) *Pr* 753,271, Oct 12, 1933 The plastic layer, or layers, is made translucent or opaque by various addns, or has designs worked thereon, to give marble, metal and other effects. The sheets find various decorative uses

**Safety glass** Fritz Eckert *Pr* 750,150, Aug 11, 1933 Safety glass is composed of sheets of tempered glass combined with one or more intermediate elastic sheets

**Compound glass** Fritz Eckert *Brit* 396,313, Aug 3, 1933 Compound glass comprises 1 or more sheets 1 toughened or hardened glass bonded to a flexible layer such as celluloid. One or more ordinary glass sheets may be included

**Laminated glass** Schlesische Spiegelglas-Manufaktur Carl Tusch G m b H *Pr* 751,686, Sept 7, 1933 The glass is made up of a no of thin sheets, one or more of which give special effects such as of color or design

**Laminated glass sheets** James I Walsh (to Celluloid Corp) U S 1,934,011, Nov 21 Glass sheets are united by a plastic compn comprising a cellulose deriv such as cellulose nitrate or acetate plasticized with 70-75% of dibutyl phthalate, diethyl phthalate, dibutyl tartrate, triacetin to render the material flowable under the action of heat and pressure. Cl C A 27, 3576

**Manufacture of insulating glass for walls of buildings, etc** Frederick Gelstharp (to Pittsburgh Plate Glass Co) U S 1,934,798 Nov 14 Mech features

**Double-walled container suitable for insulating fractionating columns, etc** Walter J Podbielniak *Pr* 753,588, Nov 21 Various details are described of a device formed in part of fused quartz and in part of low expansion heat resistant glass joined and sealed to the quartz

**Composite heat-insulating and structural units** George A Bole and John D Sullivan (to Battelle Memorial Institut) U S 1,934,788, Nov 14 A backing of burned cellular ceramic material is joined with a sheet metal facing such as Cu or Cu alloy over which is applied a vitreous coating

**Clay, etc** *Pr* Chemie A-G *Ger* 582,096, Aug 21, 1938 Sulfates are formed in clays, mortars, etc., by adding Ba aluminate, Ba ferrite, Ba ferrate or mixts of these to the clay, etc., prior to working. Thus, Ba aluminate is added to clay contg 0.1%  $SO_2$ , before working the clay

**Apparatus and method for ornamenting bricks.** Bertrand C. Lamb and Antony E. Lamb (trading as South Eastern Brick & Terra Cotta Co.). Brit. 397,331, Aug. 24, 1933.

**Ceramic products.** Soc. anon. de carbonisation et de distillation des combustibles. Fr. 750,370, Aug. 9, 1933. Clay is added to the thinning agent in the form of an impalpable powder with the necessary amt. of water to bind the paste. The final paste is composed of thinning agent at least 90 and plastic clay at most 10%, without the introduction of any foreign material.

**Ceramic articles.** Rudolf E. Heerd. Ger. 587,097, Oct. 30, 1933. A compn. for making lustrous translucent ceramic articles comprises feldspar and subordinate amts. of kaolin and quartz, the latter having been previously fused and comminuted. The compn. is molded and then given a single firing.

**Stoneware articles, etc.** Jean M. Large. Fr. 751,726, Sept. 8, 1933. Mg sands contg. 28-32%  $MgCO_3$  are used in making stoneware pipes, tiles, etc., and in making champagne bottles.

**Refractory masses.** Arthur Sprenger. Ger. 582,235, Aug. 11, 1933. Addn. to 577,932 (C. A. 28, 605\*).

<sup>1</sup> Fireproof masses are obtained by fusing Cr ores. The resulting mass contains  $MgO$ ,  $Cr_2O_3$ ,  $MgO \cdot Al_2O_3$ , and  $Al_2O_3 \cdot SiO_2$ , with an excess of  $Cr_2O_3$ .

**Refractory masses.** Friedrich Siemens A.-G. Ger. 582,534, Aug. 16, 1933. The liquation of silicates in molding fused fireproof masses of oxides of Cr, Al, Mg and Si, etc., is prevented by casting the mass in thin layers so that it quickly solidifies.

<sup>2</sup> **Refractory masses.** Ture R. Haglund. Ger. 582,800, Aug. 23, 1933. Highly fireproof masses are produced by fusing materials contg. 80% or more of oxides of Mg, Al and Cr, the residue being oxides of Si and Fe, with optional small amts. of  $CaO$ . Cf. C. A. 27, 3577.

**Refractory and ceramic products.** Gewerkschaft Westend. Ger. 582,393, Aug. 12, 1933. Addn. to 524,534 (C. A. 25, 4375). In producing fire clay, stone products, etc., the total addn. of flux and plasticity-diminishing agent is about 4%.

<sup>3</sup> **Fireproof stone.** Victor Moritz Goldschmidt. Ger. 582,893, Aug. 24, 1933. Refractory products are made by heating a mixt. of granular olivine and finely ground serpentine,  $MgO$  or substances yielding  $MgO$ . The product contains Mg silicates.

## 20—CEMENT AND BUILDING MATERIALS

J. C. WITT

**Experimental cement plant at University of California.** W. Kelly. *Eng. News-Record* 111, 519-21 (1933).—An illustrated description of the complete dual-kiln unit and 3-stage continuous grinding mill. The fineness of the ground cement is detd. by means of a recently developed suspension turbidimeter, which consists of a light source producing a beam of parallel rays, heat filter, sample container, and a light-tight box contg. a photronic cell connected to a microammeter. Fineness is expressed in terms of sp. surface (surface area of particles in sq. cm. per g.). Clear castor oil is used as the suspending medium.

R. E. Thompson  
**New test data aid quality control of gunite.** E. P. Stewart. *Eng. News-Record* 111, 558-61 (1933). Additional observations (cf. C. A. 26, 542) made during relining of a second reservoir (Woodland) in Syracuse are described in detail. With a 1.25-in. nozzle, gunite of max. strength and density was obtained with an air velocity of 110 ft. per sec., with the nozzle held approx. 4 ft. from the work. The av. mix employed was 1:3.8, with the sand contg. 4% moisture by wt. The strength of the gunite increases as the water content decreases, but there is a practical limit to the dryness of the mix (10% under and 10% above the reinforcing mesh). R. E. Thompson

**Silo wall protective coatings.** G. F. Steigerwalt. *Apr. Eng.* 14, 154-5 (1933).—The results of lab. tests on disks immersed for different periods of time in various concns. of acetic and lactic acids indicated that the following materials offer possibilities as protective coatings for silo walls: (1) portland cement plus Fe filings contg.  $NH_4Cl$ ; (2) coal tars when applied on rough surfaces; (3) emulsified asphalts plus portland cement or Cumar resin solns.; (4) Cumar resin solns., either clear or with rubber, portland cement or emulsified asphalts; (5) Stonite; and (6) S. D. O. Favorable results with these materials depend on clean walls, complete coating, proper mixts. of the materials, and sufficient time and proper curing for the coatings to set and harden. K. D. Jacob

**Preservative treatments for silo walls.** F. C. Fenton. *Apr. Eng.* 14, 153-4 (1933).—Applications of  $MgSiF_6$  and of Na silicate improved the resistance of new masonry and concrete silo walls to the action of silage, but were of little, or no, value on old walls. Concrete paint, Al foil and portland cement wash with Fe filings gave poor protection. The best results were obtained by the application of thin coatings of water-gas tar dild. with gasoline or tar thinner; synthetic resin (Cumar) in benzene soln. also gave promising results. K. D. Jacob

Results of tests on the effect of molasses on concrete.

Miles N. Clair and M. A. Morrissey. *Eng. News-Record* 111, 775 (1933).—Exposure to molasses was found to cause appreciable softening and disruptive cracking of neat cement briquets, particularly at early ages of hydration. Action is but slight on 28-day-old briquets. Light refined molasses is more destructive than the dark partly refined product. It is believed that disruption is due to the formation of Ca succinate. Protective coatings of  $Na_2SiO_3$ ,  $MgSiF_6$  or a paraffin-base waterproofing liquid were effective for a few months only,  $Na_2SiO_3$  giving the best results. R. F. Thompson

**Road-tar consistency conversion chart.** E. O. Rhodes. *Eng. News-Record* 111, 474-5 (1933).—A set of conversion curves shows the relationship between the consistencies of road tars made from normal by-product coke-oven tars as detd. by different methods. In general, the Engler sp. viscosity test at 40 and 50° was found most satisfactory for the lower range of consistencies and float tests at 32° and 50° for the higher ranges. R. E. Thompson

**The qualities of tars for use on roads.** W. E. Cone. *Gas World* 99, 576-7; *Gas J.* 204, 714-15 (1933).—A general discussion. P. J. Wilson, Jr.

**Timber for aeronautical use.** A. W. Seeley. *Aircraft Eng.* 5, 281-4 (1933).—A complete guide to the treatment and inspection of woods for ground engineers.

A. W. Furbank

**Selection of concrete sewage pipes (Kruger) 14.** App. for heating or cooling cement (Ger. pat. 578,652) 1. Working up fuel ash [in manuf. of portland cement] (Ger. pat. 578,831) 18.

**Cement.** Elias R. Wilner (to Advance Cement Process Corp.). U. S. reissue 19,005, Nov. 21. A reissue of original pat. No. 1,785,508 (C. A. 25, 574).

**Cement.** Chemische Fabrik Grünau Landshoff & Meyer A.-G. (Walter Kirchner, inventor) Ger. 578,716, June 16, 1933. See U. S. 1,910,297 (C. A. 27, 4053).

**Cement.** Georg Wieland. Ger. 582,877, Sept. 15, 1933. A hydraulic binding agent is made by intimately mixing non-hydraulic or hydraulic binding agents such as lime or cement with the residue known as "Natrolite" obtained from processes for making  $Al_2O_3$  or Al from bauxite. Catalysts such as gypsum, which promote hydration, may be added.

**Cement.** C.B.R. (Cimenteries et briqueteries Réunies) (Soc. anon.). Fr. 750,215, Aug. 7, 1933. White portland cement is made from materials as poor in Fe as possible in a rotary furnace, the reducing atm. being

produced by projecting wood, lignite or charcoal in pieces on to the incandescent cement clinker which has passed the baking zone.

**Cement.** Soc. anon. des hauts-fourneaux, forges et aciéries de Pompey. Fr. 751,853, Sept. 11, 1933. A setting accelerator for slag cement is composed of an alkali chloride (about 1%).

**Cement.** Paul Ducret. Fr. 752,365, Sept. 21, 1933. See Ger. 561,037 (C. A. 27, 1132).

**Rotary drum for burning crude cement slurry.** Fried. Krupp Grusonwerk A.-G. Ger. 582,915, Aug. 25, 1933.

**Paving.** David B. Andrews and Henry B. H. Hurd. U. S. 1,934,680, Nov. 14. A playing ground suitable for tennis courts, etc., has a firm resilient surface composed of a homogeneous mixt. of clay, hydrated lime, anthracite screenings and ZnO baked together and reduced to a powd. condition (there being a preponderance of clay in the mixt.).

**Road-surfacing tar from crude tar.** Thermal Industrial & Chemical (T.I.C.) Research Co. Ltd. Ger. 577,520, June 1, 1933. See Brit. 339,640 (C. A. 25, 2839).

**Tar-bitumen mixtures.** Soc. anon. des établissements Jean François. Fr. 751,956, Sept. 13, 1933. A tar-bitumen mixt. for road use is obtained without heating by mixing tar with finely ground kieselguhr suitably wetted with water and then adding the bitumen as an emulsion. A homogeneous mixt. is obtained by heating.

**Emulsions for road surfacing.** Robert J. Lacau. Ger. 582,907, Aug. 26, 1933. Natural asphalt or mineral oil distn. residues are mixed with crude coal tar at temps. between 400° and 450° and emulsified with addn. of water, to give a road-surfacing compn.

**Bituminous emulsions.** Heinrich Kretzer. Ger. 584,-695, Sept. 22, 1933. Addn. to 575,101 (C. A. 27, 3580). The process of Ger. 575,101 is modified by using waxes such as bees wax, carnauba wax or Japan wax as the emulsifying agent.

**Asphalt emulsions.** Erwin Bergel. Austrian 134,983, Oct. 25, 1933. Varieties of asphalt which are not easily emulsified with aq. alkalis, e. g., petroleum asphalt, are mixed with 5-10% of a natural asphalt of high sapon. no., e. g., Trinidad or Bermuda asphalt. Stable emulsions are thus obtained. If the proportion of natural asphalt is raised, e. g., to 25-50%, emulsions are obtained which break readily when mixed with the usual road-making materials.

**Artificial stone resembling marble.** Hynek Oberherr (to American Artificial Marble Co.). U. S. 1,935,985, Nov. 21. Artificial stone is formed with a body portion formed of chalk and portland cement and a polished surface formed of a layer of Ca oxalate crystals, MgF<sub>2</sub> and water glass.

**Hardening ground.** The Francon Cementation Co. Ltd., Abram R. Neclauds and Anthony Gee. Brit. 396,-

1 939, Aug. 17, 1933. Soil or other measures are hardened by introducing chem. substances in soln. into the measures, either continuously or intermittently and before, during or after the introduction of compressed air or other gas, the solns. reacting to form ppts. or deposits of a siliceous or petrifying nature. A slurry of cement, lime or other grouting material may also be added. The solns. may contain Na silicate, Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>, MgCl<sub>2</sub>, etc.

**Building material.** Ivan Kardos and Maschinenfabrik Komnick G. m. b. H. Ger. 579,961, July 3, 1933. Material suitable for pressing into blocks for building purposes consists of limestone, chalk, or mixts. of pumice, kieselguhr, sand blast-furnace slag, etc., impregnated with molten bitumen or tar, and with lime or cement added as binding agent.

**Constructional materials.** Bart T. Neervoort and Jan S. Volker. Fr. 752,144, Sept. 16, 1933. Building stones, tiles, etc., are made by adding bagasse freed from sugar to a hydraulic binder and mixing with air to a magma. The proportion of bagasse is such that in the finished product it is wholly enveloped.

**Sheet material suitable for use as a wall covering.** Louis C. Fleck (to Paper Patents Co.). U. S. 1,936,355, Nov. 21. An embossed cellulose sheet is coated with a dry and highly flexible waterproof protective material comprising a shellac base which has been emulsified with a relatively small quantity of rubber latex (suitably not over 4% the quantity of the shellac).

**Wallfacings.** Heinrich Borsari-Fischer and Eugen Borsari-Welti (trading as Borsari & Co.). Brit. 396,247, Aug. 3, 1933. Plates of fusible bituminous material are secured to walls, inner surfaces of concrete tanks, etc., by heating the inner surface of the plates and pressing them, if necessary with a roller, onto the heated face of the wall.

**Impressing colored designs on wood or the like for decorative purposes.** John W. Beiger (to Carrom Co.) U. S. 1,936,182-3, Nov. 21. Various details of operation are described.

**Cork-board substitute and "artificial lumber."** Masuzo Shikata. U. S. 1,936,040, Nov. 21. A compressor is filled with water-soaked peat having a high elec. resistance board inserted therein, and the peat is then dehydrated and consolidated into the form of a board by pressure and the action of an elec. current. App. is described.

**Preserving fibrous materials such as insulation board or wood.** Elbert C. Lathrop and Fergus A. Irvine (to Celotex Co.). U. S. 1,935,196, Nov. 14. A colloidal complex comprising Fe(OH)<sub>3</sub> and arsenious acid is used as an impregnating material.

**Treating wooden timbers to prevent cracking.** Carl H. Siever. U. S. 1,936,439, Nov. 21. After forming canals in timbers, they are dried, impregnated with a water proofing liquid such as creosote under heat and pressure and the ends of the canals are closed to confine some of the liquid in them.

## 21 FUELS, GAS, TAR AND COKE

A. C. FIELDNER AND ALDEN H. EMERY

**Certain technical aspects of motor fuels.** Jacques C. Morrell. *Agr. Eng.* 14, 220 2(1933). The characteristics and properties of gasoline are discussed and compared with those of alc. and alc.-gasoline mixts. The conclusions are unfavorable to the use of the mixts. as motor fuel.

**Gas as motor fuel: a German view.** W. G. Rumbold. *Gas World* 99, No. 2576, Ind. Gas Suppl. 12, 2(1933).—A survey of the motor fuel situation in Germany indicates that the use of gas for this purpose is worthy of consideration.

**The calculation of the heating value of fuels from the elementary analysis.** R. Vondracék. *Brennstoff-Chem.* 14, 404-5(1933).—Heating values calcd. from the formulas of Dulong, Grumell and Davis (C. A. 27, 5511) and V. (C. A. 21, 1532) are compared with calorimetric values for a no. of fuels and other combustible substances. The

formula of G. and D. like that of Dulong gives low values with high O and high with high H contents. That of V. is unsuited for coke unless modified but gives the best agreement with pure substances with the exception of naphthalene. Values for naphthalene vary widely when calcd. by all 3 formulas. V. recommends his formula to check calorimetry with a tolerance of 50 cal. F. W. J.

**Calculating the calorific value of solid fuels.** A. J. V. Underwood. *Gas World* 99, 528(1933).—A nomogram to facilitate use of the Grumell and Davis formula (cf. C. A. 27, 5511).

**The place of oil in the world of fuel.** John Cadman. *Gas World* 99, 562-3(1933).—See C. A. 28, 2837.

**Combustion of hydrocarbons.** Wm. A. Bone. *Chemistry & Industry* 1933, 908-6; cf. C. A. 27, 3060. —Hydroxylation is the primary reaction; in the rare cases

where peroxides have been found they follow hydroxylation. Howard Agnew Smith

**Anthracites: peranthracites and true anthracites.** P. La Beau. *J. usines gas* 57, 392-7, 417-28, 472-9; *Compt. rend.* 197, 1234-6 (1933).—See C. A. 27, 5512.

**The thermal reaction and the hydrogenation of coal.** B. J. C. van der Hoeven  
III. **Berginization of Fushun coal at an initial hydrogen pressure of 100 kg./sq. cm.** R. Abe, S. Fujikawa and K. Sugiyama. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 606-9 (1933); cf. C. A. 27, 1135. The results with an initial  $H_2$  pressure of 100 kg./sq. cm. are much the same as with 75 kg./sq. cm. reported previously. Berginization does not represent a simple hydrogenation; an important relation exists with the thermal reaction of the  $O_2$  combination of the coal.

**Production of gasoline by hydrogenation of coal.** Norman Taylor. *Soc. Chem. Ind., Victoria, Proc.* 32, 740 (1932).—Destructive hydrogenation is composed of 4 types of reactions: (1)  $PhOH$ ,  $PhSH$  and  $PhNH_2$  are reduced by  $H_2$  to  $C_6H_6$ ; (2) unsatd. compds. are satd., as  $C_6H_{12} = C_6H_{14}$ , and benzene  $\rightarrow$  cyclohexane; (3) cracking, as  $C_{14}H_{30} + H_2 = 2C_7H_{14}$ ; and (4) gas formation, as  $C_7H_{16} + H_2 = C_4H_{10} + CH_4$ . Conditions of hydrogenation are chosen to favor reactions (1) and (3). The coal is ground and mixed with heavy oil, then with  $H_2$  and all subjected to 3-4000 lb. pressure per sq. in., heated to  $450^\circ$  and pumped through the converter which contains solid catalyst. The following products are formed: heavy oil contg. coal ash and unconsumed coal, boiling above  $300^\circ$ ; middle oil, boiling  $170-200^\circ$  to  $300^\circ$ ; gasoline, boiling below  $170-200^\circ$ ; and hydrocarbon gases. Yields are heavy oil 3%, medium oil 30%, gasoline 22%, gas 22%, liquor 10%, insol. residue 4%;  $H_2$  absorbed 80%, all based upon 100 parts of ash-free coal, tar or oil. Gas-phase hydrogenation treats oils boiling below  $300^\circ$ , at 3-4000 lb. pressure and  $450^\circ$  in the presence of a catalyst. From both the liquid and vapor processes the products of hydrogenation are sep'd. by ordinary refinery methods. In vapor-phase hydrogenation a low-temp. catalyst yields a naphthenic, while the high-temp. catalyst yields an aromatic, gasoline. The following reactions, taking place in the presence of catalyst, furnish the  $H_2$  for the process:  $CH_4$  and  $C_2H_6$  + steam  $\rightarrow$   $CO$  +  $H_2$ ,  $CO$  + steam  $\rightarrow$   $CO_2$  +  $H_2$ ,  $C$  + steam  $\rightarrow$   $CO$  +  $H_2$ . From 3.65 tons of coal there is obtained 1 ton of gasoline, with an overall thermal efficiency of 43%. Gasoline made from lignite gave a 41.9% thermal efficiency. The gasoline has a sp. gr. of 0.72-0.78, 10-20% distils over below  $75^\circ$ , 28-45% below  $100^\circ$ , final b. p.  $195-200^\circ$ . The knock rating or octane number is 67-72. T. recommends blending natural-gas gasoline with the product. Products of the process other than gasoline are kerosene, Diesel or gas oil, fuel oil, lubricating oils and  $(NH_4)_2SO_4$ . Hydrogenation gasoline cannot compete against petroleum gasoline. H. E. Messmore

**Coal carbonization by internal heat.** Samuel Moore. *Gas J.* 204, 504-8; *Gas World* 99, 517-19 (1933).—Two Moore gas-making machines with a combined capacity of 90,000 cu. ft. per 24 hrs. have been operated since 1928 at Burnham-on-Sea, and in that time have saved 1 1/2 times their cost of £6000. Each consists of a metal shell contg. a vertical coal-gas retort superimposed on a water-gas generator, the retort being surrounded by a series of twin regenerative heating chambers. The plant-operating results are not representative of the retorts alone due to addn. of gas from inefficient horizontal retorts. From a suitable coal in a one-stage operation, coal, carburated water, blue water or mixed gas, and a domestic coke of good quality and any desired volatile may be produced. The coke can be entirely gasified if desired. Operation is simple. P. J. Wilson, Jr.

**The determination of sulfur in fuels.** Review of the most important work appearing since 1929. Egbert Bittich. *Brennstoff-Chem.* 14, 383-8 (1933).—A comprehensive bibliography of methods for solid, liquid and gaseous fuels bringing that of Muhlert, C. A. 24, 2863, up to date. F. W. Jung

**A method for determining the behavior of coal during fusion and formation of coke.** K. Bunte, H. Bruckner and W. Ludwig. *Glückauf* 69, 765-70 (1933).—A method is described whereby plastic resistance to  $N_2$  (C. A. 18, 2064), rate of loss in wt., rate of gasification and expansion can be detd. simultaneously under the same heating conditions. Complete test results are given for 7 German coals, covering the range in rank of those used for coke and gas making. J. D. Davis

**The ash melting point of coal and coke.** H. A. J. Pieters and G. Smeets. *Helv. Chim. Acta* 53, 446-8 (1933). The m. ps. were detd. by the cone method for 5 samples of coal ash with melting index ( $SiO_2 + Al_2O_3$ )/( $FeO + CaO + MgO$ ) varying from 13.9 to 0.3. The cones of 25 mm. height, 7.5 mm. base, were heated in a kryptol furnace at a rate of  $5^\circ$  per min.; the temp. was measured by a Pt-PtRh couple. The m. ps. in an oxidizing atm. (temp. at which the top of the cone touches the base plate) were little different, some above  $1370^\circ$ , the lowest  $1350^\circ$ . For a reducing atm., particularly if  $C$  rods were present in the furnace (11-13%  $CO$ , and 9-15%  $CO_2$ ), the m. p. varied from more than  $1370^\circ$  to  $1100^\circ$ . The temps. measured agreed well with those of standard Seger cones. The m. p. detd. in a reducing atm. satisfactorily follows the melting index. The Fe content is instrumental in detg. the drop from oxidizing to reducing atm. m. p. The latter temp. checks fairly well the results of Bunte ash-softening expts. (C. A. 22, 1457; 23, 5301). By shaking coal with crude  $HCl$  acid for 5 min., the ash m. p. can be raised from  $1145^\circ$  to  $1340^\circ$  and by boiling 50 g. coal with 100 cc. 4  $N$   $HCl$  the ash m. p. can be raised from  $1145^\circ$  to more than  $1100^\circ$ . B. J. C. van der Hoeven

**Clarification of turbid waters from coal washeries.** R. de Izaguirre. *Anales soc. españ. fis. quim.* 31, 760-75 (1933).—The coagulating action of various salts and colloids upon turbid water from coal washeries was exam'd. The turbid water acts as a negatively charged suspension, and coagulation is caused by cations.  $Ca(OH)_2$  assumes a special position among the electrolytes, and its strong coagulating action seems to be caused by destructive action on the bicarbonates. According to this conception,  $HCO_3^-$  ions should have a peptizing action. In coagulation by positively charged colloids, and particularly by protective colloids, irregular series are often encountered, making it necessary to test each substance systematically, because otherwise the most effective concns. can easily be passed over. The best results were obtained with tannin at concns. of 1-4 g. per cu. m. E. M. Svanmies

**Flow coal from lignite.** G. Benthin. *Angew. Chem.* 46, 742-4 (1933).—Flow coal is an intimate mixt. of extremely fine coal particles and oil which has the properties of oil as far as handling is concerned. The suspension of lignite particles can be obtained by incorporation of about 1.5% of soap which forms a gel, but this introduces certain disadvantages and a search was made for methods of using the lignite itself as a source of gel. It was found that creosote oil is an excellent material if small amts. of alkali soaps are added also (0.3-0.5% alkali). Addns. of pyridine or org. bases are preferable to those of alkali. The swelling action of creosote upon lignite is due to the orientation introduced by the  $OCH_3$  group of the ring which causes the formation of a stable gel with the likewise oriented humic acid in the lignite. The possibility of partial de-ashing of the lignite by peptization with creosote and small amts. of alkali salts is also mentioned. Five references. Karl Kammermeyer

**Modern gas-works policy and development.** J. E. Wakeford. *Gas World* 99, 574-5; *Gas J.* 204, 716-18 (1933).—The favorable results secured at Brighouse with gas dehydration, naphthalene removal,  $C_6H_6$  recovery and detn. of the comparative monetary value of coals by carbonization tests are described. Some difficulty was experienced in evapg. the  $NH_3$  liquor, but it is now sold. The hot-cold system of dry gas purification requires a heater for the gas entering each box. Revivification and absorption of the last traces of  $H_2S$  are speeded, and the capacity of the boxes is increased considerably. P. J. Wilson, Jr.

The use of gas in bottles in Denmark. Smidth. *J. usines gas* 57, 505-11(1933). B. J. C. van der Hoeven.

Town gas supply from coke works. G. P. Lishman. *Gas J.* 204, 657-9; *Gas World* 99, 559-61(1933).—At the Lambton Coke Works there are 35 Smet-Solvay waste heat ovens consuming 75% of their gas make, and 35 regenerative Simplex ovens consuming about 55%. Operating results from these ovens, the naphthalene removal, and gas dehydration plants are given.

P. J. Wilson, Jr.

The working of a dry gas meter. A. W. Sharman. *Gas World* 99, 606-7(1933). P. J. Wilson, Jr.

Losses due to unaccounted for gas. T. H. Williams. *Gas World* 99, 527-8(1933).—A discussion of the method of calcg. unaccounted for gas, and of the types of losses.

P. J. Wilson, Jr.

Application of radiation and convection theory to the practical calculation of the capacity and efficiency of gas-burning appliances. Werner Geck. *Gas u. Wasserfach* 76, 817-23, 833-40(1933).—G. discusses the application of black body calculations to gas-using appliances, noting that the wave length and energy maximum of radiated energy depends on the temp., introduces the idea of "black gas radiation," and gives the wave lengths of absorption bands of carbon dioxide and water, and the fraction of energy absorbed by these bands, the energy radiated by carbon dioxide and water, the radiation of layers and cylinders, influence of wall reflection on radiation and heat transfer by convection. The heat-transfer number increases with decreasing size of jet so that numerous small burner openings are preferable to one large opening. Flue-gas removal, friction in pipes and other flow resistances are discussed as well as effect of excess air.

R. W. Ryan

Mechanism of explosive combustion of gaseous hydrocarbons. Alfred W. Francis. *Chemistry & Industry* 1933, 926-7.—A criticism of Bone's conclusions that preliminary partial decompn. does not occur and that the affinity of ethylene and acetylene for  $O_2$  in flames exceeds that of H. It is suggested that part of the hydrocarbon mixt. burns, furnishing energy for decompn. of the remainder of the mixt. Cf following abstract.

Howard A Smith

Mechanism of explosive combustion of gaseous hydrocarbons. W. A. Bone. *Chemistry & Industry* 1933, 928-9.—B., basing arguments on exptl. evidence, disagrees with Francis (preceding abstract). H. A Smith

Dry purifying materials (for manufactured gas). K. Runte, H. Bruckner, W. Ludwig and O. Runge. *Gas u. Wasserfach* 76, 785-9(1933).—The activity of an iron oxide purifying material depends on its content of hydrated iron oxide (which can be calcd. from the combined  $H_2O$ ) rather than on its total  $Fe_2O_3$  content. Wetness and total  $H_2O$  content were detd. on a series of nine artificial and natural iron oxide purifying materials. Wetness was detd. by shaking 10-30 g. of material (depending on its water content) with 50 cc. of 95% isopropyl alc., filtering, mixing 25 cc. of the filtrate with 25 cc. of petroleum and detg. the rise in temp. The wetness of the purifying material was then read from a calibration chart prepd. by using alc. of known water content. Ordinary methods of detg. total  $H_2O$  content give low results. A table of loss of wt. of the purifying materials under various drying conditions is given. The most accurate results are obtained by igniting 1-3 g. of the purifying material up to dark redness in an unglazed porcelain boat in a quartz tube through which a stream of nitrogen is passed, and detg. the wt. of  $H_2O$  absorbed in a  $CaCl_2$  tube. This is the total moisture. Combined or bound  $H_2O$  is equal to the total  $H_2O$  less the wetness. On spent oxides, wetness is detd. as above and combined  $H_2O$  by digesting 10 g. of the material for 1 hr. with alc., filtering off the alc. on a Gooch crucible, washing the material with water-free ether, removing S with repeated portions of  $CS_2$ , drying by suction, and igniting 1 to 3 g. as above, and detg. the  $H_2O$  by  $CaCl_2$  absorption. Humic acid may be present in some bog ores and a method for its detn. is given as well as the humic acid contents of 3 bog iron ores. The ca-

pacities of the nine purifying materials for absorbing  $H_2S$  are given as well as curves for reaction velocity activity as detd. by a static method.

R. W. Ryan

Some new methods for the control of dry purification. W. A. Currie, Jr. *Gas World* 99, 553-7; *Gas J.* 204, 721, 837-9(1933).—Lab. methods for detn. of  $H_2O$  and Fe in the oxide are described. Sensitivity of the oxide to fouling is detd. by fouling a portion of the oxide under controlled conditions and extg. the S formed with  $CS_2$ . The percentage of available Fe oxide =  $500 S/3(100 - S)$ , where S is per centage of S extd.  $NH_3$  in the gas to the boxes is detd. by absorbing the  $NH_3$  from 200 cc. of gas in 5 cc. of 1%  $H_2SO_4$ . The acid soln. in a Nessler tube is treated with Nessler reagent, and the color compared with the yellow color from 0.0025 N  $NH_4Cl$ . The Nessler reagent has shown no sign of being affected by the  $H_2S$  extd. from the gas with the  $NH_3$ .  $H_2S$  is detd. by absorbing it from a similar sample in a 2% NaOH soln. and comparing the color formed by addn. of Na nitroprusside to this soln. in a Nessler tube with the color of a standard  $H_2S$  soln. The optimum  $H_2O$  content of bog ore fouled to various degrees and the influence of the gas temp. are discussed. Precautions to prevent drying out of the oxide are recommended. In the discussion the use of a tube of bromothymol blue, the only indicator not affected by  $H_2S$ , for detg.  $NH_3$  quickly in the gas is mentioned. P. J. W., Jr

The determination of small amounts of nitric oxide and their removal from coke-oven gas. A. Guyer and R. Weber. *Brennstoff-Chem.* 14, 405-8(1933); cf. *C. A.* 26, 2849.—A rapid colorimetric method is described which requires less gas and time. The gas is passed 20-30 l./hr. through a spiral washing bottle with a No. 1 Jena filter supporting 5 cm. fresh Griess reagent (0.25%  $\alpha$ -naphthylamine + 0.4% sulfanilic acid in 20% HOAc). Comparisons are made with colorations obtained with known amts. of N/3000  $NaNO_2$  soln. added to similar amts. of reagent. A table is given for detg. the true content from the found oxidized NO. Amts. to 0.00002% by vol. may be detd. Greatest absorption from the gas of a no. of treated and untreated  $Fe_2O_3$  and  $Fe(OH)_3$  purifying agents was obtained with "Luxmasse" after treatment with  $H_2S$ . Expts. at  $-100^\circ$  show 2-5 parts per million NO will not sep. in air as  $NO_2$  with cyclopentadiene to form gums.

F. W. Jung

The testing of commercial activated carbon for the determination of benzene in coke-oven gas. R. Kattwinkel. *Brennstoff-Chem.* 14, 424-7(1933); cf. *Glückauf* 67, 1409-11(1931); 69, 853-8(1933).—The absorbabilities of 3 samples for 3 different types of benzenes have been detd. both by vapor and by liquid in a series of repeated tests. Distn. temps. with superheated steam at  $240^\circ$  to recover absorbed material were found inadequate and were raised to  $330^\circ$  to reduce losses from vapor soly. in  $H_2O$ , adhesion in the app. and retention in the C. Recovery was less complete with smaller absorptions. Factors for correcting to 100% recovery depended upon the type of benzene and the test conditions. An uncorrected recovery of < 95% by distn. of 20 cc. absorbed material from an unstated amt. of C indicates insignificant absorbability.

F. W. Jung

Increasing benzene yield in the Ruhr area. Rettenmaier. *Gas u. Wasserfach* 76, 791-2(1933).—The value of light-oil products from coal carbonization as well as the wt. of light oil produced per ton of coal carbonized has gradually increased since 1928, the present av. yield of light oil being 10.3 kg. per metric ton of coal. The yield of gas and crude tar has also increased. These increases are attributed to the use of new ovens with silica refractories which increase light oil yields at the expense of the phenols, to the lower rate of oven operation during the depression and to improvements in light oil recovery and refining.

R. W. Ryan

The extraction of phenols from caustic phenolate solutions. K. Drees and G. Kowalski. *Brennstoff-Chem.* 14, 382-3(1933); cf. *C. A.* 26, 6100.—The extractive properties of ether,  $C_6H_6$ ,  $CCl_4$  and aniline are compared. The first 3, mixed 80:20 with pyridine, are 3 times as effective

as ether alone while aniline, acetone and Me Et ketone, mixed 20:30 with ether, are twice as effective.

F. W. Jung

**Ammoniacal liquor problem at Oldham.** Norman Partington. *Gas J.* 204, 719-20(1933).—Concn. of a fixed  $\text{NH}_3$  soln. by the W. C. Holmes & Co. process in which hot gases from the retorts were used resulted in a loss of 22.9% of the  $\text{NH}_3$  over a 2-year period. About 16% of this is attributable to the process itself. After consideration of other processes for evapn. of the liquor a condensing and washing plant consisting of a cyclone tar extractor, primary and secondary water-cooled condensers, a Livesey and finally a rotary brush washer was installed. In this app. 30 gallons of liquor per ton of coal carbonized was produced for sale. The  $\text{NH}_3$  concn. varied from 9 to 11 oz. Attention to steaming in the retorts and maintenance of the  $\text{CO}_2$  concn. in the gas below 3.5% were necessary.

P. J. Wilson, Jr.

**The behavior of a primary tar solution in dialysis.** G. Free. *Brennstoff-Chem.* 14, 401-4(1933).—The phys. and chem. properties of 6 fractions and a residue obtained from the glacial HOAc soln. have been examd. The fractions in HOAc were sub-divided with benzine,  $\text{C}_6\text{H}_6$ , and acetone and the contents of solid paraffins, bases, phenols and neutral oils were detd. in the benzene-sol. fractions. Paraffins are sepd. practically completely by the collodion membrane. Benzene-sol. and neutral material increased in the fractions with continued dialysis. Possible use in tar study is indicated.

F. W. Jung

**Primary, low-temperature tar.** R. Biayna Nicolau. (*Quim. e ind.* 10, 276-9(1933).—A review. E. M. S.

**The chemistry of pitch.** Fritz Hofmann and Leo Boente. *Brennstoff-Chem.* 14, 381-2(1933); cf. *C. A.* 27, 2558. The bases in the liquid portions of a distillate obtained in carbonizing pitch have been studied. Primary bases appear to have increased in concn. by the distn.; *o*-toluidine and 2-naphthylamine and several unidentified higher-boiling bases, apparently pyrene derivs., were isolated.

F. W. Jung

**A general review of the achievements and tendencies in the coke-oven industry today.** M. E. Nicklin. *Gas World* 99, No. 2574, Coking Sect. 129-32(1933).—A review of progress in coke cleaning and blending, use of domestic and blast-furnace coke, and of coke-oven gas, and recovery and purification of by-products.

P. J. Wilson, Jr.

**Preparation of coke for the market.** H. Singleton. (*Gas J.* 204, 601-3; *Gas World* 99, 557-8(1933).—Coke of 1:20%  $\text{H}_2\text{O}$  was placed in a suitable hopper and completely dried by blowing through it a current of hot waste gases from a retort setting. Some reduction in the S content was also effected.

P. J. Wilson, Jr.

**The dependence of the characteristics of coke upon conditions of preparation.** III. W. J. Muller and E. Jundl. *Brennstoff-Chem.* 14, 421-4(1933); cf. *C. A.* 27, 5940. The relationship between ignition point and temp. and rate of carbonization for both slowly and rapidly gasified coke is shown with surface diagrams. Both a modified Melzer app. and the Müller-Courard tube were used with air and  $\text{O}_2$  in detg. ignition points for which time-temp. curves are given of various industrial coxes.

F. W. Jung

**The commercial sampling and analysis of coke.** R. A. Mott and R. V. Wheeler. *Colliery Guardian* 147, 869-71, 912-16(1933).—Tests were made to det. the probable error in the sampling and analysis of coke by specified methods, and to show how the errors could be minimized. The coke in a quenching car was divided into a large no. of zones, and from each zone a 5-, a 2.5- and a 1-lb. increment was taken, on each of which the  $\text{H}_2\text{O}$  was detd. The results showed that for a true av. sample the wt. of each increment should approximate the av. wt. of the unbroken pieces in the consignment, 2-3 lb. In the 5- and the 2.5-lb. increments the av. deviation from the mean  $\text{H}_2\text{O}$  content increased rapidly up to a  $\text{H}_2\text{O}$  content of 5%, but did not increase much thereafter. This is because there is a max. amt. of  $\text{H}_2\text{O}$  that a particular coke quenched in a particular way can absorb. A figure and formula are

given by use of which can be calcd. the no. of increments necessary from different parts of the consignment to ensure a  $\text{H}_2\text{O}$  content within 1% of its true value. Cokes ranging in  $\text{H}_2\text{O}$  from 3 to 13% could be crushed to pass  $\frac{1}{4}$  in. without appreciable loss of  $\text{H}_2\text{O}$  before analysis. In sampling 50 lb. of coke of through  $\frac{1}{4}$  in. size for  $\text{H}_2\text{O}$ , the sample should not be less than 1 lb., and should be collected by at least 20 increments. This sample is too small for correct detn. of ash; but normally, if a 2-lb. sample were taken for  $\text{H}_2\text{O}$ , it would serve also for the general analysis. Despite the concn. of ash in coke of through 1 in. size, the exclusion of less than 2 in. sizes in the original sample does not introduce material error. A practical scheme for sampling coke is outlined.

P. J. Wilson, Jr.

**Pneumatic cleaning of gas coke.** C. W. H. Holmes. *Gas J.* 204, 827-30(1933).—In order to remove from coke, slate and other incombustible matter which provide planes of weakness along which fracture occurs, the raw coke from the ovens is fed onto a triangular perforated metal sheet. This forms the upper surface of an air chest which is reciprocated at high speed in the direction of its length. Air is supplied to the under surface of the fan at a pressure of 3 in. water gage. Under the action of the air and jiggling the bats sink to the bottom of the layer, are trapped behind riffles, and gradually are jigged off at one point, while the cleaned coke leaves at another. On this table coke nuts from unscreened Durham gas coal had their ash content reduced from 12.4% to 8.3. The refuse was 68.5% ash. The process may also be used for the sepn. of reasonably closely sized coke into light, porous and heavy coke of lower porosity. The decrease in the  $\text{H}_2\text{O}$  content of the coke in passing over the table is not great.

P. J. Wilson, Jr.

**The manufacture of household coke in coke ovens.** H. O. H. Cercel. *Gas J.* 204, 831-3(1933).—A brief description of the production of coke suitable for open grates in metal and firebrick retorts, *narrow ovens* operated at 750°, as at the Bruay plant, and *Lecocq coke ovens*.

P. J. Wilson, Jr.

**Wood gas (Luck) 22.** Blast-furnace operations with peat fuel (Chizhevskii, et al.) 9. Formation of coal (Niggli) 8. Tars for use on roads (Cone) 20. Refining [gaseous products of pyrogenic decompos.] (Ger. pat. 578,630) 22. Valves for use with gas holders (Brit. pat. 396,307) 1.

**Carbonizing fuel.** Compagnie générale de construction de fours. Fr. 752,009, Sept. 15, 1933. The fuel is agglomerated to a shape such that it fits the interior of the distn. retort without appreciable play. It may be formed in one or several pieces, preferably as truncated cones.

**Dressing fuel.** Erz- u. Kohle-Flotation G. m. b. H. (Wilhelm Schäfer and Willy Mertens, inventors). Ger. 582,723, Aug. 21, 1933. Fibrous fuel is sepd. from hard coal by flotation by using as an addn. agent dextrin or starch treated with HCl, or inorg. chlorides or org. acid chlorides. Examples are given.

**Motor fuels.** André P. Siréjols. Fr. 750,375, Aug. 9, 1933. Liquids obtained by the distn. of rubber, if desired after rectification or refining, are added to motor fuels.

**Gaseous fuel for engines.** Luis de Florez (to Texas Co.). U. S. 1,936,155, Nov. 21. A fuel suitable for internal-combustion engines of lighter-than-air craft contains H about 52 and butane about 48%. U. S. 1,936,156 relates to a fuel contg. H about 27.5 and propane about 72.5%.

**Gels suitable for fuels.** James W. McBain (to S. Sternau & Co.). U. S. 1,934,725, Nov. 14. About 2.5-5.0% of a nitrocellulose, insol. in the alcs. used at ordinary temps., is dissolved in alcs. such as anhyd. EtOH at a low temp. of about -30° to -60° and the temp. is then permitted to rise to normal temp. without evapn. to produce a solid gel suitable for use as a fuel.

**Liquid fuel and coke.** Pape & Co. G. m. b. H. Fr. 750,337, Aug. 8, 1933. Tar, pitch and other combustible liquids are passed in a finely divided state through a

strongly heated chamber to form vapors of hydrocarbons and coke and the vapors are brought without condensation to a 2nd chamber in which they are "cracked" to form more volatile liquids suitable as motor fuels. The uncondensed gases are used to pulverize the starting material.

**Device suitable for filtering oils and liquid fuels.** Napoleon R. Thibert. U. S. 1,935,136, Nov. 14. Structural details.

**Apparatus for distilling bituminous fuels.** I. G. Farben-ind. A.-G. (Adolf Traut, inventor). Ger. 578,822, June 22, 1933.

**Directly heated fuel-distilling furnace.** Kohlenveredlung und Schwelwerke A.-G. Ger. 578,563, June 15, 1933.

**Furnace for pre-drying and burning pulverulent fuel.** Elektrowerke A.-G. (Bernhard Kramer, inventor). Ger. 578,500, June 14, 1933. Addn. to 508,919 (C. A. 25, 625).

**Drying fuels with superheated steam.** Rudolf Steiner and Viktor Skutl. Austrian 135,007 and 135,008, Oct. 25, 1933. Addns. to 121,405 (C. A. 25, 2548). Ger. 583,907, Sept. 12, 1933. Addn. to 527,021 (C. A. 25, 5275).

**Superheating steam.** Charles E. Lucke (to Babcock & Wilcox Co.). U. S. 1,934,723, Nov. 14. Various details of app. and operation are described. U. S. 1,934,724 also relates to app. for steam production and superheating and desuperheating.

**Control device for steam generators.** Marcus Lothrop. U. S. 1,935,981, Nov. 21. Various structural and operative details are described.

**Apparatus for desuperheating steam.** Charles W. Gordon (to Superheater Co.). U. S. 1,935,195, Nov. 14. Structural features.

**Hydrogenation of carboniferous materials in the liquid phase.** Imperial Chemical Industries Ltd. (Charles F. R. Harrison, inventor). Ger. 579,626, July 14, 1933. See Brit. 311,193 (C. A. 24, 670).

**Hydrocarbons.** Charles J. Greenstreet. Brit. 307,468, Aug. 18, 1933. Hydrocarbons, free from phenols and suitable as fuel for internal-combustion engines, are obtained by subjecting a mixt. of mineral oil with creosote oil, tar acids or coal-distn. products contg. tar acids, in finely divided form and with or without the addn. of steam or residual gases of the process, to extensive surface contact with catalysts, e. g., Fe, Ni, steel, Cu, Co, Mn, Cr, Mo, Sn, Al, alkali metals, alk.-earth metals, Si, B, pumice, firebrick, SiO<sub>2</sub>, Carborundum, carbides, nitrides, etc., at 350-650° and withdrawing the product as soon as it is free from phenols. The high pressures used in hydrogenation processes are not used. Cf. C. A. 27, 4378.

**Vertical retorts for carbonizing coal.** Frederick J. West, Ernest West and West's Gas Improvement Co. Ltd. Fr. 750,656, Aug. 16, 1933.

**Means for compressing coal in discontinuously operated coke ovens.** Gustav Hilger. Ger. 587,035, Oct. 30, 1933.

**Crushing apparatus for working up lignite.** Maschinenfabrik Buckau R. Wolf. A.-G. Ger. 578,894, June 17, 1933.

**Distilling crude lignite.** Rheinisch-Westfälisches Elektrizitätswerk A.-G. and Theo. Schmidt. Fr. 752,300, Sept. 20, 1933. The retort is in the form of a series of chambers one above the other.

**Fuel gas.** Vergasungs-Industrie A.-G. Austrian 134,812, Oct. 10, 1933. In a generator for the manuf. of mixed distn. gases and water gas from fuels such as brown coal, lignite or peat, the gases evolved (mainly CO<sub>2</sub> and steam) from that part of the shaft in which the fresh fuel is preheated to about 400° are separately withdrawn and mixed with the steam for the water-gas reaction. Gas of low CO<sub>2</sub> content and high-calorific value is obtained.

**Gas mixtures.** Edmond Voiturem. Ger. 582,664, Aug. 19, 1933. A mixt. contg. C<sub>2</sub>H<sub>2</sub>, H and CO is produced by treating gaseous satd. hydrocarbons with H and O in a reaction chamber at temps. above 1300°.

**Purifying gases.** The Gas Light & Coke Co. Fr. 42,691, Sept. 1, 1933. Addn. to 721,898 (C. A. 26, 4114). Active charcoal used for purifying gases is re-

generated by hydrogenation with a compd. of V, U, Cr, Fe or W as catalyst. Thus, used charcoal is treated with a soln. of NH<sub>4</sub> vanadate in water and heated to 440-50° under pressure.

**Purifying gases.** Christian J. Hansen. Fr. 750,531, Aug. 11, 1933. NH<sub>3</sub> is removed from gases which are then treated to remove H<sub>2</sub>S by solns. of salts of HCNS, while adding SO<sub>2</sub> to the washing liquid or to the gas. Cf. C. A. 27, 830.

**Gas washing.** Établissements Ernest Arnoult. Fr. 750,662, Aug. 16, 1933. Residual waters from gas washing, contg. principally H<sub>2</sub>S, are oxidized in contact with air, with or without a catalyst such as colloidal Ni sulfide. An app. is described.

**Device for testing gases.** Apparat-Bauanstalt Ing. Hans Klinkhoff (Leonhard Kneissler, inventor). Ger. 578,517, June 14, 1933. The quantity of CO<sub>2</sub>, CO or H<sub>2</sub>, especially in flue gases, is measured by noting the changes of heat cond. of a wire as a current of the gas passes over it.

**Hydrogen-containing gases.** Wm. L. Spalding (to American Cyanamid Co.). U. S. 1,935,675, Nov. 21. Gases contg. CO, such as water gas, producer gas or cracked natural gas, are satd. with water vapor, steam is added if necessary and reaction is effected to produce CO and H<sub>2</sub>; water is condensed from the reacted gases; the gases are compressed after satn. and they are passed to the condensing step at a higher relative gas pressure than that of the satg. step, and excess water from the satg. step is passed to the condensing step. App. arrangement and various details of operation are described.

**Gas generator.** Heinrich Steinfeldt. Ger. 582,629, Aug. 18, 1933. Addn. to 423,555.

**Gas generator fed by waste vegetable materials.** Humboldt-Deutzmotoren A.-G. Fr. 750,554, Aug. 16, 1933.

**Gas generation from materials such as gasoline, alcohol, etc.** Carl O. Wannack (to S. H. G., Inc.). U. S. 1,935,925, Nov. 21. Various details of app. and operation are described for mixing and utilizing liquid fuel and air.

**Gas producers.** Harald Kenner. Ger. 582,539, Aug. 16, 1933. In treating broken fuel such as coke with steam a max. yield of fuel gases is obtained by mixing a catalyst such as furnace dust with the steam.

**Operating slagging gas producers.** Louis Chavanne. Ger. 584,798, Sept. 25, 1933. Addn. to 507,082 (C. A. 27, 1489). Details are given of an alternative method of regulating the height of the fusion zone and the temp. of the gas.

**Coal-gas retort.** Gerhard Verse. Ger. 578,800, June 17, 1933.

**Weighting gas-holders.** R. & J. Dempster Ltd., Joseph W. Scott and Arthur J. Sheeran. Brit. 396,667, Aug. 10, 1933.

**Device for removing sulfur, etc., from gases.** C. Otto & Co. G. m. b. H. Ger. 578,710, June 16, 1933.

**Desulfurizing gas.** Gastechnik G. m. b. H. Fr. 753,127, Oct. 7, 1933. The purifying material is used in a solid porous form instead of a powder and may be made by agglomeration with sulfite lyc, sol. glass, cement, etc. The porosity may be increased by the incorporation of org. materials or salts which are afterward decomposed by heat. The material may be used in columns or towers, used material being drawn off at the bottom and fresh material introduced at the top.

**Apparatus for removing hydrogen sulfide from gases.** Trinidad Leaseholds, Ltd. Ger. 579,938, July 4, 1933.

**Tar emulsions.** Fernando Elosequi. Fr. 752,178, Sept. 18, 1933. Montan wax and suint are used along with a soln. of NaOH for emulsifying tar.

**Coking coal.** Kohlenveredlung und Schwelwerke A.-G. Ger. 578,564, June 15, 1933. Coal is conveyed over perforated surfaces on its way to the coking or distg. chamber for pre-treatment with hot furnace waste gases contg. O.

**Coking briquets.** Emilie Gevers-Orban and Julien Pieters. Ger. 578,628, June 15, 1933. Fine granular

fuel with a high content of volatile substances is subjected to a pre-distn after which it is briquetted with a binding agent. These briquets are mixed with a further amt of the crude fuel and the whole is subjected to a further distn so that the briquets are completely coked and the fuel is partly coked ready for making further briquets.

## 22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W F FARAGHLR

Bibliography of Soviet (Russia) patents on petroleum A A Bochtlingk *Foreign Petroleum Tech* 1, 13 22, 99-109, 115 19(1933) A A Bochtlingk

Vapor pressure and vaporization of petroleum fractions Donald I Katz and Geo Granger Brown *Ind Eng Chem* 25, 1373 94(1933) —A crit survey of the methods of calcg the equil compns of liquid and vapor under all conditions is summarized conveniently for engineering use in the design of distn equipment for hydrocarbon mixts.

L W I Cummings  
Petroleum fuels I W I Cummings *Chem Eng* *Using Rev* 25, 417 20(1933) —An attempt to correlate the chemistry of petroleum fuels with their performance in practice. The fuels discussed include (1) liquefied gaseous fuels, (2) motor spirits, (3) kerosenes, (4) Diesel fuel oils and (5) bunker fuels. W H Boynton

Improved lamp for determination of sulfur in light petroleum products I R Gillis *Ind Eng Chem*, *Anal Ed* 5, 421(1933) —A modification of the lamp prescribed in A S I M method D90 301 consists in surrounding the wick tube with a larger glass tube so that the wick can be raised or lowered without removing the lamp from the chimney. This is very good for either light or heavy gasolines or illuminating oils. J I F

The distillation of bituminous schists from the department of Jura, province of Franche Comte (France) Jean Barlot *Compt rend* 197, 450 2(1933) cf C A 27 3322 —Org matter ranges from 13 to 27%, lime 35-40%, SiO<sub>2</sub> 35-40%, and pyrites 1-5%. The best results are obtained at about 500°. It is concluded that the character of the crude oils obtained depends more upon the particular process used than on the place of origin, that their content in those hydrocarbons which distil off before 205° is never less than 30% and may under favorable conditions be 50% higher than this. These beds average 5 m in thickness, though some reach 50 m, and represent enormous fuel reserves. A W Iurbank

Assay of gas oil for carburation purposes J A van Dijk *Het Gas* 53, 419 53(1933) —Natural gas oils contain aromatic and naphthenic ring mols and paraffins, but no olefins. Olefins found in them, e g, by the 41 SO<sub>4</sub> method (sp gr 1.73), are due to sulfonation of aromatic compds. General objections are raised to this method that will remove with the aromatic rings important paraffinic side chains. Application of the Waterman, et al (C A 26 4702) and Vlughter, Diss Delft (1932) methods to gasoline assay is advocated by hydrogenation of olefins and aromatic compds, the no of double bonds is detd (olefins separately by the McIlhenny Br no) in the resulting paraffin naphthenic mixt and the ratio of the 2 is detd by the sp refraction method. For practical reasons a somewhat modified method is made up from the methods of Waterman and of Carpenter (C A 22, 3766). The McIlhenny Br no is detd and if little or no olefins are found (for cracked oils of high olefin content hydrogenation is necessary), 50 cc of oil is shaken for 1 hr with H<sub>2</sub>SO<sub>4</sub> of d = 1.84, sepd and shaken twice for 2 hrs with a mixt of 80% of 1.84 H<sub>2</sub>SO<sub>4</sub> and 20% (by wt) of 25% oleum. The aniline point and sp refraction have now reached const values. The change (rise) in aniline point before and after the H<sub>2</sub>SO<sub>4</sub> treatments is a measure for the aromatic ring content of the oil (the vol contraction of the oil indicates the total amt of aromatic compds.) A factor of 0.8-0.87% by wt. of aromatic rings per 1° aniline point

rise is used. The treated oil is twice shaken with pure concd H<sub>2</sub>SO<sub>4</sub> to remove sulfonic acids before the aniline point detn. For subsequent analysis it is neutralized by heating on a steam bath with a small amt of anhyd Na<sub>2</sub>CO<sub>3</sub> and shaking, and is dried overnight with CaCl<sub>2</sub>. After filtration the acid-free and water free oil, a mixt of paraffins and naphthenes is analyzed from sp refraction (Abbe), sp gr (d<sub>20</sub> in 4 decimals, Sprengel's pycnometer), and mol wt (in pure C<sub>12</sub>H<sub>26</sub> by f p lowering of about 11°) by using the Waterman-Vlughter charts. The naphthenic content is calcd back to the original vol of the oil before acid treatment. The paraffin content of the oil is found by difference 100 - (aromatic ring + naphthenic ring content). For sp gr detn of the original oil, d<sub>20</sub>, the Mohr balance is used. The Rutten app is used with a few changes to det the boiling curve of the oil at 60 mm Hg pressure. CO<sub>2</sub> is sucked through the boiling capillary to prevent oxidation, the flask is heated in an air-bath and is protected by asbestos against radiation (sketch). The distn rate (initial flame 3 cm) is 50 drops per min. total distn takes 1 hr, fractions are collected between 0°, 150°, 200°, 250°, 300° and residue. For 10 oil samples the results of the methods are given: paraffin content 60-76%, one had more than 20% distg below 150°. The upper limit in a good gas oil is 20%, or perhaps only 10% of this fraction. Paraffin content together with boiling range are the most significant factors for the evaluation of the oils. B J C van der Hoeven

Spectrographic detection of formaldehyde in an engine prior to knock Gerard M Risswiler and Lloyd Withrow *Ind Eng Chem* 25, 1359 66(1933) —The formation of CH<sub>2</sub>O in the non-inflamed gases in the knocking zone of an Otto cycle engine running under knocking conditions with several different fuels is proved by characteristic absorption bands. The presence of CH<sub>2</sub>O has not been detected in fuels which do not knock, and its incorporation into a fuel does not produce knock.

L W I Cummings  
The dielectric losses of insulating oils at very high frequencies Harald Beck *Physik Z* 34, 721 9 (1933) —The dielec losses of oils at frequencies from 10<sup>7</sup> to 10<sup>8</sup> were measured with the aid of a differential calorimeter with an accuracy of 2%. From the loss angles at these frequencies no conclusions could be drawn concerning the low frequency breakdown potential, since impurities in the oil greatly lower the latter without influencing the former. In high-potential fields purification of the oils also had no effect on the loss angle. The losses are attributed almost exclusively to mol dipoles, since curves for various kinds of insulating oils show maxima characteristics of pure dipole substances. The influence of viscosity on the max agrees qualitatively with the Debye theory. L F Steiner

Effect of lubricating oils on the spontaneous ignition temperature of motor fuels Tsuruo Araki and Saburo Otsu *J Soc Chem Ind, Japan* 36, suppl binding 589 (1933) —It was found that the spontaneous ignition temps of various gasolines were lowered by the addn of lubricating oils. Mineral oils lowered the temps more than castor oil. Karl Kammermeyer

Lubricating oils M Roger *J agr prat* 97, 319 20 (1933) —A list of the qualities of good lubricating oils and of the standard tests used to compare various oils.

J. R. Adams

**Cracking hydrocarbon oils.** Soc. anon. "Le carbone." Ger. 583,802, Sept. 9, 1933. Addn. to 540,088 (C. A. 26, 1764). The liquid or vaporized oil is passed at a raised temp. through blocks, rolls, spirals or disks of active C prep'd. from loose or woven fibers, e. g., from cotton wadding or from lamp-wick fabric.

**Apparatus for cracking hydrocarbon oils.** Panhandle Refining Co. Ger. 582,793, Aug. 23, 1933.

**Bubble tower suitable for fractionating hydrocarbon oils.** Frank W. Hall (to Texas Co.). U. S. 1,935,709, Nov. 21.

**Refining cracked hydrocarbon vapors of motor-fuel boiling-point range.** Jacque C. Morrell (to Universal Oil Products Co.). U. S. 1,935,162, Nov. 14. The vapors are passed upwardly through a descending subdivided flow of an acid refining agent such as  $H_2SO_4$  or  $H_3PO_4$  and the vapors are then passed through a tortuous path to sep. entrained reaction products and are subsequently filtered through a filtering medium contg. an alk. substance such as fuller's earth and lime. App. is described. Cf. C. A. 28, 625.

**Refining hydrocarbon oil distillates.** Jacque C. Morrell and Gustav Egloff (to Universal Oil Products Co.). U. S. 1,935,160, Nov. 14. Vapors obtained as an overhead product of motor-fuel-boiling range from an oil-cracking process are subjected in heated condition to treatment with  $SO_2$  and steam in the presence of an added metal such as Zn or Sn, Ca, Mg, Al, Cu, Pb, Hg, Co, Ni, Cr, Mn, Mo, V or W in order to remove S, gum-forming compds., etc. U. S. 1,935,161 relates to a generally similar process in which the treatment with  $SO_2$  and steam is effected in the presence of a metallic oxide such as Fe oxide. Cf. C. A. 27, 2797.

**Treating hot tarry residuum from hydrocarbon oil cracking.** George Armistead, Jr. (to Texas Co.). U. S. 1,936,283, Nov. 21. See Can. 331,532 (C. A. 27, 3810).

**Purifying crude hydrocarbon material such as gas oils or paraffin oils.** Max Harder and Wilhelm Dietrich (to I. G. Farbenind. A.-G.). U. S. 1,935,207, Nov. 14. The material is treated simultaneously with  $H_2SO_4$  and with an oxide of N at a temp. not exceeding  $30^\circ$ .

**Removing paraffin from hydrocarbon oils.** Deutsche Petroleum-A.-G. Ger. 582,646-7, Aug. 19, 1933. Paraffin is removed from hydrocarbon oils, especially lubricating oils, by thinning if necessary with easily boiling liquids such as benzene or petroleum and treating with  $H_2SO_4$  in the cold. The paraffin-acid product is then sep'd. by a centrifuge (582,646). Alternatively, the oil may be dissolved in low-boiling liquids, acidified and treated with soda or NaOH, the paraffin being removed as before by a centrifuge (582,647).

**Removing wax from admixture with oil.** Clarence A. Ward (to Standard Oil Development Co.). U. S. 1,936,181, Nov. 21. A dild. wax-contg. oil is chilled and while chilled is mixed with a finely divided granular material such as infusorial earth in the proportion of about 8-10 lb. per bbl. of material under treatment; the oil is settled while it is at a temp. of about  $-18^\circ$  to  $-13^\circ$ , the oil is withdrawn from the wax and settled granular material, and the diluent is removed from the oil.

**Separating waxes from oils.** I. G. Farbenind. A.-G. (Karl F. Goetze, Bruno Engel and Fritz Christmann, inventors). Ger. 578,505, June 14, 1933; Brit. 397,169, Aug. 14, 1933. Paraffin or wax-like substances are sep'd. from hydrocarbon oils to give refined oils for lubricating purposes, by adding a precipitant and cooling. Highly polymerized or condensed high-mol. paraffins obtained by treating hard or white paraffin are preferred as the precipitant. Derivs. of these contg. halogen, O or S are still more effective as precipitants. Examples are given.

**Purifying crude paraffin.** Hans Klein, Hans Kaehler and Hermann Zorn (to I. G. Farbenind. A.-G.). U. S. 1,936,453, Nov. 21. For purifying ppt'd. crude paraffin wax by removal of impurities comprising oils and colored asphalt-like substances, the wax is washed with a mixt. of a formate of a lower alc. such as methyl formate and an org. solvent such as a mixt. of  $C_6H_6$  and MeOH which has

greater solvent power for the asphalt-like substances than the formate.

**Oils.** Sigbert Seelig. Ger. 582,717, Aug. 21, 1933. A process is described for obtaining oils by heating distn. residues in a rotating-drum furnace without cracking the resulting vapor.

**Refining oils, etc.** Heliöder Rostin. Ger. 578,630, June 15, 1933. Oil, hydrocarbons, liquid or gaseous products of pyrogenic decompns., etc., are refined by leading them with  $H_2S$  over finely divided freshly reduced Fe. The Fe may be present with a carrier such as pumice. The Fe and  $H_2S$  may be recovered after the process by leading H or gas mixts. contg. II over the used Fe. Examples are given.

**Refining oils.** N. V. de Bataafsche Petroleum Maatschappij. Fr. 753,229, Oct. 11, 1933. Oils contg. S are purified by distg. to obtain fractions and treating the fractions separately so that the S compds. therein are converted into other S compds. having different volatilities, distg. the fractions again to remove the greater part of the S and mixing the resulting fractions freed from S. The conversion of the S compds. may be by treatment with plumbite with or without the addn. of free S, treatment with clay or fuller's earth in the vapor phase, treatment with  $H_2SO_4$  or with nascent H. It is not always necessary to so treat all the fractions, and those of lowest b. p. may be treated only with NaOH lye.

**Mineral oils.** Texaco Development Corp. Fr. 752,104, Sept. 16, 1933. The constituents of low viscosity index are sep'd. from fractions of lubricating oils contg. paraffin without previous removal of paraffin by submitting the oil to an extn. by means of furlurol at about  $52-93^\circ$ . The extd. matter is eliminated without appreciable cooling of the oil.

**Refining mineral oils.** Standard Oil Co. Ger. 575,610, Apr. 29, 1933. Mineral lubricating oils are refined by treatment with an acid such as  $H_2SO_4$ . After such treatment and before neutralization the oil is treated in one or more stages with dehydrated  $AlCl_3$  to remove acids sol. in the oil. The oil is then sep'd. from the  $AlCl_3$  sludge and the acid removed.

**Solidified mineral oils.** Eduard O. Ornfeldt. Fr. 752,368, Sept. 21, 1933. Mineral oils, such as petroleum, etc., are dispersed in the presence of small amts. of soap preferably mixed with org. solvents, such as EtOH, with small amts. of beeswax or constituents of this wax; a part of the beeswax may be replaced by paraffin, etc.

**Mineral oil distillation.** Arthur E. Pew, Jr., and Henry Thomas (to Sun Oil Co.). U. S. 1,935,953, Nov. 21. A stream of oil is flowed through a series of vaporizers maintained under low subatm. pressure so that a rapid flow of a substantially unbroken thin sheet of oil passes over the floor of each vaporizer; partial vaporization of the oil is effected by heat interchange with and condensation of Hg vapor, and the oil vapors, after they leave the surface of the liquid oil, are maintained out of heat-exchange relation with the heating medium. App. is described.

**Mining oil sands.** Wm. C. Laughlin (to Filtration Equipment Corp.). U. S. 1,935,643, Nov. 21. A tunnel is formed below a bed of the sands, heat and water are applied to the sands from various points in the tunnel and the sands and oil are caused to flow into the tunnel, and are there disintegrated and pumped to a sepn. plant at some distance. App. is described.

**Return bend fitting for oil stills.** Fred C. Fantz. U. S. 1,936,386, Nov. 21. Structural details.

**Return bend for oil-cracking tubes.** Herbert C. Stockham (to Fred C. Fantz). U. S. 1,935,233, Nov. 14. Mech. features.

**Pipe-coil system suitable for heating oil in cracking furnaces.** Donald J. Bergman (to Universal Oil Products Co.). U. S. 1,936,284, Nov. 21. Structural details.

**Motor fuel.** N. V. de Bataafsche Petroleum Maatschappij. Ger. 582,718, Aug. 21, 1933. See Fr. 742,957 (C. A. 27, 3812).

**Cracked gasoline.** Charles P. Wilson, Jr. (to Texas Co.). U. S. 1,935,967, Nov. 21. For the production of cracked gasoline of good stability, oil such as gas oil or the

like is cracked in a cracking zone in which sepn. of vapors from liquid takes place and high superatm. pressure is maintained on the vapors during their sepn.; sepd. vapors are cooled to a temp. below an active cracking temp. and are digested in a polymerizing chamber in the absence of a solid adsorptive contact material, at an elevated temp. below the cracking temp. and under superatm. pressure to effect polymerization of unstable compds. of potential gum-forming character and the polymerization products are sepd. from the stabilized gasoline, as by rectification. App. is described.

**Lubricating oils.** Standard Oil Development Co. Ger. 582,853, Aug. 24, 1933. A prepn. for lowering the pour pt. of lubricating oils is obtained by condensing hard or soft paraffin and removing the undesired constituents by a selective solvent. Thus, kerosene is condensed by the aid of  $AlCl_3$  and extd. with amyl alc. to remove the constituents which do not lower the pour point of oils.

**Lubricating oils.** Gulf Refining Co. Fr. 751,640, Sept. 7, 1933. Refined lubricating oils are obtained by mixing non-filterable distillates contg. wax, and which do not lend themselves to centrifuging, with distn. residues capable of modifying the wax. The proportion of distillates to residues is controlled according to their viscosities, so as to obtain a mixt. capable of being freed from its wax by centrifuging. The percentage of residues is between the values  $(65-5.6\sqrt{V-50})$  and  $(85-5.6\sqrt{V-50})$ ,  $V$  being the viscosity of the distillates. The distillates and residues may be derived from different crude oils, the residues being derived from oil contg. relatively less asphaltic impurities.

**Lubricating oils.** C. C. Wakefield & Co. Ltd. Fr. 752,113, Sept. 16, 1933. A lubricant for bearings comprises a vegetable oil such as castor oil, and a small amt. of an org. compd. of Sn or metallurgical Sn, e. g., Sn iodide of Sn. An org. compd. of Pb, such as  $Et_4Pb$  or Pb oleate, may also be present.

**Apparatus for reclaiming used lubricating oil.** Joseph G. Sarvent. U. S. 1,936,033, Nov. 21. Various details are described of an app. comprising a retort in the upper portion of which air inlets are provided, fans and an atomizing disk also being provided which are mounted on a single shaft for simultaneous rotation and serve to facilitate sepn. of water vapors, etc.

**Multiple-layer filter for used lubricating oil, etc.** Wellington I. Clayes. Ger. 587,222, Oct. 31, 1933. This corresponds to Brit. 382,001 (C. A. 27, 4072).

**Asphalt.** Richard Lichtenstern. Ger. 578,934, June 19, 1933. The elasticity of asphalt masses is improved by adding Chinese wood oil and a condensing agent such as  $FeCl_3$  or  $AlCl_3$ .

**Asphalts.** Standard Oil Development Co. Fr. 753,036, Oct. 5, 1933. Asphalt is composed of a mixt. of asphaltic residues from the distn. of petroleum oil and an ext. obtained by extn. of the high-boiling fractions of petroleum oil. The extn. is made with a solvent such as  $PhOH$ ,  $SO_2$ , or furfural.

**Emulsifying apparatus suitable for preparing bituminous emulsions, etc.** Frederick O. W. Loomis and Daniel M. Loomis. U. S. 1,935,884, Nov. 21. Various structural, mech. and operative details are described.

**Bituminous masses.** Deutsche Asphalt-A.-G. der Linmer und Vorwöhrer Grubenfelder (Hans Wirth, inventor). Ger. 582,676, Aug. 19, 1933. Colored masses are prepd. by mixing clear bitumen such as steam pitch with asphalt-limestone meal and org. coloring matter of the type known as lime-coloring.

**Bitumen.** Cuthbert H. Grimshaw. Ger. 582,608, Aug. 17, 1933. Bitumen emulsions are colored by mixing them with org. dyes and white clay. An emulsifying agent may also be present.

**Retention of kaolin in print-paper.** I. G. Kulev. *Bumashnaya Prom.* 12, No. 7, 22 39(1933). -The discussion of the processing methods for addn. and retention of kaolin in print paper is based on general factory practice and the literature on the subject.

**Flax waste for production of cardboard.** L. Evin and N. Dovgalyuk. *Bumashnaya Prom.* 12, No. 7, 457 (1933). -A good grade of cardboard was obtained from flax waste by cooking with 3 pts. of 10%  $CaO$  at a pressure of 3-4 atm., and with a mixt. of 4%  $NaOH$  and 10%  $CaO$  at 100°.

**Bagasse.** 111. Hemicellulose (Hachihama) 28. Sugar from wood (Bergius) 28. Bagasse utilization [production of cellulose] (Honig) 28. Treating sulfite liquor (U. S. pat. 1,936,250) 13.

**Vogel, W.:** Die Herstellung und Untersuchung der Sulfitzellulose Extrakte sowie ihre Anwendung in der Gerberei. Freiburg i. Sa.: Verlagsanstalt E. Mauckisch. 72 pp. Reviewed in *J. Intern. Soc. Leather Trades Chem.* 17, 707(1933).

**Cellulose.** Wolff & Co. Komm.-Ges. auf Aktien and

## 25- CELLULOSE AND PAPER

CARLETON F. CURRAN

**Oxycellulose.** Karl H. Bergmann. *Angew. Chem.* 46, 713 16(1933). -A reliable method for the detn. of oxy-cellulose is given and an attempt is made to define it chemically. Oxycellulose prepd. with (1)  $KClO_4$  and  $HCl$ , (2)  $NaOCl$  (acid and alk.), (3)  $Br$  and lime, (4)  $H_2O_2$ , (5)  $HNO_3$  and (6)  $KMnO_4$  (acid and alk.) were investigated by dissolving the oxycellulose from the fiber by means of boiling alkali and also by treatment in the cold. The hot treatment gave 0.1-0.3% yield of a product analyzing  $(C_6H_6O_6)$  and cold treatment gave 2-3% of presumably polyglucuronic acid  $(C_6H_6O_7)_x$ . Considerable exptl. data are presented. Nine references.

**Studies on iodine colorimetry of cellulose dextrins and the foundation of an iodocolorimetric method for determining cellulose.** Lauri Paloheimo and Viljo Valavaara. *Biochem. Z.* 266, 301 22(1933). -The cellulose dextrins obtained by means of 70%  $H_2SO_4$  are colored an intense red upon the addn. of a  $KI-I_2$  soln. By dilg. the acid concn. to 50% the hydrolysis may be stopped and the soln. examd. photometrically. The celluloses of different origins are equiv. to each other colorimetrically. By preliminary alkali treatment of cellulose most of the non-cellulose substances which are sol. in the 70%  $H_2SO_4$  can be removed without affecting the cellulose itself.

**Ultra-violet light and nitrocellulose films.** A. Kraus. *Farbe u. Lack* 1933, 545-6, 556-8. -Expts. were made to clarify the relations among effects of ultra-violet light upon plasticizers, nitrocellulose and films contg. them. The following detns. were made either on the plasticizers, on films contg. nitrocellulose and plasticizers or on both: yellowing,  $n$ , acid no., acetone-insol. matter, alc.-sol. matter, N content, tensile strength, distensibility. No simple relation exists among these properties.

G. G. Sward

Richard Weingand. Ger. 582,795, Aug. 23, 1933. Foils of regenerated cellulose or of cellulose compds. are prevented from cracking when stored by a thin coating of wax or wax-like substance without solvent.

**Cellulose.** Papeteries Navarre (Soc. anon.). Fr. 42,741, Sept. 14, 1933. Addn. to 750,032 (C. A. 28, No. 2). The invention is extended to cover the cellulose itself treated by the sizing process of Fr. 750,032.

**Cellulose.** The Mathieson Alkali Works. Fr. 753,037, Oct. 5, 1933. Fibrous cellulose is treated to swell, parchmentize or gelatinize the fibers, by submitting it to the action of one or more sol. salts of the group Na, K or NH<sub>4</sub>, e. g., NaI, NaNO<sub>3</sub>, NH<sub>4</sub>NO<sub>3</sub> or KI, dissolved in aq. NH<sub>3</sub>, and limiting the concn. and duration of the treatment to avoid complete dispersion of the cellulose.

**Cellulose solutions.** Emil Scheller. U. S. 1,936,483, Nov. 21. Solns. suitable for rayon manuf. are prepd. by dissolving cellulose in a suitable solvent such as cuprammonium soln. or a caustic alkali-CS<sub>2</sub> viscose-producing mixt. in the presence of a definite quantity of O predetd. in accord with the desired viscosity.

**Centrifugal apparatus for refining cellulose.** Aleksander Lampén. Ger. 587,088, Oct. 30, 1933.

**Alkali cellulose.** Franz Steinmigg. Fr. 751,617, Sept. 7, 1933. Alkali cellulose for manuf. of viscose is prepd. and ripened by passing cellulose in the form of a ribbon or thin band from a roll through a mercerizing lye, freeing it from excess lye by pressing rollers and passing it immediately, still in the form of ribbon, into a ripening chamber. The temp. of the ripening chamber is preferably 40°.

**Cellulose capsules.** Chemische Fabrik von Heyden A.-G. Ger. 578,642, June 16, 1933. These are prepd. by dipping molds into viscose in its most viscous condition. The covered molds are then plunged into a pptg. liquid consisting of a neutral or weakly acid salt bath, e. g., AcONH<sub>4</sub> and AcONa, or Na<sub>2</sub>SO<sub>4</sub> and (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> at 20-40°.

**Porous cellulose articles.** C. F. Burgess Laboratories, Inc. Ger. 577,656, June 2, 1933. See Brit. 317,330 (C. A. 24, 2296).

**Hydrolyzing cellulose.** Henry Dreyfus. Fr. 750,495, Aug. 11, 1933. Cellulose is hydrolyzed by a soln. of a salt having an acid character or an acid salt, e. g., a bisulfate, or sulfate of Cu, sulfate of Ni or Al or ZnCl<sub>2</sub>.

**Hydrolysis of pentosans.** Roland Runkel. Ger. 576,498, May 11, 1933. Addn. to 574,921 (C. A. 27, 4670). In hydrolyzing vegetable matter rich in pentosans by the method of 574,921, the hydrolysis is carried out in diffusion batteries under raised pressure.

**Hydroxyalkylcellulose.** Henry Dreyfus. Brit. 397,116, Aug. 14, 1933. Cellulose is caused to react with a hydroxyalkylating agent in the presence of a primary or secondary org. base contg. at least 1 alkyl, aralkyl or alicyclic radical free from OH groups. The org. base may be replaced by its reaction product with alkylene oxide or chlorohydrin, e. g., oxyethylmethylamine, oxyethylethylamine. Etherifying agents specified are ethylene oxide (I), propylene oxide (II), butylene oxide, epichlorohydrin, glycidic acid. In examples cotton linters are (1) heated in an autoclave with I in presence of Et<sub>2</sub>NH, (2) moistened with PrNH<sub>2</sub> and treated with I under pressure and (3) heated with oxypropylmethylamine and an excess of II. The products may be used as sizes or further esterified or otherwise etherified to produce products for use in the manuf. of filaments, films, plastics or varnishes.

**Cellulose derivatives.** Zellstoffabrik Waldhof and Otto Faust. Brit. 397,404, Aug. 24, 1933. Cellulose esters and ethers for use in the prepn. of plastic masses, foils, varnishes, etc., are prepd. from a soda or sulfate pulp made from a single kind of wood which has been sorted to eliminate all pieces of other species. The esters and ethers so obtained give bright colored transparent products. Examples are given of the prepn. of (1) cellulose acetate to be worked up, after ripening to give Me<sub>2</sub>CO soly., into foils with the use of methylglycol and plasticizer and into varnishes with the aid of Me<sub>2</sub>CO, methylglycol, BuOH and

plasticizer and (2) nitrocellulose to be worked up into plates with the aid of BuOAc and camphor.

**Cellulose ethers.** Henry Dreyfus. Brit. 397,117, Aug. 14, 1933. See Fr. 749,401 (C. A. 28, 636°).

**Cellulose ethers.** "Châtillon" Società anon. italiana per la seta artificiale. Austrian 134,991, Oct. 25, 1933. Alkali cellulose is treated with an alkyl or aralkyl halide or sulfate in the presence of caustic alkali, water and a water-insol. org. solvent, e. g., benzene. The concn. of caustic alkali in the reaction mixt. is increased as the reaction proceeds by distg. off an azeotropic mixt. of water and org. solvent. The solvent may be condensed and returned to the mixt. The method is particularly useful in prepg. benzylcellulose. App. is described.

**Cellulose ether.** I. G. Farbeund. A.-G. (Otto Leuchs, inventor). Ger. 582,726, Aug. 21, 1933. Ethers insol. or sol. with difficulty are converted to easily sol. form by treatment with degradation or hydrolyzing agents with or without addn. of solvents or swelling agents. Thus, ethylcellulose is treated with concd. H<sub>2</sub>SO<sub>4</sub> in the presence of alc. and water to give a swelled sol. mass.

**Cellulose ester and ether compositions.** Henry Dreyfus. Brit. 397,191, Aug. 21, 1933. In producing plastic masses, molding powders and other (semi-) solid compns. contg. cellulose esters or ethers, plasticizers or other materials are incorporated by means of media contg. methylene ethylene ether (I). Thus the plasticizer may be dissolved in I or a mixt. of I with another solvent or non-solvent, the soln. sprayed or otherwise incorporated with the cellulose deriv. and the mass worked up in the usual manner. In an example a soln. comprising tricresyl phosphate, mono-methylated isomeric xylene sulfonamides, I, C<sub>6</sub>H<sub>5</sub> and alc. is incorporated with Me<sub>2</sub>CO-sol. cellulose acetate or cellulose acetate of 58-60% Ac content and the mass molded into sheets, plates, etc.

**Esterifying cellulose.** Ruth-Aldo Co. Inc. Ger. 578,706, June 16, 1933. See Brit. 282,793 (C. A. 22, 3988).

**Mixed cellulose esters.** Kodak A.-G. Ger. 577,704, June 7, 1933. See Brit. 360,058 and 360,417 (C. A. 27, 600, 1167).

**Cellulose acetate.** Henry Dreyfus. U. S. 1,936,180, Nov. 21. Cellulose is pretreated with formic acid and then acetylated with Ac<sub>2</sub>O in the presence of pentachlorides of congeners of N such as SbCl<sub>5</sub> or PCl<sub>5</sub> and of HCl, each present in a proportion of about 5-15% the wt. of the cellulose.

**Cellulose acetate compositions.** Kodak A.-G. Ger. 587,240, Nov. 1, 1933. See Brit. 342,444 (C. A. 25, 4421).

**Partly hydrolyzed cellulose acetate.** Kodak A.-G. Ger. 579,652, July 1, 1933. See Brit. 356,012 (C. A. 26, 5753).

**Dehydrating cellulose nitrate and other nitrated compounds.** N. V. de Bataafsche Petroleum Maatschappij. Brit. 397,309, Aug. 24, 1933. See Fr. 743,520 (C. A. 27, 3819-20).

**Saccharification of wood, etc.** Henry Dreyfus. U. S. 1,936,190, Nov. 21. Cellulosic material such as sawdust is treated with an org. acid anhydride such as Ac<sub>2</sub>O and hydrolyzed, one or more stages of treatment being under such conditions as to degrade the cellulose material to sugars.

**Carbohydrate derivatives.** Henry Dreyfus. Fr. 750,493, Aug. 11, 1933. Derivs. of cellulose and other carbohydrates are made by causing unsatd. org. compds. such as C<sub>2</sub>H<sub>4</sub> to act thereon. A catalyst may be used and the reaction may be carried out under pressure and at 100-200°.

**Viscose products.** H. Th. Bohme A.-G. Chemische Fabrik, and Heinrich Bertsch. Ger. 582,900, Aug. 25, 1933. The properties of viscose rayon films, etc., are improved by adding the sulfonation products of oils and fats in the presence of acid chlorides or anhydrides. Examples are given.

**Colored filaments, etc., from viscose.** Courtaulds Ltd. Ger. 587,224, Oct. 31, 1933. See Brit. 342,606 (C. A. 25, 5578).

**Rayon from viscose.** Theodoor Koch (to American

Enka Corp.). U. S. 1,886,479, Nov. 21. At any stage in the viscose production before normal ripening has taken place there is added to the viscose a small proportion (suitably about 0.05-2%) of a sulfonated fatty acid with a sulfonation degree of about 100% and contg. so small a quantity of unsulfonated fat or fatty acid that the viscose shows no turbidity with an excess of lye. The unripened treated viscose is spun in an acid pptg. bath. Cf. C. A. 27, 5530.

**Cellulose fiber of low viscosity** George A. Richter (to Brown Co.). U. S. 1,935,129, Nov. 14. A product which is suitable for viscose manuf., etc. is prepd. by treating cellulose fiber such as refined wood fiber or cotton with a soln. contg. NaOH and a sol. permanganate under non-mercerizing temp. conditions, and then under mercerizing temp. conditions.

**Artificial fibers.** Soc. Nobel française. Fr. 751,824, Sept. 11, 1933. Condensation products of polyvinyl alc. with aliphatic aldehydes are spun into threads by a wet or dry process.

**Creped threads.** Henry Dreyfus. Fr. 751,822, Sept. 11, 1933. Creped threads of high torsion are composed of unsapond. filaments and sapond. filaments of cellulose ester. The degree of sapon. corresponds to a loss of 10-30% of the wt. in the case of cellulose acetate and a corresponding amt. for other esters. The sapond. filaments may be 25-75% of the thread. Cf. C. A. 27, 1769.

**Films, threads, etc.** Henry Dreyfus. Fr. 749,792, July 29, 1933. Halogenated cyclic dicarboxylic acids, their anhydrides or esters, e. g., the diethyl ester of 3,5-dichlorophthalic acid, 3'-chlorobenzophenone-2,4'-dicarboxylic acid, are used as softening or plasticizing agents or solvents for cellulose derivs. in the manuf. of products therefrom.

**Artificial filaments from cellulose organic derivatives such as cellulose acetate.** Henry Dreyfus and Wm. I. Taylor (to Celanese Corp. of America). U. S. 1,935,203, Nov. 14. A soln. such as one comprising cellulose acetate is extruded in filament form into an evaporative medium and (by a special described app.) the filaments are stretched over only a portion of their length in which they are in a semi-solid condition. Cf. C. A. 27, 3331.

**Extrusion device for manufacture of artificial threads or filaments.** Joshua Bower (to Celanese Corp. of America). U. S. 1,935,200, Nov. 14. Mech. details including an automatic cut-off valve are described.

**Films, sheets, etc.** Henry Dreyfus. Fr. 749,914, Aug. 1, 1933. Films, etc., are made from artificial products contg. lower and higher fatty acid derivs. of cellulose, e. g., cellulose acetate and cellulose palmitate.

**Artificial ribbons, etc.** Henry Dreyfus. Fr. 752,271, Sept. 20, 1933. Flattened products of thick cross section are obtained by uniting a series of continuous long filaments, e. g., of cellulose acetate, in the form of a flattened thread composed of individual filaments and passing this thread into contact with one or more surfaces to distribute on the thread a liquid having a softening action. An app. is described.

**Artificial ribbon, foil, etc.** Soc. pour la fabrication de la soie "Rhodaseta." Fr. 751,828, Sept. 11, 1933. Hair, ribbon and foil are made from a bundle or sheet of cellulose ester filaments particularly the acetate, the bundle or sheet being caused to pass by the entraining means as soon as possible after being wetted by a solvent or swelling agent, and before the filaments have become plasticized, swollen or sticky.

**Apparatus for dry spinning artificial filaments, etc.** British Celanese Ltd., Edward Kinsella and Reginald H. J. Riley. Brit. 397,114, Aug. 10, 1933.

**Apparatus for spinning rayon.** Breda Visada Ltd. Ger. 582,999, Aug. 30, 1933.

**Spinning centrifuge for rayon.** N. V. Intern. Spinpot Exploitatie Maatschappij (I. S. E. M.). Ger. 587,223, Nov. 1, 1933.

**Apparatus for continuously spinning rayon.** Industrial Rayon Corp. Fr. 751,941, Sept. 12, 1933.

**Apparatus for spinning and after-treating rayon.**

**Barmer Maschinenfabrik A.-G.** Ger. 582,107, Aug. 9, 1933. Addn. to 572,706 (C. A. 27, 4398).

**Apparatus for spinning cuprammonium rayon.** Seta Bemberg S. A. Ger. 579,171, June 23, 1933. Addn. to 577,726 (C. A. 28, 639<sup>4</sup>).

**Rayon.** Hans Altwegg. Ger. 582,855, Aug. 24, 1933. Cellulose acetate rayon is spun in a soln. contg. more than 20% of amyl ketone or its homologs. Examples are given.

**Rayon.** I. G. Farbenind. A.-G. Fr. 751,728, Sept. 8, 1933. Rayon is washed free from acid, dried, twisted and wound on bobbins of variable diams. and treating liquids are applied by sprinkling.

**Rayon.** Giuseppe Salimei. Fr. 753,290, Oct. 12, 1933. Filaments are obtained in the form of spindles of any desired length by the application of pulsations of regulated frequency and length to the spinning soln.

**Rayon.** Henry Dreyfus. Fr. 42,662, Sept. 1, 1933. Addn. to 702,174. Rayon of diminished luster is obtained by spinning a soln. of cellulose or cellulose deriv. contg. a practically white condensation product of the ketone-aldehyde type. The product may be obtained by condensing 1 mol. of acetone with 6 mols. of CH<sub>2</sub>O in the presence of aq. NaOH.

**Rayon.** Henry Dreyfus. Fr. 752,143, Sept. 16, 1933. In dry spinning the evapp. agent is caused to pass through the mass of spinning soln. to temper it in its path toward the spinning nozzles. An app. is described.

**Rayon, etc.** Henry Dreyfus. Fr. 750,549, Aug. 11, 1933. Rayon and textiles made therefrom having a high tenacity and affinity for cotton dyes are obtained by submitting to sapon. filaments of cellulose acetate or other org. esters of cellulose which have been submitted to a drawing with the aid of softening agents. Fr. 750,550.

**Filaments, etc., having a relatively high tenacity and affinity for cotton dyes are obtained by submitting to sapon. filaments, etc., made from org. esters of cellulose of high viscosity, particularly cellulose acetates the viscosity of which (measured by the speed of flow of a 6% soln. in acetone) is above 30 when compared with a standard of glycerol (viscosity equal to 100).** Fr. 750,551, Aug. 12, 1933. Cellulose acetate and other esters of cellulose are sapond. by treating them with an agent contg. a sapon. agent and another alk. reagent of lower alkalinity, e. g., NaOH and CaO. Fr. 750,552. In making filaments, etc., from artificial materials, finely divided insol. substances are incorporated therein by means of an agent in which they are insol. or by incorporating a substance in the spinning soln., the products being afterwards treated with a reagent which will convert such substance to its final form. Examples are given of the formation in the filaments of phosphates of Sn and Zn and of BaSO<sub>4</sub>. Cf. C. A. 28, 639<sup>1,2,3</sup>, 640<sup>1</sup>.

**Rayon, etc.** Soc. pour la fabrication de la soie "Rhodiaseta." Fr. 751,893, Sept. 11, 1933. Rayon filaments having very different titers, particularly filaments of 1-3 deniers and filaments of 12-15 deniers, are spun in the same manner as natural fibers. The products have a hairy or swollen aspect.

**Apparatus for denitrating in rayon' manufacture.** George Juer (to Tubize Chatillon Corp.). U. S. 1,935,637, Nov. 21. Various details are described of an app. in which material such as nitrocellulose is supported on a porous medium such as a perforated false bottom of a vat while immersed in liquid such as denitrating soln. which is artificially cooled and circulated.

**Device for distributing wood chips in pulp digesters.** Walter H. Swanson (to Paper Patents Co.). U. S. 1,936,341, Nov. 21. Mech. features.

**Apparatus for straining aqueous suspensions of wood pulp, etc.** Firma J. M. Voith. Ger. 587,011, Oct. 28, 1933.

**Pulping raw fibrous materials.** George A. Richter (to Brown Co.). U. S. 1,935,728, Nov. 21. Raw material such as manila, sisal or ramie is treated with an oxidizing reagent such as Cl water and hypochlorite liquor; the material is then pulped in a Na sulfite liquor. Cf. C. A. 27, 3077.

**Device for regulating the density of pulp in paper making.** Franz Hassmann. Ger. 578,549, June 15, 1933.

**Dyeing paper or pulp.** Soc. pour l'ind. chim. à Bâle. Brit. 396,992, Aug. 17, 1933. Dyeings or printings fast to  $H_2O$  are produced on paper (pulp) by treating, either simultaneously or separately, with a  $H_2O$ -sol. dye contg. 1 or more  $HSO_3$  and (or)  $COOH$  groups and a  $H_2O$ -sol. salt of a compd. that contains at least 1 basic N and an aliphatic satd. residue comprising at least 10 C atoms (other than a salt of an unsym. mono- or di-acylated diamine or a corresponding quaternary  $NH_4$  compd.). In examples (1) paper half-stuff is dyed vivid green by treating with Benzyl Green B and then with a soln. of the stearic acid ester of oxyethylpyridinium chloride and (2) tissue paper is dyed with Direct Safranin B or Kiton Blue A and treated in a bath contg. octadecyltrimethylammonium methosulfate.

**Paper.** Wm. E. Bair, Jr. (to The Mead Corp.). Brit. 396,063, July 26, 1933. See U. S. 1,875,208 (C. A. 26, 6138).

**Paper.** Harry H. Nelson and Guillaume Becker. Fr. 42,723, Sept. 14, 1933. Addn. to 735,525 (C. A. 27, 1174). The cellulose thiosulfocarbonate is pptd. on the fibers in a non-coagulated sol. form by means, e. g., of a soln. of  $NaCl$ ,  $Na_2SO_4$  or  $NH_4Cl$ . The alkali cellulose for the manuf. of the thiosulfocarbonate is made at a low temp. The  $NaOH$  is made at a concn. higher than that required and dild. by the addn. of ice to obtain the soln. at a low temp. A small amt. of resin soap or castor-oil soap is added to the thiosulfocarbonate.

**Clarifier for paper manufacture, etc.** August H. Popp. Ger. 577,239, May 26, 1933. Addn. to 561,892 (C. A. 27, 1231).

**Hollander for paper making.** Anton D. J. Kuhn. Ger. 578,522, June 15, 1933.

**Water-extracting apparatus for cylinder paper machines.** Charles L. Ellis (to Downingtown Mfg. Co.). U. S. 1,935,837, Nov. 21. Structural and mech. features.

**Indicating weight and moisture variations in webs in paper-making apparatus.** Arthur E. Broughton. U. S. 1,936,225, Nov. 21. Various details of app. and operation are described.

**Sizing paper.** Antoine C. Gillet. Fr. 741,876, Sept. 11, 1933. A stable suspension of colloidal resin in the presence of a basic resinat (of  $Na$ ,  $K$  or  $NH_4$ ) or an acid salt, e. g.,  $Al_2(SO_4)_3$  is used for sizing or waterproofing paper. The resin is ground in the presence of the solvent which is used in amt. such that the mixt. forms a paste at ordinary temp. Fr. 751,877 describes a pulverizing app. for obtaining emulsions of resin for sizing paper. Cf. C. A. 28, 614<sup>2</sup>.

**Porous paper for the suction bags of vacuum cleaners.** Air-Way Electric Appliance Corp. Brit. 396,142, Aug. 3, 1933. See U. S. 1,854,427 (C. A. 26, 3378).

**Transparent grease- and moisture-proof sheet material**

**suitable for making transparent bags.** Chester E. Beecher (to Glassine Paper Co.). U. S. 1,936,375, Nov. 21. Supercalendered sheets of greaseproof paper are joined by an intermediate film of wax substantially confined to the inner faces of the sheets.

**Apparatus for coating or impregnating paper with regenerated cellulose.** Papeteries Navarre Soc. anon. Ger. 587,012, Oct. 28, 1933. This corresponds to Brit. 395,197 (C. A. 28, 324<sup>3</sup>).

**Vulcanized fiber.** Ernst Becker and Karl Letters (to I. G. Farbenind. A.-G.). U. S. 1,935,892, Nov. 21. Paper is parchmentized with a  $ZnCl_2$  soln. contg. up to about 3% of an alkali metal or alk. earth metal chloride or  $NH_4Cl$ , which serves to regulate the sp. gr. of the product.

**Applying mineral coating compositions to paper.** Donald H. Bradner (to Champion Coated Paper Co.). U. S. 1,936,286, Nov. 21. Various details of operation are described for producing a uniform smooth homogeneous coating. Cf. C. A. 28, 644<sup>7</sup>.

**Safety paper.** Felix Schoeller & Bausch Feinpapierfabrik (Victor Bausch, Jr. and Adolf Schroth, inventors). Ger. 582,530, Aug. 16, 1933. In the manuf. of safety paper by using benzene- or naphthalenecarboxylic acids or their derivs., compds. such as  $Fe_2O_3$  salts and ferrocyanides sol. in acids but insol. in water are added to the pulp. The pulp is given a  $pH$  value of 3-5 before addn. of the carboxylic acids. The  $pH$  value of the latter may be about 3.

**Waterproofing paper.** Manifattura italiana carte e affini (Soc. anon.). Fr. 753,158, Oct. 9, 1933. Paper for making containers for food products is treated with colloidal solns. which have been purified by treatment with wood charcoal, alkali bromides and gelatins. The compn. may contain nitrocellulose in scales, denatured alc. and solvents for the nitrocellulose.

**Waterproofing paper or cardboard.** Benno R. Ruiss. Austrian 134,997, Oct. 25, 1933. An emulsion of wax in wax-soap soln. is prepd. by heating a wax such as Japan wax with an appropriate amt. of an alkali carbonate or like saponif. agent. The emulsion is treated with  $Al_2(SO_4)_3$  and then added to paper or cardboard stuff at 80-95°.

**Playing-cards.** François du Pour. Brit. 396,254, Aug. 3, 1933. The cards are made by coating a sheet of paper or cardboard bearing the card figures with a compn. comprising at least 1 cellulose ester or ether, e. g., the nitrate, acetate or ethylate, and filling, coloring or plasticizing substances. The cellulose compd. may be applied as a soln. in  $Me_2CO$ ,  $AmOAc$ ,  $BuOH$ ,  $Et_2O$ , etc., to which may be added filling and glazing materials (e. g., resin), plasticizers (e. g., camphor, triacetin, tricresylphosphate, palatinol, sipalin, castor oil, linseed oil), dilg. liquids (having no solvent action on the cellulose esters or ethers (e. g., gasoline,  $C_6H_6$ ,  $EtOH$ , etc.)) The slippery quality is increased by adding Japan wax, montan wax, carinauba, etc., in colloidal state or in soln.

## 24 EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNKER AND C. G. STORM

**Verification of the law of combustion of colloidal powder.** H. Muraour and G. Aunis. *Compt. rend.* 197, 1117 20 (1933). - Values for the speed of combustion of a double-base smokeless powder (non-solvent type) at pressures up to 1508 kg./sq. cm., based on a series of experimental firings in a 150 cc. pressure bomb, are compared with values calcd. by 3 different methods. C. G. Storm

**The causes of the progressive disappearance of diphenylamine in colloidal powders.** Henri Muraour. *Compt. rend.* 197, 758 40(1933). - Diphenylamine acts as a reducing agent on nitric esters. Cu salts catalyze this reaction. Chlorides of the alkalis and alk. earths reinforce the effect of the Cu salts, but org. salts (oxalates and tartrates) retard the action. Salts of Cu and chlorides also favor the denitration of guncotton by alc. sym. Diethylphenylurea is as useful as diphenylamine in stabilizing nitrocellulose. P. R. Brown

**Analogs of tetryl. I. Trinitrophenylnitraminoethyl nitrate (Pentryl).** LeRoy V. Clark. *Ind. Eng. Chem.* 25, 1385 90(1933). - C. has investigated various chem., phys. and explosive properties of "Pentryl." This explosive is particularly effective as a base charge in compound detonators. It is comparable with tetryl in most of its explosive properties. C. G. Storm

**Mechanical effects observed in the rapid overheating of lead azide in a vacuum.** W. Schumacher. *Compt. rend.* 197, 917-18(1933). - When heated rapidly on a metal plate in a vacuum,  $PbN_3$  detonated, causing indentation or penetration of the plate. Similar effects were obtained with  $AgONC$ , whereas  $Hg(ONC)$ , invariably decompd. without detonation and with no effect on the plate, even of 0.03 mm. thickness. C. G. Storm

**Theory of explosive reactions.** Henri Muraour. *Rev. gen. sci.* 44, 567 71(1933). - An excellent résumé and

elaboration of theories of combustion and detonation of explosives previously advanced by M. (cf. C. A. 21, 1185, 2086; 22, 3992; 25, 2293; 26, 2057; 27, 603, 3334, 5189, 5540). C. G. Storm

**Experimental study of the influence of certain factors on the ability of dust deposits to propagate explosions.** Etienne Audibert and Louis Delmas. *Ann. mines* [13], 4, 89-125 (1933).—Using a cylindrical steel explosion gallery 1.8 m. diam.  $\times$  150 m. long, the authors conducted an extensive series of expts. to study the effects of variations in content of volatile matter in coal dust, and in the fineness of the dust, on the ability of the latter to propagate explosions initiated by means of a charge of black powder. C. G. Storm

**The application of ammonite in the coal industry.** F. A. Pershakov. *Ugol i Zhelazo* 1933, No. 90-91, 94-104.—Tests of various ammonites show a rate of explosion of about 3000-4000 m./sec. as compared to 5000 for 63% dynamite. The strength is about 50-60%, and the cost under Soviet conditions is about 60% that of 63% dynamite. H. W. Rathmann

**Explosive combustion of gaseous hydrocarbons** (Francis) 21.

**Device for ascertaining the presence of, and estimating the amount of, explosible gases or vapors in mines.** Henry T. Ringrose. *Ger.* 578,931, June 19, 1933.

**Apparatus for indicating the presence of inflammable vapors or gases.** Henry T. Ringrose. *Ger.* 582,618, Aug. 18, 1933.

**Blasting cartridges.** Alexander C. Scott. *Brit.* 397,203, Aug. 24, 1933. The cartridge comprises in combination a pressure-resistant but rupturable container in which is placed a quantity of non-explosive salt, decomposable by heat to yield non-inflammable decompn. products, and a heating element consisting of a self-combustible mixt., inadequate by its own combustion to burst the container, with means to ignite the same so that the salt may be decompd. and the container ruptured. In an example the salt is  $\text{NH}_4\text{NO}_3$ , to which  $\text{NH}_4\text{Cl}$ ,  $\text{NaCl}$ ,  $(\text{NH}_4)_2\text{C}_2\text{O}_4$ ,  $\text{NaHCO}_3$ ,  $\text{ZnSO}_4$ ,  $\text{MgSO}_4$ , or  $\text{Na}_2\text{SO}_4$  may be added. From 1 to 2% asbestos may be mixed therewith to prevent binding and recrystn. The heating element may be black powder or a mixt. of  $\text{KClO}_4$  or  $\text{KClO}_3$  with a fuel, e. g., cellulose acetate.

**Blasting charges.** Air liquide L' (Soc. anon. pour l'etude et l'exploitation des procédés Georges Claude). *Fr.* 752,086, Sept. 15, 1933. Liquefied or solidified gases used as blasting charges for mines are rapidly evapd. by a heating compn. composed of oxygenated mineral compds. and combustible fatty substances, e. g.,  $\text{KClO}_3$  90 and paraffin 10%.

**Chemical time fuse.** Otto Treichel and Ludwig Flörshcim. *Ger.* 582,783, Aug. 22, 1933. The components of an explosive mixt. are kept apart till one or other passes a capillary filter.

**Pyrotechnical devices somewhat similar to "sparklers."** Milton M. Adler. U. S. 1,936,221, Nov. 21. A compn. formed of  $\text{Ba}(\text{NO}_3)_2$ , shellac,  $\text{KClO}_3$ , and kyanolith may be applied to a support such as a stick and granules of a bi-metallic alloy such as an alloy of Cu and Mg or Al are applied to the surface of the compn.

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

**Chemical resistance of materials in the production of sulfur dyes.** G. E. Bonvech. *Anilinokrasochnaya Prom.* 3, 263-7 (1933).—The destructive action of chemicals used and generated in the production of S dyes on various grades of iron equipment is discussed. Chas. Blanc

**Brown vat dyes.** M. A. Il'inskii and M. M. Shchuykin. *Anilinokrasochnaya Prom.* 3, 253-7 (1933).—A systematic survey was undertaken of the foreign patents for production of various brown vat dyes with a view of selecting the best suitable dyes and methods for domestic production. Chas. Blanc

**A brilliant rose (dye) of the thioindigo group.** Indanthrene brilliant rose R. V. I. Munaev and A. N. Nikolaeva. *Anilinokrasochnaya Prom.* 3, 258-62 (1933).—Indanthrene brilliant rose R (I) (IG) is a mixt. of 70% I, 20% dextrin and some unknown substance, probably some wetting materials. The chem. structure of 4,4'-dimethyl-6,6'-dichloro-2,2'-bisthionaphtheneindigo (II) ascribed to I (cf. *Tiba* 9, 371, 603 (1931)) was verified by synthesizing I by following the method of Herz (*Ger. pats.* 364,822, 367,346, 367,493, 371,258, 408,021). The product in all its chem. and tinctorial properties is identical with the com. I and *Helindon rose B*. Chas. Blanc

**Aniline black for printing without potassium ferrocyanide.** E. A. Rakhlin. *Anilinokrasochnaya Prom.* 3, 312-21 (1933).—Several recipes were developed for aniline black (I) for printing without the use of  $\text{K}_4\text{Fe}(\text{CN})_6$ . The following formula was used in the factory production for 6 months, giving a good shade of black with no impairment of the strength of the textile and decreased cost:  $\text{PhNH}_2$  72,  $\text{HCl}$  (18 B $\epsilon$ .) 70, 50% lactic acid (II) 30, 7.7%  $\text{Al}(\text{OH})_3$  160,  $p\text{-C}_6\text{H}_4(\text{NH}_2)_2$  (III) 3,  $\text{NaClO}_4$  40,  $\text{VCl}_5$  (1:1000) 50 and  $\text{NH}_4\text{Cl}$  10 parts. I at  $p\text{H}$  4 gives a satisfactory black and durable goods. To obtain a good black without III the  $p$  of I must be below 4, which causes weakening of the textile. Substitution of  $\text{AcOH}$  for II is also impracticable, because of considerable increase in  $p\text{H}$ , which impairs the strength of textile. The deterioration of I in storing is caused by decompn. of III with

formation of phenazine. Partially decompd. I can be improved by addn. of III. Chas. Blanc

**Determination of basic dyestuffs by means of silicotungstic acid.** E. B. Johnson. *J. Soc. Chem. Ind.* 52, 354 F (1933); cf. Trotman and Frearson, *C. A.* 26, 2321.—Dissolve 0.1 g. dye in  $\text{H}_2\text{O}$  (acidified with few drops of  $\text{HCl}$ ), and dil. to 100 cc.; add a slight excess of 5% silicotungstic acid (acidified with  $\text{HCl}$ ), heat on the water bath until the ppt. coagulates; settle, filter and wash twice in a beaker with hot dil.  $\text{HCl}$ , then several times with hot water, filter, dry and weigh, at  $110^\circ$ . Then ignite, and weigh the residue, which is silica and tungstic oxide, and calc. the dye by difference. For any given dye, once a factor is established, it is not necessary to dry to const. wt., but partially dry and ignite. With methylene blue, the factor for converting residue, after ignition, into methylene blue hydrochloride is 0.2368. For aminoazobenzene 1 part ash equals 0.3127 base. H. E. S.

**The determination of specific gravity. II. The influence of dyeing and of superficial saponification on the specific gravity of acetate rayon.** P. M. Heertjes, W. Coltof and H. I. Waterman. *Rec. trav. chim.* 52, 1001 (1933); cf. *C. A.* 27, 3615.—Sp. gr. detms. by the method previously described showed an apparent decrease in sp. gr. for acetate rayon dyed with Cellitfast Red B, but no change for the rayon partially sapon. or partially sapon. and dyed with Benzopurpurine 4 B. The apparent sp. gr. decrease for the former is explained by a clogging of the pores by the dye, so that the imbibition gas cannot enter. After sapon., there are no more pores to be clogged by the Benzopurpurine, and the sp. gr. is that of the original rayon. L. E. Steiner

**Throwing illustrated, with reference to changes caused by piece-dyeing trend and rayon.** A. Weiss. *Textile World* 83, 2191-4 (1933).—Twenty-four photographs illustrate the processes occurring in a throwing plant from the time the raw silk is received in the bale or the rayon in cases to the prepn. for shipping of the finished yarns. Ruby K. Wornor

**Throwing silk and rayon.** Dale S. Chamberlin. *Tex-*

*sile World* 83, 1984-5(1933).—Extracting and drying are discussed from the chemical-engineering standpoint.

Ruby K. Worner

**Fine structure of silk.** V. Swelling phenomena in fibroin fibers. Kametaro Ohara. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 22, 216-32(1933); cf. *C. A.* 27, 4403.—In the presence of some neutral salts at room temp. fibroin fibers swell and may dissolve. Photomicrographs show that the outer zone swells first, the central zone either breaking up into fibrils or swelling into spheroids, or in some cases remaining insol., with spiral or irregular bending. If the swelling is active spherical enlargements develop at certain points. The active salts include Ba and Ca thiocyanates, Ba, Ca and Sr iodides, Li and Mg bromides, Ba, Ca, Sr and Ni nitrates, Na, Ca, Sr, Co, Mg, Zn, Al and Fe chlorides, Ba(ClO<sub>3</sub>)<sub>2</sub> and Na<sub>2</sub>SiO<sub>4</sub>. In Cu(OH)<sub>2</sub>-glycerol mixts. and in NaOBr the swelling is of a different type, the fibers breaking into short pieces which then dissociate into fibrils. The various forms of swelling indicate that the fibers consist of relatively short micelles parallel to the long axis of the fiber, and more closely packed in the center than at the outside. At intervals this oriented structure is interrupted by a region of random arrangement, which is the first to show swelling, and which thus allows the fibers to break across.

K. V. Thimann

**The action of alkaline copper solution on silk fibroin.** IV. The fibroin-copper-amine compounds in the system fibroin-copper-amine (1-2). Yujiro Takamatsu. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 506 604(1933); cf. *C. A.* 28, 332<sup>3</sup>.—Exptl. data for the compns. of the 2 compds., established in previous work, are presented, showing that the ratios of fibroin:Cu:ethylenediamine are 1:1:1 and 1:2:2. Equations for the formation of the compds. are given and the effects of excess of ethylenediamine are discussed.

Karl Kammermeyer

**Finishing glove silk.** T. P. Sheridan. *Textile World* 83, 1999(1933).—An outline of the processes and a discussion of precautions to be observed are given.

Ruby K. Worner

**The swelling of protein fibers. II. Silk gut.** I). Jordan Lloyd and R. H. Marriott. *Trans. Faraday Soc.* 29, 1228-40(1933); cf. *C. A.* 27, 2864.—Silk fibers (fibroin) were subjected to the action of water, to NaOH 0.5-10 *N*; to HCl 0.5-10 *N*, to 2 *M* solns. of the salts: NaCl, NaNO<sub>3</sub>, LiI; and to satd. solns. of urea and thiourea. The fibers absorb H<sub>2</sub>O to about 30% of their wt. The absorption increases with the addn. of NaOH up to 6 *N* and decreases slightly for higher concns. The swelling is accompanied by splitting into fibers, and a permanent ability to swell in pure water more than before alkali treatment. The water is imbibed and the alkali aids by irreversibly breaking the coordinate linkages between the imino group of one chain and the carbonyl group of a parallel chain. The swelling is not increased much by acids less than 2 *N* but the strength of the fibers is destroyed. At 10 *N* concn., HCl dissolves the silk in 24 hrs. Salt, urea and thiourea cause slight swelling and weakening of fibers. The strong birefringence of silk fibers falls off slowly in acid and rapidly in alkalis. None of the treatments affected the x-ray diagrams.

F. E. Brown

**Effect of previous starching upon ease of washing cotton fabrics.** Lawrence E. Stout and Knapel F. Schiermeier. *Ind. Eng. Chem.* 25, 1403-5(1933).—Soil is more easily removed in washing a garment which has been starched. The order of decreasing value is boiled wheat and rice starch, sol. wheat and rice starch, boiled corn starch. Quant. data indicate their relative value. F. D. Snell

**Processing men's high-grade novelty suitings taxes finisher's skill.** G. L. Atkinson. *Textile World* 83, 1994(1933).—A finishing routine, beginning with the scouring of the gray goods, is given.

R. K. Worner

**Warp-sizing practice.** Ghent R. Robertshaw. *Textile World* 83, 1988(1933).—A table gives the approx. wts. of corn starch and softener to each 100 gal. of water for sizing various numbers of cotton yarns from 10s to 100s.

Ruby K. Worner

**Waste heat.** William R. Clendinning. *Textile World*

83, 2174-5(1933).—Suggestions are given for recovering waste heat in textile finishing plants. R. K. Worner

**Chemical examination of furs in relation to dermatitis.** H. E. Cox. *Analyst* 58, 738-48(1933).—Details are given concerning the kind of fur and mode of dyeing 216 specimens suspected of having caused dermatitis; of these 37 were undyed and probably did not cause the disease. It was proved experimentally that *p*-phenylenediamine penetrates the dead skin easily but does not penetrate living skin under normal conditions. It seems likely that irritation is caused by the abnormal penetration of the dye into the skin followed by local reaction with certain constituents of the blood or serum. Tests are described for distinguishing *p*-phenylenediamine from Baudrowski's base and a colorimetric method is given for detg. small quantities of the diamine. W. T. H.

**Arylides of 1-(carboxyphenyl)pyrazolone** [products used in prepn. of dyes] (Ger. pat. 582,806) 10. Oxidation products of sulfurized hydrocarbons [assistants in the treatment of textiles] (Ger. pat. 583,853) 10. Weighting agents from aq. solns. of Ti-H<sub>2</sub>SO<sub>4</sub> compds (U. S. pat. 1,934,778) 29. App. for distg. dry cleaners' solvent (U. S. pat. 1,935,183) 1. Aminoaralkylaryl compds. [products used in production of dyes] (U. S. pat. 1,936,090) 10.

**Thorpe, J. F., and Linstead, R. P.: The Synthetic Dyestuffs and Their Intermediate Products.** 7th ed. of "Cam and Thorpe." Rewritten and enlarged. London: C. Griffin & Co., Ltd. 472 pp. 30s. Reviewed in *Chem Trade J.* 93, 322(1933).

**Dyes.** L. B. Holliday & Co. Ltd., Joe Kitson and Cecil Shaw. Ger. 578,735, June 20, 1933. See Brit. 293,110 (*C. A.* 23, 1511).

**Dyes.** Soc. pour l'ind. chim. à Bâle. Ger. 579,633, June 29, 1933. Dyes are produced by condensing leuco compds. of  $\alpha$ -polyhydroxy- or  $\alpha$ -aminohydroxyanthraquinone, in which at least 2 OH groups or 1 OH and 1 NH<sub>2</sub> group are in the *p*-position to each other, with aromatic amines contg. either COOH or HSO<sub>3</sub> groups. The condensation takes place in aq. suspension with addn. of H<sub>2</sub>BO<sub>3</sub>. Sulfonic acids of the leuco compds. may be used, HSO<sub>3</sub> groups in the  $\beta$ -position being split off on condensation. The prepn. of the leuco compd. and the condensation may take place in one operation. In an example, 1-hydroxy-4-aminoanthraquinone-5-sulfonic acid is warmed in water with *p*-aminophenol, H<sub>2</sub>BO<sub>3</sub>, hyposulfite and glacial AcOH. On neutralizing the liquid, a dye which colors wool in green shades is produced. Other examples are given.

**Dyes.** J. R. Geigy A.-G. Ger. 582,680, Aug. 21, 1933. Addn. to 494,531 (*C. A.* 24, 3651). The method of 494,531 for producing basic *o*-hydroxynitroso dyes is modified by introducing the NO group into the nucleus of 1,3-aminophenols in which the NH<sub>2</sub> group is substituted by a strongly basic residue. The resulting nitroso compds. are then converted to their metal lakes. Thus, an aq. soln. of pyridylacetyl-*m*-aminophenol is treated with NaNO<sub>2</sub> and HCl. The resulting nitroso compd. is treated with glacial AcOH, crystd. AcONa and Fe<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>. The resulting metal lake imparts a grass-green color to silk. Other examples are given.

**Dyes.** I. G. Farbenind. A.-G. (Walter Albrecht, inventor) Ger. 578,502, June 14, 1933. Dyes are produced by treating 1-amino-2-alkoxy-4-haloanthraquinone with H<sub>2</sub>SO<sub>4</sub>, in optional presence of H<sub>2</sub>BO<sub>3</sub>, under conditions of temp. and concn. at which the halo atom is replaced by OH and no sulfonation occurs. Examples are given.

**Dyes.** I. G. Farbenind. A.-G. Fr. 42,029, Aug. 23, 1933. Addn. to 728,650 (*C. A.* 26, 6154). Dyes for cellulose esters and ethers are prepd. by heating polyaminoanthraquinones with Et<sub>2</sub>SO<sub>4</sub>, whereby Et is introduced into the amino groups.

**Dyes.** I. G. Farbenind. A.-G. Fr. 753,137, Oct. 7, 1933. Dyes of the anthracene series are prepd. by oxida-

tion of leuco sulfuric acid esters of  $\beta$ -aminoanthraquinones their acyl derivs. or substituted products, by  $\text{PbO}_2$  in an alk. aq. soln. or in a suitable org. solvent. Examples are given.

**Dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 750,480, Aug. 11, 1933. Dyes obtained from 1-diazo-2-hydroxynaphthalene-4,6-disulfonic acid and coupling component such as  $\beta$ -naphthol are treated with metallizing agents, the metals of which are capable of forming complex metal compds. with the dyes. Compds. of Cr, Cu, Fe, Co, Ni, Mn, Zn, V and Ti may be used.

**Dyes.** Chemische Fabrik vorm. Sandoz. Fr. 752,240, Sept. 20, 1933. Water-sol. dyes of the anthraquinone series are prepd. by treating with sulfonating agents anthraquinone derivs., of which at least 2  $\alpha$ -positions are substituted, the one by a  $\beta$ -naphthylamine radical or that of one of its substitution products, and the other by an acylamino group. A cyclization as well as a sulfonation takes place. Examples are given of dyes prepd. from 1-benzoylamino-4- $\beta$ -naphthylaminoanthraquinone and its 2-methyl and 2-bromo derivs., and 1-acetylamino-2-methyl-4- $\beta$ -naphthylaminoanthraquinone.

**Dyes (nitrogenous compounds of anthraquinone series).** Soc. pour l'ind. chim. à Bâle. Brit. 396,976, Aug. 17, 1933. Leuco-1,4,5,8-tetrahydroxyanthraquinone (I) or leuco-1,4-dihydroxy-5,8-diaminoanthraquinone, or a *N*-alkylated deriv. thereof, is heated at above  $100^\circ$  in an aq. soln. of  $\text{NH}_3$  or a primary aliphatic amine, preferably in the presence of a small proportion of a reducing agent, and the leuco compd. thus formed is oxidized to the corresponding anthraquinone deriv. which, if desired, is sulfonated. A modification consists in starting from the corresponding unreduced anthraquinone deriv. and conducting the process in the presence of a correspondingly larger proportion of reducing agent. 1-Hydroxy-4,5,8-triaminoanthraquinone or its *N*-alkylated derivs. are obtained; these are dyes for acetylcellulose and, on sulfonation, yield sol. wool dyes. In examples (1) I is heated at  $120^\circ$  in presence of a little  $\text{Na}_2\text{S}_2\text{O}_4$  with aq.  $\text{NH}_3$ ,  $\text{MeNH}_2$  or hydroxyethylamine to give 1-hydroxy-1,5,8-triamino-, trimethylamino- and tris(hydroxyethylamino)-anthraquinones, resp., on oxidation and (2) I is heated at  $120^\circ$  with aq.  $\text{NH}_3$  alone in a closed vessel to give a triamino deriv. as above; it dyes acetylcellulose blue shades.

**Azo dyes.** Otto Sobst (to General Aniline Works). U. S. 1,934,773, Nov. 14. Red dyes of good fastness are formed (suitably on the fiber) from components such as 2',3'-hydroxynaphthoyl-4-methyl-2-methoxy-5-chloro-1-aminobenzene or a similar 2',3'-hydroxynaphthoylamino-halocresol ether by coupling with a diazo compd. of the benzene series which does not contain a sulfonic or carboxylic group, e. g., the diazo compd. of 4-chloro-2-methyl-1-aminobenzene, asym. *m*-xylydine or the like. Several examples are given with details of procedure.

**Azo dyes.** Leopold Laska and Arthur Zitscher (to General Aniline Works). U. S. 1,934,807, Nov. 14. Azo dyes of good fastness, especially to light, and which dye red to blue to black are formed from components such as 2',3'-hydroxynaphthoyl-2-amino-6-methoxy (or ethoxy)-naphthalene and various amino derivs. of the benzene and naphthalene series. Numerous examples are given.

**Azo dyes.** George H. Ellis, Henry C. Olpin and Denis H. Mosby (to Celanese Corp. of America). U. S. 1,935,624, Nov. 21. Azo dyes which are suitable for dyeing cellulose acetate and like materials are obtained by coupling an aromatic diazo compd. such as may be derived from amines of the benzene or naphthalene series with an unsulfonated  $\alpha$ -naphthylamine coupling component substituted in an  $\alpha$ -amino group by an aliphatic radical contg. at least one hydroxyl group, such as  $\omega$ -hydroxyethyl- $\alpha$ -naphthalene or the like.

**Azo dyes.** Denis H. Mosby, Henry C. Olpin and George H. Ellis (to Celanese Corp. of America). U. S. 1,935,657, Nov. 21. Azo dyes which are suitable for dyeing cellulose acetate and the like are formed from components such as 3,5-dinitro-*o*-anisidine and  $\alpha$ -naphthylamine or the like. Several examples are given.

**Azo dyes.** Scottish Dyes Ltd. Ger. 579,840, July 5, 1933. See Brit. 333,507 (C. A. 25, 604).

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Ger. 582,612, Aug. 17, 1933. Azo dyes are produced in the substance or on the fiber by coupling the *m*-nitroanilide of 2,3-hydroxynaphthoic acid with a diazotized substituted monoacetyl deriv. of 2,5-dialkoxy-1,4-diaminobenzene. Thus, cotton is impregnated with a soln. of 1-(2',3'-hydroxynaphthoylamino)-3-nitrobenzene and treated with the diazo soln. of 4-(1'-methyl)-phenoxyacetylamino-2,5-dimethoxy-1-aminobenzene.

**Azo dyes.** I. G. Farbenind. A.-G. (Werner Lange, inventor). Ger. 582,644, Aug. 19, 1933. Dyes are produced by coupling nitroarylhydroxy-1,2-naphthotriazolesulfonic acids with diazo compds. in an alk. bath. Thus, Na 4'-nitrophenyl-5-hydroxy-1,2-naphthotriazole-7-sulfonate is coupled with 1-aminobenzene-4-sulfonic acid in alk. soln. to give a bluish red color to chromed leather. Other examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. (Gerhard Schrader, inventor). Ger. 582,645, Aug. 19, 1933. Azo dyes insol. in water are produced in the substance or on the fiber by coupling diazonium compds. of *Bs*-1-aminobenzanthrone or its substitution products with coupling components contg. no soly.-inducing groups. Thus, cotton is soaked in a soln. of 1-(2',3'-hydroxynaphthoylamino)-3-nitrobenzene and treated with a soln. of diazotized *Bs*-1-aminobenzanthrone neutralized by  $\text{AcONa}$ , to obtain fast blue-black-violet shades. Other examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. (Richard Stüsser, inventor). Ger. 582,899, Aug. 24, 1933. Azo dyes are produced in the substance or on the fiber by coupling arylthiazolepyrazolone with diazo or tetrazo compds. contg. no soly.-inducing groups. Thus, nitro-1-aminobenzene is diazotized and coupled with dehydrothiitoluidinepyrazolone to give a yellow dye suitable for use as pigment in the lacquer industry. Other examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 42,638, Aug. 23, 1933. Addn. to 728,186 (C. A. 26, 5764). Azo dyes are prepd. by monodiazotizing and coupling with any components, substitution products of 4-nitro-1,3-diaminobenzene, with the exception of those having strongly acid substituents such as  $\text{Cl}$ ,  $\text{NO}_2$ , and  $\text{SO}_3\text{H}$ . Examples are given of dyes from 1-methyl-(and 1-methoxy)-2,4-diamino-5-nitrobenzene.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 750,328, Aug. 8, 1933. Azo dyes, insol. in water, are prepd. by diazotizing or tetrazotizing a component free from solubilizing groups and combining with 1 or 2 mols. of a pyrazo-

lone of the formula  $[\text{S.Ar.N}:\text{C}:\text{Ar}'][\text{N}:\text{N}:\text{CX}:\text{CH}_2:\text{CO}]_n$  (the N atom of the pyrazolone group is joined to a C atom of an aromatic group of the  $\text{C}_6\text{H}_5$  or  $\text{C}_{10}\text{H}_7$  series designated by Ar or Ar', and X is an alkyl, phenyl or esterified carboxyl group). Examples of dyes prepd. from the pyrazolone of dehydrothiitoluidine and dehydrothioxylydine are given.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 751,653, Sept. 7, 1933. 4-Diazo-3-alkoxydiphenylamine is coupled with an arylamide of 2,3-hydroxynaphthoic acid or one of its derivs., formed by linkage of a benzene radical. Thus, a 4-amino-3-methoxydiphenylamine  $\rightarrow$  2',3'-hydroxynaphthoyl-1-amino-2,5-dimethylbenzene is a greenish blue dye. A large no. of examples is given. The dyes are sol. in water.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 753,054, Oct. 6, 1933. Azo dyes insol. in water are prepd. by coupling arylamides of hydroxyarylcarboxylic acids or  $\beta$ -keto-carboxylic acids, diazo compds. of asym. mono- or dibenzyl-*p*-diamines which are substituted in the benzyl radical and may be substituted in the diamine radical by any substituents, but do not contain arylsulfonyl groups or groups which render the products sol. in water. Thus, 1-amino-4-(2',4'-dichlorobenzylamino)-2,5-dimethoxybenzene  $\rightarrow$  2-(2',3'-hydroxynaphthoylamino)naphthalene gives an indigo-blue shade. Several examples are given.

**Metalliferous azo dyes.** Fritz Straub and Walter Hanhart (to Soc. pour l'ind. chim. à Bâle). U. S. 1,936,276, Nov. 21. Monoazo dyes such as those formed from 1-amino-2-hydroxynaphthalene-4,6-disulfonic acid with  $\beta$ -naphthol or other coupling component are treated with metallizing reagents such as Cr fluoride or a Cu, Fe, Co, Ni, Mn, Zn, V or Ti compd. in order to obtain metalliferous products which give fast dyeings on various materials. U. S. 1,936,277 relates to products dyeing cotton various orange to violet to blue to gray tints produced by the action of metallizing reagents on disazo dyes such as those formed from tetrazotized 4,4'-diaminostilbene-3,3'-dicarboxylic acid and various coupling components.

**Monoazo dyes.** Bernhard Richard (to J. R. Geigy S. A.). U. S. 1,936,266, Nov. 21. Dyes giving fast red dyeings on wool and silk, resistant to fulling, light and sea water, are obtained from components such as diazotized 2-aminodiphenyl ether-4-sulfonic acid-(N)- $\alpha$ -thyl-anilide and *p*-toluenesulfonyl-1-aminouyl-8-hydroxynaphthalene-3,6-disulfonic acid or the like.

**Disazo dyes.** I. G. Farbenind. A.-G. Brit. 395,820, July 27, 1933. Disazo dyes are made by coupling tetrazo compds. of diamines, obtained by condensing 2 mols. of an aromatic amine with 1 mol. of an aliphatic ketone, with  $C_6H_5$  derivs. contg. at least 1 OH group attached to the nucleus, all the components being free from  $HSO_3$  and  $COOH$  groups. They are sol. in oil and are used for coloring varnish lacquers, oil varnishes and intaglio printing inks. In examples (1) condensation product from  $Me_2CO$  (1 mol.) and  $PhNH_2$  or *o*- or *m*-toluidine (2 mols.)  $\Rightarrow$  *p*-cresol, 4-chloro-3-methylphenol, 2,4-dimethylphenol or an *o*- and *p*-cresol mixt. and (2) product from  $Me_2CO$  (1 mol.) and *o*-anisidine or aminohydroquinone dimethyl ether (2 mols.)  $\Rightarrow$  *p*-cresol.

**Disazo dyes.** I. G. Farbenind. A.-G. Brit. 396,078, July 28, 1933. Disazo dyes of the type  $R':N:NR:N:NR''$ , in which R is a diphenyl- or diphenylurea-dicarboxylic acid residue, R' an acetoacetic arylide residue and R'' a pyrazolone residue, are sulfonated. The dyeings when after-treated with Cu salts are fast to light and washing. In examples (1) the dye acetoacetic-*o*-aniside (I)  $\leftarrow$  4,4'-diaminodiphenylurea-3,3'-dicarboxylic acid  $\rightarrow$  1-*m*-aminophenyl-3-methyl-5-pyrazolone (II) is treated with  $H_2SO_4 \cdot H_2O$ ; an orange shade is obtained on cotton by after-treatment with Cu salts and (2) the dye I  $\leftarrow$  benzidine-3,3'-dicarboxylic acid  $\rightarrow$  II is sulfonated as above (brown on cotton on after-treatment with Cu salts).

***o*-Hydroxyazo dyes.** I. G. Farbenind. A.-G. (Walther Benade, inventor). Ger. 582,688, Aug. 21, 1933. See Brit. 396,895 (C. A. 28, 652<sup>a</sup>).

**Vat dyes.** Wilhelm Eckert and Otto Braunsdorf (to General Aniline Works). U. S. 1,935,945, Nov. 21. Vat dyes which dye cotton fast yellow are produced by condensing a naphthoyle-arylimidazole-*peri*-dicarboxylic acid with a compd. such as aniline,  $\beta$ -naphthylamine, *o*-toluidine or cyclohexylamine by heating the materials together in an inert diluent such as an excess of the amine. Cf. C. A. 27, 1518.

**Vat dyes.** I. G. Farbenind. A.-G. (Georg Kranzlein, Heinrich Vollmann, Hermann Boedeker and Hans Becker, inventors). Ger. 576,404, May 10, 1933. Addn. to 574,966 (C. A. 27, 4682). Vat dyes are produced by treating 5-amino-2,1-anthraquinoneacridone with halogenated aromatic or aromatic-aliphatic ketones or polyketones of open or cyclic structure with no quinone character. Thus, 5-amino-2,1-anthraquinoneacridone is treated with *p,p'*-dibromobenzophenone,  $AcONa$  and  $(AcO)_2Cu$  in  $PhNO_2$  to give a light-fast dye. Other examples are given.

**Vat dyes.** I. G. Farbenind. A.-G. (Heinz Scheyer, inventor). Ger. 576,466<sup>a</sup> May 11, 1933. Addn. to 550,712 (C. A. 26, 4958). Condensation products from glyoxal or its derivs. and anthrone or its substitution products are heated with acid-condensing agents such as  $AlCl_3$  to give vat dyes. Examples are given.

**Vat dyes.** I. G. Farbenind. A.-G. (Karl Köberle, inventor). Ger. 578,503, June 14, 1933. Nitro compds., mol. in water and capable of use as vat dyes, are reduced by treatment with metals in the presence of concd.  $H_2SO_4$ .

1 Thus, 4-nitro-3',5'-dichloroanthraquinone-2,1-benzene-acridone is treated with Cu powder and concd.  $H_2SO_4$  to give the 4-amino deriv. which colors vegetable and animal fibers from a violet vat in fast greenish blue shades. Other examples are given.

**Vat dyes.** I. G. Farbenind. A.-G. Fr. 41,546, Jan. 28, 1933. Addn. to 609,194 (C. A. 25, 3404). Vat dyes of the anthraquinone series are prepd. by replacing naphthalene-2,6-dicarboxylic acid by the dicarboxylic acids of *m*- or *p*-diphenylbenzene in the process of Fr. 609,194.

**Vat dyes.** I. G. Farbenind. A.-G. Fr. 753,185, Oct. 9, 1933. Dyes of the anthraquinone series are prepd. by treating with condensing agents (fused caustic alkalis) at a high temp. 4-(anthraquinonylamino)naphthalimides or 4-(anthraquinonylamino)-1,8-naphthoyle-arylimidazoles or mixts. of isomers of these compds. or their derivs. or substitution products. The dyes from the 1st 3 have the formula I, and from the 2nd the formula II or III.

Examples are given of the prepn. of dyes and of bromo-1',-8'-naphthoyle- (m. 241-3°, this is sepd. into isomers, m. 223° and m. 280°) and 4'-bromo-1',8'-naphthoyle-4-chloro-benzimidazole, m. 230°, and di(4'-bromo-1',8'-naphthoyle)benzimidazole, m. above 360°.

**Vat dyes.** I. G. Farbenind. A.-G. Fr. 750,545, Aug. 11, 1933. Dye preps. contain a vat dye, a hyposulfite and a tertiary alkali phosphate, e. g., tetrabromindigo 3,  $Na_2S_2O_4$  1 and  $Na_3PO_4$  10 parts.

**Vat dyes of the anthraquinone series.** Johann Rosenbach and Willy Lassmann (to General Aniline Works). U. S. 1,934,771, Nov. 14. Dyes generally of yellow to red color are formed by condensing an  $\alpha$ -aminoanthraquinone compd. such as 1-aminoanthraquinone, 1-amino-4-benzamidoanthraquinone, 1-amino-5-benzamidoanthraquinone or 1-amino-4-methoxyanthraquinone by heating with compds. such as diphenyl ethers and benzophenones contg. one  $COCl$  group in 3- or 4-position or contg. two  $COCl$  groups in 4,4'-, 3,3'-, 4,3'-, or 4,2'-positions (and which may also contain other substituents) or with carboxylic acid bromides, in an inert solvent such as  $PhNO_2$ ,  $PhCl$ ,  $C_6H_5Cl$ , or an excess of diphenyl ether-carbonyl chloride or benzophenonecarbonyl chloride. Numerous examples with details of procedure are given.

**Vat dyes of the anthraquinoneacridine series.** Heinrich Neresheimer (to General Aniline Works). U. S. 1,935,724, Nov. 21. Vat dyes which dye cotton bluish

green to olive shades are prepd. by causing a 2'-benzanthronyl-1-aminoanthraquinone contg. an aliphatic carboxylamino group in the 4-position of the anthraquinone radical to react with an acid-condensing agent such as  $\text{AlCl}_3$ ,  $\text{H}_2\text{SO}_4$ , or chlorosulfonic acids.

**Indigoid vat dyes.** Soc. pour l'ind. chim. à Bâle. Ger. 582,890, Aug. 21, 1933. Addn. to 552,927 (C. A. 26, 5767). Asym. dyes of the above type are prepd. by condensing 5,6-dihalo-3-hydroxythionaphthenes or their 2-derivs. with suitable compds. and halogenating the resulting dyes. Thus, 5,6-dichloro-3-hydroxythionaphthene is condensed with the *p*-dimethylamino anil of 4-methyl-6-chloro-3-hydroxythionaphthene to give a dye which colors cotton in fast blue-green shades. A table of compds. and colors of dyes produced is given.

**Indigoid dyes.** Soc. pour l'ind. chim. à Bâle. Ger. 582,613, Aug. 17, 1933. Addn. to 552,927 (C. A. 26, 5767). Asym. indigoid vat dyes are prepd. by condensing 5-halo-6-methyl-3-hydroxythionaphthene and its 2-derivs. with suitable compds. such as  $\alpha$ -isatinilide, 5-bromo- $\alpha$ -isatin chloride, the *p*-dimethylaminoanil of 6-chloro-3-hydroxythionaphthene, etc. A table of components and color of dye produced is given.

**Indigoid dyes.** Soc. pour l'ind. chim. à Bâle. Ger. 582,614, Aug. 14, 1933. Hydroxythionaphthene of the

general formula aryl CO aryl-CO-CH<sub>2</sub>-S, their oxidized product or 2-derivs. are condensed with suitable components. Thus, the 2-(*p*-dimethylamino)anil of 5-benzoyl-7-methylhydroxythionaphthene, and 2,1-naphthothioindoxyl are condensed to give a dye which colors cotton brown shades. Other examples are given.

**Thioindigo dyes.** I. G. Farbenind. A.-G. (Franz Wieners, inventor). Ger. 582,852, Aug. 24, 1933. Sym. dyes of the thioindigo series are prepd. by heating methyl ketones of multinuclear aromatic hydrocarbons or their substitution products with a free  $\alpha$ -position in the keto group, with sulfur halide, in optional presence of indifferent org. solvents. Thus,  $\alpha$ -naphthyl methyl ketone in  $\text{PhNO}_2$  is treated with a mol. amt. of  $\text{SCl}_2$  at 90° to give 2,1-naphthoxythiopheneindigo. Other examples are given.

**Treating molten materials with liquids as in indigo manufacture.** Joseph E. Jewett (to National Aniline and Chemical Co.). U. S. 1,934,716, Nov. 14. Molten material such as that for indigo production is introduced into a circulating stream of liquid such as aq. liquid. App. is described.

**Dye preparations.** I. G. Farbenind. A.-G. Ger. 578,939, June 19, 1933. Crystd. or coarsely dispersed dyes are mixed to an aq. paste; polyacrylic acid or its homologs or salts are added with a solvent which does not dissolve the product. Thus, dimethoxydibenzanthrone is mixed with water and dextrin. Na ligninsulfonate and the Na salt of polyacrylic acid are then added. The product is used for printing fabrics.

**Green sulfur dyes.** I. G. Farbenind. A.-G. (Friedrich Muth, inventor). Ger. 582,716, Aug. 21, 1933. Indophenols or leuco indophenols from alkyl- or aralkyl-1-naphthylamine-6- or -7-sulfonic acids and *p*-aminophenols are fused in the presence of Cu or its salts. Aq. polysulfide solns. may be present. Thus, the leuco phenol from ethylnaphthylamine-6-sulfonic acid and *p*-aminophenol is added to a polysulfide soln. with  $\text{Na}_2\text{S}$  and S.  $\text{CuSO}_4$  is then added and the water distd. off till the temp. becomes 103°. The dye is pptd. in the mass by an air current. Other examples are given.

**Anthraquinone dyes.** I. G. Farbenind. A.-G. Fr. 750,329, Aug. 8, 1933. Dyes are prepd. by condensing a 1-amino-4-haloanthraquinone-2-sulfonic acid or a substitution product thereof with a monoacylated arylendiamine, substituted or not, the acyl group corresponding to  $\text{R}(\text{CH}_2\text{CH})_x\text{CO}$ — (R is an aromatic group substituted in any manner and  $x$  is 1 or 2). Examples are given.

**Azine dyes.** Robert Lantz and Andre Wahl (one-half to Société anon. des matières colorantes & produits chim. de Saint-Denis). U. S. 1,935,849, Nov. 21. For prep. azines, primary phenylamines are caused to react on di-

1 naphthoxazines in order to substitute for the O of the oxazines the NR group in which R designates a carboxylic aryl radical; e. g., for obtaining asymmetric phenylimino-*N*-phenyldinaphthazine, 1 part of asymmetric phenyliminodinanaphthoxazine is boiled with 5 parts of  $\text{PhNH}_2$ , the resulting liquor is poured into an excess of  $\text{HCl}$ , and the liquor thus obtained is purified by dissolution with boiling alc. and pptn. with  $\text{NaHCO}_3$ . Some other examples also are given with details of procedure.

**Acid dyes of the anthraquinone series.** Karl Zahn and Heinrich Koch (to General Aniline Works). U. S. 1,935,929, Nov. 21. Dyes producing blue tints on animal fiber from an acid bath are obtained by causing 1-amino-4-haloanthraquinone-2-sulfonic acids or their salts such as alkali metal salts to react with a *m*- or *p*-aminoaryalkyl-sulfone or a substitution product substituted in either or both the alkyl or aryl radicals. Several examples with details of procedure are given. Cf. C. A. 28, 337<sup>a</sup>.

**Anthraquinone derivatives.** Imperial Chemical Industries Ltd. Fr. 752,272, Sept. 20, 1933. Derivs. contg 2 anthraquinone rings joined in other than the *meso* position by one or 2 atoms of N are prepd. by causing a chloroanthraquinone to react with an arylsulfonamidoanthraquinone or by causing 2 mols. of chloroaryl-sulfonamidoanthraquinone to react. The arylsulfonamidoanthraquinone need not be isolated from the medium in which it is prepd. Thus, *p*-toluenesulfonamide is caused to react with 1-chloro-5-benzoylaminoanthraquinone in an org. medium with a substance absorbing the acids and a catalyst, then the 1-benzoylamino-5-*p*-toluenesulfonamidoanthraquinone is caused to react with a further amt. of 1-chloro-5-benzoylaminoanthraquinone. The product may be treated with concd.  $\text{H}_2\text{SO}_4$  and an oxidizing agent to obtain an orange vat dye.

**1-Methylamino-4-aminoanthraquinone.** Soc. pour l'ind. chim. à Bâle. Fr. 753,089, Oct. 6, 1933. 1-Methoxy-4-aminoanthraquinone is heated with an alk. soln. of  $\text{MeNH}_2$  until a sample shows the reaction complete. It dyes acetate silk very strong bluish violet shades.

**Halogenated 4,5,8,9-dibenzopyrene-3,10-quinones.** Georg Kraenzlein, Heinrich Vollmann and Hans Becker (to General Aniline Works). U. S. 1,935,720, Nov. 21. Vat dyes of the 4,5,8,9-dibenzopyrene-3,10-quinone series contg. different halogen atoms possess especially good fastness properties, particularly to washing, and, moreover, partly yield the valuable scarlet tint of the unhalogenated dye where iso-(4,5,8,9)-dibenzopyrene-3,10-quinone yields on introduction either of Cl alone or Br alone dyes whose tints considerably differ from that of the dyes free from halogen. These 4,5,8,9-dibenzopyrene-3,10-quinones contg. different halogen atoms may be obtained by after-chlorination of brominated dibenzopyrenequinones, as well as by after-bromination of chlorinated dibenzopyrenequinones. The position of the halogen atoms, first of all that of the Br atoms, influences the tint. As halogenated agents there may be used both halogen itself or an agent splitting off halogen. The reaction is preferably carried out in the presence of a solvent, such as chlorosulfonic acid, concd.  $\text{H}_2\text{SO}_4$ , oleum or the like. It may also be advantageous to gently heat the soln. or to add a catalyst, such as, for instance, I, Fe, etc. The halogenation may likewise be effected in a melt of alkali and  $\text{AlCl}_3$ . Several examples with details of procedure are given. Cf. C. A. 27, 5197.

**Aryl amides of hydroxycarbazolecarboxylic acids.** I. G. Farbenind. A.-G. (Friedrich Muth, inventor). Ger. 576,966, May 19, 1933. These are prepd. by converting 2-hydroxycarbazole-3-carboxylic acids substituted by hydrocarbon residues in the ring imino group, into their arylamides. Thus, 9-methyl-2-hydroxycarbazole-3-carboxylic acid and *p*-chloroaniline are dissolved in toluene.  $\text{PCl}_5$  is added drop by drop. The liquid is then made alk. by  $\text{Na}_2\text{CO}_3$  and steam blown through. The product, 9-methyl-2-hydroxycarbazole-3-carboxylaminochlorobenzene, m. 377-8°. The following are prepd. similarly, designating 9-methyl-2-hydroxycarbazole-3-carboxylamino-as [1], [1]-

benzene, m. 254°, [1]-2'-methoxybenzene, m. 188-90°, [1]-2'-methylbenzene, m. 193°, [1]-2'-methyl-4'-methoxybenzene, m. 183°, [1]-2',5'-dimethoxybenzene, m. 245°, [1]-2'-methoxy-4'-chlorobenzene, m. 222°, [1]-1'-naphthalene, m. 232°, [1]-2'-naphthalene, m. 183°, 9-ethyl-2-hydroxycarbazole-3-carboxylamino-2'-methylbenzene, m. 187°, and 9-phenyl-2-hydroxycarbazole-3-carboxylamino-2'-methylbenzene, m. 135°. The compds. are used as dye intermediates. See Brit. 372,301 (C. A. 27, 3616).

**Alkylthiosulfonic acids.** Deutsche Hydrierwerke A.-G. Ger. 578,508, June 15, 1933. High-mol. alkylthiosulfonic acids or their salts etherified in the  $\alpha$ -position are prep'd. by condensing aliphatic, alicyclic or aliphatic-aromatic alcs. contg. at least 8 C atoms, with low-mol. aliphatic aldehydes and dry hydrohalide. The resulting  $\alpha$ -monohalogenated ethers are treated with stable salts of  $H_2S_2O_4$  in the presence or absence of indifferent diluents, at ordinary or raised temp. and pressure. Thus, lauryl alc. is ppt'd. by addn. of AcH or paraldehyde and the liquor sat'd. with dry HCl. The resulting lauryl  $\alpha$ -chloroethyl ether seps. as a layer and b. 148-53° at 15 mm. It is then treated with  $Na_2S_2O_4$  to give the thiosulfonic acid deriv. Other examples describe the prep'n. of lauryl  $\alpha$ -chloromethyl ether, b. 162-3° at 18 mm., naphthyl bromomethyl ether, and octadecyl chloromethyl ether, m. 27°. These are treated with  $Na_2S_2O_4$ . The products are useful as wetting or penetrating agents in acid wool dyebaths.

**Color lake.** I. G. Farbenind. A.-G. (Hodo Zschimmer, inventor). Ger. 578,957, June 19, 1933. See U. S. 1,912,878 (C. A. 27, 4428).

**Nitrogenous compounds (dyes and dye intermediates)** from perylenequinone, etc. Max A. Kunz and Karl Koberle (to General Aniline Works). U. S. 1,935,721, Nov. 21. N-contg. compds. which are in part suitable as intermediate products for the manufacture of dyes and in part as dyes, are obtained when perylenequinone, ms-benzodanthrone, ms-naphthodanthrone, allo-ms-naphthodanthrone, ms-anthradianthrone or their methyl or halogen derivs. are subjected to the action of hydroxylamine or its salts, preferably in an acid inorg. dissolving or suspending medium capable of splitting off water, such as for example  $H_2SO_4$ ,  $H_3PO_4$ , chlorosulfonic acid, etc. Condensing catalysts, for example metals or metal compds., such as Fe, Cu, Hg, etc., or iron or copper sulfate, may be added to the reaction mixt. Various examples with details and modifications of procedure are described.

**Dyes and intermediates.** Imperial Chemical Industries Ltd. Ger. 579,804, July 4, 1933. See Brit. 358,121 (C. A. 26, 6152).

**Intermediate and dyes.** I. G. Farbenind. A.-G. Fr. 753,104, Oct. 7, 1933. 4-Amino-1,8-naphthalenedicarboxylic acid and its derivs. are prep'd. by treating 4-sulfo-1,8-naphthalenedicarboxylic acid or its anhydride or one of its salts by cyclohexylamine, alkylamines (or their substitution products), hydrazine,  $NH_3$  or compds. yielding  $NH_3$ . Examples are given of the prep'n. of the above and of the methylaminonaphthalenemethylamide, m. 256-8°, undecylaminonaphthalundecylamide, m. 84-6°, hydrazinonaphthalhydrazide, m. above 300°, cyclohexylaminonaphthalcyclohexylamide, heptadecylaminonaphthalheptadecylamide, sulfocyclohexylaminonaphthalheptadecylamide (dyes animal fiber greenish yellow shades) and hydroxyethylaminonaphthalhydroxyethylamide, m. 214°. The products may be used as dyes or intermediates for dyes.

**Intermediates and dyes.** I. G. Farbenind. A.-G. Fr. 750,501, Aug. 11, 1933. New compds., 2-(3'-hydroxy-2'-naphthyl)-4-hydroxy-6,7-benzopseudoasimidobenzene (2-(3'-hydroxy-2'-naphthyl)-4-hydroxy- $\alpha$ -naphtholtriazole) and its derivs. are prep'd. by coupling diazotized 2-amino-3-hydroxynaphthalene, the H of the OH group of which is replaced by an appropriate radical such as acyl or alkyl, with a 2-amino-3-hydroxynaphthalene in which the H of the OH group is also replaced by an appropriate radical, transforming the  $\alpha$ -aminoazo dye thus formed to the pseudoazide by known methods and removing the radicals joined to the OH groups. Examples are given of the prep'n. of the compd. itself, m. 289-3° (uncor.), and of the 7',8'-dibromo, m. above 320°, the 7'-methoxy-8-

1 methoxy, m. 265-7° (uncor.), the 8-bromo, m. 296-7° (uncor.), derivs., and of 2-amino-3,3'-dimethoxy-1,2'-azonaphthalene, m. 196° (uncor.). Examples and a table of dyes prep'd. from these compds. are given.

**Intermediates and dyes.** Chemische Fabrik vorm. Sandoz. Fr. 751,711, Sept. 8, 1933. Radicals of biliary acids are introduced into aminonaphtholsulfonic acids by treating the latter with functional derivs. of biliary acids. The products may be converted to dyes by coupling diazotized mono- or poly-amines or aminoazo dyes. The products and the dyes have pronounced bactericidal properties. Examples are given of the prep'n. of 1,8,3,6-, 1,8,4,6-, 1,8,3,6-desoxy- and 1,8,2,4-cholylaminonaphtholdisulfonic acid and 1,8-diformyldeoxycholylaminonaphthol-4-sulfonic acid, and dyes prep'd. therefrom.

**Intermediates.** Soc. pour l'ind. chim. à Bâle. Ger. 579,918, July 3, 1933. Intermediates substituted in the naphthalene nucleus, with at least 1 COOH group, and contg. a heterocyclic nucleus, are prep'd. by converting mercapto-, or aminonaphthalenecarboxylic acids into naphthothioindoxyl or naphthindoxyl derivs. substituted in the naphthalene nucleus by at least 1 COOH group. Thus, 2-mercaptanaphthalene-3-carboxylic acid is treated with alkali and  $CH_2ClCO_2H$  to give 2-naphthylthioglycolic 3-carboxylic acid. This is heated in a water bath with  $PCl_5$  in  $o$ - $C_6H_4Cl_2$  to obtain the dicarboxylic acid chloride.  $AlCl_3$  is added to this to give 2,1-naphthothioindoxyl-3-carboxylic acid chloride. Sapon. of this gives the free carboxylic acid m. 250°. Designating naphthothioindoxyl as [1], the prep'n. of the following is also described; 2,1-[1]-4-carboxylic acid, m. 230°, 2,1-[1]-5-carboxylic acid, m. 240°, 3-carboxy-2,1-[1], 2,3-[1]-1-carboxylic acid, m. 174.5°, the *p*-dimethylaminonil of 2,1-[1]-3-carboxylic acid, m. 350°, and 2,1-naphthothioisatin-3-carboxylic acid, m. 296-7°.

**Intermediates for dyes.** I. G. Farbenind. A.-G. Fr. 751,757, Sept. 9, 1933. Acenaphthalic acids substituted in the ring and 1,4,5,8-naphthalenetetracarboxylic acids are prep'd. by sulfonating, nitrating or halogenating acenaphthalic acid in known manner and if desired submitting the products to transformation reactions or oxidation to form the tetra acids, or to both kinds of reactions and in any order. Examples are given of the prep'n. of 2-sulfo-, 2-hydroxy-, 2-methoxy-, a dinitro- a diamino- and a monochloro-1,4,5,8-naphthalenetetracarboxylic acid, m. 300°, a dinitro- and a monochloro-acenaphthalic acid, m. 208.10°.

**Safranine dye intermediates.** Walter C. Meuly (to E. I. du Pont de Nemours & Co.). U. S. 1,934,727, Nov. 14. Cresidine is condensed with *p*-nitrochlorobenzene-*o*-sulfonic acid in the presence of an alk. comp'd. such as  $NaHCO_3$  and the resulting product is reduced (suitably with Fe and HCl) to obtain the corresponding amino comp'd. An intermediate thus prep'd. is readily converted into a dye of greenish blue color and good fastness to light and to washing. Various details of procedure are given.

**Dyeing.** I. G. Farbenind. A.-G. Brit. 397,016, Aug. 17, 1933. Azo dyes are made on the fiber, e. g., cotton, regenerated cellulose or animal fibers, by coupling thereon a diazo, tetrazo or diazoazo comp'd. with a 2',3'-hydroxynaphthoyl-2-amino-6-alkoxynaphthalene (from the corresponding acid and amine according to customary methods), the resulting dyes being free from groups lending soly. In examples cotton is padded with the 6-methoxy deriv. and developed with diazotized 1-amino-2,4-dimethylbenzene or 1-amino-4-methyl-2,3-dichlorobenzene or padded with the 6-ethoxy deriv. and developed with diazotized 1-amino-2-methoxy-4-nitrobenzene.

**Dyeing.** I. G. Farbenind. A.-G. (Arthur Zitscher and Wilhelm Seidenfaden, inventors). Ger. 578,648, June 15, 1933. Azo dyes insol. in water are produced on the fiber by treating the latter with hydrazinesulfonic acids from

bases of the general formula  $CH:CY.C(NH_2):CH.CY:C-NHAcyl$  (where Y represents similar or different substituents contg. no soly.-inducing group) and azo components contg. OH groups, in an alk. medium, and steaming the

product. Thus, Na 4-benzamido-2,5-dimethoxybenzene-1-diazosulfonate is suspended in AcOH and heated with addn. of Zn dust. When the color disappears, the soln. is made alk., giving Na 4-benzamido-2,5-dimethoxybenzene-1-hydrazinesulfonate. Calico is treated with a soln. contg. the above and 4,4'-di(acetoacetylaminio)-3,3'-dimethylbiphenyl, thiodiglycol, NaOH and  $\text{Na}_2\text{CrO}_4$ . The calico is then steamed and rinsed. Other examples are given.

**Dyeing.** Soc. pour l'ind. chim. à Bâle. Ger. 578,838, June 17, 1933. Textiles of vegetable origin, such as cotton or rayon goods, are immunized against direct dyeing by treatment with anhydrides or chlorides of org. carboxylic acids in the presence of tertiary bases. Thus, cotton is treated with phthalic anhydride or BzCl and pyridine. The product is immune from direct-acting or acid dyes.

**Dyeing.** I. G. Farbenind. A.-G. Ger. 579,936, July 3, 1933. Liquid or fusible org. materials are dyed by introducing the dye with phosphalides, especially lecithin. Thus, a mixt. of stearin and ceresin is fused and colored with a dye to which textile lecithin is added. If mordant dyes are used, lake-forming metal compds. are added.

**Dyeing.** I. G. Farbenind. A.-G. (Leopold Laska and Arthur Zitscher, inventors). Ger. 582,966, Aug. 25, 1933. Azo dyes are produced on the fiber by impregnating the fiber with a soln. of 2-(2',3'-hydroxynaphthoylamino)-6-alkoxynaphthalene and treating the impregnated fiber with diazo, tetrazo or diazoazo compds. A table of components and colors of dyes produced is given.

**Dyeing textiles.** Marcel Guinet. Fr. 751,846, Sept. 11, 1933. Textiles, particularly rayon, are impregnated by a colloid or colloidal soln. having a basis of animal gelatin or pickled hide, immersed in a tanning bath comprising vegetable tanning agents or salts of Cr and then dyed.

**Dyeing textiles.** Henry Dreyfus. Fr. 753,128, Oct. 7, 1933. Deep dyeings are obtained by dyeing textiles which already have a deep gray or other deep color due to the presence of a pigment in the textiles. Suitable pigments are lampblack,  $\text{Fe}_3\text{O}_4$  and aniline black. The process is particularly suitable for products of cellulose esters and ethers.

**Printing materials containing cellulose esters.** British Celanese Ltd. and George H. Ellis. Brit. 397,470, Aug. 10, 1933. In producing discharge effects on materials made of or contg. cellulose esters the materials are saponified after coloration with a ground color but prior to discharge thereof. Saponig. agents are NaOH, KOH,  $\text{Na}_2\text{CO}_3$ ,  $\text{K}_2\text{CO}_3$ , Na silicate or  $\text{Na}_3\text{PO}_4$ , which may be used, if desired, in aq. or alc. soln. and, if desired, with other substances, e. g., swelling agents. In examples (1) a woven cellulose acetate fabric, dyed red with 4-nitro-2-methoxybenzene-1-azo-4'-dimethylaminobenzene, is saponified, to an extent corresponding to about a 10% loss, by cover-padding with a  $\text{Na}_2\text{CO}_3$  soln. contg. starch thickening, dried, steamed, washed off, dried, printed with a paste contg. Zn  $\text{CH}_3\text{O}$ -sulfoxylate, methylated spirits, Et lactate and gum arabic thickening, dried, aged, washed and dried to yield a white discharge on a red ground and (2) a fabric of equal parts of cotton and cellulose acetate, dyed in contrasting shades with 2-nitro-4-methylbenzene-azo-*p*-xylylene on the acetate and Chlorazol fast blue 2 BNS on the cotton, is padded with sodium carbonate soln., dried on a stenter, steamed, printed as in (1), steamed or aged, washed and dried to yield discharges on a 2-color ground.

**Printing textiles.** I. G. Farbenind. A.-G. Fr. 41,789, Apr. 13, 1933. Addn. to 727,727 (C. A. 26, 577Q). The hydroxynaphthraquinones of Fr. 727,727 are replaced by S-contg. derivs. of anthraquinones, particularly mercaptans, their salts or ethers, rhodanides or dianthraquinonyl mono- or di-sulfides, or their substitution products or reduction products contg. O in the *meso* position.

**Printing fabrics.** I. G. Farbenind. A.-G. (Richard Fischer and Hermann Freund, inventors). Ger. 578,649, June 15, 1933. Addn. to 562,823 (C. A. 27, 1206). Textiles, etc., are printed with a paste contg., in addn. to the

1 diazoamino compd. and coupling component of 562,823, an ester salt of a leuco vat dye. The printed fabric is dried and treated with a soln. of an oxidized dye prepn. contg. org. acid,  $\text{H}_3\text{PO}_4$  or acid-yielding salts. It is then dried on heated cylinders or in heated chambers, and developed by steaming. In an example, cotton goods are printed with a paste contg. an azo dye,  $\text{H}_2\text{SO}_4$  ester of the leuco vat dye 5,7,5',7'-tetrabromoinidigo,  $\text{C}_6\text{H}_4(\text{OH})_2$ , alc., thickening, ZnO, water and NaOH, dried and treated with a prepn. 2 contg. a salt of  $\text{PhNH}_2$ , tragacanth,  $\text{NaClO}_3$ , AcOH,  $\text{HCO}_2\text{H}$ , and  $\text{NaNO}_2$ . The product has red shades on a black background. Cf. C. A. 28, 341', 342'.

**Printing fabrics.** Joh. G. Kastner. Ger. 578,776, June 17, 1933. A printing paste contains a soln. or decoction of ground carob beans which has been reduced to produce sugar-like disintegration products by treatment with acids or diastases. Other thickening agents may also be present. In the example, the paste contains the above thickening with indanthrene blue,  $\text{K}_2\text{CO}_3$ , glycerol, NaOH, and hyposulfite.

**Printing fabrics.** I. G. Farbenind. A.-G. (Ludwig Biffander and Georg Böhner, inventors). Ger. 578,821, June 17, 1933. A vat dye paste for printing fabrics has a content of polyglycerol. Thus, the paste may consist of indanthrene blue, polyglycerol (obtained by treating glycerides with alcoholic KOH at  $10^\circ$ ), starch-tragacanth thickening,  $\text{Na}_2\text{CO}_3$ ,  $\text{C}_2\text{H}_5\text{O}$  and sulfoxalate. Other examples are given.

**Printing wool.** H. Th. Rohme. A.-G. Ger. 578,916, June 19, 1933. In printing wool with substantive or acid dyes, a 4-10% addn. of pyridine or its homologs or derivs. is given to the paste. Thus, the printing paste may consist of 2.7% dye, 21.3% water, 4% pyridine, 67% tragacanth, 3%  $\text{Na}_3\text{PO}_4$  and 2% NaCl.

5 **Printing wool.** I. G. Farbenind. A.-G. Fr. 753,141, Oct. 7, 1933. Fast printings are obtained on wool by application or discharge, with vat dyes, by adding amino-acetic acid or one of its salts to the printing or discharge pastes.

**Coloring cellulose derivatives such as cellulose acetate, etc.** George H. Ellis, Denis H. Mosby and Henry C. Olpin (to Celanese Corp. of America). U. S. 1,935,623, Nov. 21. The material is treated with unsulfonated azo dyes contg. an anthraquinone nucleus and an aminonaphthoic acid nucleus (no sapon. of the material taking place during the treatment). Numerous examples are given.

**Coloring cellulose acetate and similar cellulose esters.** George H. Ellis (to Celanese Corp. of America). U. S. 1,935,205, Nov. 14. Dyes are used such as those formed by coupling diazotized unsulfonated aminoxanthene derivs. with *p*-xylylene, cresidines, anisidines, *m*-phenylenediamine, nitro-*m*-phenylenediamine, *m*-aminophenol, monoacetyl-*m*-aminophenol, dimethyl-*m*-aminophenol,  $\alpha$ -naphthylamine,  $\beta$ -naphthylamine or 1-amino-2-methoxynaphthalene. The dyes or components may be applied to the cellulose esters or ethers in the form of aq. solns. of their salts, such as the hydrochlorides, or in the form of aq. suspensions or dispersions. Several examples with details of procedure are given. Cf. C. A. 28, 342'.

8 **Yarn-dyeing machine.** Friedrich Faigle and Carl Faigle. Ger. 578,938, June 20, 1933.

**Apparatus for producing mixed colors on fabrics, etc., by spraying.** Leopold Radó. Ger. 578,937, June 19, 1933.

**Fast-color reserves under ground dyeings.** Philippe Brandt, Emil Gubler and Ernst Tschan (to Durand & Huguenin, S. A.). U. S. 1,934,788, Nov. 14. See Fr. 40,862 (C. A. 27, 1520).

9 **Vats for dyeing stockings, etc.** Charles Callebaut and Julien de Blicquy. Fr. 42,694, Sept. 1, 1933. Addn. to 725,236 (C. A. 26, 4963).

**Fibrous materials.** Heberlein & Co. A.-G. Fr. 752,367, Sept. 21, 1933. Materials made from vegetable fibers are improved by treatment with a hydroxycuprammoniacal soln. contg. a small amt. of alkali hydrate, such that the amt. of free alkali is always below 1.5%. This treatment may be followed by mercerization with a concd. alk. soln.

**Greasing textile fibers and fabrics.** Walther Schrauth. U. S. 1,936,484, Nov. 21. Materials are treated with an ester of a fatty acid having less than 13 C atoms in the mol. and an aliphatic alc. having 8 or more C atoms in the mol. and having an I value below 15, *e. g.*, with lauryl propionate, cetyl acetate, etc.

**Bleaching fibers.** Kurt Schumacher. Fr. 752,283, Sept. 20, 1933. Fibers of linen, hemp, etc., are bleached by boiling with  $\text{Na}_2\text{CO}_3$ , treating with Cl, treating with  $\text{H}_2\text{O}_2$ , decocoting and finally treating with Cl.

**Wetting-out fibers.** A. Röchberg G. m. b. H., Georg Braun G. m. b. H. and Eduard Voit. Ger. 578,775, June 16, 1933. Animal fibers are wetted out in acid dye baths by using the products obtained by treating mineral oils with  $\text{H}_2\text{SO}_4$ . These may be washed before use. Examples describe the method applied to wool.

**Dressing textiles.** Georges Lefranc. Ger. 578,502, June 15, 1933. Textiles, especially rayon, are dressed with emulsions of oils, fats or resins to which colloidal  $\text{SiO}_2$  is added in addn. to the usual protective colloid. Examples are given.

**Oil emulsions for treating textiles.** August Chwala and Edmund Waldmann. Austrian 134,993, Oct. 25, 1933. A mixt. of a mineral oil with an animal or vegetable oil, fat or wax is treated with a strong sulfonating agent, *e. g.*, oleum or  $\text{HSO}_3\text{Cl}$ , and the product is washed, *e. g.*, with a salt soln., neutralized with an alkali or an org. base, and dild. with water. Alternatively, an animal or vegetable oil, fat or wax is treated with a strong sulfonating agent and the product, before it is washed or neutralized, is mixed with a mineral oil. Sulfonation may be effected in the presence of org. acids or their anhydrides, phenols, hydroaromatic or halogenated hydrocarbons, alcs., ketones, or  $\text{H}_2\text{P}_2\text{O}_7$  or its salts, or these substances may be added after the sulfonation but before neutralization. The emulsions may be mixed with an aq. casein soln. Examples are given.

**Apparatus for the wet treatment of textiles.** Richard Weise. Ger. 577,046, May 22, 1933. Addn. to 562,735 (C. A. 27, 1208).

**Bowking cotton goods.** Hanseatische Mühlenwerke A.-G. Ger. 578,561, June 15, 1933. The bowking lye is given an addn. of lecithin.

**Apparatus for conditioning yarn by moistening.** Charles F. Dulken. U. S. 1,935,261, Nov. 14. Various structural and operative details are described.

**Rayon Glanzstoff-Courtaulds G. m. b. H.** Brit. 397,253, Aug. 24, 1933. Rayon spinning-cakes or other bobbinless windings that have been treated with liquids and dried are wound off so that the inner and middle thread layers which correspond to the approx. horizontal portion of the shrinkage curve are wound separately from the outer layers. The thread obtained from the inner and middle layers shows very uniform shrinkage when subsequently wetted and dyes uniformly and is particularly suited for the production of woven fabrics. The non-uniform layers, which may be wound off first onto bobbins or into hanks, are moistened and dried to improve their shrinkage properties.

**Rayon.** Heberlein & Co. A.-G. Fr. 752,258, Sept. 20, 1933. Rayon threads are improved by submitting them to a torsion at least 4 times greater than the normal torsion, and preferably as accentuated as possible, winding or unwinding them in this state, moistening at a high temp., drying them and submitting them to a counter torsion in the opposite direction. The moistening may be effected by dipping the thread on a bobbin into boiling water.

**Silk and rayon.** Cäemische Fabrik vorm. Sandoz. Fr. 752,337, Sept. 20, 1933. These are dulled by treating the fibers successively by sol. salts of acids, the anion of which contains a metal of the 6th group and by sol. salts of polyvalent metals, the treatments being in either order. Thus a cloth contg. viscose and cotton is printed with a paste contg. Na tungstate, water and tragacanth, dried and passed into a soln. of  $\text{BaCl}_2$ . The cloth becomes dulled in places. If a dye is added to the printing paste,

colored mat effects are obtained. Other examples are given.

**Treating fabrics of cellulose derivatives such as cellulose acetate to render them less liable to develop faults.** George H. Ellis (to Celanese Corp. of America). U. S. 1,935,203, Nov. 14. The fabrics are impregnated with substances, such as xylene and a sulfonated soap, capable of swelling, without dissolving, the cellulose derivs., so as to increase the cohesion and coeff. of friction between the yarns of the fabric.

**Artificial threads.** British Celanese Ltd. and Percy F. C. Sowter. Brit. 397,137, Aug. 8, 1933. Yarns, especially of cellulose acetate or other org. derivs. of cellulose, having the appearance of spun yarn, *i. e.*, yarn made from staple fiber, are produced by subjecting a bundle of filaments in a softened condition to an operation, *e. g.*, stretching, whereby individual filaments are broken. For example, threads of  $\text{Me}_2\text{CO}$ -sol. cellulose acetate may be softened in 40–50% dioxane, or an equiv. concn. of diacetone alc., Et lactate, glycol monoacetate, Me glycol monoacetate or the like, and stretched to 300–500%. The yarn may be treated to lay the projecting ends and subjected to a gassing operation. The final twisting is preferably effected in the presence of a softening agent, *e. g.*, by means of a Topham box, whereby a more crinkled yarn is obtained.

**Apparatus for coating threads or ribbons with Cellophane, etc.** Soc. anon. des textiles synthétiques. Fr. 751,881, Sept. 11, 1933.

**Apparatus for bleaching textiles.** Firma Fr. Gebauer. Ger. 587,034, Oct. 28, 1933. Addn. to 492,058 (C. A. 24, 2616).

**Curling artificial fibers.** Heberlein & Co. A.-G. Brit. 397,046, Aug. 17, 1933. Artificial fibers are given a permanent wool-like curliness by twisting to at least 4 times the normal amt., preferably as much as possible, moistening at a relatively high temp., drying and then twisting in the opposite direction. Moistening is effected by steaming under pressure or by immersing the bobbins in (nearly) boiling  $\text{H}_2\text{O}$ , with or without wetting agents. Examples are given of the production of curled fibers from cuprammonium, viscose and acetate rayon yarns.

**Rubber-coated fabric.** John R. Couture (to E. I. du Pont de Nemours & Co.). U. S. 1,936,500, Nov. 21. In finishing rubber-coated fabric sheet material, an intermediate coat of varnish is applied over the rubber, and, over this intermediate coat, there is applied a final coat of steam-refined petroleum residue asphalt, and the product is baked. The intermediate coat is of a character to produce a more flexible film than the final coat.

**Rubber-coated sheet material.** Chester E. Linscott (to American Rubber Co.). U. S. 1,935,189, Nov. 14. Fibrous sheet material such as a textile fabric is coated on both sides with a solid deposit from latex having a subnormal content of water-solubles, the deposit on one side being insufficient in thickness to mask or completely level up the surface irregularities of the material and the rubber of this deposit being at least superficially combined with a heavy metal soap such as Zn stearate and a halogen such as Br, etc.

**Coated fabric for tire covers, etc.** Dale G. Higgins (to E. I. du Pont de Nemours & Co.). U. S. 1,934,711, Nov. 14. A textile fabric such as a teal or duck has superposed on its outer surface a light colored cellulose nitrate film contg. casein and glycerol, by which migration of the antioxidant contained in the tire and resulting discoloration is prevented when the material is used as a tire cover. Cf. C. A. 27, 5990.

**Washing and cleansing textile materials such as cotton, wool or shoddy.** Heinrich Ulrich and Curt Schuster (to General Aniline Works). U. S. 1,935,217, Nov. 14. An aq. bath is used comprising a soap, stripping reagent, etc., and an aliphatic ammonia deriv. contg. at least one hydroxyalkyl group, such as diethanolamine.

**Apparatus for removing the dirt and solid impurities in fatty water from wool washers.** James W. Adams. Ger. 578,856, June 17, 1933.

**Laundering method.** Robert A. Phair (to H. Kohn-

stamm & Co.). U. S. 1,935,603, Nov. 21. There is added, to wash water contg. suspended colored mineral matter such as Fe and Mn compds., a softener prepd. from a water-sol. fluoride such as NaF or Na silicofluoride,  $\text{Na}_2\text{CO}_3$  and an alkali metal phosphate, and washing is effected directly in the resulting wash water.

## 26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

**Practical evaluation of paints by exposure to weather and wind.** A. A. Kraeff. *Verfkronek* 6, 255 66(1933).—A description of the procedure for outdoor testing of paints on metal or wood at Bandung, Java. Loss of luster, of elasticity, pulverization, mold growth, bleaching, cracking, "alligatoring," blistering, chipping, erosion, beading, wrinkling, etc., were observed; photographs of the effects are given and details discussed. One conclusion is that no paint in one coat is able to protect iron against rust; a double coat is many times as durable as a single one. Single thick coats are liable to crack. Mold growth is prevented by the use of aged linseed oil (raw or boiled), no excess oil, fast drying, use of paint which gives a smooth, hard coat with high  $\text{BaSO}_4$  content. Added fungicides should be resistant to sunlight and mold and should not attack iron; none of the customary preps. has been found entirely successful. B. J. C. v d H.

**Carbon black in the paint industry.** J. W. Snyder. *Official Digest, Fed. Paint & Varnish Production Clubs* No. 130, 285 92(1933).—The color of C black is greatly influenced by mech. action, e. g., shaking, tamping, etc., moisture content, grinding conditions and vehicle. Until recently, the color has also been proportional to the oil absorption, but such is not the case with "new Process" pigments. G. G. Sward

**Is cork important in paint technology?** Fr. Kolke. *Farben-Chem.* 4, 338 40(1933).—Ground cork imparts to paints heat-insulating, shock-absorbing, acoustical and anticorrosive properties. In protecting the contents of a vessel from external heat, cork paints are very good, but in preserving heat in a vessel, cork paint is superior to most others. G. G. Sward

**Establishing technical expressions.** W. van Wullen-Scholtten. *Farben-Ztg.* 38, 1581-3(1933). Definitions of a no. of words used in paint technology are discussed. G. G. Sward

**Oil requirements and the structure of paints.** Hans Wolff and G. Zeidler. *Paint & Varnish Production Mgr.* 9, No. 12, 18, et seq.(1933); cf. C. A. 27, 3348, 28, 3186. G. G. Sward

**Examination of a few dry pigments.** W. L. A. Warner. *Verfkronek* 6, 267-8(1933); cf. C. A. 27, 5556.—For the analysis of chromate green (mixture of Prussian blue and chromate yellow) the methods of Kappelmeyer (C. A. 25, 5302) for sulfate content, basic Fe and  $\text{Fe}(\text{CN})_6$  content are recommended. For total Pb content the electrolytic method is proposed. For direct Pb chromate detn.: weigh 550 mg. pigment and transfer to a 100-10 cc. volumetric flask, add 10 cc. 4 N NaOH and heat gently to decompose, cool, fill up to 110 cc., shake and filter dry. Transfer 100 cc. filtrate to a 300-cc. stoppered Erlenmeyer flask, add 4 g. KI, 20 cc. 25% HCl and place the flask for 2 hrs. in the dark, then titrate with 0.1 N  $\text{Na}_2\text{S}_2\text{O}_3$ . B. J. C. van der Hoeven

**Chemical and physical properties of iron oxides.** Joseph W. Ayers. *Official Digest, Fed. Paint & Varnish Production Clubs* No. 130, 298-307(1933).—The following properties of typical Fe oxide pigments are given: chem. analysis, tinting strength, particle size, sp. gr., oil absorption, brightness, effect on drying time, hiding power and anticorrosiveness. G. G. Sward

**The role of ferrous chloride in the manufacture of Prussian blue and Mars yellow.** Geo. Zerr. *Farbe u. Lack* 1933, 533-4, 544.—Prussian blue prepd. with  $\text{FeCl}_2$  has a softer texture than that prepd. with  $\text{FeSO}_4$ . This property is probably assocd. with the gelatinous nature of the intermediate white prep of the former as contrasted with the low consistency of the sulfate white pulp. A sp. gr. table of  $\text{FeCl}_2$  solns. is given. G. G. Sward

**Printing inks—their composition and manufacture.** L. F. Engelhardt. *Oil, Paint and Drug Reporter* 124, 30M(1933).—The relation between printing inks and paint is briefly outlined. Printing processes are briefly described. G. G. Sward

**Some experiences with fires in varnish factories.** H. Deekert. *Farbe u. Lack* 1933, 496-7, 520, 535-6.—Ten cases of fires in varnish plants are discussed. G. G. S.

**The influence of the solvent on the viscosity of oleo varnishes.** Carl Boller. *Farben-Chem.* 4, 400-11(1933). The chem. influence of solvents on varnishes is very slight. On the other hand, the phys. influence is great. Tests with  $\text{C}_6\text{H}_6$ , benzine, trichloroethylene and  $\text{CCl}_4$  indicate that vis. of thinned varnishes are proportional to the vol. ratios of thinner used. G. G. Sward

**Coloring of black enamels.** W. Hutter. *Farbe u. Lack* 1933, 471.—The use of nigrosin, etc., in black enamels instead of lamp black or vine black avoids settling difficulties but introduces slow drying, a condition often resulting from the use of aniline dye pigments. G. G. Sward

**Chemical problems of the linoleum industry.** A. B. Miller and Foster D. Snell. *Ind. Eng. Chem.* 25, 1307 11(1933).—The oxidized oil-rosin binder of linoleum, while excellent for covering floors, has the faults of low water resistance and alkali resistance. Modification with synthetic resinoids offers promise. Chem. modification of the binder and processing would tend to reduce the h. p. and equipment required. Foster Dee Snell

**Decolorizing and bleaching processes for resins.** H. Anshagen. *Farbe u. Lack* 1933, 523, 532.—A brief review citing 45 patents. G. G. Sward

**The preparation of coumarone resin.** Shōzo Masai. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 583(1933).—As a source of prep. coumarone resin the fraction of crude benzene distg. between  $160^\circ$  and  $185^\circ$  was found best, the yield of resin was 0.17% by wt. of crude benzene. As polymerizing agent 1 to 3 vols. % of 66° B $\phi$ .  $\text{H}_2\text{SO}_4$  was found preferable. Karl Kammermeyer

**Azo dyes [pigment in the lacquer industry]** (Ger. pat. 582,890) 25. Oils from rubber [use in the prep. of paints and varnishes] (Brit. pat. 397,136) 30. Hydroxy-alkyl cellulose [products for use in the manuf. of varnishes] (Brit. pat. 397,116) 23. Cellulose ethers [products used in the manuf. of varnishes] (Brit. pat. 397,117) 23. Cellulose derivs. [use in the prep. of varnishes] (Brit. pat. 397,404) 23. Disazo dyes [use in coloring varnish lacquers] (Brit. pat. 395,820) 25.

**Paint.** Albert G. Rodwell. *Fr.* 753,182, Oct. 9, 1933. A pigment or coloring material is added to a vehicle prepd. by impregnating gelatinous  $\text{SiO}_2$  with a soln. of rubber latex (in water or a soln. of borax or other alkali) and adding a soln. of an alkali silicate. The proportion of gelatinous  $\text{SiO}_2$  or latex soln. in the mixt. of these 2 constituents is between 3% and 66%. Lithopone or Al powder may be used as coloring material.

**Priming composition for paints.** Egon Meier. *Ger.* 578,154, June 10, 1933. Addn. to 548,992 (C. A. 26, 4180). The compn. contains tetrahydronaphthalene,  $\text{Ca}(\text{OH})_2$ , cellulose lacquer, oil or fatty acids, and filling material.

**Cleaning and preparing metal for painting.** Howard R. Neilson (to H. E. Westervelt). U. S. 1,935,911, Nov. 21. A cleaning compn. is formed contg.  $\text{H}_3\text{PO}_4$  and a soap-like glucoside such as saponin and is substantially free from oils, waxes and greases. The mono-butyl ether of ethylene glycol and a small proportion of oleic acid also may be used.

**Pigments.** Imperial Chemical Industries Ltd. Fr. 751,957, Sept. 13, 1933. Inorg. or org. pigments are improved by grinding with a sulfonic acid or a sulfuric ester, the mol. of which contains an aliphatic chain of at least 8 C atoms, *e. g.*, the sulfuric ester of dodecyl, cetyl, oleyl or stearyl alc. The grinding is carried out in the absence of water, or with water and subsequent drying.

**Titanium pigments.** Titanium Ltd. Ger. 578,736, June 16, 1933. See Fr. 685,893 (C. A. 24, 6040) and Can. 305,012 (C. A. 25, 833).

**Luminescent colors.** I. G. Farbenind. A.-G. Fr. 751,709, Sept. 8, 1933. Luminescent colors are incorporated in polymerized styrene, polymerized vinyl naphthalene, polymerized vinyl tetrahydronaphthalene or their homologs.

**Stabilizing organic salts used as driers.** I. G. Farbenind. A.-G. Brit. 397,276, Aug. 24, 1933. Heavy, earth metal or alk.-earth metal driers, *e. g.*, Co naphthenate or resinate, are stabilized and their solubilities in org. solvents improved by adding up to 10% of solid satd. fatty acids or solid free carboxylic acids of the lower members of the olefin or aromatic series, their substitution products, which may have the Me, OH, Cl, NO<sub>2</sub> or sulfo group at the nucleus, and derivs. with at least 1 free COOH group in the side chain. The following stabilizers are referred to: stearic, palmitic and benzoic acids, mixed crotonic and arachidic acids, mixed hippuric and salicylic acids, mixed mandelic, and cinnamic acids, mixed anthranilic and hydrocinnamic acids and mixed aminophenylacetic, palmitic, benzoylbenzoic acids. The stabilizers are added immediately after the manuf. of the drier or, where the drier is produced by the action of an alkali metal salt of the drier acid on a salt of the drier metal, during the course of pptn. if desired. Cf. C. A. 27, 2050.

**Lithographic ink.** John G. Goedike. U. S. 1,935,629, Nov. 21. A plate oil is used together with wool fat, an aq. dispersion of gum arabic and a pigment.

**Lithographic materials.** Richard Berger. Brit. 397,365, Aug. 24, 1933. Siccativ materials of the kind used in oil painting, *e. g.*, Zn salts, Pb<sub>3</sub>O<sub>4</sub>, PbO, Pb(OAc)<sub>2</sub>, pyrolusite and manganous oxalate and borate, are used in the production of sheet metal or paper lithographic plates inscribed with lithographic ink from a typewriter ribbon or otherwise produced for office purposes. The siccatives, which may be mixed with the ink immediately before hand inscribing or dusted on afterward if the inscription is done with a typewriter, are suitable for use with ordinary inscribing inks contg. waxes, fats, resins, soaps, solvents and coloring matter.

**Coating compositions.** Herbert O. Albrecht (to E. I. du Pont de Nemours & Co.). U. S. 1,936,534, Nov. 21. A coating compn. which is suitable for baking on metals comprises a drying oil and a soln. in a hydrocarbon solvent of a phosphate of a triethanolamine ester of a fatty or resinic acid.

**Coating compositions.** The Goodyear Tire & Rubber Co. Fr. 753,027, Oct. 5, 1933. Coatings are made by mixing a pigment and a deriv. or transformation product of rubber in a cylinder grinding mill until a homogeneous sheet is obtained and dissolving the sheet in an appropriate solvent. The rubber deriv. may be that obtained by the action of chlorostannic acid on Sn. A plastifying agent such as linseed oil, butyl stearate or ethyl abietate may be added.

**Protective coating.** Elektrochemische Werke München A.-G. Fr. 752,222, Sept. 19, 1933. A protective coating for more or less porous surfaces consists of an aq. colloidal soln. of wood oil, polymerized by heating.

**Varnishes, paints, etc.** I. G. Farbenind. A.-G. (Friedrich Meidert, inventor). Ger. 578,586, June 29, 1933. The deposition or gelatinization of drying substances in volatile org. solvents, *e. g.*, in varnishes, etc., is prevented by addn. of free aromatic carboxylic acids, their homologs, substitution products or derivs. BzOH and its derivs. are especially effective.

**Varnishes and priming compositions.** Erich W. Frenkel and Alexander Brust (to Pittsburgh Plate Glass Co.). U. S. 1,936,230, Nov. 21. Blown linseed oil is treated

with less than 5% of S chloride, and the material is mixed with a thinner and a drier.

**Apparatus for testing the hardness of materials such as painted and varnished surfaces.** George G. Sward. U. S. 1,935,752, Nov. 21. Mech. features.

**Lacquers.** Lanning P. Rankin (to Hercules Powder Co.). U. S. 1,935,917, Nov. 21. Nitrocellulose is used together with products of a terpene alc. such as  $\alpha$ -terpineol having one double bond which has been ozonized and then heat treated.

**Colored lacquers, etc.** Soc. pour l'ind. chim. à Bâle. Ger. 583,650, Sept. 7, 1933. Addn. to 564,067 (C. A. 27, 1203). As equalizing agents for lacquers, plastic masses, etc., contg. dyes insol. in water and in alc., use is made of org. acid amides which are readily sol. in alc. but scarcely sol. in water.

**Ornamenting surfaces.** Leo J. Mitchell. U. S. 1,935,213, Nov. 14. Metal or wood surfaces are coated with a resinous base compn. such as a varnish or lacquer and over this there is applied a thin layer of a halogen salt of Bi such as Bi oxychloride and the article is then baked in order to give a lustrous finish.

**Plastic masses.** Xenia Winter. Ger. 582,936, Aug. 25, 1933. Masses for hot pressure molding are prepd. by introducing cement into dry or hot water-swelled Japanese lacquer.

**Plastic and resinous compositions.** Soc. Nobel française. Fr. 750,318, Aug. 8, 1933. Violent reactions are avoided in the polymerization of vinyl esters and the final resin is more easily removed from the vessel if water is added during the polymerization. The later the addn. of the water the harder is the resin obtained. Examples are given of the polymerization of vinyl acetate in the presence of benzoyl peroxide. Fr. 750,349. Plastic materials are composed of polymerized vinyl acetate and cellulose esters, with or without plastifiers. They may be used as a substitute for celluloid. Fr. 750,350. Condensation products are obtained by the action of aldehydes on vinyl esters, more or less saponified. Org. solvent and external heat are not required.

**Resin acid derivatives.** Chemische Fabriken Kurt Albert G. m. b. H. Ger. 578,827, June 17, 1933. Addn. to 554,701 (C. A. 26, 6165). Resin acids are treated with compds. of the general formula R<sub>1</sub>-CONR<sub>2</sub>R<sub>3</sub>, where R<sub>1</sub>, R<sub>2</sub> and R<sub>3</sub> represent H or org. residues, which b. above 200°. Thus, Congo copal is heated to 300° with AcNH<sub>2</sub> to give a copal amide product m. 58-67°. Other examples are given. The products are used for therapeutic and chem. purposes.

**Resins.** Bakelite G. m. b. H. (Ernst Elbel, inventor). Ger. 578,712, June 16, 1933. Resin is rendered non-inflammable by leading a gaseous flame extinguisher, such as NH<sub>3</sub> or HCl, into the plastic mixt. of resin and org. filling material (*e. g.*, sawdust) before molding.

**Resins.** Firma Louis Blumer. Ger. 582,546, Aug. 16, 1933. Resin-like products are obtained by partly or wholly esterifying the free OH groups in phenolic resins. Thus, the resin obtained by condensing cresol alc. and CH<sub>3</sub>CICH<sub>2</sub>OH is heated with colophony in an atm. of CO<sub>2</sub> to give a resin-like product. Other examples are given.

**Resins.** Friedrich C. Bunge. Ger. 582,728, Aug. 21, 1933. Phenols are heated with primary monohydric alcs. and O under pressure in the presence of O-carrying catalysts such as V salts, Pd or Pt. Thus, PhOH is heated with MeOH and O at 20 atm. in an autoclave, alk. V soln. being present. Other examples are given.

**Resins.** I. G. Farbenind. A.-G. (Karl Ott and Friedrich Frick, inventors). Ger. 578,570, June 15, 1933. Resin-like products are obtained by condensing tertiary org. bases contg. at least 2 hydroxyalkyl groups attached to the N atom with monobasic or polybasic acids or both in the warm, till the product is insol. in aq. acids. Thus, trihydroxyalkylamine may be condensed with fresh natural resins such as colophony. Or dihydroxyethylaniline may be condensed with (CO<sub>2</sub>H)<sub>2</sub>. Other examples are given. The products can be used as elec. insulators.

**Resins.** I. G. Farbenind. A.-G. (Josef Binapfl, inventor). Ger. 581,956, Aug. 8, 1933. Resins are produced by condensing phenols with natural resins at about room temp. in the presence of a condensing agent, such as  $\text{BF}_3$ . Thus, colophony is condensed with cresol in the presence of  $\text{CCl}_4$  and  $\text{BF}_3$  to give a thick mass suitable for use in the varnish industry. Other examples are given.

**Condensation products.** I. G. Farbenind. A.-G. (Josef Binapfl, inventor). Ger. 582,846-7, Aug. 23, 1933. Addns. to 581,956 (preceding abstr.). The method of 581,956 for condensing phenols with natural resins is modified by condensing esters of the latter with phenols in the presence of condensing agents, at high or low temps. Thus, the glycerol ester of colophony is condensed with crude cresol in the presence of  $\text{BF}_3$ . Other examples are given (582,846). The phenol-natural resin condensation products of 581,956 can be treated with aldehydes to give resins. Examples are given (582,847).

**Condensation products.** August Nowack A.-G. (Reinhard Beutner and Richard Hessen, inventors). Ger. 582,195, Aug. 10, 1933. Addn. to 536,552 (C. A. 26, 1400). The method of 536,552 for obtaining resins by treating crude tar oils to which hydrocarbons are added, with  $\text{CH}_2\text{O}$ , is applied to the fraction boiling below  $205^\circ$  obtained by distg. crude tar oil, alk. condensing agents being present. The addn. of further hydrocarbons is optional in the later patent. Examples are given.

**Condensation products.** Chemische Fabriken Kurt Albert G. m. b. H. Ger. 582,954, Aug. 25, 1933. Diarylketone carboxylic acids are heated with polyhydric alcs. at temps. above  $150^\circ$ , with or without condensing agents, till a resinous mass results. Diarylketone carboxylic acids of the general formula  $\text{HOOC-R-CO-R'-COOH}$ , in which R and R' are aromatic residues, are used. Thus, glycerol is condensed with benzophenone-2,4'-dicarboxylic acid. Natural resin acids, fatty oils or drying oils may be added.

**Synthetic resins.** Allgemeine Elektrizitäts-Ges. (to International General Electric Co., Inc.). Brit. 395,880, July 27, 1933. Molding substances are manufd. from the ingredients of aromatic amine-aldehyde resins in a single condensation process by working the resin-forming components and filling materials, with or without coloring material and plasticizing agents, in the absence of solvents on a heated rolling mill, with or without previous mixing. Condensation and polymerization accelerators may be added. Among examples (1) wood meal, paraformaldehyde,  $\text{PhNH}_2$ , phthalic acid and coloring matter are

worked in a rolling mill at  $120-40^\circ$  to produce compacted sheets which may be further worked on the roller and (2) wood meal,  $\beta$ - and (or)  $\alpha$ -naphthylamine, crotonaldehyde,  $\text{BzOH}$  and coloring matter are similarly worked and the product is powdered. Cf. C. A. 28, 352<sup>a</sup>.

**Synthetic resins.** Allgemeine Elektrizitäts-Ges. Ger. 578,707, June 16, 1933. In prep. synthetic resins from polyhydric alcs. and polybasic acids, a drying oil is added before or during the process. The oil may be added to one of the components, e. g., the acid. Thus, linseed oil is dissolved in phthalic acid anhydride. Glycerol is then added and the whole heated to give a resin.

**Synthetic resins.** I. G. Farbenind. A.-G. (Josef Binapfl, inventor). Ger. 582,848, Aug. 23, 1933. Resin-like products obtained by condensing natural resins or resin acids with phenols or their substitution products are esterified by alcs. and the products treated with aldehydes. Thus, colophony in  $\text{CCl}_4$  is condensed with crude cresol in the presence of  $\text{BF}_3$ . The product is esterified by heating with glycerol and the final product treated with  $p\text{-CH}_3\text{O}$ . Other examples are given.

**Synthetic resins.** I. G. Farbenind. A.-G. Fr. 753,001, Oct. 5, 1933. A methylol compd. of urea is submitted to an acid condensation in an alc. solvent in the presence of an ester contg. an OH group and derived from a fatty acid contg. at least 10 C atoms, the reaction mixt. is neutralized, the solvent removed and the resinous product is heated to  $80-130^\circ$  until it becomes sol. in aromatic hydrocarbons. Glycerol esters of linoleic and ricinoleic acids may be used.

**Synthetic resins.** Soc. pour l'ind. chim. à Bâle. Fr. 751,801, Sept. 11, 1933. Condensation products sol. in water and having the character of reversible gels are prepd. in the dry state or as solns. by condensing urea or thiourea or their derivs. or mixts. with  $\text{CH}_2\text{O}$  or substance yielding it, without going beyond the hydrophilic stage, carefully drying the solns. obtained, preferably in the absence of condensation accelerators, and dissolving the dry product to a clear hydrosol suitable for the prepn. of varnishes, impregnating materials or molding powders, in the presence or absence of fresh amts. of substances capable of condensing. Cf. C. A. 28, 605<sup>a</sup>.

**Synthetic resins.** Armin Spitzer. Fr. 752,231, Sept. 19, 1933. Hardenable resins fast to light are made by causing aldehydes to react with at least 3 materials, one an aromatic sulfamide, one a phenol and one a carbamide. In an example a resin is made from  $p$ -sulfotolueneamide 500,  $\text{PhOH}$  50, urea 250 and  $\text{CH}_2\text{O}$  soln. (37%) 1500 g.

## 27.-FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

The reaction of castor oil with citric acid and phthalic anhydride. Ryohei Oda. J. Soc. Chem. Ind., Japan 36, Suppl. binding 623 5(1933); cf. C. A. 28, 608<sup>a</sup>.—Expts. were carried out at atm. and reduced pressure and temps. of  $150^\circ$  to  $170^\circ$ . Some reaction between the substances was noted in both cases. K. Kammermeyer

**Bleaching of palm oil with bleaching earths.** W. Schaefer and G. Bitter. Seifensieder Ztg. 60, 789-91 (1933).—S. and B. describe a bleaching process for palm oil in which the oil is rapidly stirred at  $130^\circ$  for 1 min. with 4% of bleaching earth plus 0.10-0.30% concd.  $\text{H}_2\text{SO}_4$  (exact amt. detd. by preliminary test); 10 min. addnl. stirring results in a color equal to a bleach with 10% earth. P. Escher

**Bleaching of palm oil at Serdang.** C. D. V. Georgi and T. D. Marsh. Malayan Agr. J. 21, 505-6(1933).—Air bleaching tests with a catalyst Co borate were carried out as follows: oil from a De Laval separator was heated to  $90^\circ$  with closed steam in an iron tank while being agitated with air through a perforated pipe. About 0.01% of powd. Co borate was then dusted over the oil and color changes were noted at the end of 1 and 2 hrs. The max. change occurs at  $2\frac{1}{2}$  hrs. The bleaching effect is permanent for more than 1 yr. E. Scherubel

**Sampling of oil-press cakes.** R. Heublyum. Seifensieder Ztg. 60, 807-8, 828(1933).—The oil content of press cakes decreases from the top of the press toward the middle and increases again toward the bottom. In the individual cakes the oil content decreases from the center toward the edge, the difference amounting to 1% and over. Protruding edges may contain a high percentage of oil. A sampling method is outlined according to which a no. of samples are cut, increasing from the center to the edge, to represent the av. oil content. P. Escher

**Examination of soy-bean lecithin products.** L. Allen. Fettchem. Umschau 40, 218-19(1933).—To distinguish between soy-bean lecithin and egg lecithin A. exts. the oil with acetone, evaps., saponifies, seps. the liquid fatty acids and dets. in the latter the hexabromide no. which is considered proof of the presence of soy-bean oil, accompanying the soy lecithin. P. Escher

The influence of package and storage upon the quality of toilet soaps. F. W. F. Freise. Seifensieder Ztg. 60, 833-4(1933).—Toilet soaps in colored wrappers lose aroma when exposed to direct sunlight for 4-6 weeks in the following color order: violet, blue, yellow, red; green and black protect the aroma well. A list of some 20 essential oils is given in the order of greatest permanence, headed by pine-

needle and -cone oil and gaultheria. In cold-made soaps the addn. of lard or refined castor oil seems to destroy the original coconut oil aroma in sunlight as well as diffused daylight more quickly than addn. of olive oil, although chem. analysis shows no change in the soap. Very dry and very moist air are detrimental to aroma and surface appearance; 70-75% humidity at 23° is most favorable (in Brazil) for unwrapped cold-made soaps. Among the injurious gases are CO, SO<sub>2</sub>, kettle vapors, CO<sub>2</sub>, etc.

P. Escher

**Testing the cleansing ability of soap solutions by means of washing tests.** B. Tyutyunnikov and A. Soboli. *Seifensieder Ztg.* 60, 787-9, 808-9 (1933).—An elaborate washing test has been developed to imitate factory conditions: Standardized test pieces of fabrics are cleansed and their whiteness is detd. by a photometer; they are formed into sacks and filled with 15 g. of glass beads; they are soiled in 3 different standardized ways, washed in a rotating chambered drum at 20-40° and at 85° with soap solns. equal to 0.40% fatty acids at 60 revolutions per min. for 7½ min., then rinsed 3 times (the last rinsing with acidified H<sub>2</sub>O), dried, ironed and tested again for whiteness; a soiled test piece washed only in distd. H<sub>2</sub>O is used as a standard. The detergent power is expressed as the ratio of how much better than distd. H<sub>2</sub>O the soap has removed the dirt.

P. Escher

**Sodium petroselinate as a soap.** Jirō Mikumo. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 632-3 (1933); cf. C. A. 21, 1041.—CH<sub>3</sub>(CH<sub>2</sub>)<sub>10</sub>CH:CH(CH<sub>2</sub>)<sub>4</sub>COONa dissolves well in water at room temp. and the viscosity of the fresh aq. soln. is practically identical with that of Na oleate at 20° in the concn. range of 0.1-1.0%. The surface tension of the soln. is smaller than that of Na oleate and somewhat greater than that of Na elaidate above 45°. Exptl. data for surface tension at 20, 45 and 60° and suspending power for TiO<sub>2</sub> powder are presented. Petroselinic acid will make a soap similar to oleate soap or better in detergency.

Karl Kammermeyer

**Antibacterial properties of soaps.** Emil Klarmann. *Soap* 9, No. 12, 23-7, 107-9, 111, 113, 115 (1933).—A survey of work on this subject to date is reported. There are many regularities to be found in the relationship between the chem. constitution and the antibacterial action of c. p. soaps. In the homologous class of soaps of satd. fatty acids the antibacterial action is a direct function of the length of the C chain, the position of the max. effect varying with regard to the different bacteria. The soaps of unsatd. fatty acids display an almost specific efficacy against pneumococci and certain streptococci while showing little action upon staphylococci or the organisms of the typhoid-colon group under conditions comparable to those in practical use. Among the several homologous series of substituted soaps studied that of the α-bromo soaps contains some compds. of a rather extraordinary bactericidal potency. A no. of investigations demonstrate conclusively that certain important pathogenic microorganisms are not likely to succumb to the action of the tech. soaps under the customary conditions of use.

E. Scherubel

**New kettle practice.** Geo. S. Tate. *Soap* 9, No. 12, 59-60 (1933).—A method using lyes of unusually high concn. has been worked out as follows for tallow, coconut-oil soaps: Grain the nigre and at the same time add enough tallow more than to take up the free alkali. After settling, draw off the spent lye. Bring the mass to a boil and run in the coconut oil. Concurrently, in the proper sapon. proportions lye of 45-50° Bé. is run in with steam on. At the same time salt is added to the extent of 6-8%. After the coconut oil, run in the tallow and treat with alkali in the same manner and at the same time add enough 8° Bé. brine to keep the mass to 20-30% H<sub>2</sub>O content. About 0% salt should always be present in the kettle contents. When the fat charge is all in, 98-99% of the NaOH should be in. By this method the kettle has the appearance of an opaque stiff paste and boils in a puffy manner. The advantage of this method is that the kettle is at all times under chem. control and no "middle soaps" are formed. Charging can also be done in one

operation and larger charges made because the mass boils down instead of swelling up. A saving in steam consumption is also attained as much greater use is made of the heat of reaction. A distinctly better appearing and keeping product is also obtained.

E. Scherubel

Rambiazina oil [used in soap making] (Fr. pat. 752,093)

17. Device for filtering oils (U. S. pat. 1,935,136) 21.

**Hydrophilization of fats.** Emilio Gottardo. Fr. 751,951, Sept. 13, 1933. Fatty substances, particularly of mineral origin, are hydrogenated and rendered hydrophile by the action of supersatd. salt solns. of all kinds. Thus, petrolatum is heated to boiling with a supersatd. soln. of NaCl, MgCl<sub>2</sub>, CaCl<sub>2</sub> or FeCl<sub>3</sub>. The properties of the hydrophile petrolatum obtained vary according to the salt used.

**Device for charging rotary cooling drums with liquid fats, fat emulsions, etc.** Schroder & Co. Kuhlstrommel-u. Apparatebau and Rudolf Knollenberg. Ger. 578,093, June 16, 1933.

**Greases.** Gustav J. C. Beckmann. Fr. 751,935, Sept. 12, 1933. Consistent greases are made by mixing whale oil decomposed to about 56% and castor oil decomposed to about 49% with one or more other fatty acids decomposed to about 75%, e. g., bone grease or suet, and adding a mineral oil in the presence of NaOH or KOH.

**Fatty acids.** I. G. Farbenind. A.-G. (Christoph Beck, and Heinrich Diekmann, inventors). Ger. 578,779, June 16, 1933. Fatty acids and technically useful salts or salt solns. are obtained by sapon. the oxidation products of hydrocarbons and treating the resulting fatty acid salts of alk. or alk. earth metals with dil. aq. HNO<sub>3</sub> at temps. below 100°. The dil. HNO<sub>3</sub> is led into the aq. soap soln. from below and is not allowed to come into contact with the upper fatty acid layer. This is removed leaving the lower aq. salt soln., which can be worked up into the solid salt if desired. Examples are given. Cf. C. A. 27, 4817.

**Separating mixtures of stearin and olein.** Ernst A. Mauersberger. Ger. 578,858, June 17, 1933. The mixt. is heated and dissolved in toluene or xylene. The soln. is given an addn. of a low-mol. alc. or ketone and cooled. The stearin seps. out and is filtered off and the olein is obtained by driving off the hydrocarbon and the alc. Examples are given. Cf. C. A. 27, 4945.

**Separating fatty acid mixtures.** Ernst A. Mauersberger. Ger. 579,937, July 3, 1933. Addn. to 578,858 (preceding abstr.). The method of 578,858 for sepg. stearin and olein by dissolving them in toluene or xylene is modified by adding water, or aq. alc. or ketone during or after the dissolving process.

**Apparatus for distilling fatty acids, mineral oils, etc.** Carl H. Keutgen. Ger. 578,857, June 17, 1933.

**Sulfonated higher fatty acid esters.** Alfred Rheiner and Jacob Link (to Chemische Fabrik vorm. Sandoz). U. S. 1,936,205, Nov. 21. Products having good wetting, cleansing and emulsifying properties are obtained by the action of H<sub>2</sub>SO<sub>4</sub> on esters of fatty acids of high mol. wt. of derivs. of polyhydric alcs. in which the hydroxylic groups are partly or completely replaced by halogen, alkoxy, aryloxy, aralkyloxy or carboxyalkyl groups, such as the oleic ester of the monoethyl ether of glycol, the oleic ester of α-glycerol monoxylyl ether, the oleic ester of com. glycerol dichlorohydrin, the oleic ester of diethylene glycol monobutyl ether or the oleic ester of glycerol monochlorohydrin (details of treatment of all of which are given).

**Hydrogenated oils.** Dietrich Hildisch. Fr. 751,735, Sept. 8, 1933. See Brit. 397,039 (C. A. 28, 609<sup>a</sup>).

**Tall oil.** I. G. Farbenind. A.-G. (Robert Held and Hans Franzen, inventors). Ger. 578,843, June 17, 1933. High-mol. fatty acids are obtained from tall oil by esterifying the acids with di- or trihydric aliphatic alcs. and subjecting the resulting product to an autoclave cleavage, so that only the fatty acids are effected. The liberated fatty acids are then sepd. from the resin acid esters and alcs. in the usual way. In an example, tall oil refined by distn.

contg. 35% resin acids and 8% unsaponifiable substance is treated with excess of glycerol and a small amt. of Sn powder. On heating for 4 hrs. to 230°, the fatty acids are esterified. The product is then heated to 180° in an autoclave with an equal amt. of water and a small amt. of Zn dust. The fatty acids are freed and are obtained by steam distn. The distillate contains an 85% yield.

**Use of solvents such as xylene and gasoline for extracting oils from waste fish and similar materials.** Charles S. Ash (to Calif. Packing Corp.). U. S. 1,934,677, Nov. 14. Various details of app. and operation are described in connection with which an azeotropic mixt. of the solvent with water is formed and vaporized, water being sepd. and the solvent used cyclically.

**Disemulsifying and improving soy-bean material.** Egon C. Winkler and Hubert Goller. U. S. 1,936,281, Nov. 21. Readily sol. substances are extd. by dialysis with water at a pressure other than atm. pressure (suitably either sub- or super-atm. pressure) and at a temp. of 65-80° so that the seed cases of the beans act like a semi-permeable diaphragm. App. is described.

**Material for candle manufacture.** James Egan and Victor Mills (to Procter & Gamble Co.). U. S. 1,935,946, Nov. 21. Paraffin scale is mixed with split fatty acid of a hydrogenated oil hydrogenated to an I value of 5 or less.

**Wax conversion products.** I. G. Farbenind. A.-G. Fr. 751,795, Sept. 9, 1933. Natural or artificial ester waxes, such as carnauba or beeswax, wool grease or spermaceti are heated with amines contg. at least one replaceable H atom joined to N, e. g., ethanalamine, NH<sub>2</sub>, MeNH<sub>2</sub>, PhNH<sub>2</sub>, piperidine, etc., to form products which are more easily dispersed in water and have a higher reactivity in chem. transformations, e. g., sulfonation. The hydrophilic properties may be further increased by alkylation, acylation or salt formation. Examples are given.

**Soap.** Adolf Welter. Ger. 587,063, Oct. 30, 1933. Soap which has been bleached with HOCl is deodorized by heating it under pressure with a soln. of caustic alkali or alkali carbonate or with NH<sub>3</sub> or an amine or a salt thereof.

**Cleaning and other agents.** Oranienburger chemische Fabric A.-G. (Kurt Lindner and Johannes Zickermann, inventors). Ger. 582,790, Aug. 23, 1933. An agent for cleaning, emulsifying, wetting, etc., is prepd. by treating natural or synthetic fats, fatty acids or fat-like substances with condensable lactones, alcs. or ketones, in the presence of water-removing sulfonating agents such as H<sub>2</sub>SO<sub>4</sub> halohydrins; the product is then partly or wholly neutralized. Thus, olein, iso-PrOH and ClHSO<sub>3</sub> are heated to give a wetting agent. Other examples are given.

**Wetting and other agents.** Deutsche Hydrierwerke A.-G. Brit. 396,774, Aug. 11, 1933. Products resembling Turkey-red oils are prepd. from unsubstituted, unsatd. ali-

phatic and cycloaliphatic alcs. contg. not less than 8 C atoms by treating with an acylating agent and then with sulfonating agent. The sulfonation produces satn. of the double bond(s) but with further treatment the OH group is replaced by a sulfuric ester group with removal of the acyl group. If the 2nd stage is effected with ClHSO<sub>3</sub>, the acylating agent may be recovered, e. g., as AcCl. By hydrolysis of the disulfonated products dihydroxy derivs. are obtained. Among examples (1) com. oleic alc. is acetylated with AcCl, sulfonated with H<sub>2</sub>SO<sub>4</sub> and neutralized and (2) the fatty alcs. from sperm oil are treated with Ac<sub>2</sub>O and then with H<sub>2</sub>SO<sub>4</sub>; after prolonged treatment the product is boiled with H<sub>2</sub>O and the hydrolysis completed with soda lyc, whereby a hard wax is obtained which may be emulsified by means of soapy substances.

**Wetting and other agents.** Henkel & Cie., G. m. b. H. Brit. 397,445, Aug. 24, 1933. Org. thiosulfates having saponaceous properties are prepd. by reaction of salts of H<sub>2</sub>S<sub>2</sub>O<sub>4</sub> with esters, including thioesters, of aliphatic, hydroaromatic or aliphatic-aromatic OII or SH compds., having at least 6 C atoms, with carboxylic acids contg. reactive halogen atoms. In an example dodecylchloroacetic ester is treated with Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub>. The esters may be derived from benzyl, β-phenylethyl, naphthene and resin alcs., polyhydric alcs. and mercaptans, hydroxy fatty acids and their esters and amides, oxyalkylethers and oxyalkylthioethers of the higher alcs. and oxyalkyl esters of fatty acids. Other halogenated acids mentioned are monobromosuccinic, dichloroacetic, α-bromolauric, benzylchloride-4-carboxylic, 2-chlorobenzoic and 5-sulfo-2-chlorobenzoic.

**Wetting and other agents.** I. G. Farbenind. A.-G. Fr. 751,652, Sept. 7, 1933. Sulfonation products of aliphatic carbinols are prepd. by reducing the condensation products of aliphatic ketones or of a mixt. of ketones and treating with the usual sulfonation agents. Condensation products of ketones obtained by alk. or acid treatment may be used. Examples are given of products obtained from mesityl oxide, a mixt. of mesityl oxide and phorone (from crude acetone) and from condensation products of methyl ethyl ketone and methyl propyl ketone.

**Wetting and other agents.** Soc. anon. des matières colorantes et produits chimiques de Saint-Denis and Jean P. Sisley. Fr. 753,055, Oct. 6, 1933. Wetting, cleansing dispersing agents are made by simultaneously sulfonating oleyl oleate and one or more fatty alcs. of high mol. wt. (e. g., cetyl or oleyl) in the presence of catalysts.

**Wetting and other agents.** Ernst A. Mauersberger. Fr. 753,080, Oct. 6, 1933. Wetting, bleaching, dispersing, impregnating agents are made by esterifying aliphatic alcs. of higher or very high mol. wt. with boric acid and sulfonating the esters with anhyd. sulfonating agents, without dissociating the boric acid groups. Examples are given.

## 28- SUGAR, STARCH AND GUMS

J. K. DALR

**Nomogram for the recovery of sucrose in sugar factories.** Auguste Esnouf. *Arch. Suikerind.* 41, 678-9 (1933).—Three nomograms have been prepd. which give the sucrose recovery, calcd. by the *s-i-m*-formula, and the recovery of sugar of given sucrose content, from raw materials ranging in purity from 40 to 60, from 60 to 75, and from 75 to 95.

F. W. ZERBAN

**Effect of single ions on the solubility and on the rotation of sucrose.** H. W. Kunst. *Arch. Suikerind.* 41, 657 (1933); cf. C. A. 27, 5571.—In the previous study on this subject the effect of the salts or ions on the rotation of sucrose was not considered. This effect has now been detd. and the necessary corrections to the soly. data have been applied, but they did not alter the sequence of the ions previously found. The effect of the ions on the rotation closely follows the lyotropic series: Mg-Ca-Sr-Ba; F-NO<sub>3</sub>-Cl-CNS-Br-I, instead of F-Cl-Br-NO<sub>3</sub>-I-CNS; and Li-K-Na, instead of Li-Na-K. In general the polarization depression is the greater, the smaller the

hydration of the ions, but other factors evidently also play a part.

F. W. ZERBAN

**Electrical control and regulation of  $p_H$  in sugar factories.** V. Khainovsky. *Arch. Suikerind.* 41, 111, Mededel. Proefsta. Java-Suikerind. 631 729(1933).—An instrument has been developed for factory use, to be placed at the various stations for guiding the operators. The electrode pair consists of an Sb rod with surface oxide film and a calomel half-cell with satd. KCl soln. The electrode vessels are arranged in various ways to suit the different factory operations, but always so that the juice passes through the vessel at a given const. velocity. The  $p_H$  meter is a Wheatstone bridge with triode tubes, and a ma. meter as indicating instrument, visible at a distance. Detailed directions, with drawings, are given for the construction of the entire equipment in the factory work shop, for its installation, calibration, practical use and periodic inspection. A complete list of the parts to be purchased is appended.

F. W. ZERBAN

**Filtration in the sugar industry. Specification of the filterability of precipitates.** P. Honig and W. Thomson. *Arch. Suikerind.* 41, 111, *Mededel. Proefsta. Java-Suikerind.* 803-83 (1933).—In a systematic investigation of new filtration procedures it was found necessary to study the filtering qualities of the pptts. obtained in factory operation. Special small-scale equipment constructed for the purpose is described and illustrated. If there is no initial resistance or other disturbing factor, the square of the volume  $V$  of filtrate, obtained under const. pressure, multiplied by a const., equals the time  $t$ . The const. varies with the properties of the slurry. In filtration through cloth or other material,  $C'V^2 + C'V = t$ , where  $C'$  is a 2nd const. depending on the properties of the cloth and some other factors. In actual expts. on pptts. from juice clarification the so-called filtration const.  $C$  is detd. from 2 points on the curve by making use of the formula:  $V = C \times \sqrt{1/\eta} \cdot \sqrt{1/g} \cdot \sqrt{t}$ , where  $\eta$  is the viscosity, and  $g$  the concn. of insol. matter in the slurry. The filtering quality of a ppt. is characterized also by  $C'$ , which equals  $C$  uncor. for viscosity and insol. matter, and found from the equation:  $V = C' \sqrt{t}$ . Values of the filtration const. found for juices treated by defecation, sulfitation and carbonatation are given. The sweetening-off process has also been studied. The amt. of wash water required is least when the pressure is kept low, and more time allowed. The effect of the pressure applied during filtration varies from case to case. The temp. effect also varies, because hot water passes through the cake more rapidly and may thus be less effective than cold water. For the same reason thick cakes may be sweetened off more readily than thin ones. F. W. Zerban

**Studies relating to boiling in the manufacture of cane sugar. Brasmoscope charts for boiling in 4 stages.** J. G. Thume. *Rev. ind. agr. Tucuman* 22, 316-23 (1932).—After detn. of the calcd. real purities (cf. *C. A.* 27, 3843) at 4 stages of boiling in each pan, a chart for each stage is given, based on the boiling tables (*C. A.* 27, 3843) which shows the relation of vacuum to b. p. of the massecuite at a supersatu. of 1.2. By use of these charts, better control of the process and elimination of personal errors are effected. Nelson McKaig, Jr.

**Purification and acidification of polysaccharide solutions by electricity.** V. R. Hardy. *Ind. Eng. Chem.* 25, 1395-9 (1933). The work of Heubaum (*C. A.* 27, 4949) has been continued with a larger app. Diffusion juices from Jerusalem artichokes, of varying concn., were electro-dialyzed under varying conditions. Increase in the concn. or flow of the juice or decrease in the current  $d$  increased the  $pH$  of the final soln. With less-permeable diaphragms in the cells the final  $pH$  of the juice is only slightly higher than with more permeable ones. The final  $pH$  depends mainly on the amt. of K or ash removed. The optimum  $pH$  for hydrolysis is 4.2. At 2¢ per kw. hr. the cost of current to produce this  $pH$  is 0.04 to 0.1¢ per lb. of sirup produced. The process removes about 40% of the colloids present. The concn. of the juice changes little during the treatment. F. W. Zerban

**Complete condenser equipment for vacuum pans, operating as, or in conjunction with water-jet pumps.** L. H. de Langen. *Arch. Suikerind.* 41, 545-47 (1933).—Three types of such equipment are described and illustrated. In the Schutte-Koerting design the condenser and water-jet pump are combined into one, the air and condensed steam being carried off through the same pipe. This system is very simple, but requires a large amt. of water. In the app. designed by Stork, part of the water is by-passed through an injector, and the remainder goes to the condenser proper. The water from the injector can be used over again, because its temp. is raised only slightly. But the installation is not economical, because the pump pressure must be kept high for the injector, while this is not necessary for the condenser. In the design of the Java Sugar Expt. Station the water is first used in the injector, and then enters the condenser after the air has been removed from it. This app. requires less water and less power than the other types, and can also be

equipped with an automatic vacuum regulator.

F. W. Zerban

**Automatic measuring and application of wash water for centrifugals.** Th. G. Ninaber. *Arch. Suikerind.* 41, 583-7 (1933).—The app. of van Kleef-Meinecke is described, with diagrams. It has given very satisfactory results in practice, reducing the color of the sugar to 0.5 of that obtained with washing by the old hand method.

F. W. Zerban

**Milling losses.** Th. K. L. van Dort. *Arch. Suikerind.* 41, 663-74 (1933); cf. *Houmaes, C. A.* 27, 1539.—An important factor affecting the ratio between the purities of the last and 1st mill juices is destruction of sucrose by microorganisms. The latter affects also the juice lost % fiber, which depends on the purity of the last mill juice. A study of control data shows that the polarization of bagasse, which also enters into the juice lost % fiber, is not subject to sucrose destruction, because the bagasse juice is largely held in unruptured cells. It follows that in the interpretation of juice lost % fiber, the ratio between the purities of last and 1st mill juice must be considered, and that this ratio gives a valuable measure of sucrose destruction by microorganisms. Infection was found to be particularly heavy in the imbibition pipe lines carrying the last mill juice to the front of the mill train. The use of Cu for these pipe lines, and for the juice conduits and tanks largely prevents this infection, and is a paying investment.

F. W. Zerban

**Sugar from wood.** Friedrich Bergius. *Chem. Trade J.* 93, 356-8 (1933); cf. *C. A.* 27, 4947.—The strong-acid process has reached the commercial stage. The acid is reduced to 1.2% in the concd. sirup by atomization with air pressure and drying in a stream of hot air. The removed acid is recovered and used again. The commercial plant at Mannheim-Rheinau, completed in May 1933, is briefly described. Lignin recovered from the process can be briquetted without a binder and has a calorific value of 9000 B. t. u. A pure and hard charcoal can also be obtained from these briquets. The sugars from conifers consist of glucose, mannose and pentoses; those from foliaceous trees chiefly pentoses, in addn. to glucose. W. H. Hoynton

**Yeast-growth stimulants in white sugars.** H. H. Hall, Lawrence H. James and L. S. Stuart. *Ind. Eng. Chem.* 25, 1052-4 (1933); cf. *C. A.* 27, 2596-7.—Various samples of com. sucrose varied in their ability to support yeast growth. In some samples insufficient N was present. Upon purification of the sugars by recrystn., the yeast crop was reduced in every case. The ash of sugars when added to suitable media exerted no yeast-stimulating action. The yeast-stimulating substances in sugar contain N, are org. in nature, and are sol. in 80% EtOH.

C. R. Fellers

**Studies on bagasse. III. Hemicellulose.** Yoshikazu Hachihama. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 634 5 (1933); cf. *C. A.* 27, 4122.—Hemicellulose extd. from Formosan bagasse free from water-sol. substance consisted of 12.8% araban and 87.2% xylan.

Karl Kanimmermeyer

**Progress in bagasse utilization.** P. Honig. *Arch. Suikerind.* 41, 545-54 (1933).—A résumé of modern developments in this field is presented. The Pomilio process (*C. A.* 26, 5202) for the production of cellulose, and the manuf. of paper board from bagasse in Hawaii (*C. A.* 25, 416) are described in detail. F. W. Zerban

**Technically important properties of starch in connection with its constitution.** M. Samco. *J. Soc. Chem. Ind.* 52, 389 91T (1933).—A brief review. F. L. Dunlap

**Field tests on sugar cane in Java (Demandt) 15** Effect of molasses on concrete (Clair, Morrissey) 20. N optimum and border effect in sugar cane (van Dillewijn, Levert) 15.

**Corn sugar.** Charles Ebert (to International Patents Development Co.). U. S. 1,936,157, Nov. 21. Corn

sugar is obtained in the form of sep. cryst. dextrose granules aggregated in pellet-like form with shaved slab dextrose, by mixing shaved slab sugar with sep. granules of cryst. dextrose and tumbling and drying the mixt.

Continuous diffusion apparatus for sugar, etc. Auguste E. Vasveux. Fr. 751,884, Sept. 11, 1933.

Method and apparatus for decolorizing sugar solutions with bone black. Paul Kuichalik. Ger. 587,108, Oct. 30, 1933.

Unevenly heated boiler for sugar compositions, caramel, etc. Albert Henkel (Alfred Richter, inventor). Ger. 587,009, Oct. 28, 1933.

Starch. Akt.-Ges. fur chem. Ind., Fabrik Rannersdorf

(Wilhelm Goldlust, inventor). Austrian 135,600, Oct. 25, 1933. Starch which forms a paste with cold water is prepd. by dry-mixing crude starch or starchy materials in the cold with about 4-5% of caustic alkali and a similar or higher proportion of an oxide or salt of a bivalent metal, e. g., Zn or Cd.

Starch. Henkel & Cie G. m. b. H. Ger. 582,679, Aug. 21, 1933. A cold water starch is prepd. by intimately mixing starch with solid or dissolved caustic alkali in the presence of a small amt. of an org. solvent immiscible with water, and drying to form a granular mass. The org. solvent is present as an aq. emulsion. An example is given.

## 29- LEATHER AND GLUE

ALLEN ROGERS

The use of collodion cotton in leather finishes. Anon. *Farbe u. Lack* 1933, 521 2.—Typical formulas are given in which nitrocellulose is used in priming, second and finishing coatings for leather. G. G. Sward

Mol. wt. of gelatin (Atkin) 2. Measurement of  $p_H$  (Thompson) 2. Azo dyes [for chromed leather] (Ger. pat. 582,644) 25. Purifying waste water from tanneries (Ger. pat. 582,662) 14.

Frasers' Leather Products Directory of Canada. 1934 ed. Montreal: Fraser Pub. Co. 392 pp. \$2.00.

Leather Trades' Year Book, 1933. London: Leather Trades' Pub. Co., Ltd. 276 pp. 10s.

Leather. Chemische Fabrik Pott & Co. G. m. b. H. Ger. 578,785, June 20, 1933. Mineral-tanned leather is rendered more durable by treatment in the undyed state with neutral alkali salts of aromatic sulfonic acids, e. g., chrome leather is treated with Na naphthalene-2,6-disulfonate.

Tanning and weighting agents from aqueous solutions of titanium-sulfuric acid compounds. Ludwig Teichmann and Franz Specht (to I. G. Farbenind. A.-G.) U. S. 1,934,778, Nov. 14. An aq. soln. corresponding to about equimol. proportions of  $TiO_2$  and  $H_2SO_4$  is treated with such a quantity of a basic agent such as  $CaCO_3$  or  $SrCO_3$

forming a water-insol. compd. with  $H_2SO_4$  that the remaining soln. contains 0.5-0.9 mol.  $H_2SO_4$  per mol. of  $TiO_2$ .

Detanning leather. Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler (Fritz Stather and Erich Böhme, inventors). Ger. 582,919, Aug. 25, 1933. Undyed chromed leather waste is detanned for use in making glue by treatment with solns. of HCN salts, the resulting complex Cr-CN compd. being removed by washing.

Detanning chromed leather. Otto Gerngross. Ger. 582,628, Aug. 18, 1933. Chromed leather waste is detanned to render it suitable for the manufacture of glue by treatment with hydroxides and water-sol. salts of alk earth metals (Mg being excepted)

Artificial leather (coated fabric). Andrew J. Hemmer (to E. I. du Pont de Nemours & Co.). U. S. 1,934,709, Nov. 14. A coated fabric such as a coated flexible sheeting is provided with a final coating of baked polyhydric alc.-"polybasic" acid resin asphalt varnish contg., in combined form, the acid radical of an oil having drying properties such as linseed oil.

Glue. Alfred Mentzel. Ger. 582,691, Aug. 21, 1933. Dried bones are treated to restore the lost hydration water before treatment with inorg. or org. acids to make glue. The water is restored by treatment with solns. with a  $p_H$  value of 4.7 5, e. g., weak acid solns. Cf. C. A. 27, 3636.

## 30- RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

Molecular weight and chain length of natural and synthetic rubber. A. J. Wildschut. *Rec. trav. chim.* 52, 935-40 (1933).—The mol. wts. of natural rubber and synthetic rubbers were detd. as dil.  $C_6H_6$  solns. by the viscometric method of Staudinger (cf. *Hochmolekulare Verbindungen*, C. A. 26, 3513). Staudinger's formula gives good results for synthetic rubber and for plasticized natural rubber, whereas for crude unworked rubber such data are of value only in a relative way. The chain length of synthetic methylrubber is approx. the same as that of plasticized natural rubber. However, the mol. wts. of natural rubbers of different origins vary considerably, and this in turn explains their different behavior during the process of plasticization. In this latter process, the mol. wt. diminished rapidly at first to less than 0.5 its original value, after which there was little change. Heating natural rubber causes a much more extensive polymerization than mastication, and upon heating a condition is reached where the sp. viscosity is proportional to the concn. C. C. Davis

The status of the question of the technical synthesis of rubber. M. A. Lur'e. *J. Chem. Ind.* (Moscow) 1933, No. 6, 71-7. H. M. Leicester

Modifications of the gutta-percha hydrocarbon. III. A. W. K. de Jong. *Rec. trav. chim.* 52, 1028 31 (1933); cf. C. A. 27, 6015. When a petr. ether soln. of gutta-percha hydrocarbon is cooled to 0°, 2 different products

are obtained; one on drying forms a compact mass, the other a porous mass with either open or closed pores. When the pores are closed, the product contracts in the dilatometer, because on evacuation the petr. ether passes through the walls of the pores, with no opportunity for air to take its place. When the porous product is heated to its m. p. in the dilatometer, the walls of the pores collapse and contraction takes place. Moreover when the product with closed pores is immersed in petr. ether, contraction takes place, either because of weakening and collapse of the pore walls, or because of penetration of petr. ether through the walls. The formation of these products may be explained with the aid of the hypothesis of Bungenberg de Jong (C. A. 22, 2865; 23, 16; 24, 2934) if it is assumed that the character of the network is independent of the size of the particles. C. C. Davis

Odorants for rubber. F. Jacobs. *Rev. gén. caoutchouc* 10, No. 95, 3-7 (1933).—A review and discussion of historical aspects and present developments in the use of various org. compds. to make the odor of vulcanized rubber products less unpleasant. Tests by J. of various com. products show that  $S_2Cl_2$  cures are most destructive (few com. odorants survived); vulcanization in hot air is less destructive, vulcanization in steam is still less so; while vulcanization in molds is least destructive to the odorants. By the proper choice and use of odorant, the normal odor of the vulcanizate can be masked under all conditions of

manuf. For a certain time after vulcanization the intrinsic odor of the vulcanizate is abnormally strong, but upon standing the effect of the odorant becomes relatively more prominent. C. C. Davis

**Service tests and performance.** T. L. Garner. *India Rubber J.* 86, 586-8(1933).—A review and discussion of present developments in correlating lab. tests with performance in service (cf. Dinsmore, *C. A.* 26, 4730).

C. C. Davis  
**Rubber testing.** J. R. Scott. *India Rubber J.* 86, 593-6(1933).—Though in comparing the properties of different vulcanizates, as in the examn. of fillers, accelerators, antioxidants, etc., all mixts. should be vulcanized to the same state of cure, published data show that there has been insufficient attention to this factor. Expts. show that "inert" fillers like barytes, blanc fixe and whiting differ markedly in their effect on the rate of vulcanization (judged by optimum phys. properties) of mixts. accelerated by org. compds. Various criteria of the optimum cure which have been suggested by various authors are discussed. The individual methods lead to very different times of cure, and each method has its advantages and objections. Too little attention has been paid to quality after aging and particularly to quality after repeated stresses, both of which represent important factors in service conditions.

C. C. Davis  
**Effect of oils and chemicals on Duprene compounds.** O. M. Hayden and E. H. Krisman. *Ind. Eng. Chem.* 25, 1219-23(1933).—The synthetic rubber Duprene (polymerized 2-chloro-1,3-butadiene, *C. A.* 26, 78) and natural rubber in comparable compds. contg. ZnO, C black and whiting were immersed in a variety of oils and solvents and their swelling, tensile strength and elongation compared. A wide variety of vegetable, animal and mineral oils and petroleum distillates all had much less effect on Duprene than on natural rubber and caused no disintegration of the former even after long immersion. The effect was particularly marked at elevated temps. Aromatic and chlorinated hydrocarbons swelled both rubbers to about the same extent, but caused much less loss of strength in Duprene. It was also much less affected by 50% H<sub>2</sub>SO<sub>4</sub>, and practically not at all by 50% NaOH. The selection of compounding ingredients for Duprene stocks resistant to various materials is discussed. Arnold M. Collins

**The use of titanium white (titanium dioxide) in cold-vulcanized rubber.** Erich Wurm. *Kautschuk* 9, 148-50, 171 2(1933).—Two samples of TiO<sub>2</sub> with  $p_H$  values of 6.5-7.5 and 1 sample of an older type with a  $p_H$  value of 4.0, and a com. ZnS were tested in rubber (contg. 2% MgO) cured in S<sub>2</sub>Cl<sub>2</sub> soln. and aged in a 70° Geer oven. Judged by ultimate elongation, tensile strength and tensile product, the closer to neutral is a TiO<sub>2</sub>, the better is the aging of rubber contg. it, i. e., after a short time in the Geer oven the vulcanizates contg. the TiO<sub>2</sub> with the higher  $p_H$  values were the poorer, both judged by hand and in tensile strength. In agreement with earlier work (cf. *C. A.* 23, 5351) the results show that a neutral grade of TiO<sub>2</sub> can be used advantageously in cold vulcanization without any danger of poor aging. For such use TiO<sub>2</sub> is more economical than ZnS, for 11 parts of TiO<sub>2</sub> give the same whiteness as do 20 parts of ZnS. The effects of small proportions of active ZnO and of stearic acid and Mg carbonate in the usual proportions were also investigated. No deleterious effect on aging was noticeable with 0.1% ZnO (based on the rubber). Slightly acidic TiO<sub>2</sub> ( $p_H$  not below 6.5) can, by the addn. of small proportions of active ZnO, be rendered harmless to aging. Discoloration through oxidation on aging is less with active ZnO present. Mg carbonate (15%) and stearic acid (1%) have greater beneficial effects on the aging. C. C. D.

Rubber-coated sheet material (U. S. pat. 1,935,189) 25.  
Rubber-coated fabric (U. S. pat. 1,936,500) 25.

**Apparatus for refining crude rubber or latex by treatment with steam, etc.** Electrical Research Products, Inc. *Ger.* 582,407, Aug. 15, 1933.

**Rubber.** Società italiana Pirelli. *Ger.* 578,472, June 14, 1933. Addn. to 554,992 (*C. A.* 26, 6182). In making rubber objects by coagulating rubber latex by the method of 554,992, the latex is heated to 40-60° prior to coagulation.

**Rubber.** I. G. Farbenind. A.-G. (Walter Bock and Eduard Tschunkur, inventors). *Ger.* 578,905, June 19, 1933. See U. S. 1,911,672 (*C. A.* 27, 4133).

**Rubber.** I. G. Farbenind. A.-G. (Hans Tochtermann, inventor). *Ger.* 582,526, Aug. 16, 1933. Natural or synthetic rubber is colored by mixing into the rubber aq. suspensions, or pastes of coloring matter insol. in water. Examples are given. Cf. *C. A.* 27, 2801; 28, 685<sup>4,4,4</sup>.

**Rubber.** Hermann Plauson. *Ger.* 582,566, Aug. 17, 1933. A paint or impregnating agent is prepd. by treating natural or synthetic rubber, regenerated rubber or semi-polymerized rubber, mixed with lacquer-forming resins and hydrocarbon solvents, with H<sub>2</sub> at high temp. and pressure, in the presence of a hydrogenation catalyst. The products may be treated with AlCl<sub>3</sub>, ZnCl<sub>2</sub>, or O<sub>2</sub>.

**Rubber.** The B. F. Goodrich Co. *Fr.* 750,473, Aug. 11, 1933. Diarylamines in the aromatic ring in which is substituted at least one aliphatic hydrocarbon radical contg. at least 2 C atoms, and in which hydroxyalkyl groups may also be present, are used for retarding the deterioration of rubber, etc. Such compds. include *p*-isopropyl-, tertiary *p,p*-dibutyl- and *p*-hydroxyethyl-*p*-isopropyl-diphenylamine. *Fr.* 750,474. Deterioration of rubber, etc., is retarded by treating it with a *meso*-disubstituted acridane, e. g., *meso*-dimethylacridane.

**Rubber.** The Naugatuck Chemical Co. *Fr.* 751,811, Sept. 11, 1933. Products obtained by the reaction of an aminodiarylamine and an acid chloride or anhydride, called acylaminodiarylamines, are incorporated in rubber to increase the resistance thereof to aging. Examples are given of the prepn. of *m*-acetamido- (*m*. 136°), and *m*-(*p*-toluenesulfonamido)phenyl- $\beta$ -naphthylamine, *m*. 155°, *p*-acetamido- (*m*. 160°) and *p*-(*p*-toluenesulfonamido)-diphenylamine, *m*. 147°, and *p*-(*p*-toluenesulfonamido)-phenyl-*p*-tolylamine, *m*. 168°.

**Rubber.** Imperial Chemical Industries Ltd. *Fr.* 752,236, Sept. 19, 1933. The age-resisting properties of rubber are increased by incorporating therewith a salt of a compd. obtained by causing boric acid to react with an aromatic *o* dihydroxy compd., such as catechol, 3,4-dihydroxytoluene or 2,3-dihydroxynaphthalene. The salt may be one of Zn, Na, K, NH<sub>4</sub>, an alkylamine, pyridine, piperidine, PhNH<sub>2</sub>, 2,4-tolylene diamine, diphenylguanidine, di-*o*-tolylguanidine or a naphthylamine.

**Rubber.** Soc. anon. des pneumatiques Dunlop. *Fr.* 753,187, Oct. 9, 1933. Crude or unvulcanized rubber is prepd. in crumbs or small pieces by putting the rubber in bulk in contact with water or other appropriate fluid, such as an aq. soln. of a liquid miscible with water, so that the rubber absorbs the fluid, and then dividing up the rubber as desired. Before dividing up, a fluid paste consisting of a suspension of Spanish white, clay or other inert material or Ca(OH)<sub>2</sub> may be applied to the rubber.

**Rubber compositions.** Paul Meyersberg and Georg Wolf. *Austrian* 134,982, Oct. 25, 1933. In the manuf. of rubber compns. contg. org. fillers, e. g., leather, cork, wood meal or textile fibers, the rubber is mechanically treated until it has acquired a viscous fluid consistency and is simultaneously or subsequently kneaded with the filler until the moisture content of the latter has been reduced by at least 50%. Various methods of procedure are indicated.

**Rubber compositions.** Norman Swindin and Nordac Ltd. *Ger.* 587,239, Nov. 1, 1933. See *Brit.* 339,002 (*C. A.* 25, 2597).

**Rubber compositions.** The International Latex Processes Ltd. *Fr.* 752,249, Sept. 19, 1933. Porous or microporous materials are made by mixing fibrous materials with floccular or granular ppts. prepd. from aq. dispersions of rubber, rendering the mixt. compact by filtration and vulcanizing while preventing evapn. of the liquid contained therein. The material may be molded before vulcanization.

**Solutions of rubber.** Nikolaus Lebedenko, Max Naphtali, Nikolaus Kroll and Hermann Meyer. Fr. 752,350, Sept. 20, 1933. Solns. of vulcanized rubber in fine colloidal and even mol. dispersion in org. solvents are obtained by first forming gels of the intermediate vulcanized products and chemically destroying the gels *in statu nascendi*. Thus, smoked sheets are heated in a mixt. of xylene, toluene and  $C_6H_6$  and  $S_8$  ( $CH_2$ )<sub>6</sub>( $NH_2$ )<sub>4</sub> and ZnO are added and the temp. is increased to 140–5°. The mixt. is vulcanized and forms a spongy gel. The pressure increases but after 15–20 min. the mass becomes liquid. Other examples are given.

**Apparatus for distilling rubber.** Intertropical-Comfina. Fr. 750,393, Aug. 9, 1933.

**Apparatus for mixing, kneading and plasticizing rubber and other materials.** Albert Lasch and Ernst Stromer (to Baker Perkins Co.). U. S. 1,936,248, Nov. 21.

**Sheet rubber.** Nicolaas H. van Harpen (to Algemeene Vereeniging van Rubberplanters ter Oostkust Sumatra). U. S. 1,936,490, Nov. 21. In prepg. sheet rubber which can be rapidly dried, a coagulated rubber cake is laminated to a sheet 1.5–2.5 mm. in thickness (measured in moist condition) and the sheet is passed through a printer comprising a set of helically grooved rollers to form a ribbed sheet having uninterrupted parallel ribs on each side spaced 2.5–3.5 mm. apart, the ribs on one side intersecting the ribs on the other side and the thickness of the sheet over the ribs being less than 3 mm. (measured in humid condition), and the ribbed sheet is finally dried and smoked.

**Treating rubber to retard deterioration.** Wm. P. ter Horst (to Naugatuck Chemical Co.). U. S. 1,935,279, Nov. 14. Rubber is treated with about 0.75% of the reaction product of a ketone such as acetone and a di-(arylamino)diaryldialkylmethane such as *p,p'*-di-(naphthylamino)diphenyldimethylmethane or the like. Cf. C. A. 28, 3761<sup>1,2</sup>.

**Rubber articles formed from aqueous dispersions.** Win. A. Steidle (to Morgan & Wright). U. S. 1,935,165, Nov. 14. For increasing the gas impermeability and tear resistance of rubber deposited directly from aq. dispersions, a deposit formed from an aq. dispersion is superficially dried and is treated under differential pressure with a soln. of glycerol which is permanently retained in the deposit, then further dried and vulcanized.

**Apparatus for making threads or filaments from dispersions of rubber.** The International Latex Processors Ltd. Fr. 753,148, Oct. 7, 1933.

**Rubber cement.** James B. Crockett. U. S. 1,936,106, Nov. 21. Rubber latex which may have a solids content of about 80–80% is used with a larger quantity of a rubber solvent such as gasoline and sufficient acid to give the mixt. a  $pH$  less than 7 and form a continuous, sticky, viscous mass through which the water of the latex is distributed.

**Oils from rubber.** Hermann Plauson. Brit. 397,136, Aug. 9, 1933. Oils for use in the prepn. of paints and varnishes and as impregnating media for paper, cloth, leather, etc., are produced by the catalytic hydrogenation of natural or synthetic rubber in the presence of solvents such as petroleum hydrocarbons. Hardening agents, natural or artificial copals, amber or other resins and drying oils may be added to the liquid. In examples equal parts of natural or synthetic rubber and a petroleum distillate boiling at 130–200° are heated with a Ni catalyst in the presence of H<sub>2</sub> in an autoclave 3–6 hrs. at 200–300° and 50–150 atm. The resultant liquid, with or without added resins, is used as a paint or varnish. Vulcanization may be effected or treatment with Cl or chloride of lime, followed by  $K_2CO_3$ , may be used to make the product lighter in color; alternatively the product may be treated with oxidizing agents or ozonized air. The rubber and solvent may be heated with  $AlCl_3$ ,  $ZnCl_2$  or  $FeCl_3$  previous to hydrogenation.

**Plastic materials.** I. G. Farbenind. A.-G. Fr. 750,500, Aug. 11, 1933. Plastic materials which may be used

for making molded articles, artificial leather, etc., are obtained by treating natural rubber, vulcanized or not, with HF.

**Synthetic rubber.** Eduard Tschunker and Walter Bock (to I. G. Farbenind. A.-G.). U. S. 1,935,733, Nov. 21. Hydrocarbons of the butadiene series suitable for the manuf. of synthetic rubber are emulsified with an aq. viscous soln. of an emulsifying agent such as blood albumin and polymerization is caused to proceed in the emulsions in the presence of a substance such as Mn borate and air acting as an oxidizing agent on the hydrocarbons at the temp. of polymerization (which may be 60°).

**Rubber substitute.** Louis Laurin and Émile Bidot. Fr. 751,798, Sept. 9, 1933. A rubber substitute contains approx. strong glue 100, salicylic acid 0.2, gum tragacanth 25, wood flour 435, water 200, glycerol 125, castor oil 18, colza oil 11, fatty soap 6, suet 3, resinat treated with  $CH_2O$  3, soln. of resin (e. g., bakelite in naphtha) 5,  $K_2Cr_2O_7$  3 and K alum 6 parts. Cf. C. A. 27, 1236.

**Nitrophenylbenzothiazyl sulfide.** Robert L. Sibley (to Rubber Service Laboratories Co.). U. S. 1,936,099, Nov. 21. A mercapto-benzothiazole is heated with a nitrochlorobenzene in water, to form a product which may be used as a rubber vulcanization accelerator.

**Rubber vulcanization accelerator.** I. G. Farbenind. A.-G. (Max Bogemann, inventor). Ger. 582,567, Aug. 17, 1933. Accelerators for the vulcanization of rubber

consist of unsym. disulfides of the type  $S.R.N:CSSX$ , in which R represents arylene with N and O in the *o*-positions, and X and aryl residue substituted by NO<sub>2</sub>. An example mentions  $\mu$ -benzothiazolyl *p*-nitrophenyl disulfide.

**Rubber vulcanization.** Frederick L. Kilbourne, Jr. and John N. Street (to Firestone Tire & Rubber Co.). U. S. 1,936,561, Nov. 21. An accelerator is used prepd. by dissolving a mixt. of di-*o*-tolylguanidine, 2-mercapto-benzothiazole and phthalic anhydride in stearic acid. U. S. 1,936,562 (Frederick L. Kilbourne, Jr.) relates to prepn. of an accelerator by fusing together di-*o*-tolylguanidine, 2-mercaptobenzothiazole and phthalic anhydride or mixing them in acetone soln. or the like.

**Vulcanizing rubber.** Clayton O. North (to Rubber Service Laboratories Co.). U. S. 1,936,115, Nov. 21. In vulcanizing rubber with S, a reaction product of substantially 3 mol. proportions of mercaptobenzothiazole and 1 mol. proportion of 2,4-diaminodiphenylamine is used as a vulcanization accelerator. Cf. C. A. 28, 3761<sup>1,2</sup>.

**Vulcanizing rubber.** I. G. Farbenind. A.-G. (Wilhelm Lommel and Rudolf Schroter, inventors). Ger. 578,673, June 16, 1933. In vulcanizing rubber, a small amt. of a high-mol. amine with a long or branched aliphatic chain is added in addn. to the usual accelerator. Thus, a vulcanization mixt. contains crepe latex, ZnO, S, stearic acid, mercaptobenzothiazole disulfide and a small addn. of a 2-aminononadecane. Other examples are given.

**Vulcanizing rubber.** I. G. Farbenind. A.-G. Fr. 751,796, Sept. 9, 1933. A thiuram sulfide having no tendency to prevulcanization (e. g., dimethyl- or diethyl diphenylthiourea disulfide, tetrabutylthiourea disulfide, dipentamethylene thiourea monosulfide, and dicyclohexyldiethylthiourea monosulfide) and an accelerator having a tendency to prevulcanization (e. g., dithiocarbamates, xanthates and mercaptoarylenethiazoles) are added to rubber and the mixt. is vulcanized.

**Vulcanizing rubber.** Schering-Kahlbaum A.-G. Fr. 753,026, Oct. 5, 1933. Dithiocarbamates of the formula  $RR'N:CSSH.R''R'''NH$  ( $R, R'$  represent residues, the same or different, which may be joined in a ring;  $R'', R'''$  also represent radicals, the same or different, which may be joined into a ring, the 2 rings may contain substituents) are used as vulcanization accelerators. The compds. are made by the action of  $CS_2$  on an equimol. mixt. of piperidine or its homologs with other primary or secondary bases, or free dithiocarbamic acid with a base differing from the corresponding base used as primary material. An example is given of the use of pentamethylenedithiocarbamate of cyclohexylamine.

# CHEMICAL ABSTRACTS

Vol. 28

FEBRUARY 20, 1934

No. 4

## 1-APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

Development of new equipment materials for chemical manufacture. W. R. Huey. *Ind. Eng. Chem.* 26, 10-16(1934). E. H.

New laboratory glass filters. P. H. Prausnitz. *Chem.-Ztg.* 57, 885-6(1933).—Jena glass Büchner funnels with plane fritted bottoms 65-120 mm. diam. and with wedge-perforated glass bottoms 45-110 mm. diam. and a rapid filtering analytical glass funnel are described. P. S. R.

Design of fractionating columns. I. Entrainment and capacity. Mott Souders, Jr. and Geo. G. Brown. *Ind. Eng. Chem.* 26, 98-103(1934). E. H.

A more sensitive design of the Geiger-Müller counter. Trevor R. Cuykendall. *Rev. Sci. Instruments* 4, 676 8 (1933). E. H.

A new apparatus for determination of apparent volume (compacted) of powders. Erich A. Becker. *Farben-Ztg.* 38, 1085-6(1933).—An app. for detg. the apparent vol. of powders consists of a cylinder supported on a platform which is caused to rise and fall by means of a cam. The no. of strokes is 250 per min. and the distance of fall is 3 mm. Two and one-half min. is usually enough, but with needle-shaped pigments, 10 min. may be required. 5

Apparatus for working with substances sensitive to moisture. H. Grubitsch and N. Skalla. *Z. anal. Chem.* 95, 103-5(1933).—An ingenious glass app. is shown which permits weighing suitable samples for a gas-evolution analysis or for a furnace combustion without danger of the sample being affected by atm. moisture, as is advantageous in work with substances such as the dihalides of Sm or Eu or  $CaC_2$ . W. T. H.

The sources of error of liquid thermometers resulting from the behavior of the indicators used. Walter Grundmann. *Z. Physik* 86, 550-4(1933).—The precision obtainable with thermometers contg. liquids as indicators is mainly detd. by the compressibility, the gas absorption, distn. and contraction of the liquid. The coincidence of these influences can diminish the reliability of the thermometers to a much higher degree than is usually believed. 7

Portable vacuum tube voltmeter for measurement of glass electrode potentials with examples of  $p_H$  estimations. Floyd DeEds. *Science* 78, 556 8(1933). E. H.

Air-ionization chamber for measuring low-voltage x-ray intensities in Röntgens. Fred M. Uber. *Rev. Sci. Instruments* 4, 649-50(1933). E. H.

Advances in the construction of gas-heated industrial furnaces. O. Wolff. *Z. Ver. deut. Ing.* 77, 1273-6 (1933). E. H.

Calorimeter for heats of fusion (Rossini) 2. [App. for] measuring the viscosity of surfaces (Bergami) 2. App. for dividing liquids into drops (U. S. pat. 1,938,219) 29. Device for taking samples of liquids from tanks (U. S. pat. 1,938,224) 22. Means for supplying air or gas in finely divided form to liquid in a tank (Brit. pat. 397,841) 14.

Industrial Piping. A Case Book of Proven Practices and Methods. Chicago: Eng. Publications, Inc. 286 pp. \$3.50. Reviewed in *J. Western Soc. Engrs.* 38, 296 (1933).

Buret with a mechanical suction device. Oskar E. Peters. *Ger.* 580,848, July 17, 1933.

Apparatus for carrying out exothermic catalytic reactions. I. G. Farbenind. A.-G. (Joseph Bayer, inventor). *Ger.* 581,075, July 27, 1933. Addn. to 548,962 (C. A. 26, 3963).

Apparatus for chemical and physical reactions between liquids and gases. Harry Pauling. *Fr.* 750,923, Aug. 22, 1933.

Vessels resisting chemicals. Müller & Krieg. *Ger.* 581,806, Aug. 4, 1933. A method of constructing the above from ceramic plates vulcanized together is described.

Automatic device suitable for mixing chemicals with water, etc. Daniel R. Murray. *U. S.* 1,937,582, Dec. 5, 1933. Structural and operative details.

Digester with internal flanges for mixing the contents. Giesserei & Maschinenfabrik Oggersheim Paul Schütz & Co. A.-G. (Georg Knerr, inventor). *Ger.* 580,511, July 12, 1933.

Device for removing froth in sedimentation apparatus. The Dorr Co., Inc. *Ger.* 580,778, July 21, 1933.

Colorimeter for solutions. Virgil A. Schoenberg (to Light Research Corp.). *U. S.* 1,938,544, Dec. 5, 1933. Structural and operative details are described.

Crystallizers. Roy Pitcairn. *Brit.* 397,432, Aug. 24, 1933.

Photometric apparatus suitable for various turbidity and colorimetric tests. Martin W. Baden. *U. S.* 1,938,004, Dec. 5, 1933. Structural features.

Spatulas. Gustav Ruth A.-G. (Lothar Barenfeld, inventor). *Ger.* 580,593, July 13, 1933. Spatulas with a cellulose ester or ether base are prep'd. by using softening agents consisting of org. substances sol. in water. Examples are given. 6

Pyrometer tube. Arthur T. Kathner. *U. S.* 1,937,199, Nov. 28. The body portion of a pyrometer tube is formed of steel contg. Cr 25-35% and Ni about 1% or less and which is sufficiently dense and compact to exclude gases at temps. above 980°. 7

Thermometer for furnaces. Henri Soumille and Georges Guiguet. *Fr.* 750,756, Aug. 18, 1933.

Columns of filling material for reactions, filtering, etc. Garvenswerke Maschinen-, Pumpen- und Waagenfabrik W. Garvens. *Ger.* 580,215, July 7, 1933. Addn. to 578,650 (C. A. 28, 690°).

Filters. Jesus de la Torre and Luis R. de la Torre (trading as J. de la Torre e Hijo). *Brit.* 398,055, Sept. 7, 1933. See *Fr.* 748,842 (C. A. 27, 5221).

Edge filters. The Stream-Line Filter Co. Ltd., Henry S. Hele-Shaw and Stanley Baker. *Brit.* 397,867, Aug. 25, 1933.

Filter for liquids. Frederick G. Seeley. *Ger.* 583,639, Sept. 7, 1933.

Filter for fluids. Raphaël Malbay. *Fr.* 752,703, Sept. 29, 1933. The filter is made up of a series of superposed hollow perforated round members projecting from a central hollow spindle.

Filtering apparatus provided with a rotary or oscillatory brush or scraper which assists the reverse flow in cleaning the filter. Serck Radiators Ltd. and Charles O. Wagner. *Brit.* 397,471, Aug. 14, 1933.

Filtering apparatus provided with an oscillatory pump vanes which causes a reverse flow through a portion of the filtering medium while the flow of filtrate is maintained.

- Auto-Klean Strainers Ltd. and W. R. Beldam. Brit. 397,907, Sept. 4, 1933.
- Apparatus suitable for filtering liquids such as motor fuels. Arthur A. Sidney. U. S. 1,937,415, Nov. 28.
- Device for removing filter cakes from rotating filters. Filtration Engineers Inc. Ger. 581,777, Aug. 2, 1933.
- Filters for mine products. Blomfield Engineering Co. Ltd. Fr. 753,544, Oct. 18, 1933.
- Filter press with plates of ceramic material. Wilhelm Schuler G. m. b. H. (Ernst Bauder, inventor). Ger. 583,557, Sept. 5, 1933.
- Double plate for filter presses. Mayer Wilderman. Ger. 583,558, Sept. 6, 1933.
- Filter plates. Élie Assié. Fr. 752,803, Oct. 2, 1933. A filter plate is made by baking a mixt. contg. quartz, sand, SiC, etc., an agglomerate such as clay, kaolin or feldspar and an org. material such as sawdust.
- Apparatus for separating moisture from a flowing stream of compressed air. James A. Stuard. U. S. 1,937,855, Dec. 5. Structural features.
- Still for continuous separation of volatile solvents. Henri Venturino. Fr. 752,608, Sept. 27, 1933.
- Device for removing granular materials from flowing liquids. Akt.-Ges. für chemische Produkte vorm. H. Scheidemandel (Wilhelm Wachtel, inventor). Ger. 579,915, July 3, 1933.
- Apparatus for separating minerals of different specific gravities by use of water, etc. Wm. D. McAdoo (10% to Ernest J. Schabelitz). U. S. 1,938,087, Dec. 5. Structural and mech. features.
- Apparatus for aerating liquids, separating solids from liquids, emulsifying immiscible ingredients, etc. Cyril F. Morgan and Watney Combe Reid & Co. Ltd. Brit. 398,114, Sept. 7, 1933.
- Apparatus for treating granular solids with gases. Kristian Middelboe. Fr. 752,541, Sept. 25, 1933.
- Apparatus for evaporating liquids. Metallgesellschaft A.-G. (Friedrich A. Oetken and Paul Roepstorff, inventors). Ger. 580,928, July 19, 1933.
- Device for mixing liquids in determined proportions. Willy Kordatzki. Ger. 581,594, July 29, 1933.
- Centrifugal apparatus for purifying washing liquids such as trichloroethylene. Ramesohl & Schmidt A.-G. Ger. 584,501, Sept. 21, 1933. Addn. to 530,722 (C. A. 26, 5).
- Column apparatus for treating organic liquids with gases or vapors. I. G. Farbenind. A.-G. (Adolf von Friedolsheim and Martin Luther, inventors). Ger. 581,832, Aug. 8, 1933.
- Apparatus and method for separating gases from liquids. Anglo-Persian Oil Co. Ltd. and Arthur C. Hartley. Brit. 397,540, Aug. 28, 1933.
- Device for dispensing uniform mixtures of liquids and gases such as carbon dioxide and ethylene oxide from receptacles. Thomas C. Martin and Simon Meyer (to Carbide and Carbon Chemicals Corp.). U. S. 1,938,036, Dec. 5. Structural and operative details.
- Device for breaking down foam into its gaseous and liquid constituents. Ernst Jantzen. Ger. 580,847, July 18, 1933.
- Apparatus (with a shell and superposed decks) for contact of gases with liquids as in washing, rectification, etc. Raymond R. Collins (to Lummus Co.). U. S. 1,938,247, Dec. 5. Structural details.
- Container for transporting and storing liquefied gases. Harry D. Edwards (to Linde Air Products Co.). U. S. 1,937,877, Dec. 5. Structural features.
- Gas-scrubbing tower and electrical precipitator. Alexander N. Crowder (to Research Corp.). U. S. 1,937,265, Nov. 28. Various structural and operative details are described.
- Gas-washing apparatus. Robert R. Harmon and Peabody Engineering Corp. Brit. 397,802, Aug. 22, 1933, 397,809, Aug. 22, 1933, divided on 397,802, and 397,870, Aug. 22, 1933, divided on 397,802.
- Gas-washing apparatus. Erwin Falkenthal. Ger. 579,686, June 29, 1933.
- Filling material for gas-washing towers, etc. Metallges. A.-G. (Helmuth Wendeborn, inventor). Ger. 579,885, July 5, 1933. Porous irregular sinter products of non-combustible materials such as clay or quartz are used.
- Device for moistening hot gases, especially those to be electrically cleaned. Siemens-Schuckertwerke A.-G. (Richard Heinrich, inventor). Ger. 580,979, July 19, 1933.
- Apparatus for purifying gases by contact with wet surfaces. Ateliers J. Hanrez (Soc. anon.). Fr. 751,099 and 751,100, Aug. 26, 1933.
- Control valves for gas purifiers. Harry Bott and Newton, Chambers & Co. Ltd. Brit. 398,866, Aug. 17, 1933.
- Means for increasing the sensitivity of gas detectors for gases having inflammable constituents. Abraham L. Marshall (to The British Thomson-Houston Co. Ltd.). Brit. 397,815, Aug. 31, 1933.
- Gas-analysis apparatus. Aktiebolaget Carba. Ger. 581,505, July 31, 1933.
- Holder and pendulum apparatus for measuring the specific gravity of gases by oscillations. Hendrik A. Romp. U. S. 1,937,437, Nov. 28. Structural and operative details.
- Apparatus for recovering gases and vapors by adsorption in active charcoal, etc. Edgar R. Sutcliffe. Brit. 397,128, Aug. 8, 1933.
- Apparatus for adsorbing gases or vapors by solid adsorbents. Soc. de recherches et d'exploitations pétrolières. Fr. 753,818-19, Oct. 25, 1933.
- Apparatus for introducing cooling gases into rotating drum kilns. Fried. Krupp Grusonwerk A.-G. Ger. 581,711, Aug. 1, 1933.
- Cooler for rotary drum kilns. Arno Andreas. Ger. 579,962, July 3, 1933.
- Cooling tower for lyes. Maschinenbau- A.-G. Balcke. Ger. 583,787, Sept. 9, 1933.
- Jet apparatus for evaporating salt solutions under reduced pressure. Paul H. Müller. Ger. 583,763, Sept. 9, 1933.
- Laboratory device for quickly drying liquids. Georg F. Stieger. Ger. 583,848, Sept. 11, 1933.
- Rotating drum for heating, cooling or drying. Friedrich Ulde. Ger. 580,626, July 13, 1933.
- Rotary drying and grinding apparatus. Ofenbau-Ges. m. b. H. and Heinrich Bangert. Brit. 398,000, Sept. 7, 1933.
- Rotary drum drier. Benno Schilde Maschinenbau-A.-G. Ger. 584,077, Sept. 22, 1933.
- Plate drier. Max Herlitz. Ger. 584,502, Sept. 21, 1933. Addn. to 572,603 (C. A. 27, 4380).
- Tubular driers. Humboldt-Deutzmotoren A.-G. Ger. 579,541, June 28, 1933.
- Tube drier. I. G. Farbenind. A.-G. (Karl Heil, inventor). Ger. 580,822, July 17, 1933. Addn. to 574,930 (C. A. 27, 4447).
- Tube drier. Theodor Baucr. Ger. 581,721, Aug. 1, 1933.
- Tube drier. Maschinenfabrik Buckau R. Wolf A.-G. Ger. 584,679, Sept. 22, 1933.
- Tube drier. Maschinenfabrik Buckau, R. Wolf A.-G. Ger. 584,939, Sept. 26, 1933. Addn. to 550,818 (C. A. 26, 4735).
- Drying kiln. Siemens-Schuckertwerke A.-G. (Hans v. Droste, inventor). Ger. 579,505, June 27, 1933.
- Apparatus for drying granular material, e. g., small coal, stones, sand. Sidney Bates and The Mickley Coal Co. Ltd. Brit. 397,297, Aug. 24, 1933.
- Device for drying or slowly burning fine granular masses. Ludwig Honigmann. Ger. 580,628, July 13, 1933.
- Drier for dyes, clays, etc. Philip W. Bur. Ger. 579,540, June 28, 1933.
- Apparatus for drying, carbonizing and oxidizing substances. Robert Glinka. Ger. 579,640, June 29, 1933.
- Drying device for moist materials which are powdery when dry. Maschinenfabrik Friedrich Haas G. m. b. H. and Ludwig Honigmann. Ger. 584,503, Sept. 20, 1933.
- Rotary drying furnaces. Félix L. M. Deneden. Fr. 752,393, Sept. 21, 1933.

- Annealing furnace.** Siemens-Schuckertwerke A.-G. <sup>1</sup> Ger. 579,822, July 1, 1933.
- Regenerative furnaces.** Paul Müller. Fr. 751,509, Sept. 5, 1933. Construction of baffles is described.
- Reverberatory turning and semi-turning furnaces.** Wm. F. Wiltshire. Fr. 754,190, Nov. 2, 1933.
- Air- and water-cooled furnace wall.** Maxwell Alpern (to American Engineering Co.). U. S. 1,937,003, Nov. 28.
- Annular kilns.** Friedrich Meyer. Ger. 580,693, July 14, 1933.
- Rotary drum kiln.** Johan-S. Fasting. Ger. 580,572, July 13, 1933.
- Heat-exchange apparatus suitable for cooling liquids.** Wm. W. Barnum. U. S. 1,937,804, Dec. 5. Structural features.
- Heat-transfer apparatus suitable for various purposes.** Wm. E. Oakley (to Revere Copper and Brass, Inc.). U. S. 1,937,713, Dec. 5. Structural features.
- Tubes for heat-exchangers.** Roger S. Brown. Brit. 397,064, Aug. 31, 1933.
- Gilled tubes for heat-exchangers.** Hilding Sandberg. Brit. 397,358, Aug. 24, 1933.
- Gilled tubes for heat-exchangers.** Allmanna Svenska Elektriska Aktiebolaget. Brit. 397,360, Aug. 24, 1933.
- Plate heat-exchangers for liquids.** Holstein & Kappert Maschinenfabrik "Phonix" G. m. b. H. Brit. 397,706, Aug. 31, 1933.
- Method and apparatus for heat-treating comminuted material.** National Electric Heating Co., Inc. Brit. 397,666, Aug. 31, 1933. Comminuted material, *e. g.*, coal, filter clay, cement, is heated by being suspended in a fluid medium and passed through a tubular heater directly heated by elec. current, whereby the suspension is raised to a high temp. for a short time. In an example a rich coal, ground to 250 mesh, is passed through a Ni-Cr tube 40 ft. long at about 1300° F. in 0.8 sec. App. for *coking coal*, mixed with gas, and for *making cement* is described.
- Photoelectric apparatus suitable for regulation of "self-firing" furnaces.** Albert W. Hull (to General Elec. Co.). U. S. 1,938,426, Dec. 5. Various structural and operative details are described.
- Photoelectric cells.** Compagnie française pour l'exploitation des procédés Thomson-Houston. Fr. 42,448, July 19, 1933. Addn. to 679,145.
- Photoelectric cell.** Max A. E. Pressler. Fr. 752,378, Sept. 21, 1933. The light-sensitive layer is produced by vaporization of an alkali metal on a metal base previously covered with a chem. compd., *e. g.*, an oxide or a fluoride. The metal base is roughened before the active layers are applied.
- Photoelectric tube.** Ernest E. Charlton (to General Elec. Co.). U. S. 1,938,374, Dec. 5. Various structural and operative details are described.
- Photoelectric tubes.** Werner Kluge (to General Elec. Co.). U. S. 1,938,431, Dec. 5. The interior of the envelope is coated with a layer of foundation metal such as Ag and after introducing O into the tube a glow discharge is passed to oxidize the metal layer; alkali metal is admitted into the tube and is vaporized by heating the tube, and a voltage is applied to the tube during the heating period to cause current to flow through the tube and sensitize the alkali metal. Cf. C. A. 27, 5590.
- X-ray apparatus.** Oscar H. Pieper. Fr. 752,849, Sept. 30, 1933. Method of mounting the tubes.
- X-ray apparatus for radiographic and fluoroscopic examinations.** Montford Morrison and Stanley E. Lundquist (to Westinghouse X-Ray Co.). U. S. 1,937,835, Dec. 5. Structural and elec. features.
- X-ray tube.** Montford Morrison (to Westinghouse Lamp Co.). U. S. 1,937,834, Dec. 5.
- Anticathodes for x-ray tubes.** Compagnie générale de radiologie. Fr. 753,864, Oct. 14, 1933.
- Cathode-ray tubes.** Fernseh A.-G. Fr. 751,280, Aug. 30, 1933. A continuous fall of potential is provoked on the interior walls.
- Cathode-ray tubes.** Radioaktiengesellschaft D. S. Loewe and Kurt Schlesinger. Fr. 753,487, Oct. 17, 1933.
- Braun tubes.** Hans E. Hollmann. Brit. 397,785, Aug. 31, 1933. Elec. and structural features.
- Discharge apparatus.** Max A. E. Pressler. Brit. 397,254, Aug. 24, 1933. A hot cathode, which may be indirectly heated, is placed between an anode and a plate-shaped control electrode which is arranged apart from the envelope and very near the cathode, said control electrode having a recess and a photoelec. coating, *e. g.*, a monolat. layer of Cs on an oxidized Ag surface, and being provided with a terminal for suitably biasing.
- Discharge apparatus.** Siemens-Schuckertwerke A.-G. Brit. 397,712, Aug. 31, 1933. At least those parts of the main arcing chamber most subject to the (heat) effects of the discharge consist wholly or in part of vitrified  $Al_2O_3$ . This may be used, in addn., for internally disposed insulating members of metal vapor rectifiers, or such members may consist of pure vitrified insulating oxides, *e. g.*,  $ZrO_2$ , spinel, corundum,  $MgO$ .
- Discharge apparatus.** Walter L. W. Schallreuter. Brit. 397,933, Sept. 7, 1933. To prevent hardening, a gas-filled tube has a stream of gas or vapor added to the discharge space, said gas being such as to form (1 or more constituents of) the filling by chem. change when subjected to the discharge, and an absorbent, in communication with the tube, takes up the excess unchanged gas, particularly when no discharge is taking place. The substance evolving the gas is connected with 1 part of the tube and the absorbent with another part. Among examples a tube has a side branch contg.  $CaCO_3$  evolving  $CO_2$ ; during discharge  $CO_2$  is decompd. in the presence of a catalyst, *e. g.*, Si on an electrode, to form CO, giving a luminous discharge, and O which is absorbed by the electrodes, preferably of Al or Mg, or by P or alkali or alk.-earth metal. A sec. side branch contains KOH which absorbs  $CO_2$  but not CO. Other examples are given. Cf. C. A. 27, 4965.
- Discharge device for passing current in both directions.** Allgemeine Elektrizitäts-Gesellschaft (to International General Electric Co., Inc.). Brit. 397,972, Sept. 7, 1933.
- Discharge tubes.** Compagnie française pour l'exploitation des procédés Thomson-Houston. Fr. 752,520, Sept. 25, 1933. App. for making.
- Electric discharge tubes.** Le matériel téléphonique (Soc. anon.). Fr. 752,668, Sept. 28, 1933.
- Electric discharge tubes for the production or reception of electric oscillations.** Radioröhrenfabrik G. m. b. H. Fr. 753,815, Oct. 25, 1933.
- Electron-discharge tube.** Leo Szilard. Ger. 579,679, June 29, 1933.
- Electron-discharge tube.** Osram G. m. b. H. Komm.-Ges. (Edmund Germer, inventor). Ger. 581,872, Aug. 4, 1933.
- Thermionic valve grids.** N. V. Philips' Gloeilampenfabrieken. Brit. 398,101, Sept. 7, 1933.
- Two-stage thermionic valves.** Radioaktiengesellschaft D. S. Loewe and Paul Kapteyn. Brit. 397,612, Aug. 31, 1933.
- Thermionic cathodes.** Allgemeine Elektrizitäts-Gesellschaft (to International General Electric Co., Inc.). Brit. 397,291, Aug. 24, 1933. An indirectly heated cathode consists of a metal, preferably Ni, open-ended tube contg. a compressed mixt. of an electron-emitting material and an initially non-coherent metal mass, preferably BaO and powd. W.
- Thermionic cathodes.** Allgemeine Elektrizitäts-Gesellschaft (to International General Electric Co., Inc.). Brit. 397,939, Sept. 7, 1933. Structural features.
- Thermionic cathodes.** Telefunken Gesellschaft für drahtlose Telegraphie m. b. H. Brit. 397,350, Aug. 24, 1933. An indirectly-heated cathode has a bifilar heating winding, carried on an insulating body having portions of greater diam. than that carrying the winding, and a metallic screen with a roughened or blackened outer surface fitting on the enlarged portions so as to leave a space between the winding and the screen, the structure being surrounded by a cathode. A Ni screen may be roughened by applying a coating of powd. W or Zr.
- Thermionic cathodes.** The General Electric Co. Ltd.

- and John T. Randall. Brit. 397,656, Aug. 31, 1933. 1  
Cathodes, particularly for discharge lamps, consisting of a self-supporting mass heated by means, e. g., a W spiral, that does not contribute to the rigidity of the mass, are prepd. by forming a mass of the desired shape from alk.-earth peroxide and decomp. by heat. Powd. metal, e. g., W, may be mixed with the peroxide, which may be bound with a 10% soln. of nitrocellulose in AmOAc, e. g., 20 g. BaO<sub>2</sub> to 4.5 g. binder. Gum tragacanth is not suitable.
- Thermionic cathodes. The M-O Valve Co. Ltd. Fr. 750,898, Aug. 21, 1933. The core is made of an alloy of Ni with Ti and/or Al, e. g., Ni contg. 2% of Al. Cf. C. A. 28, 382<sup>a</sup>.
- Incandescent cathode. Allgemeine Elektrizitäts-Ges. Fr. 751,598, Sept. 6, 1933.
- Use of celluloid sleeves at the end of condenser tubes for preventing corrosion and electrolytic action. Leo H. Spanyol. U. S. 1,937,600, Dec. 5. Structural details.
- Shipping drum suitable for tars, pitches, rosins, etc. George E. Black (to Pittsburgh Steel Drum Co.). U. S. 1,937,806, Dec. 5. Structural details.
- Apparatus (with a foraminous rotatable drum) for calcining materials such as clay, gypsum or ores. Hugo Roth (to "Müllag" Mühlenbau und Industrie A.-G.). U. S. 1,937,413, Nov. 28. Various structural, mech. and operative details are described.
- Apparatus suitable for regulating various valve-control systems. Raymond E. Olson and Robert D. Cleveland (to Taylor Instrument Cos.). U. S. 1,937,666, Dec. 5. Structural and mech. details.
- Emulsifying apparatus. Guy C. Hurrell. Brit. 397,621, Aug. 31, 1933.
- Automatic apparatus for evacuating muds from purifiers, decanters, separators, etc. Compagnie Industrielle Franco-Africaine (Pierre Mercier, inventor). Fr. 753,900, Oct. 26, 1933.
- Apparatus for bringing viscous masses into a finely divided state. Lonza Elektrizitätswerke und Chemische Fabriken A.-G. Fr. 754,246, Nov. 3, 1933.
- Device for preparing emulsions. Alfred Hoffmann. Ger. 581,826, Aug. 3, 1933.
- Apparatus for distributing oils, etc., over contact masses. Gewerkschaft Kohlenbenzin. Ger. 584,647, Sept. 22, 1933.
- Apparatus for classifying granular materials. Fried. Krupp Grusonwerk A.-G. Fr. 751,159, Aug. 28, 1933.
- Automatic apparatus for taking samples of ore, coal or cement on conveyors, etc. James F. Geary and Harry C. Jennings. U. S. 1,937,473, Nov. 28. Mech. features.
- Apparatus for determining the specific gravity and temperature of liquids held under pressure in tanks, such as petroleum oils. Frank M. Ginger and Charles K. Francis (to Skelly Oil Co.). U. S. 1,937,755, Dec. 5. Various structural and operative details are described.
- Apparatus suitable for extraction of the fatty content of materials, by use of a solvent. Philip A. Goldfisch (to Laboratory Construction Co.). U. S. 1,937,694, Dec. 5. Structural details.
- Apparatus for producing highly porous slag. Ludwig v. Reiche and Julius Giersbach. Ger. 583,555, Sept. 5, 1933.
- Acid-resistant reservoirs. Didier-Werke A.-G. Fr. 754,064, Oct. 31, 1933. Construction of interior lining is described.
- Apparatus for signaling the presence of carbon monoxide and methane. Joanny Vergnais. Fr. 753,932, Oct. 27, 1933.
- Reservoir for absorption, condensation, etc., processes. Bama-Meguain A.-G. Fr. 752,571, Sept. 26, 1933. Method of mounting by suspension is described.
- Annealing plant. Felten & Guillaume-Eschweiler Draht A.-G. Ger. 580,831, July 17, 1933.
- Acetylene generators. Habran Frères et Dubé (S. a. r. l.). Fr. 754,201, Nov. 3, 1933.

- Thermoelements at high temperatures. A. Schulze. Z. Ver. deut. Ing. 77, 1241-2 (1933).—Discussion of the properties of thermoelements for the range 1000° to 2000° including: Pt-Pt, 0 to 100% Rh; Pt-Pt, 8% Re; Pt-Pt, 4.5% Re, 5% Rh; Rh-Pt, 8% Re; Rh-Rh, 8% Re; Ir-Rh, 40% Ir; Ir-Ir, 10% Ru. The couple Ir-Rh, 40% Ir shows a practically linear relation between e. m. f. and temp. from 0° to 2000°, giving 10.85 mv. for the 2000° interval. F. D. Rossini
- A natural classification of chemical elements and compounds. F. M. Shemyakin. Uspekhi Khim. 2, 630-42 (1933); cf. C. A. 27, 213.—A review discussing the periodic table from the standpoint of nuclear structure, isotopes, abundance in nature and the chem. compds. formed. F. H. Rathmann
- Pseudoatoms and isosteric compounds. II. Comparison of the groups N<sub>2</sub> and CO. H. Erlemeyer and Martin Leo. Helv. Chim. Acta 16, 897-904 (1933); cf. C. A. 27, 213.—Comparison of isosteric compds. is of importance in a study of the relationship between structure and properties, since chem. and phys. behaviors depend upon the no. and arrangement of external electrons. The assumption is made that N<sub>2</sub> and CO, which are isosteric, are obtained from the atoms in such a way that external electron shells form common to the whole mol. They exhibit similar properties. N<sub>2</sub>O and CO<sub>2</sub> are also isosteric. Isosteres of the N<sub>2</sub> group are .N(:N)., .N.N., .N:CH., .CH:CH.; isosteres of the carbonyl group are .C(:NH)., and .C(:CH<sub>2</sub>). A table of 27 possible isosteres of N<sub>2</sub>O and CO<sub>2</sub> groupings is given. Isomorphism of typical compds. contg. the N<sub>2</sub> and CO groupings was investigated. Melting-point diagrams of azobenzene and benzophenone, also of *p*-aminoazobenzene and *p*-aminobenzophenone, show the formation of eutectics, but no mixed crystals. Azobenzene does form mixed crystals with stilbene and benzalaniline. The dibenzyl esters of H<sub>2</sub>N<sub>2</sub>O<sub>3</sub> and H<sub>2</sub>CO<sub>3</sub>, contg. the isosteric groups N<sub>2</sub>O and CO<sub>2</sub>, form mixed crystals. PhMgCl, PhN<sub>2</sub>Cl and PhCO-

Cl decompose thermally in much the same way, indicating the chem. similarity of isosteric compds. The behavior of  $N_2$  and CO toward metals appears anomalous, since N compds. analogous to the metal carbonyls are not known. However, the reduction of both gases by  $H_2$  in contact with metals which form carbonyls is comparable. Since those metals that form carbonyls are best suited for  $NH_3$  synthesis, it is regarded as highly probable that metal  $N_2$  compds., analogous to the carbonyls, may be capable of transitory existence.

L. F. Audrieth

Recent researches on paramagnetism and the atomic moments. G. Foëx. *J. phys. radium* [7], 4, 517-32 (1933); cf. *C. A.* 28, 12<sup>a</sup>.—In this comprehensive survey of recent theoretical and exptl. work in paramagnetism, theories are checked against exptl. results. Present theories seem to give a fairly satisfactory representation of the variation of magnetic moment with at. no., especially since the moments have been calcd. from spectroscopic data without the introduction of any arbitrary consts. However, the theories fall far short of accounting for the "fine structure" of the phenomena, doubtless because of the difficulty of introducing satisfactorily the conditions imposed by the solid state. In particular, no satisfactory interpretation has yet been given for the Weiss law, especially in its application to strongly hydrated crystals and solns., and cases in which  $\Theta$  varies linearly with  $C$ . Again, theory seems to indicate that an  $lgn$  may exist in many magnetic states, corresponding to the various spectral states, with progressive passage from one state to another with variation in temp. Exptly., however, all the atoms seem to be in the same state if the substance is pure magnetically. This uniformity is probably a consequence of the solid state, for which theory at present makes no provision. Further, it is found exptly. that if the magnetic moment varies, the changes are discontinuous, usually less than one Bohr magneton, and frequently equal to an integral no. of Weiss magnetons. These, and other discrepancies between theory and expt., indicate the necessity for much further investigation.

W. W. Stiffler

Effect of magnetic fields on the energy transference in paramagnetic gases. H. Senfleben and J. Pictet. *Physik. Z.* 34, 834-5 (1933); cf. *C. A.* 27, 3863.—The heat cond. of a paramagnetic gas is diminished by a magnetic field. Exptly., over a wide range, this effect depends only on the quotient  $H/p$ , ( $p$  = pressure), and approaches a satn. value as  $H/p$  increases. Because no satisfactory theoretical explanation has yet been given, expts. were made on mixts. of  $O_2$  with diamagnetic gases such as  $H_2$ ,  $He$ ,  $N_2$ ,  $A$ ,  $CO_2$  and  $Kr$ . The results are similar to those for pure  $O_2$  but the effect is much reduced. This reduction is greater for gases like  $Kr$  and  $H_2$ , whose mol. wt. differs considerably from that of  $O_2$ , than it is for  $N_2$ ,  $A$  and  $CO_2$ . The ratio of the effect at satn. in  $O_2$  to that in the mixt. is taken as the measure of the effect of the foreign gas. For mixts. with  $CO_2$ ,  $N_2$  and  $A$ , the measured and the calcd. values of this ratio agree well if it is assumed that the effect of the magnetic field on the  $O_2$  mol. is (1) independent of whether it is in a mixt. or in pure  $O_2$ , and (2) independent of the nature of the mol. with which it collides. For  $H_2$ ,  $He$  and  $Kr$ , agreement between exptl. and calcd. results is obtained by assuming that the nature of the "collision partner" alters the effect of the field on the  $O_2$  mol. Hence the field affects the energy transfer between the  $O_2$  mol. and those of the foreign gas.

W. W. S.

Effect of magnetic fields on the diffusion of paramagnetic gases. H. Senfleben. *Physik. Z.* 34, 835-6 (1933); cf. *C. A.* 27, 639.—From the results obtained for its effect on heat cond. (cf. preceding abstr.) a magnetic field probably would diminish the rate of diffusion of  $O_2$  into a diamagnetic gas by a few tenths of 1%. Expts. were made by a differential elec. method, sensitive to a change in rate of diffusion of  $1/100\%$ . A definite effect was observed for diffusion of  $O_2$  into  $CCl_4$  but the interpretation of the results is complicated by unavoidable magneto-constructive effects produced by the field.

W. W. Stiffler

A law of discontinuous distribution of the ferromagnetic Curie points. IV. Applications to the variation of the Curie point in solid metallic solutions. Robert Forrer.

*J. phys. radium* [7], 4, 501-12 (1933); cf. *C. A.* 28, 12<sup>a</sup>.—F.'s law that  $\Theta = F\sqrt{N}$  (where  $\Theta$  denotes the abs. temp. of the Curie point,  $N$  the no. of effective contacts of the electron lattice, and  $F$  the const. corresponding to  $N = 1$ ) is applied to the interpretation of the data for a no. of alloys contg. solid solns. The no. of contacts varies linearly with the appropriate at. standard, and the const. slope of the line gives  $\Delta N$ , the change produced by replacing an atom of one of the constituents by an atom of the other. To analyze the tabulated data of several investigators, two methods are used. For low concns. the atoms are treated as individuals, while for higher concns. the problem is attacked by considering the distribution of electrons collectively between the atoms of the alloy. The analysis of Fe-Ni and Ni-Fe alloys by the first method shows that Ni dissolved in Fe possesses an elec. doublet, and that Fe dissolved in Ni has a magnetic triplet. This method is applied also to Fe-Co, Co-Fe, Fe-Si, Fe-Au and Fe-Sn alloys. The Ni-Co, Ni-Pd, Ni-Cu and Fe-Co alloys are treated by the second method. The results fall into 3 categories: (1) the dissolved atom with its participating electrons may contribute to a pos. mol. field, as in Fe-Ni, Fe-Si, Fe-Co, etc.; (2) it may serve merely as a diluent, as in Ni-Pd and Fe-Co; or (3) the participating electron of the dild. atom may furnish some neg. contacts as in the case of Ni-Cu.

W. W. Stiffler

Magnetic anisotropy of the naphthalene molecule. Constantin Sălceanu. *Bull. sect. sci. acad. roumaine* 16, 5-7 (1933).—The math. theory by which the magnetic anisotropy of the naphthalene mol. can be calcd. from its optical anisotropy, by the method used by Ramanadham, is outlined. The value is calcd. as  $204 \times 10^{-14}$ .

W. W. Stiffler

Method and experimental arrangement for measuring the indexes of refraction of substances in the fused state. Constantin Sălceanu. *Bull. sect. sci. acad. roumaine* 16, 8-12 (1933).—Measurements of the  $n$  of a liquid by means of a hollow prism may be in error because of lack of parallelism of the glass windows, etc. Methods of minimizing these errors are discussed and the math. theory of an interpolation method, for detg. the  $n$  of a given liquid in terms of the known  $n$ s of two others is developed. The exptl. arrangement described consists of an elec. furnace with suitable apertures in the sides, which fits onto the prism table of the spectrometer. An equilateral hollow brass prism, with Pyrex windows, fits into this furnace.

W. W. Stiffler

The invariant of magnetic rotation for some organic substances rendered liquid by fusion. Constantin Sălceanu. *Bull. sect. sci. acad. roumaine* 16, 13-15 (1933).—According to Mallemain's theory, the expression  $\Delta n/d$  ( $n - 1$ )<sup>2</sup>, in which  $\Delta$  is Verdet's const.,  $n$  is the refractive index, and  $d$  is the density, should be invariant for any given substance and independent of its state. A table is given, showing the values of  $n$ ,  $d$  and  $\Delta$  for naphthalene from 84° to 188°,  $\beta$ -methylnaphthalene from 34° to 174°, triphenylmethane from 100° to 180°, and phenanthrene from 100° to 170°, with the corresponding value for  $\Delta n/d/(n - 1)$ <sup>2</sup>.  $\beta$ -Methylnaphthalene shows a progressive increase of about 5% for this invariant, but for the other 3 compds. it remains const. within 2%, thus confirming the theory, at least to a first approximation.

W. W. Stiffler

Measurements of the magnetic rotatory power on some fused organic substances. Constantin Sălceanu. *Bull. sect. sci. acad. roumaine* 16, 16-19 (1933).—Measurements of the magnetic rotatory power and the dispersion were made on several org. compds. for the 3 standard Hg lines. Values of  $\Lambda$  (the Verdet const.) and of  $\Lambda/d$  are given for  $\alpha$ -methylnaphthalene from 19° to 164°. In this interval  $\Lambda/d$  is approx. const. with a mean value of  $4.62 \times 10^{-2}$ . Similarly for phenanthrene between 104° and 217°,  $\Lambda/d$  decreases gradually from 5.48 to  $5.32 \times 10^{-2}$ , and for benzyl, in the interval 100° to 204°,  $\Lambda/d$  decreases only from 2.66 to  $2.58 \times 10^{-2}$ . Some data are also given for the dispersion. The magnetic birefringence is a mol. phenomenon while the magnetic rotation is at.

W. W. Stiffler

Calculation of Verdet's constant  $\Lambda$  as a function of the atomic refractivities, for some substances rendered liquid by fusion. Constantin Sălceanu. *Bull. sect. sci. acad. roumaine* 16, 20-3 (1933).—Details of the calcn. of  $\Lambda$  from the at. refractivities according to Mallemain's theory are given for triphenylmethane, naphthalene and phenanthrene. The calcd. results agree with the exptl. values within 2 to 5%, thus verifying the theory for these compds. to a first approximation. W. W. Stiffler

Verification of the law of rotatory magnetic dispersion for some organic substances rendered liquid by fusion. Constantin Sălceanu. *Bull. sect. sci. acad. roumaine* 16, 24-6 (1933).—Mallemain's general equation for magnetic rotatory dispersion can be verified indirectly by showing that the ratio of the rotatory magnetic dispersion to the dispersion due to elec. birefringence is equal to the inverse ratio of the corresponding wave lengths. The data for  $\beta$ -methylnaphthalene and phenanthrene do not satisfy this condition, and hence the law is inadequate. This is attributed to failure to consider the effects of the absorption bands in the ultra-violet. W. W. Stiffler

Magnetic anisotropy in crystals of trans-dinitrotetraminecobaltic chloride. Lester W. Strock. *Z. Physik. Chem.* B23, 235-8 (1933).—The structure of  $\text{Co}(\text{NH}_2)_4(\text{NO}_2)_2\text{Cl}$  was investigated and the const. of the crystal are given. It belongs to the rhombic group and there are 16 mols. to the unit cell. In a magnetic field it crystallizes with the  $\beta = [100]$  plane parallel to the lines of force and the crystals are magnetically anisotropic. G. M. M.

Magnetic susceptibility of ions. Kiyoshi Kido. *Science Repts. Tôhoku Imp. Univ.*, First Ser. 22, 835-67 (1933).—The theoretical equations of Pauling, Slater, Angus and others, for calcg. the diamagnetic susceptibilities of ions, are reviewed. The susceptibilities of many ions calcd. by these formulas generally fail to agree with K.'s exptl. values. Further, when susceptibility,  $\chi$ , is plotted against valency no.,  $n$ , the exptl. and theoretical curves are different in nature. The ionic susceptibility is the sum of a paramagnetic and a diamagnetic term:  $\chi_{\text{ion}} = \chi_p + \chi_d$ . The existence of the  $\chi_p$  term indicates distortion of an electron orbit due to an assocn. of the ions in the mol. By using K.'s exptl. values for  $\chi_{\text{ion}}$ , the mol. susceptibilities of a no. of inorg. compds. are calcd. with the assumption of an additive law. The agreement with exptl. detd. values is excellent for homeopolar compds. The additive law holds also for some org. compds. For ions with the same nuclear charge, a pair of electrons in the outer surface of the same total quantum no. produces the same change in  $\chi$ . A double-bond linkage between atoms decreases the diamagnetic susceptibility. Many tables of ionic susceptibilities are given. W. W. Stiffler

Dielectric-constant studies. I. An improved voltage-tuning resonance method and its application to aqueous potassium chloride solutions. J. Gilbert Malone, A. L. Ferguson and L. O. Case. *J. Chem. Physics* 1, 830-41 (1933).—The behavior of various types of app. used in detg. dielec. const. of aq. solns. of electrolytes is studied. While the voltage-tuning method is theoretically unaffected by the cond. of the soln., other disturbing factors are present. The change in dielec. const. detd. by this method depends more or less on the characteristics of the particular generating and receiving circuits used. Dielec. const. are given for aq. KCl in concns. up to 0.050  $M$  at 25° and  $\lambda = 31.7$  m. The dielec. const. rises with concn. II. The Drude method applied to aqueous solutions of potassium chloride. J. Gilbert Malone, L. O. Case and A. L. Ferguson. *Ibid.* 842-6.—The Drude method was used for detg. dielec. const. of  $\text{H}_2\text{O}$ -EtOH and aq. KCl solns. Values obtained with 3 distinct types of detectors were concordant for  $\text{H}_2\text{O}$  and for  $\text{H}_2\text{O}$ -EtOH solns., but discordant for aq. KCl solns. The change in dielec. const. of electrolytic solns. detd. by this method depends at least in part on the characteristics of the app. Gerald M. Petty

Dielectric properties of solutions of electrolytes in a non-polar solvent. Charles A. Kraus and Gilman S. Hooper. *Proc. Nat. Acad. Sci.* 19, 939-43 (1933).—Dielec. const.-concn. curves are given for tetraisoamyl-

and triisoamylammonium picrate, tetraisoamylammonium bromide,  $\text{AgClO}_4$  and  $m\text{-C}_6\text{H}_4(\text{NO}_2)_2$  at 25°. Values are given for the molar polarization, elec. moment and distance between the centers of charge in an ion pair. It is suggested that the symmetry of the ions has an effect on the dielec. behavior of an electrolyte at high concns.

Howard A. Smith  
The dielectric constants of aqueous solutions at very high frequency. Ernst Plotze. *Ann. Physik* 18, 288-98 (1933).—Dielec. const. of aq. solns. of  $\text{CuSO}_4$ ,  $\text{La}(\text{NO}_3)_3$  and  $\text{K}_4\text{Fe}(\text{CN})_6$  at max. concns. of 0.002  $M$  were detd. by Drude's method. The measurements were made at  $\lambda = 60.0$  cm., and at 17°. The results agree with the Debye-Onsager-Falkenhagen theory. Gerald M. Petty

Dipole moments of the chlorobenzophenone oximes. George S. Parsons and C. W. Porter. *J. Am. Chem. Soc.* 55, 4745-6 (1933).—The  $\alpha$  and  $\beta$  forms, resp., of *o*-, *m*- and *p*-chlorobenzophenone oxime (m. 131°, 96-7°, 122-3°, 105-6°, 162-4° and 91-2°, resp.) have dipole moments of 161, 161, 1.50, 1.61, 2.320 and 2.381  $\times 10^{-18}$  e. s. u., resp. The values for the *o*- and *p*-compds. were obtained in dioxane soln., in which assocn. is slight. These results do not give an unambiguous answer to the question of oxime structures. H. A. Beatty

Simplified formulas for the calculation of expansion coefficients and compressibilities of gases at low pressures from the Beattie-Bridgeman equations of state. J. B. M. Coppock. *J. Phys. Chem.* 37, 995-9 (1933).

P. H. Emmett  
Acoustical studies. II. The behavior of a gas with several independent internal-energy states. Wm. T. Richards. *J. Chem. Physics* 1, 863-79 (1933); cf. *C. A.* 27, 1791.—Einstein's method of describing the acoustical behavior (Richards and Reid, *C. A.* 28, 387) of a disocg. gas is extended to a nondissocg. gas in which five groups of internal-energy states have different relaxation times. The variation of the velocity of sound with frequency demonstrates different relaxation times; variations with pressure show effects due to three-body collisions or to radiation from optically active states. Math. Gerald M. Petty

Hydrodynamic equations with capillary terms. Theory of surface tension. Y. Rocard. *J. phys. radium* [7], 4, 533-48 (1933).—For a complete formulation of the equl. and the movement of a fluid composed of mols. having mutual attraction according to the kinetic theory, a system of pressures and tensions dependent on the 2nd space derivative of the  $d$ . must be considered in writing, for a non-uniform  $d$ . distribution, the hydrodynamic equations for the movement. The tensions represent the effects of capillarity. A quantity  $H$  is set up for the surface tension; a numerical calcn. of  $H$  agrees well with expt. and justifies the empirical rule of Ramsey and Shields.  $H$  divided by the crit. pressure and the diam. of the mol. is a unique function of  $T/T_c$  ( $T_c$  = crit. temp.) for all substances having the same kind of intermol. forces. No new hypothesis was necessary to obtain these results. L. R. S.

Measurement of surface tension of liquids by the parallel-plate method. Naoyasu Sata and Katuzo Kurano. *Kolloid-Z.* 65, 191-5 (1933).—The surface tensions detd. by this method approach the theoretical curves as the thickness of the plate is increased. For  $\text{H}_2\text{O}$ , the thickness is 7-8 mm.; for EtOH, PhNO<sub>2</sub> and PhNH<sub>2</sub>, 5-6 mm.; for  $\text{CHCl}_3$  and  $\text{CHBr}_3$ , 4-5 mm. These values agree with the plate thicknesses at which the creeping height reaches a max. value for these liquids. Expts. with flint, crown, and soda-lime glasses, and quartz show that plate compn. is not a factor. Arthur Fleischer

Molecular diffusion of light in liquids. E. Canals and P. Peyrot. *Bull. soc. chim.*, 53, 741-4 (1933).—Light diffused by pure liquids is only partially polarized, which leads to the conclusion that mols. are optically anisotropic. The amt. of mol. anisotropy can be estd. by the measure of depolarization. This depolarization was measured for several halogen derivs. of ethane, propane, isopropane and amylene, as well as  $\text{C}_6\text{H}_6$ , heptane, isopentane,  $\text{CH}_3\text{CHCl}$  and  $\text{CHCl}_3$ . James H. Hibben

Evaporation and diffusion of volatile materials into an

inert gas stream. Eric Preston. *Trans. Faraday Soc.* 29, 1188-98(1933).—Vapor-tension measurements by a dynamic method for glasses of the approx. compns. 30% PbO, 70% SiO<sub>2</sub>; 80% Na<sub>2</sub>O, 50% SiO<sub>2</sub>; and 80% K<sub>2</sub>O, 50% SiO<sub>2</sub> were theoretically evaluated. It is concluded that evapn. at normal pressures is in essence a process by which a thin vapor in equil. with the liquid phase according to the Herz-Knudsen equations, diffuses into the passing gas. This diffusion seems to be sensibly governed by the same considerations as those deduced from the kinetic theory for the diffusion of gases into an enclosed space. It appears correct to assume that in the vapor PbO, Na<sub>2</sub>O and K<sub>2</sub>O are unimol. Frank Urban

The vapor-pressure curve of nitrobenzene. Maria T. Toral and E. Moles. *Anales soc. españ. fis. quim.* 31, 735-45(1933).—Vapor pressures of pure PhNO<sub>2</sub> were detd. from 95.8° to 207.9°. Results can be expressed by the equation  $\log p = 8.172443 - (2552.683/T)$ . Calcd. b. p. at 760 mm. pressure is 209.6°, not agreeing well with the literature. From the values found, the heat of evapn. can be obtained from the equation  $L = 94.84 \text{ cal./g.}$ , and the ebullioscopic const.  $E = 49.13$ , agreeing with the values obtained by Biltz, Bachmann and Dziewonski. If vapor-pressure detns. are made by using an exposed-stem thermometer, and the results corrected as usual, values are obtained which deviate considerably from those obtained by the use of thermometers with unexposed stem. E. M. Symmes

The equation of state and the parachor. A. Eucken. *Nachr. Ges. Wiss. Göttingen Math.-physik. Klasse* 1933, 340-9.—The parachor relation  $V^{1/3}\sigma$  or  $V^{1/3}/\sigma = \text{const.}$ , where  $V$  is the mol. vol. and  $\sigma$  the surface tension, can be derived from a general equation of state applicable to liquids even at high pressure and in agreement with the London attraction law. The additivity of the parachor is explained by the fact that the latter represents about 2.9 times the zero-point vol. P. H. Emmett

Wall effect in the falling-ball method for viscosity. Alfred W. Francis. *Physics* 4, 403-6(1933).—The wall effect of balls falling in a vertical cylindrical tube in a viscous fluid is probably independent of the abs. radii of the ball and tube and only slightly dependent on the abs. viscosity. The bottom effect is negligible. The revised formula proposed for liquids of high viscosity is:  $\eta = 2gR^2(\rho_1 - \rho_2)(1 - R/r)^{3.25}/9u$ , where  $\eta$  is the viscosity in poises,  $R$  and  $r$  are the radii of ball and tube in cm.,  $g = 980 \text{ cm. per sec.}^2$ ,  $u$  is the observed velocity in cm. per sec., and  $\rho_1$  and  $\rho_2$  are the ds. of ball and liquid, resp. The function agrees well with observations at least to the ratio,  $R/r = 0.83$ , while the limit of agreement for Ladenburg's formula is the ratio 0.09. L. E. Steiner

Fluidity measurement of liquids, solutions, emulsions, etc. A. R. Matthis. *Ind. chim. belge* [2], 4, 497-502 (1933).—A simple fluidimeter is described. A. L. H.

The determination of the coefficients of viscosity of viscous liquids, and the application of Le Chatelier's formula. B. Deryagin. *J. chim. phys.* 30, 548-55 (1933).—The variation of viscosity with temp. as measured with falling spheres in potato molasses and in a 42% soln. of sugar in glycerol, is expressed by Le Chatelier's equation:  $\log \log(\eta/\eta_0) = A - B/T$ . L. E. Steiner

Fluidity of dioxane-water mixtures. John A. Geddes. *J. Am. Chem. Soc.* 55, 4832-7(1933).—The fluidity-concn. curves reveal the hydrate, C<sub>4</sub>H<sub>8</sub>O<sub>2</sub>·5H<sub>2</sub>O. S. Bradford Stone

Measurement of the surface tension of solid substances. V. P. Berdennikov. *Physik. Z. Sowjetunion* 4, 397-419 (1933).—Griffith's theory of the widening of surface cracks in glass was tested and applied to the surface-tension measurement of solid substances. For glass in *vacuo*, and in water the surface energies in ergs are 1214 and 290; in other media the values are intermediate. The order for glass is not valid for quartz. L. E. Steiner

Recrystallization and coloration. IV. Karl Przibram. *Sitzber. Wiss. Wien Math.-naturw. Klasse Abt. IIa*, 142, 251-7(1933); cf. *C. A.* 27, 3400.—Micrometric measurements of grain growth in pressed KBr show that the hindrance of recrystn. by Ra irradiation affects formation of

crystal nuclei and not the grain growth. The recrystn. time-pressure diagram for NaCl is carried to a pressure of 10,000 kg./sq. cm. It seems that recrystn. of KCl and KBr after pressure compared with unpressed melted crystals causes a lessening of the lattice disturbance, since pressed samples change color more quickly. O. E. S.

Remarkable optical properties of the alkali metals. R. de L. Kronig. *Nature* 132, 601(1933).—The optical behavior observed by R. W. Wood (*C. A.* 27, 5240) can be fully accounted for by means of the quantum theory of metallic dispersion developed by K. Frank Urban

The theory of forced double refraction. K. F. Herzfeld and R. H. Lee. *Phys. Rev.* 44, 625-31(1933).—The double refraction produced in NaCl and KCl crystals through elastic stress is calcd. but the results contain too many unknown consts. to be checked against expt. L. S. Kassel

Isothermic crystallization or transformation of a given mass independent of time. G. Tanmann. *Z. anorg. allgem. Chem.* 214, 407-13(1933).—Two types of formation of crystn. centers in isothermal transformations are described (1) on the surface of melts and (2) regular distribution of centers throughout the mass. The derivation of the formula relating the total vol. of centers and time is given. Examples of the transformation process are given which include monoclinic to rhombic S and the reverse, of NH<sub>4</sub>NO<sub>3</sub> below and above 32° and of Al<sub>2</sub>Zn<sub>3</sub> decompn. Certain Ni and Mn steels are also described. R. H. L.

The Faraday effect at high frequencies. G. P. Harnwell, W. Bleakney, S. N. Van Voorhis and J. B. H. Kuper. *Phys. Rev.* 44, 785(1933).—The result of preliminary expts. on the Faraday effect at high frequencies is not conclusive but the general method of investigation with continuous oscillations is considered feasible. The method has the advantages of steadiness of operation and great flexibility. Allen S. Smith

Free rotation in the lattice of silicon hydride. Klaus Clusius. *Z. physik. Chem.* B23, 213-25(1933).—Pure SiH<sub>4</sub> was prepd. from Mg silicide and HCl and its sp. heat measured from 10° abs. to the b. p. At 63.4° abs. a break in the curve indicates a rotation in the solid state. Below the m. p., the solid is weakly birefringent but below the transition point the double refraction is strong. The results are compared with those obtained with CH<sub>4</sub>. The unsym. form of the transition curve is ascribed to strong coupling of the rotators. G. M. Murphy

The electron conduction of cuprous oxide. W. Schottky and F. Waibel. *Physik. Z.* 34, 858-64(1933).—The Hall effect of Cu<sub>2</sub>O in the temp. range —180 to about 850° was investigated to det. whether the mechanism of cond. changes near 500°. The possibility of a change from an excess electron cond. to a defect cond. with increasing temp. was considered to account for discrepancies in exptl. results. In the temp. range where one or both mechanisms are predominant the Hall const.  $R$  is inversely proportional to the concn. of the conductors. The latter shows unusual variation with the O content at room temp. Between 400° and 500° the curve of  $R$  vs.  $1/T$  passes through 0 and becomes pos. above 500°. The quantity  $R \times \kappa$  ( $\kappa = \text{cond.}$ ) is proportional to the mobility. In the excess-electron region the latter decreases with increasing temp.; in the defect region the course is not well established. The results substantiate a defect-conductor theory of the blocking layer, and serve to clarify the blocking-layer effect and photocurrent. A. S. Smith

The plasticity and hardness of alkali halide crystals. Karl Przibram. *Sitzber. Akad. Wiss. Wien Math.-naturw. Klasse Abt. IIa*, 142, 259-61(1933); cf. *C. A.* 27, 3372.—The plasticity coeff.  $b$  and the Brinell hardness for NaBr, NaI and KI crystals were detd. Crystal lattice const. plotted against  $b$  gives a nearly straight line when the cation of the halide is the same. O. E. Sheppard

The densities of organic crystals. Asutosh Mukherjee. *Indian J. Physics* 8, 147-9(1933).—The flotation method of d. detn. was applied to a large no. of org. compds. The purest crystal is assumed to be the one with the greatest d. The crystal was subjected to repeated subdivision each time only the particle with the greatest d.

was retained. The  $d$ . measured in this manner compares very closely with the values calcd. from x-ray data.

Calvin Brous

The structure of carbon. Investigations by means of electron diffraction. Ferdinand Trendelenburg, E. Franz and O. Wieland. *Z. tech. Physik* 14, 489-95(1933); cf. *C. A.* 27, 2870.—C of various crystallite sizes (natural graphite, com. graphite and lampblack) was studied. The lattice parameters agree with those obtained by x-rays (cf. *C. A.* 18, 3128). The electron diffraction method gives information on the nature of the surface layers; x-rays on deeper layers. The 001 interferences, observed with x-rays, are not found with 30-kv. electrons. The basal planes are parallel to the electron-optically smooth graphite surfaces; the electron absorption in the long path resulting is too great to permit interference. The surfaces perpendicular to the basal planes are electron optically rough, permitting interferences. Thirteen references.

Victor Hicks

Crystallographic investigations with the electrical electron microscope. E. Bruche and H. Johansson. *Z. tech. Physik* 14, 487-8(1933); cf. *C. A.* 27, 1268-9.—The changes in crystal structure of a carefully polished hot Ni cathode coated with Ba azide were observed. Objects of 10  $\mu$  were resolved.

Victor Hicks

The reflection of x-rays from anthracene crystals. B. Wheeler Robinson. *Proc. Roy. Soc. (London)* A142, 422-47(1933).—The abs. intensity of reflection from the (001) planes of anthracene was measured for  $\lambda$  1.539 and  $\lambda$  0.709 A. U., on crystals up to 0.5 mg., exposed to a uniform monochromatic beam. Measurements were made with a recording ionization spectrometer with valve amplification. Errors due to non-monochromatism of the beam and to extinction and absorption in the crystal were investigated. A method of applying the extinction correction to small crystals is developed. The structure factors for the (001) planes are 30.5 for  $\lambda$  1.539 and 32.8 for  $\lambda$  0.709 A. U. The difference is discussed. The latter factor may be taken as a standard for org. crystal structure analysis.

Victor Hicks

The crystalline structure of naphthalene. A quantitative x-ray investigation. J. Monteath Robertson. *Proc. Roy. Soc. (London)* A142, 674-88(1933).—The intensities of reflection were measured photographically. The structure was obtained by trial and error, by starting from the orientation found for anthracene (cf. *C. A.* 27, 3373). These results were refined by a double Fourier analysis about the zones of the crystal axes. The electron distribution is plotted in abs. units. The orientation of the mol. in the crystal and the coordinates of the atoms are given. The structure differs from that of anthracene chiefly in the larger inclination of the long axis of the mol. to the (010) plane. The electron count agrees well with the chem. structure.

Victor Hicks

X-ray investigation of konjak mannan. Ichiro Sakurada and Keiroku Futino. *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 21, 287-301(1933).—Konjak mannan has 2 modifications:  $\alpha$ , amorphous and water-sol.;  $\beta$ , cryst. and water-insol.  $\beta$  has a tetragonal lattice with 3 hexose residues in the elementary cell with  $a_0 = b_0 = 8.5$ ,  $c_0 = 7.5$  A. U. when water-free and with  $a_0 = b_0 = 8.7$ ,  $c_0 = 8.2$  A. U. when air-dried. Under tension the micelles are oriented with the  $c$  axis parallel to the tension. The micelles of dried films and frozen sheets are also oriented. Twelve references.

Victor Hicks

Fourier analysis of the durene structure. J. Monteath Robertson. *Proc. Roy. Soc. (London)* A142, 659-74(1933).—Results of the crystal analysis of durene, 1,2,4,5-tetramethylbenzene (cf. *C. A.* 27, 5604) were subjected to a double Fourier analysis about the zones of the crystal axes. The results are given in contour diagrams drawn to abs. scale. The mol. has a regular plane hexagon benzene ring, with the Me group in the plane of the ring but displaced about 3° toward the unsubstituted positions. The orientation of the mol. in the crystal and the atomic parameters are given. An electron count shows the effect of the H atoms.

Victor Hicks

An x-ray study of the binary alloys of Si with Ag, Au,

Pb, Sn, Zn, Cd, Sb and Bi. Eric R. Jette and Emery B. Gebert. *J. Chem. Physics* 1, 753-5(1933).—The measured lattice consts. of the elements in these alloys are practically identical with those of the pure elements. Thus mutual soly. occurs to only a very slight extent. Si forms no compds. with any of these elements.

Victor Hicks

A note on the vapor pressure of zinc bromide. M. S. Desai. *Bull. Acad. Sci. United Provinces Agra Oudh India* 3, 31-2(1933).—The note corrects a mistake in a former paper (*C. A.* 27, 3865). The mistake is math., and the former equation should be  $\log P = -(A/T) + \log T + B$ , where  $A = 5839.781$  and  $B = 9.066$ . The latent heat of evapn. is therefore 25.68 kg.-cal. instead of 27.60 kg.-cal. as reported.

H. W. Leahy

The ultra-violet absorption of aldehydes. H. Conrad-Billroth. *Z. physik. Chem.* B23, 315-18(1933).—The absorption of 0.015  $M$  hexane soln. of the following substances was studied: RCHO, where R = Me, Et, Pr, Am, Bu,  $C_6H_{13}$ ,  $C_7H_{15}$ ,  $C_8H_{17}$ ,  $Me_2CHCH_2$ ,  $Me_3CH$ ,  $MeEtCH$ ,  $Me_2C$ .

G. M. Murphy

Thermodynamic properties of trifluorotrichloroethane and difluorotetrachloroethane. Frank Hovorka and Francis E. Geiger. *J. Am. Chem. Soc.* 55, 4759-61(1933).—For  $(CFCl_2)_2$  and  $CClF_2CCl_2F$  are given b. ps., m. ps.,  $E_{\text{évap}}$  consts., mol. heats of vaporization, crit. temps., Sugden's parachors,  $\eta$ , viscosities and surface tensions.

A. L. Henne

Thermodynamic properties of 2-methyl-2-pentanol. Frank Hovorka, H. P. Lankelma and K. K. Naujoks. *J. Am. Chem. Soc.* 55, 4820-2(1933).—Measurements of surface tension,  $d$ .,  $\eta$ , abs. viscosity and vapor pressure, in the range 5° to 120°, are reported.

F. D. Rossini

The sorption error in measurements involving easily sorbable gases at low pressures. Marcus Francis. *J. Phys. Chem.* 37, 1019-27(1933).—Below a pressure of 0.1 mm. of Hg, the gas sorbed on the walls of a glass app. may approach or even exceed in amt. that contained in the free space of the system. Expts. with  $SO_2$  showed a disengagement of sorbed gas amounting to more than 50% of the free gas at an arbitrary starting point.

P. T. N.

Activated adsorption of gases on charcoal. R. Burshstein, P. Levin and S. Petrov. *Physik. Z. Sowjetunion* 4, 197-211(1933).—The adsorption of  $H_2$ , CO,  $N_2$ ,  $C_2H_4$  and  $C_2H_6$  on ash-free charcoal (I) and on the same charcoal contg. 0.2% Pt (II) showed, for  $N_2$ , no effect of the Pt and, for  $C_2H_4$  and  $C_2H_6$ , the same end values for I and II but a more rapid approach to equil. for II. For H between -183° and 100°, and for CO from 20° to 400° the difference in amt. adsorbed by II and by I is a pos. const. with respect to temp. and pressure, and it varies with the Pt content. At 20° the H can be completely pumped off from I, but from II only the H adsorbed by the C, not that adsorbed by Pt. Slow, activated adsorption occurs for H at 300° and for CO at 400°. For H,  $A \propto \sqrt{P}$  and for a short time  $A \propto \sqrt{t}$  where  $A$  is the amt. adsorbed,  $P$  the pressure and  $t$  the time. For CO at 400°,  $A \propto \sqrt{t}$ ; this relation holds at 600°, 700° and 800° for I but not for II.

J. E. Steiner

Active charcoal. I. Activity of charcoals made under various conditions of carbon dioxide current. Setsuro Tamaru and Osamu Kamiike. *J. Chem. Soc. Japan* 54, 1088-110(1933).—Coconut charcoal was activated by heating in a current of  $CO_2$  at 900°. The sorption and desorption of water by the charcoal were studied by means of a thermobalance. Water could not be completely desorbed below 900°. II. Sorption equilibrium of water, sulfur chloride and silicon tetrachloride vapors in coconut charcoal. *Ibid.* 1101-8.—The repeated sorption and desorption of (1) water vapor, (2)  $SiCl_4$ , and (3)  $SiCl_4$  by coconut charcoal were studied. The charcoal was prepd. by heating at 935° in a current of  $CO_2$  for 1 hr. With (1) there was observable hysteresis in sorption and desorption but not much with (2) and (3). III. Sorption equilibrium of various organic vapors in coconut charcoal. *Ibid.* 1109-21.—Sorption equil. between coconut charcoal and  $C_6H_6CH_3$ ,  $n-C_4H_9OH$ ,  $CH_3COOH$ ,  $n-C_4H_9NH_2$ .

$C_6H_6$ ,  $C_6H_5OH$ , was studied. IV. Sorption equilibrium of less volatile organic vapors in coconut charcoal. *Ibid.* 1122-8.—Sorption equil. between coconut charcoal and the difficultly volatile substances  $C_6H_5NO_2$ , decalin,  $C_6H_5OH$  and cyclohexanone was studied. Hysteresis in sorption and desorption appears only with  $C_6H_5NO_2$ . V. Manufacture of mask charcoal by gas-activation method. Setsurō Tamaru, Yosiki Imai and Sōsuke Kanō. *Ibid.* 1129-44.—The activation of coconut charcoal and of wood charcoals by means of water vapor,  $CO_2$  and air was studied. With respect to a charcoal every gas exerted almost the same activating action. The activity of the charcoal may be detd. principally by loss of charcoal due to combustion and by the temp. of heating. VI. Sorption equilibrium of benzene vapor in charcoals prepared by impregnation method and gas-activation method. Yosiki Imai. *Ibid.* 1145-54.—Sorption equil. of benzene vapor in (1) coconut charcoal, soaked with  $Na_2SO_4$  soln. and then heated and (2) Norit charcoal was studied. Sorption and desorption were reproducible at lower pressure, but there was hysteresis at higher pressure. VII. Sorption equilibrium of benzene vapor in various charcoals made by the impregnation method. *Ibid.* 1155-67.—Filter paper of low ash content was dipped into  $H_2SO_4$ ,  $Na_2SO_4$ ,  $H_3PO_4$ , and then heated. The activity of the charcoal thus obtained was examd. by studying the sorption of benzene vapor.  $Na_2SO_4$  and  $H_3PO_4$  promoted activity. VIII. Properties of points inside the hysteresis loop of sorption equilibrium and the mechanism of sorption. *Ibid.* 1168-76.—The phenomenon of hysteresis is explained on the basis of surface adsorption and capillary condensation. T. K. Ion adsorption on metals and charcoal. A. Frumkin. *Physik. Z. Sowjetunion* 4, 239-61(1933).—A review.

L. E. Steiner  
The surface oxides of charcoal and the adsorption of electrolytes. L. Lepin. *Physik. Z. Sowjetunion* 4, 282-91(1933).—Three surface oxides of charcoal are postulated having 1, 2 and 3 valences, resp., of the surface C atoms attached to O. These react with water to form hydroxides, the first 2 being basic and the last acidic. L. E. S.  
Adsorption and capillary condensation. M. Polanyi. *Physik. Z. Sowjetunion* 4, 144-55(1933).—The "potential" theory and the capillary condensation theory of adsorption are compared and the limits of the latter discussed.

L. E. Steiner  
Capillary condensation of vapors on porous sorbents. M. Dubinin. *Physik. Z. Sowjetunion* 4, 156-71(1933).—A review. For solids with coarse pores, adsorption is largely capillary condensation; for fine pores, Polanyi's theory holds best; for intermediate cases, both types of adsorption coexist.

L. E. Steiner  
Relation between van der Waals' and activated adsorption on chromium oxide gel. John Howard. *Nature* 132, 603(1933).—Activated adsorption of  $H_2$  and  $N_2$  on a surface of  $Cr_2O_3$  diminished van der Waals' adsorption to a marked extent, showing that the 2 types of adsorption do not take place independently of each other. F. Urban

The effect of the alkali and the alkaline earth ions on the adsorption of thorium B by silver bromide crystals. J. F. King and U. T. Greene. *J. Phys. Chem.* 37, 1047-59(1933).—The adsorption of Th B ions on AgBr crystals in the presence of various concns. of the alkali and alk. earth bromides was studied. The order of repression of the adsorption of Th B is  $Cs^+ > Rb^+ > K^+ > Na^+ > Li^+$  at all concns. measured. There appears to be a relation between the adsorbability of these cations and their heats of hydration, their ionic size and solubilities of their bromide salts. There is little difference in the repressing effect of Ba, Ca and Sr ions. P. T. Newsome

The adsorbabilities of the ions. K. S. Gururaja Doss. *Indian Chem. Soc.* 10, 503-8(1933).—In general, Mukkerjee's equation (cf. *C. A.* 16, 3018) is confirmed. The adsorbability of the H ion in comparison with the Ba ion is greater than predicted, probably because of secondary factors which affect adsorption. F. E. Brown  
Exchange of energy between inert gas atoms and a solid surface. J. M. Jackson and A. Howarth. *Proc. Roy. Soc. (London)* A142, 447-50(1933).—The theory of the

thermal accommodation coeff. (cf. *C. A.* 26, 5489) for a one-dimensional exponential field is extended over the normal modes of vibration of the solid. Agreement with the work of Roberts (*C. A.* 26, 2357) on temp. variation of the accommodation coeff. of He on W was secured for the value  $4 \times 10^6$  cm.<sup>-1</sup> of the exponential index  $\alpha$ . This is in agreement with the magnitude suggested by Born (*C. A.* 26, 3968) and Slater (*C. A.* 25, 3886). Calvin Brous

Decrease of surface energy and increase of dispersibility of solid substances through the formation of an adsorption layer. Sclerometry in the physical chemistry of mechanical dispersions. III. P. Rebinder, N. Kalinovskaya and Eugenie Venstroem. *Physik. Z. Sowjetunion* 4, 365-96(1933); cf. *C. A.* 26, 638.—Solids dispersed by various mech. means in solns. of various adsorbates gave dispersibility isotherms (hardness-decrease-concn.-of-adsorbate curves) similar to adsorption curves. The isotherms followed Traube's rule for adsorption from aq. solns., and its reverse for adsorption from hydrocarbon solns.

L. E. Steiner  
Mechanical properties of adsorption layers and the stability of foams and emulsions. D. L. Talmud. *Physik. Z. Sowjetunion* 4, 420-30(1933).—A review.

L. E. Steiner  
Technic for measuring the viscosity of surfaces. Gino Bergami. *Boll. soc. ital. sper.* 8, 1276-8(1933).—The technic previously described (*Arch. sci. biol.* (Italy) 18(1933)) was modified so as to make possible the detn. of the viscosity of surfaces within wide limits—from distd. water to hydrophile colloids. The app. is essentially a differential torsion balance in which the degree of torsion of the wire is a function of the resistance of the surface of the liquid under test.

Peter Masucci  
Surface chemistry. Irving Langmuir. *Chem. Rev.* 13, 147-91; *Angew. Chem.* 46, 719-33(1933).—A summary of L.'s contributions.

Louise Kelley  
The range of surface forces. F. P. Bowden. *Physik. Z. Sowjetunion* 4, 185-96(1933).—The top plate of a pair of highly polished plates of glass, steel or ZnS in a dust-free cylinder sank on the bottom plate to a distance dependent on the limit of polish (1000 Å. or more) regardless of whether the plates were in a high vacuum, air, satd. vapors of alc.,  $H_2O$ , or nitroethane, or the liquids, alc.,  $H_2O$  or oleic acid. Friction expts. in dust-free alc. showed no friction until the equil. position (sepn.: 3600 Å.) was reached. A limited amt. of alc. between portions of the glass plates pulled the plates to 1000 Å. at these parts, the surface tension crushing the dust particles and buckling the plates. No evidence was found for oriented mol. chains up to 50,000 Å. long as suggested by others. Solid myristic acid crystd. between polished plates in a thin film has a characteristic adhesion for each solid, greater than that for the solid acid in the bulk. Between differing plates the break of the film occurs at the weaker surface at its characteristic value. Solid surfaces affect the growth of crystals in the film, but do not exert any effect through the solid film.

L. E. Steiner  
New studies in colloid chemistry. V. A. Naumov. *Uspekhi Khim.* 2, 521-50(1933).—A review, chiefly of work done in 1931 and 1932. Disperse-phase metals, inorg. and org. sols, size and shape of particles, highly polymerized natural substances as studied by optical, elec., adsorption and surface-tension methods are discussed.

F. H. Rathmann  
The optics of white sols. II. The diffuse scattered reflection. Torbjorn Caspersson. *Kolloid-Z.* 65, 162-70(1933); cf. *C. A.* 26, 5474.—A characteristic of white sols is that the particles do not absorb but reflect light to the sides. By use of Shoulejkin's (cf. *C. A.* 18, 3320) and Mie's theories, tables are calcd. showing the intensities of scattered light in different directions on varying the particle size, the difference in  $n$ s of the particles and the dispersing medium, and the wave length of the incident light. The mutual action of colloidal particles in relation to Beer's law is discussed. Arthur Fleischer

The composition of arsenious sulfide sols and its change on aging and under the influence of light. V. Krestinskaya and V. Yakovleva. *Kolloid-Z.* 65, 187-91(1933).—

Unless  $H_2S$  is passed till no test for  $H_2AsO_3$  is obtained on a filtered sample,  $As_2S_3$  sols contain  $As_2O_3$  in both the micelles and intermicellar liquid. On aging, the total S content remains unchanged, but  $As_2O_3$  is formed by oxidation with most of the equiv. sulfide changing to S. O is essential for aging. Light catalyzes the aging reaction.

Arthur Fleischer

Preparation and properties of zirconium sulfosalicylic acid jellies. Satya Prakash. *Z. anorg. allgem. Chem.* 215, 240-54 (1933).—See C. A. 27, 5612.

Capillary-electrical investigations on silver halides. H. R. Kruyt. *Physik. Z. Sowjetunion* 4, 295-303 (1933).—Capillaries of Ag halides, and coarse crystals prepd. by grinding the fused salt can be charged negatively only. Fine crystals of colloidal size may be charged positively.

L. E. Steiner

Mechanism of the formation of Kohlschütter's silver sol. Harry B. Weiser and Max F. Roy. *J. Phys. Chem.* 37, 1009-19 (1933).—The formation of Kohlschütter's Ag sol by the reduction of  $Ag_2O$  with  $H_2$  at 50-60° is accomplished only in the presence of solid  $Ag_2O$ . Satd. solns. of  $Ag_2O$  that have not been ultrafiltered ordinarily contain appreciable amts. of colloiddally dispersed oxide. In a quartz or Ag vessel an ultrafiltered  $Ag_2O$  soln. undergoes no reduction with pure  $H_2$  at 80-90°; in a glass vessel the reduction is confined to the surface, giving a thin mirror of metal; in a Pt vessel the reduction is at the surface, depositing relatively large hexagonal plates of Ag. The reduction in Pt results from catalytic activation of the  $H_2$  at the Pt surface. There is no catalytic activation and no reduction at the surface of quartz or Ag. Mirror formation at a glass surface is preceded by the formation of a film of  $Ag_2O$ , which is subsequently reduced. The oxide film results chiefly from pptn. by alkali from the glass. The ease with which solid  $Ag_2O$  is reduced by  $H_2$  indicates that the latter is readily activated at the surface of  $Ag_2O$  or at the interface Ag- $Ag_2O$ . Pauli's view that sol formation will not take place except in the presence of alkali or sulfide that can furnish a complex stabilizing electrolyte is not in accord with the exptl. observations.

H. B. Weiser

Protective action of colloids. III. Effect of sucrose and sodium oleate on the stability of colloidal manganese dioxide. Shridhar S. Joshi and Avadh N. Lal. *J. Indian Chem. Soc.* 10, 307-71 (1933); cf. C. A. 27, 4986.—The prepn. of  $MnO_2$  sols by adding solns. of sucrose (25 and 50%) and Na oleate (0.334 and 0.167%) in various amts. was studied. The viscosities of the mixts. were detd.

Frank Urban

Structure of emulsoid sol particles and their hydration film. N. H. Kolkmeijer and J. C. L. Favejee. *Nature* 132, 802-3 (1933).—The prevailing view that powder photographs of cellulose, starch and similar substances originate in the crystal structure of those substances may be erroneous. The powder lines are those of the hydration film surrounding the particles. The water film has the structure of ordinary ice.

Frank Urban

Change of stability of sols of various concentrations with their purity. S. Ghosh and R. N. Mitra. *J. Indian Chem. Soc.* 10, 471-6 (1933).—As a result of the study of 25 sols (data are given for  $MnO_2$  only), it is concluded that when a sol is coagulated by an electrolyte such that the ions carrying the same charge as the colloid particles are not adsorbed in appreciable amts., the sol: (a) behaves normally toward diln. when coagulated by ions of varying valencies, (b) does not develop ionic antagonism, (c) does not show the phenomenon of acclimatization.

F. E. Brown

Effect of the reaction of the medium at the moment of coagulation on the structure of silica gel. I. M. O. Kharmandar'yan and V. K. Markov. *Physik. Z. Sowjetunion* 4, 172-84; *Ukrain. Khim. Zhur.* 8, Wiss. Teil 1-13 (1933).—Silica gels prepd. in acid (I), neutral (II) and alk. (III) media had the following decreasing order of properties: pore vol., adsorption capacity (for vapor) and true sp. gr., III, II, I; apparent sp. gr. (with pores) I, II, III. The radii ( $r$ ) of the pores were calcd. from Minkowsky's formula; for III, 85% of the pore vol., and for I, 14%, was contributed by pores with  $r > 2.14 \times 10^{-7}$  cm.

Very few pores have any given value of  $r$ . X-ray analysis showed that the amt. of cryst. material in the gels decreased in the order III, II, I. The same order held for speed of coagulation, and the time of beginning and the extent of syneresis.

L. E. Steiner

Kinetics of the coagulation of colloids. V. Variation of viscosity during coagulation. Shridhar S. Joshi and K. S. Viswanath. *J. Indian Chem. Soc.* 10, 329-40 (1933); cf. C. A. 27, 3869.—The slow flocculation of  $As_2S_3$ ,  $As_2S_5$ -gelatin and gelatin sols by KCl was followed viscometrically.

Frank Urban

The kinetics of slow coagulation. I. D. N. Ghosh. *J. Indian Chem. Soc.* 10, 509-16 (1933).—When coagulation of a sol is rapid Smoluchowski's equation represents its rate satisfactorily. The divergence of the observed rate from the rate predicted for slow coagulation cannot be explained by: (a) autocatalysis, (b) the polydisperse nature of the colloid, or (c) the presence of traces of electrolytes. The exptl. work was done on S sols whose rates of coagulation were measured both by a tyndallmeter and by light absorption. II. *Ibid.* 517-27.—If each colloidal particle with its double layer is considered a charged condenser, energy is evolved whenever 2 particles of different potentials unite. If all particles have the same potential there is no evolution of energy on union but the larger particle has a different potential and its union with original particles causes a decrease in free energy. The S-shape of the curve which represents slow coagulations is due to: (a) a slow formation of complex particles from simple particles of equal potential, (b) a rapid union of complex particles with simple particles and (c) a slow union of complex particles after the simple particles have become few. The addn. of some coarse particles early in coagulation should straighten out the S-curve and expts. show that it does. The disappearance of autocatalytic nature on continued dialysis is due to increase in no. of complex particles. Acclimatization and aging effect are also due to changes in no. of complex particles.

F. E. Brown

Water filtration through membranes and membrane resistance. W. W. Lepeschkin. *Kolloid-Z.* 65, 184-6 (1933); cf. C. A. 26, 5512.

Arthur Fleischer

Edometer observations as aid in investigation of gel structure. K. v. Terzaghi. *Kolloid-Z.* 65, 129-48 (1933); cf. C. A. 21, 1388; *Erdbaumechanik* (1925); Auerbach and Hort, *Handbuch physik. tech. Mechanik* Vol. IV, Pt. 2 (1931); Alexander, *Colloid Chemistry*, III (C. A. 26, 1180).

Arthur Fleischer

Gels. IV. Swelling of silica gel. D. G. R. Bonnell. *Trans. Faraday Soc.* 29, 1217-20 (1933); cf. C. A. 26, 3714.—When silica gel which has undergone syneresis is kept in hot distd. water, it again absorbs a large quantity of water if the electrolyte concn. is low. This water is not exuded when the temp. is lowered to 20° and the gel is kept stored under water. V. Effect of neutral electrolytes on the syneresis of silica gels. *Ibid.* 1221-6.—Comparatively low concns. of electrolytes ( $K_2SO_4$ ,  $Na_2SO_4$ , KCl, NaCl) do not seriously affect the syneresis of silica gels at const. pH. The main electrolyte effect is an increase of coagulation, which is reflected in the decrease of the setting time and the period of induction.

Frank Urban

Electrophoresis of lecithin in the presence of neutral salt; dual nature of the charge. Christopher W. Price and W. C. M. Lewis. *Trans. Faraday Soc.* 29, 1181-8 (1933); cf. C. A. 27, 4464.—A lecithin dispersion with the addn. of not too great a concn. of  $BaCl_2$  may be regarded as a dispersion of a simple amphoteric substance, free from its adsorption charge. An attempt was made to sep. the net charge on a lecithin dispersion into its 2 parts: the charge due to ionization of the amphoteric groups, and that due to the adsorption of neg. ions by the fatty surfaces of the particles.

Frank Urban

The influence of the underlying surface on the cataphoretic mobility of adsorbed proteins. A. Dummett and Philip Bowden. *Proc. Roy. Soc. (London)* A142, 882-401 (1933).—Measurements of the electrokinetic properties of proteins adsorbed on different surfaces was made in aq. soln. In gelatin, the cataphoretic mobility was independent of the nature of the underlying surface.

Measurements on the rate of adsorption showed that surface equil. of the protein was secured in a few sec. in strong solns. ( $10^{-1}$  g./l.), but for dil. solns. required several hrs. Oxy- and carboxy-hemoglobin gave sharp adsorption maxima, an indication of satn. of the surface. The cataphoretic mobility and apparent isoelec. point were markedly dependent on the nature of the underlying surface. The two compds. had identical electrokinetic properties when adsorbed. No evidence was found for two forms of hemoglobin with different isoelec. points.

Calvin Brous

**Electrophoretic mobilities and the isoelectric point of protein-coated particles.** Otto Halpern. *J. Chem. Phys.* 1, 882-4(1933).—A math. explanation is given of the isoelec. action of quartz or glass particles of microscopic size suspended in a liquid and coated with a superficial protein layer.

Gerald M. Petty

**The distribution of the electrical charge in the protein molecule.** V. Vlassopoulos. *Praktika (Akad. Athenon)* 7, 50-3(1932)(in German).—The dielec. const. of solns. of hemoglobin was studied by addn. of acid or alkali in order to study the distribution of the reactive groups amino and carboxyl at the surface of the protein mol. The const. is similar to that of water; therefore previous measurements do not permit any clear conclusions to be drawn.

Lucien V. Dyrenforth

**Solubility of gases. II. Solubility of argon.** B. Znskind and I. Kasarnovskii. *Z. anorg. allgem. Chem.* 214, 385-95(1933); cf. *C. A.* 26, 358.—The soly. of A in 23 solvents, including homologous series of alcs., ketones, and aromatic and cyclic hydrocarbons, was studied. Contrary to the electrostatic theory, the elec. moment plays an unimportant part. The soly. of various noble gases increases with their polarizability, in agreement with the theory of London (*C. A.* 25, 1715). C. L. Wilson

**A rule for the expression of the partition of associating substances.** H. J. Almquist. *J. Phys. Chem.* 37, 991-4(1933).—The distribution of assocg. substances between water and various solvents obeys the equation  $C_s/C_w = K_s C_w + K_i$ , where  $C_s$  and  $C_w$  represent the molar concns. in the non-aq. solvent and in water, resp., and  $K_s$  and  $K_i$  are const. By making a few simple assumptions this equation is derived with the help of the mass-law relations for assocn. in each of the phases.

P. H. Emmett

**Rotatory power of very dilute solutions. I.** Psychès. *J. phys. radium* [7], 4, 594-608(1933).—A polarimetric method is described for precision measurement of the rotation of solns. on the order of 0.001 M. All the sp. rotation-concn. curves of the alkali tartrates, when extrapolated to zero concn., give  $[\alpha]_{D}^{20} = 45.7^\circ$  for the tartrate ion. From this value,  $[\alpha]$  for the Cs, Rb and K tartrates increases constantly with concn. (greatest increase for the Cs tartrate), while  $[\alpha]$  for the Na and Li tartrates passes through a max. For K tartrate,  $[\alpha]_{D}^{20} = 45.68 + 0.0642 \sqrt{C}$  ( $C$  in millimoles/l.) for the range 0.002-2.0 M.

L. E. Steiner

**Molar refraction in dilute solutions. II. Precise interferometric measurement of the refractive index.** W. Geffcken and A. Kruis. *Z. physik. Chem.* B23, 175-92(1933); cf. *C. A.* 27, 2865.—A modified form of the Haber-Loewe interferometer is described with chambers 10 and 50 cm. in length. Monochromatic light is used so that high orders of interference can be obtained. For solns. up to 2 N, the abs. precision is  $5 \times 10^{-7}$ ; for solns. below 0.1 N,  $3 \times 10^{-6}$ . The errors involved are discussed in detail. A few graphs show results for KCl, NaCl and  $\text{NH}_4\text{NO}_3$ .

G. M. Murphy

**Electroendosmosis and electrolytic water transport. III. Solutions of copper salts.** H. C. Hepburn. *Proc. Phys. Soc. (London)* 45, 755-64(1933); cf. *C. A.* 26, 359.—The electroosmotic ( $v$ ) and electrolytic water transport through parchment membranes in contact with  $\text{CuCl}_2$  and  $\text{Cu}(\text{NO}_3)_2$  solns. was detd.  $v$  is very much greater for  $\text{CuSO}_4$ . The effect of sulfate ion is too great to be accounted for by the effect of valency alone.

F. Urban

**The thermodynamics of ionized water in potassium and sodium bromide solutions.** Herbert S. Harned and

Walter J. Hamer. *J. Am. Chem. Soc.* 55, 4496-507(1933).—Measurements were made of the e. m. f. of the cells  $\text{H}_2 | \text{MOH} (0.01 M), \text{MBr} (M) | \text{AgBr} | \text{Ag}$  and  $\text{H}_2 | \text{HBr} (0.01 M), \text{MBr} (M) | \text{AgBr} | \text{Ag}$  in aq. soln. from 0.01 to 3 molal and from  $0^\circ$  to  $60^\circ$ , M being Na or K. From these data were calcd.: the values of the normal potential of the Ag-AgBr electrode; the activity coeff. of HBr and the ionic activity coeff. product of  $\text{H}_2\text{O}$  in both KBr and NaBr solns.; the partial molal heat content of HBr in KBr and NaBr solns.; and the total heat of the disson. of  $\text{H}_2\text{O}$  in aq. KBr and NaBr.

F. D. R.

**Evidence for electrolytic dissociation in sulfuric acid from Raman effect.** I. Raniakrishna Rao. *Indian J. Physics* 8, 123-35(1933).—Electrolytic disson. in  $\text{H}_2\text{SO}_4$  was studied qualitatively by using the Raman effect. Lines were observed with frequency shifts of 416, 562, 742, 910, 1043, 1171 and 1365  $\text{cm}^{-1}$ . Lines 562, 910, 1171 and 1365  $\text{cm}^{-1}$  decrease rapidly in intensity with diln. Line 1043  $\text{cm}^{-1}$  increases in intensity and is attributed to the formation of  $\text{HSO}_4^-$  through electrolytic disson. With increased diln. a new line  $\Delta\nu = 980 \text{ cm}^{-1}$  appears. This also occurs in the Raman spectra of solns. of sulfates and is considered to be caused by  $\text{SO}_4^{--}$  from further disson.  $\text{HSO}_4^-$ . Lines, 562, 1171 and 1365  $\text{cm}^{-1}$ , being analogous to the Raman lines for  $\text{SO}_2$  in soln., are attributed to mols. of the type  $\text{SO}_2(\text{OH})_2$ . This conclusion is supported by some chem. behavior and by the rapid disappearance of the lines with very slight diln. of the concd. acid.

Calvin Brous

**The ionizing effect of solvents.** A. H. W. Aten and Louise Boerlage. *Rec. trav. chim.* 52, 1046-51(1933).—The theory is advanced that a mixed solvent contg. pos. and neg. partial moments causes increased ionization, because of assocn. of the pos. ion with a solvent mol. having a neg. moment and the neg. ion with a mol. of pos. moment. Expts. on the soly. and cond. of substituted  $\text{NH}_4$  salts in  $\text{PhNO}_2$ - $\text{PhNH}_2$  mixts. are in accord with the theory.

A. B. F. Duncan

**The determination by fractional distillation of the ionization constant of weak acids that are little volatile.** P. Jaulmes. *J. chim. phys.* 30, 556-9(1933); cf. *C. A.* 27, 3870, 4487.—From the distn. of a dil. soln. of a weak volatile acid whose ionization const. is known, such as HOAc, in the presence of the salt of another weak acid that is little volatile, the ionization const. of the second acid can be calcd.

L. E. Steiner

**A thermodynamic study of lithium sulfate.** Yuji Ueda. *Science Repts. Tôhoku Imp. Univ.*, First Ser. 22, 879-91(1933).—The e. m. f. of the reversible galvanic cell, Li-amalgam (0.035%)  $| \text{Li}_2\text{SO}_4 \cdot \text{H}_2\text{O}$ , satd. soln.,  $\text{Hg}_2\text{SO}_4 | \text{Hg}$ , was given by  $E = 2.67489 - 0.000241(t - 25)$  v. from  $20^\circ$  to  $30^\circ$ . The vapor pressures of the systems  $\text{Li}_2\text{SO}_4 \cdot \text{H}_2\text{O}$ -satd. soln. and  $\text{Li}_2\text{SO}_4 \cdot \text{H}_2\text{O} - \text{Li}_2\text{SO}_4$  were 20.11 and 2.25 mm., resp., at  $25^\circ$ . The following heats of reaction were measured, at  $25^\circ$ , in cal. per mol.:  $\text{Li}_2\text{SO}_4(s) + 400 \text{ H}_2\text{O}(l), Q = 6783$ ;  $\text{Li}_2\text{SO}_4 \cdot \text{H}_2\text{O}(s) + 399 \text{ H}_2\text{O}(l), Q = 3765$ ;  $\text{Li}_2\text{SO}_4 \cdot 17.75 \text{ H}_2\text{O}(l) + 382.25 \text{ H}_2\text{O}(l), Q = 1072$ . From these and other data the following values were calcd. for  $25^\circ$ :  $2 \text{ Li}(s) + \text{S}(s, \text{rhombic}) + 2 \text{ O}_2(g) = \text{Li}_2\text{SO}_4(s), \Delta F^\circ = -313,614, \Delta H^\circ = -338,099, \Delta S^\circ = -82.3$ ;  $\text{Li}_2\text{SO}_4(s), S^\circ = 38.7$  (the units are cal., deg., mols.).

F. D. Rossini

**The electrometric titration of creatine ester hydrochloride and some related compounds.** Crawford F. Failey and Erwin Brand. *J. Biol. Chem.* 102, 767-71(1933).—The following log disson. consts. are reported: creatine (I) 2.67, *N*-methyl-*N'*-carboxymethylguanidine (isocreatine) 2.88, guanidoacetic acid (II) 2.86, creatinine 4.84 (cf. Cannan and Shore, *C. A.* 23, 162), glycoxyamidine 4.80. The Me esters of I and II undergo irreversible change in alk. solns. to the corresponding anhydrides; so on reacidification the disson. consts. obtained are those of creatinine and glycoxyamidine, resp. Disson. consts. for the Me esters of I and II therefore could not be detd.

K. V. Thimann

**Contact potentials and the effects of unimolecular films on surface potentials. I. Films of acids and alcohols.** Wm. D. Harkins and E. K. Fischer. *J. Chem. Physics* 1,

852-62(1933).—An app. was constructed for the simultaneous detn. of film pressure and surface potential, and for the detn. of the location and contour of continents and islands of condensed film. Surface potentials and film pressures were detd. for stearic, palmitic, lauric, penta-decylic and oleic acids, and cetyl and myristyl alcs. at 17°. The relations between surface potentials, dipole moments and mol. orientation in surfaces are discussed. Surface potential varies with the length and shape of the hydrocarbon part of the org. mol., the nature, no. and position of the polar groups in the mol.,  $p_H$ , temp., concn. of the film-forming substance in the film, the nature of ions in the soln. and the time. The films studied exhibited hysteresis in the surface potential. Gerald M. Petty

Derivation of equations for regular solutions. J. H. Hildebrand and S. E. Wood. *J. Chem. Physics* 1, 817-22 (1933).—Menke's probability function is used in the statistical treatment of the intermol. potentials in solns. of those sym. mols. whose entropy of mixing equals that of an ideal soln. of the same compn. The departure of 1 soln. from ideal solns. laws is calcd., and agrees with expt. Gerald M. Petty

Calculation of characteristic values for periodic potentials. Harold D. Koenig. *Phys. Rev.* 44, 657-65 (1933).—Math. L. S. Kassel

Effect of supersonic waves on chemical phenomena. II. Mechanical passivity. Nobuo Moriguchi. *J. Chem. Soc. Japan* 54, 1047-53(1933); cf. *C. A.* 28, 3987.—When a plate of an electroneg. metal was dipped into an aq. soln. of metallic salt and supersonic waves were applied, the colloid of the depositing metal was obtained. With Zn in  $\text{CuSO}_4$  soln. colloidal Cu resulted. Stable colloids of Al, Zn, Fe, Sn, Cu, Sb and Bi were prepd. by applying supersonic waves to metallic powders in water. Similarly the colloids of S, blood charcoal and  $\text{BaSO}_4$  were obtained. The evolution of  $\text{CO}_2$  by the action of  $\text{H}_2\text{SO}_4$  on marble was considerably accelerated when supersonic waves were applied, and colloidal  $\text{CaSO}_4$  was produced. T. Katsumi

The equilibrium among carbon monoxide, hydrogen, formaldehyde and methanol. I. The reactions  $\text{CO} + \text{H}_2 \rightleftharpoons \text{HCHO}$  and  $\text{H}_2 + \text{HCHO} \rightleftharpoons \text{CH}_3\text{OH}$ . Roger H. Newton and Barnett F. Dodge. *J. Am. Chem. Soc.* 55, 4747-59(1933).—A trace of  $\text{CH}_3\text{O}$  is synthesized from CO and H over a Cu-Zn catalyst at 225-50° and 3 atm.; the equil. approached from both sides gives  $\log K_p = (374/T) - 5.431$  approx.  $\text{CH}_3\text{O}$  is readily hydrogenated at 120-200° and 1 atm. over various Cu-alloy and other catalysts, but Os, Pt and pure Zn are inactive:  $\log K_p = (4600/T) - 6.470$  approx. A change in the compn. or structure of the catalyst has a marked effect on the nature and amt. of side reaction, Ni catalysts promoting decompn. of  $\text{CH}_3\text{O}$ , while some Cu catalysts yield 53-72%  $\text{HCO}_2\text{Me}$ . Conclusion: Direct thermal synthesis of  $\text{CH}_3\text{O}$  is not feasible; its production from MeOH requires a temp. of 400°. H. A. Beatty

Displacement of equilibrium at constant volume. R. Étienne. *Compt. rend.* 197, 986-8(1933); cf. *C. A.* 27, 5624.—Theoretical. Howard A. Smith

The rate of solution of oxygen in acetone solution of anhydrous stannous chloride. Susumu Miyamoto and Eiyo Utunomiya. *J. Chem. Soc. Japan* 54, 1053-60 (1933).—By means of an app. similar to that of Ledig and Weaver (cf. *C. A.* 18, 1412) the soln. velocity of O in  $\text{Me}_2\text{CO}$  soln. of  $\text{SnCl}_2$  was measured. When the concn. of  $\text{SnCl}_2$  is small the initial soln. velocity of O does not change with the concn., but when the concn. is greater the initial soln. velocity increases with concn. T. Katsurai

Effect of electric poles on linear speed of crystallization of salol. G. E. Mikhlin and S. S. Urazovskii. *J. Phys. Chem.* (U. S. S. R.) 1, 419-25(1930).—Elec. fields reduce the speed of crystn. of salol independently of the order of effect of fields and of seeding. The after-effect of the field was studied. The elec. cond. of salol under the influence of a field is not changed. G. Facrman

The kinetics of the reaction between hydrogen and nitrous oxide. I. H. W. Melville. *Proc. Roy. Soc. (London)* A142, 524-45(1933).—The kinetics of the

reaction between H and  $\text{N}_2\text{O}$  was investigated in silica bulbs at 50-400 mm. pressure and 550-700°. The reaction rate is faster than the decompn. rate of  $\text{N}_2\text{O}$ ; the main products are N and  $\text{H}_2\text{O}$ . The rate is directly proportional to the pressure of  $\text{N}_2\text{O}$  and nearly independent of that of H except when the pressure of the  $\text{N}_2\text{O}$  is high. The reaction rate increases with the width of the vessel but the increase is not proportional to the square of the diam. The apparent activation energy is 32 kg.-cal. N and A have no effect. Mechanisms for the initiation, propagation and termination of the reaction are given. C. B.

The rate of oxidation of hydrogen peroxide by chlorine in the presence of hydrochloric acid. Benjamin Makower and Wm. C. Bray. *J. Am. Chem. Soc.* 55, 4765-76 (1933); cf. *C. A.* 19, 3411.—The rate of oxidation of  $\text{H}_2\text{O}_2$  by  $\text{Cl}_2$  measured at 0.6°, 10° and 25° in 0.4-5.2 M HCl, is detd. by the bimol. reaction between  $\text{H}_2\text{O}_2$  and  $\text{HOCl}$ , the electronic mechanism of which is discussed. At low HCl concn. the velocity const. falls off in a marked degree, and no kinetic explanation can as yet be offered for this. H. A. Beatty

The rate of bromate formation in aqueous solutions containing hypobromous acid and its anion. Herman A. Liebhafsky and Benjamin Makower. *J. Phys. Chem.* 37, 1037-46(1933).—At low bromide-ion concns. the time for half decompn. of  $\text{HBrO}$  solns. was about  $10^4$  times as long as indicated by one rate law given by Skrabal and Webersich for the rate of the reaction  $5\text{HBrO} = \text{BrO}_3^- + 2\text{Br}_2 + \text{H}^+ + 2\text{H}_2\text{O}$ . Addnl. expts. and a reexamin. of the data of S. and W. indicate that the rate is approx. proportional to  $[\text{HBrO}]^2[\text{BrO}^-]$ . This rate law is analogous to that found for the formation of  $\text{ClO}_3^-$  and  $\text{IO}_3^-$  from  $\text{HClO}$  and  $\text{KIO}$ , resp. P. H. Emmett

The reaction between hydrogen iodide and chlorine. Ronald B. Mooney and Hugh G. Reid. *J. Chem. Soc.* 1933, 1315 18.—The reaction of  $\text{Cl}_2$  with HI is homogeneous and bimol., proceeding in 2 stages: (1)  $\text{HI} + \text{Cl}_2 \rightarrow \text{HCl} + \text{ICl}$ ; (2)  $\text{HI} + \text{ICl} \rightarrow \text{HCl} + \text{I}_2$ . When solns. of III and  $\text{Cl}_2$  in  $\text{CCl}_4$  are mixed, the  $\text{I}_2$  coloration appears at once. With initial concns. of HI and  $\text{Cl}_2$  in the mixed solns. varying from 0.05 M to 0.0005 M, the reaction was half complete in 0.0085 sec., which is the time required for the solns. to mix in the app. used, and is therefore an upper limit only for the time of half-reaction. The collision efficiency is  $< 2.6 \times 10^{-6}$  at room temp. The reaction is too fast to be accounted for by the mechanism  $2\text{HI} + \text{Cl}_2 \rightarrow 2\text{HCl} + \text{I}_2$ . The rapid reaction is not due to traces of moisture. Neither does reaction occur at the glass surfaces. In  $\text{C}_2\text{H}_4$  at -78° and in iso- $\text{C}_4\text{H}_{10}$  at -110° as solvents, the time required for half-reaction was 0.2 sec. This gives a value  $E < 5.5$  kg.-cal. as an upper limit for the heat of activation of the bimol. reactions 1 and 2. The reaction of III with  $\text{Cl}_2$  does not proceed by a chain of ternary collisions involving Cl atoms, e. g.,  $\text{Cl} + \text{HI} + \text{Cl}_2 \rightarrow \text{ClH} + \text{ICl} + \text{Cl}$  because all homogeneous reactions leading to the production of Cl atoms from III and  $\text{Cl}_2$  require more than 9 kg.-cal. activation and could not supply sufficient  $\text{Cl}^0$  to give the observed velocity at -110°. Ternary collisions of the type  $\text{HI} + \text{Cl}_2 + \text{M}$  ( $\text{M} = \text{any mol.}$ ) leading to  $\text{HCl} + \text{ICl}$  either directly or by way of an intermediate addn. compd.  $\text{HICl}_2$  are possible. Louise Kelley

The reaction between hydrogen iodide and the cyanogen halides. Ronald B. Mooney and Hugh G. Reid. *J. Chem. Soc.* 1933, 1318 23.—The reactions in  $\text{CCl}_4$  were followed colorimetrically by means of the free  $\text{I}_2$  formed. The reaction went to half completion in 0.02 sec. with 0.001 M concns. The velocity const. was  $1.6 \times 10^4$ . The reaction of HI with  $\text{BrCN}$  in  $\text{CCl}_4$  is not instantaneous. With concns. approx. M/200 half-reaction required about 30 sec. In carefully dried solns. the time required for half-reaction was about 10 min. The bimol. velocity const. calcd. on the assumption of the comparatively slow reaction  $\text{HI} + \text{BrCN} \rightarrow \text{HBr} + \text{ICN}$  followed by the rapid reaction  $\text{HI} + \text{ICN} \rightarrow \text{HCN} + \text{I}_2$  was 0.2 at room temp. The time for half-reaction of HI and  $\text{ClCN}$  in  $\text{CCl}_4$  is a few hrs., and the rate is retarded by using carefully dried solns. The reaction is not bimol. The reac-

tions of HI with ICN and BrCN are too rapid to be followed manometrically in the gas phase. The slower reaction of HI with C<sub>2</sub>ICN (both dry) was studied at 14° and 15° and with partial pressures of the reactants between 15 and 120 mm. The decrease in pressure obtained when the reaction was allowed to go to completion was approx. 3 times as much as would be expected from the reaction  $2\text{HI} + \text{CICN} \rightarrow \text{HCl} + \text{HCN} + \text{I}_2$  (cryst.). The solid deposit formed was probably CH<sub>3</sub>NCI, formimide chloride, and the change in pressure is accounted for by the reaction  $2\text{HI} + \text{CICN} \rightarrow \text{CH}_3\text{NCI} + \text{I}_2$  (cryst.). At 14° the gas reaction was about 20 times and at 25° 100 times as fast as in CCl<sub>4</sub> at comparable concns. If the reactions are homogeneous and proceed at rates governed by binary collisions between HI and cyanogen halide, the energies of activation of the rate-dtg. reaction can be calcd. as 9, 15 and 18 kg.-cal. for the reactions of HI with ICN, BrCN and CICN, resp.

**Kinetics of the reaction of sulfonation and monosulfonation of naphthalene.** I. S. Ioffe. *Anilinokrasochaya Prom.* 3, 298-304(1933).—Exptl. evidence is given, contradicting the observation of Guyot (C. A. 14, 404), that the concn. of spent H<sub>2</sub>SO<sub>4</sub> depends not only on the temp. of the reaction and the nature of the sulfonated compd., but also on the proportions of the 2 reagents. In the sulfonation of *p*-MeC<sub>6</sub>H<sub>4</sub>NO<sub>2</sub>, studied by Martinson (C. A. 2, 2640), the observed process is the algebraic sum of the reactions of sulfonation and hydrolysis:  $dx/dt = (dx_1/dt) - (dx_2/dt) = k_1(A - x)(S - x) - (H + x)\tau$ , in which  $k_1$  and  $k_2$  are variables and are detd. by the acidity of the medium, or  $x$ . These equations apply only to the initial stage of sulfonation and to the compds. giving only 1 isomer. By direct sulfonation of C<sub>10</sub>H<sub>8</sub> at a moderate temp. the equil. in the ratio of  $\alpha$ - to  $\beta$ -C<sub>10</sub>H<sub>7</sub>SO<sub>3</sub>H, and thereby the equil. of the sulfonation, is reached after a very prolonged heating with formation of considerably smaller proportion of  $\beta$ - in the mixt. of the isomers than is claimed by Kuwes (C. A. 3, 2702). The ratio  $\alpha$ - to  $\beta$ -C<sub>10</sub>H<sub>7</sub>SO<sub>3</sub>H at the state of equil. is equal to the ratio of the velocity coeffs. of the formation of the 2 isomers divided by the ratio of the velocity coeffs. of their hydrolysis, and depends only on these coeffs. The formula is applicable to all cases of sulfonation producing several isomers. At the state of equil. there must be 22.6% and not 80%  $\alpha$ -C<sub>10</sub>H<sub>7</sub>SO<sub>3</sub>H, as generally claimed, which value closely approximates 29.3%  $\alpha$ -C<sub>10</sub>H<sub>7</sub>SO<sub>3</sub>H obtained by prolonged heating of C<sub>10</sub>H<sub>8</sub> with H<sub>2</sub>SO<sub>4</sub> at 100°. Math. analysis of the process of sulfonation shows that with a mixt. of 2 unequally hydrolyzable isomers the ratio of the 2 is variable, whereby the proportion of the more easily hydrolyzed isomer is gradually decreased.

**The kinetics of diazotization.** I. E. Abel, H. Schmid and W. Sidon. *Z. Elektrochem.* 39, 863-71(1933).—The reaction of glycine with HNO<sub>2</sub> in an atm. of NO was followed by measuring the rate of N<sub>2</sub> evolution. The rate is  $dN_2/dt = k_1[{}^+\text{H}_3\text{NCH}_2\text{COOH}][\text{NO}_2][\text{HNO}_2]$ . At 25°  $k_1 = 2.6 \times 10^3$  (concn. in mols./l., time in min.). The kinetic equation is identical with that formulated for the decompn. of NH<sub>4</sub>NO<sub>2</sub> (cf. C. A. 25, 5338) but  $k_1$  (glycine) = 1000  $k_1$ (NH<sub>4</sub>NO<sub>2</sub>). Variations of  $k_1$  with total ionic concn. and sp. effects of excess NO<sub>2</sub><sup>-</sup> and H<sup>+</sup> are discussed. A mechanism of diazotization is suggested involving an intermediate compd. contg. 3 N atoms.

**Slow combustion of benzene. Velocity of reaction.** Jean Amiel. *Compt. rend.* 197, 984-6(1933).—Curves for the velocity of reaction vs. percentage of carbon transformed at different times after the start of the reaction are given for temps. from 693 to 773°K. The velocity is const. for the first part of the reaction and can be expressed as  $\log V = (12,300/T) + 18.21$ . Toward the end of the reaction the velocity falls off more or less rapidly, depending upon the reaction temp.

**Reaction between ethylene and bromine in the dark.** Shinroku Mitsukuri, Susumu Kinumaki and Tadatomo Asaoka. *J. Chem. Soc. Japan* 54, 1061-8(1933).—The formation of C<sub>2</sub>H<sub>4</sub>Br<sub>2</sub> by the reaction between C<sub>2</sub>H<sub>4</sub> and Br<sub>2</sub> was studied within the temp. range 0-15°. The

reaction velocity was expressed by the formula  $d[\text{C}_2\text{H}_4\text{Br}_2]/dt = k[\text{Br}_2]/[\text{C}_2\text{H}_4\text{Br}_2]$ , in which  $t$  is time and  $k$  a const.

T. Katsural

**Rates of the thermal decomposition of certain triphenylmethyl alkyl ethers.** James F. Norris and Arthur Creswell. *J. Am. Chem. Soc.* 55, 4946-51(1933).—Data are given for the Me, Et and iso-Pr ethers. The Et ether at the lower temps. and up to about 11% decompn. showed the characteristics of a reaction of the 1st order and the rate doubled for a rise of 10°. Similar results were obtained with the iso-Pr ether up to about 28% decompn. The calcd. 1st-order velocity consts. for the Me ether increased rapidly with time. Ph<sub>3</sub>CH, a product of the decompn., had a marked accelerating effect on the decompn. The presence of a small amt. of air increased greatly the rate of pyrolysis.

C. J. West

**The transformation of cyclopentadiene into its dimeride.** R. G. V. Barrett and L. J. Burrage. *J. Phys. Chem.* 37, 1029-35(1933).—The vapor pressure of cyclopentadiene was measured at various temps. during the change from 100% monomeride to 100% dimeride. The extent of transformation was detd. from the vapor pressure-compn. curve of known mixts. of the two. The amt. of monomeride remaining after 93 days at 12° was 0.73%. The transformation was apparently complete after one year. The dimeride forms liquid crystals.

P. T. Newsome

**The effect of substituents on the heat of activation of a simple addition reaction.** Eduard Hertel and Jutta Dressel. *Z. physik. Chem.* B23, 281-90(1933); cf. C. A. 27, 5228.—The rate of the reaction:  $p\text{-XC}_6\text{H}_4\text{NMe}_2 + \text{C}_6\text{HY}(\text{NO}_2)_2\text{OMe} \rightarrow [p\text{-XC}_6\text{H}_4\text{NMe}_2][\text{C}_6\text{HY}(\text{NO}_2)_2\text{O}]$ , where X = Br, H, Me, OMe, OEt and Y = H and Me was studied at 15°, 25° and 35°. The reaction is bimol. with the Me group of anisole entering into the NH<sub>2</sub> group of aniline. From the reaction rate const. the heat of activation is calcd. from the Arrhenius equation,  $\ln k = -(A/T) + B$ . If B is const. for each temp. and independent of the substituting groups, the heat of activation is an additive property.

G. M. Murphy

**Purification and physical properties of chemical compounds. IV. Development of a theoretical basis for the behavior of controlled time-temperature curves.** Evald L. Skau and Wendell H. Langdon. *Proc. Natl. Acad. Sci.* 19, 943-7(1933); cf. C. A. 27, 3912.—Mathematical development of exptl. considerations for a particular type of equipment.

**The boiling points of concentrated solutions of the system (K.NH<sub>4</sub>)(NO<sub>2</sub>,Cl).** S. I. Aronova and Z. N. Lunskaya. *Trans. Sci. Inst. Fertilizers (Moscow)* No. 92, 139-48(1932).—Satd. KCl soln.  $b_{748}$  108.7°, 100 g. of the soln. contg. 38.01 g. of the salt. Satd. KNO<sub>3</sub>  $b_{748}$  117°, 100 g. of the soln. contg. 76.72 g. KNO<sub>3</sub>. NH<sub>4</sub>Cl soln.  $b_{748}$  118°, 100 g. of the soln. contg. 46.52 g. of the salt. NH<sub>4</sub>NO<sub>2</sub> m. 170°, decomposes to H<sub>2</sub>O and N<sub>2</sub>O at 245°. A soln. contg. KNO<sub>3</sub> 58.3, KCl 9.3, and H<sub>2</sub>O 22.4 g.  $b_{748}$  121.4°. A soln. of NH<sub>4</sub>Cl 40.8, KCl 8.0, and H<sub>2</sub>O 51.2 g.  $b_{748}$  117°. Adding NH<sub>4</sub>NO<sub>2</sub> to a satd. soln. of boiling KNO<sub>3</sub> raises the b. p. The temp. increased to 165° when the soln. became thick and the expt. could not be continued. At 144.5° the compn. was: KNO<sub>3</sub> 49.2, NH<sub>4</sub>NO<sub>2</sub> 42.4 and H<sub>2</sub>O 8.3 g. KCl + KNO<sub>3</sub> + NH<sub>4</sub>Cl b. above 165°. NH<sub>4</sub>NO<sub>2</sub> by itself or in the presence of KCl does not decompose until all the water has been driven off.

J. S. Joffe

**Thermodynamic considerations on a new kind of transition point.** Otto Halpern. *J. Chem. Physics* 1, 880-1(1933).—The coexistence of two phases is observable only if the two phases show a discontinuity in energy as well as in sp. heat.

F. D. Rossini

**Binary systems. IV. Ethane-systems.** F. E. C. Scheffer and J. Smittenberg. *Rec. trav. chim.* 52, 982-6(1933); cf. C. A. 27, 4995.—In the system ethane-*p*-dichlorobenzene no phase separates because of large mutual soly. In the system ethane-1,3,5-trichlorobenzene there is phase separation over a small temp. interval. Ethane-*p*-chlorobromobenzene has a quadruple point at 40° and 53.0 atm. pressure. Ethane-*p*-chloriodobenzene has a quadruple point at 34.4° and 49.3 atm.

The Hall effect and resistance of hydrogen-bearing alloys of palladium with silver and gold. Justus Wurmman. *Ann. Physik* 18, 233-50 (1933).—The Hall, photoelec. and thermoelec. effects in H-free Pd-Ag alloys are parallel, all showing maxima at 40% Ag. In H-free Pd-Au alloys the photoelec. and thermoelec. effects have maxima at 40% Au; the Hall effect is greatest at 65% Au. Absorbed H raises the photoelec. and thermoelec. effects, and decreases the Hall effect. The data do not agree with the Sommerfeld electron theory. Data are presented in both tabular and graphical form. Gerald M. Petty

Electrical conductivity and equilibrium diagrams of binary alloys. VIII. The system: lithium-cadmium. G. Grube and H. Vosskuhler. *Z. anorg. allgem. Chem.* 215, 211-24 (1933); cf. C. A. 27, 934.—The compd.  $\text{Li}_2\text{Zn}$  was confirmed; the compd.  $\text{LiZn}$  (C. A. 27, 2407) could not be confirmed. A new compd.  $\text{LiZn}$ , formed by cooling below 93°, was found. Curtis L. Wilson

Hydrolytic decomposition of tricalcium silicate. R. Tavasci. *Ann. chim. applicata* 23, 413-27 (1933).—The complete equil. of the system  $\text{CaO-SiO}_2\text{-H}_2\text{O}$  was detd. at ordinary temp. and pressure, by hydrolysis of  $3\text{CaO} \cdot \text{SiO}_2$ . In the presence of the liquid phase, the solid phase in equil. with cryst.  $\text{Ca}(\text{OH})_2$  is essentially  $5\text{CaO} \cdot 3\text{SiO}_2 \cdot \text{aq}$ . The hydrosilicate formed behaves like zeolites. There are also discontinuities in the concn. of  $\text{CaO}$  in the liquid phase when the solid has the comps.  $\text{CaO} \cdot \text{SiO}_2 \cdot \text{aq}$ . and  $\text{CaO} \cdot 2\text{SiO}_2 \cdot \text{aq}$ . A. W. Contieri

The system: cadmium nitrate-nitric acid-water. A. Slevaters and W. Petzold. *Z. anorg. allgem. Chem.* 214, 396-402 (1933); cf. C. A. 27, 4156, 5626.—Isotherms were detd. between 0° and 50°. All ternary eutectics and transformation points lie below 0°.  $\text{Cd}(\text{NO}_3)_2$  is practically insol. in 100%  $\text{HNO}_3$ . Acid nitrates of Cd do not exist. Curtis L. Wilson

The ternary system mercurous oxide-nitrogen pentoxide-water. Henry G. Denham and Clifford V. Fie. *J. Chem. Soc.* 1933, 1416-19.—A study of the system  $\text{Hg}_2\text{O}-\text{N}_2\text{O}_5-\text{H}_2\text{O}$  at 25° was made by the well-known residue method of Schreinemakers. The existence of the following solid phases was established:  $2\text{Hg}_2\text{O} \cdot \text{N}_2\text{O}_5 \cdot \text{H}_2\text{O}$ ,  $5\text{Hg}_2\text{O} \cdot 3\text{N}_2\text{O}_5 \cdot 3\text{H}_2\text{O}$ ,  $4\text{Hg}_2\text{O} \cdot 3\text{N}_2\text{O}_5 \cdot \text{H}_2\text{O}$  and  $\text{Hg}_2(\text{NO}_3)_2 \cdot 2\text{H}_2\text{O}$ . The last-named compd. exists in an  $\alpha$  and a  $\beta$  modification, both belonging to the orthorhombic system and tabular in the plane of the lateral axes. The  $\beta$ -crystals show different crystal faces and are possibly hemimorphic. H. S. v. Klooster

The system allyl alcohol-iodine-diiodopropyl alcohol. F. G. Caughley and P. W. Robertson. *J. Chem. Soc.* 1933, 1323-6.—The reversible reaction:  $\text{CH}_2=\text{CHCH}_2\text{OH} + \text{I}_2 = \text{CH}_2\text{ICHICH}_2\text{OH}$  was studied at 25° and 50° in  $\text{CCl}_4$ , toluene, benzene and hexane. In  $\text{CCl}_4$  at M/20 concn. and 25° the disson. of  $\text{CH}_2\text{ICHICH}_2\text{OH}$  is 28% and at M/100 it is 58%. At 50° and M/20 the disson. increases from 28 to 51%. The disson. is a unimol. reaction and the reverse reaction is bimol., both reactions being only slightly sensitive to catalytic disturbances either in the light or in the dark. Light accelerates both forward and reverse reaction but leaves the equil. unchanged. Solvents change the rate of the two opposing reactions without appreciably influencing the final state of equil. H. S. v. Klooster

Catalysis of gaseous reactions by chlorine. S. Baird-stow. *Trans. Faraday Soc.* 29, 1227-8 (1933).—Decompn. of gaseous  $\text{Et}_2\text{O}$  is catalyzed by Cl about  $1/5$  as effectively as by I (cf. C. A. 28, 401<sup>a</sup>). The purely chem. theory of the mechanism of catalysis is untenable for Cl and is improbable for I. Frank Urban

Oxidation of sulfhydryl compounds by hydrogen peroxide. II. Catalysis of oxidation of cysteine by thiocarbamides and thioglyoxalines. Norman W. Pirie. *Biochem. J.* 27, 1181-8 (1933); cf. C. A. 26, 1504.—Thiocarbamide catalyzes the oxidation of cysteine to cystine by  $\text{H}_2\text{O}_2$  in acid soln. Dithioformamidine oxidizes cysteine to a sulfenic acid; this is reduced to cystine by cysteine. Substituted thiocarbamides and related substances (e. g., ergothioneine) are catalytically active. Glutathione behaves like cysteine. B. Harrow

The mechanism of heterogeneous catalysis. Etienne Audibert. *Ann. mines* [13], 4, 138-62 (1933).—The nature of the catalyst surface is discussed critically. It is suggested that "active points" consist of abnormally spaced surface atoms. P. H. Emmett

The state of hydrogen dissolved in palladium and its relation to hydrogenation catalysis. J. Franck. *Nachr. Ges. Wiss. Göttingen Math.-physik. Klasse* 1933, 263-6.—With the help of previously published data and evidence for the formation of  $\text{PdH}^+$  ions within samples of Pd to which  $\text{H}_2$  has been added, the heat of adsorption of a proton by Pd is calcd. as approx. 11 volts. This is more than twice the magnitude of the work function of Pd for electronic emission. The large energy is attributed to the clustering of electrons around the protons in the metal in much the same way that neg. ions cluster around pos. ions in solns. according to the theory of Debye. A correlation between the ideas of F. and the concepts of O. Schmidt in regard to hydrogenation catalysis is discussed. P. H. Emmett

A study of the effect of salts on the catalytic decomposition of hydrogen peroxide by colloidal platinum. Merle A. Heath and James H. Walton. *J. Phys. Chem.* 37, 977-90 (1933).—The effect of addns. of  $\text{NaCl}$ ,  $\text{BaCl}_2$ ,  $\text{AlCl}_3$ ,  $\text{ThCl}_4$ ,  $\text{NaNO}_3$ ,  $\text{Al}(\text{NO}_3)_3$  and  $\text{Th}(\text{NO}_3)_4$  on the catalytic decompn. of  $\text{H}_2\text{O}_2$  at 25° was detd. and compared with the effect on the migration velocity of the colloidal Pt particles in an elec. field. In general, a relation between the change in the rate of decompn. of  $\text{H}_2\text{O}_2$  and the migration velocity of the colloidal Pt particles is found. Salts of Th prove somewhat of an exception to this relation. Chloride ions, but not nitrate ions, exert a sp. inhibiting effect on the rate of decompn. P. H. Emmett

The promoter action of lead in hydrogenation with sodium amalgam. Gabriel Bertrand and Mme. S. De-launey-Auvray. *Bull. soc. chim.* 53, 1126-9 (1933).—See C. A. 27, 4997. G. G.

A comparison of the catalytic activities of liquid and solid surfaces. The decomposition of methanol on solid and liquid zinc. E. W. R. Steacie and E. M. Elkin. *Proc. Roy. Soc. (London)* A142, 457-65 (1933).—The temp. effect on the decompn. rate of gaseous  $\text{MeOH}$  over solid and liquid Zn was investigated between 360° and 440°. The catalytic activity of the Zn depends directly on the temp. There is no discontinuity at the m. p. of the catalyst. Catalytic activity is attributed to the entire uniformly active surface of the metal rather than to some limited part. Calvin Brous

Relationships between structure of catalyst and chemical change. III. J. Eckell. *Z. Elektrochem.* 39, 807-15; 855-63 (1933); cf. C. A. 27, 4996.—Catalysts of mixed crystals were chosen in which known amts. of the incorporated second component caused definite changes in the unit cell dimensions of the basic substance. Catalysts of  $\text{Fe}_2\text{O}_3$  and mixed crystals of  $\text{Fe}_2\text{O}_3\text{-Al}_2\text{O}_3$  were chosen to study the catalytic burning of CO with  $\text{O}_2$  to  $\text{CO}_2$ . The reaction was studied for the 3 mixts.  $\text{CO}:\text{O}_2 = 1:1, 2:1, 3:1$  and at temps. of 204°, 190°, 175° and 160°. The reaction is unimol. both for pure  $\text{Fe}_2\text{O}_3$  and for the mixed crystals  $\text{Fe}_2\text{O}_3\text{-Al}_2\text{O}_3$ . The manner in which the reaction proceeds is discussed in connection with the exptl. values of the velocity const.,  $k$ . From the temp. coeff.  $(d \ln k)/dT$ , a value for the "apparent" heat of activation  $Q$  can be obtained and compared for the various mixts. and catalysts. The value of  $Q$  in the temp. range 204-160° varied markedly with the different catalysts and with the gas mixt. With increasing  $\text{Al}_2\text{O}_3$  content of the catalyst the heat of activation decreases steadily ( $\text{Fe}_2\text{O}_3$ ,  $Q = 19,790$  cal.;  $\text{CO}:\text{O}_2 = 2:1$ ); ( $\text{Al}_2\text{O}_3$ , 21.9%,  $Q = 16,300$ ;  $\text{CO}:\text{O}_2$ , 2:1). With pure  $\text{Fe}_2\text{O}_3$ ,  $Q = 16,800, 19,790, 18,000$  cal. for mixts. of  $\text{CO}:\text{O}_2 = 1:1, 2:1, 3:1$ , resp. The decrease of the space lattice const. of the unit  $\text{Fe}_2\text{O}_3$  cell with correspondingly increasing amts. of  $\text{Al}_2\text{O}_3$  was measured and the change of the space-lattice parameter found to be proportional to the change of heat of activation measured on the same catalysts. There seemed to be no relation between dispersion of the catalyst particles as detd. by Röntgen measurements and the velocity const.

or heat of activation. When the dispersion of the particles was detd. more accurately by means of electron diffraction, it was found that the velocity const. increased with increased dispersion of the particles. Calcd. values of the activity and the activation energy of the catalysts, however, appeared to be independent of dispersion of the particles but decreased with rise of  $Al_2O_3$  content. From the results of this work, a definite relation between the change of lattice structure of the catalyst and its activity appears certain.

H. H. Rowley

**Low-temperature specific heats.** IV. The heat capacities of potassium chloride, potassium nitrate, and sodium nitrate. J. C. Southard and R. A. Nelson. *J. Am. Chem. Soc.* 55, 4865-9 (1933); cf. *C. A.* 28, 30.—From heat-capacity data, obtained in the range 15° to 290°K., are calcd. the following values of the entropy at 298.16°K.: KCl,  $19.75 \pm 0.06$ ;  $KNO_3$ ,  $31.77 \pm 0.10$ ;  $NaNO_3$ ,  $27.87 \pm 0.08$ , cal. deg.<sup>-1</sup> mol.<sup>-1</sup>.

F. D. Rossini

**Correlation of heat capacity, absolute temperature and entropy.** George A. Linhart. *J. Chem. Physics* 1, 795-7 (1933).—By assuming  $(dC_p/dS)_p = K$ , a const., as  $T \rightarrow 0$ , and  $(dC_p/dS)_p = 0$ , as  $T \rightarrow \infty$ , the following equations are derived for the heat capacity and entropy, resp.:  $\log(C/(C_\infty - C)) = K \log T + \log k$ ,  $S = 2.3(C_\infty/K) \log(C_\infty/(C_\infty - C))$ .  $K$  and  $k$  are consts. for each substance;  $C_\infty$  is the limiting high temp. heat capacity. The data on about 30 substances were found to be in accord within exptl. error with the above equations.

F. D. Rossini

**The heat capacity and entropy of nitrogen. Heat of vaporization.** Vapor pressures of solid and liquid. The reaction  $1/2N_2 + 1/2O_2 = NO$  from spectroscopic data. W. F. Giauque and J. O. Clayton. *J. Am. Chem. Soc.* 55, 4875-80 (1933).—Heat-capacity data were obtained on  $N_2(c,l)$  from 15°K. to the transition temp. 35.61°K.; on  $N_2(c,l)$  to the m. p. 63.14°K.; and on  $N_2(l)$  to the b. p. 77.32°K. The heats of transition, fusion and vaporization (at 1 atm.) were found to be 54.71, 172.3 and 1332.9 cal. per mol. resp. From the calorimetric data, the entropy of the ideal gas at 77.32°K. was calcd. to be 36.5  $\pm$  0.1 cal. deg.<sup>-1</sup> mol.<sup>-1</sup>; from spectroscopic data were calcd.  $S_{77.32}^\circ = 36.416$  and  $S_{298.16}^\circ = 45.788$  cal. deg.<sup>-1</sup> mol.<sup>-1</sup> (not including nuclear spin). The spin entropy is  $R \ln 9$ . The vapor pressures of solid and liquid  $N_2$  were measured:  $N_2$ , solid, 54.78° to 63.14°K.,  $\log_{10} p_{\text{mm}} = -381.6/T + 7.41105 - 0.0062372/T$ ;  $N_2$ , liquid, 63.14° to 78.01°K.,  $\log_{10} p_{\text{mm}} = -339.8/T + 6.71057 - 0.0056286/T$ . Values of  $\Delta(F^\circ - F^\circ)/T$ ,  $\Delta F^\circ/T$ , and the equil. const. were calcd. from 298.1 to 5000°K., for the reaction  $1/2N_2 + 1/2O_2 = NO$ .  $\Delta F_{298.1}^\circ = 20.65$  kg.-cal. mol.<sup>-1</sup>. Although lack of equil. between the non-combining rotational states of  $N_2$  persists into the solid at 13°K., no mol. rotation remains in the solid at this temp.

F. D. R.

**A simple calorimeter for heats of fusion.** Data on the fusion of pseudocumene, mesitylene ( $\alpha$  and  $\beta$ ), hemimellitene, *o*- and *m*-xylene on two transitions of hemimellitene. Frederick D. Rossini. *Bur. Standards J. Research* 11, 553-9 (1933) (Research Paper No. 607).—A vacuum flask with a thermoelement serves as a simple calorimeter for measuring heats of fusion quickly and economically, with an accuracy of a few %. The following heats of fusion, in kg.-cal. per mol., were obtained: pseudocumene,  $-44.1^\circ$ ,  $2.75 \pm 0.06$ ; hemimellitene,  $25.5^\circ$ ,  $2.00 \pm 0.05$ ; mesitylene ( $\alpha$ ),  $-44.8^\circ$ ,  $2.28 \pm 0.06$ ; mesitylene ( $\beta$ ),  $-51.7^\circ$ ,  $1.91 \pm 0.05$ ; *o*-xylene,  $25.3^\circ$ ,  $3.33 \pm 0.07$ ; *m*-xylene,  $-47.9^\circ$ ,  $2.76 \pm 0.05$ . Hemimellitene was found to have 2 transitions below the f. p.:  $-58 \pm 2^\circ$ ,  $0.28 \pm 0.04$ ;  $-46 \pm 1^\circ$ ,  $0.36 \pm 0.04$ , kg.-cal. per mol.

F. D. Rossini

**Is the melting of a crystalline substance related to its fore- and after-history?** M. Le Blanc and E. Möbius. *Ber. Verhändl. sächs. Akad. Wiss. Leipzig, Math.-phys. Klasse* 85, 75-96 (1933).—A vacuum calorimeter of the Nernst type is described with which heat capacities can be measured to  $\pm 0.1\%$  with a temp. rise of  $0.1^\circ$ . The heat capacities of 3 different samples of benzene (having impurities, resp., of  $2.9 \times 10^{-4}$ ,  $5.8 \times 10^{-7}$  and  $4.7 \times 10^{-7}$  mols. per g.) were measured at 6 or 8 temps. between  $0^\circ$  and

$5.5^\circ$ . Data were also obtained on ethylene bromide (impurity,  $2 \times 10^{-4}$  mols. per g.) at 5 temps. in the range  $10^\circ$  to  $25^\circ$ . From the data on benzene, the rapid increase in the observed heat capacity of the solid as the true f. p. is approached is related to the amt. of impurity—the purest sample giving the sharpest break in the heat capacity-temp. curve at the f. p. The shape of the observed heat capacity-temp. curve is given by the equation,  $C_p' = C_p + n R T^2/(T_f - T)^2$ , where  $C_p'$  is the measured heat capacity and  $C_p$  is the true heat capacity at the temp.  $T$ ,  $n$  is the amt. of impurity in mols. per g. and  $T_f$  is the true f. p.

F. D. Rossini

**Determination of the internal heat of rotation of ethane.** A. Bucken and K. Weigert. *Z. physik. Chem.* B23, 285-80 (1933).—The sp. heat of  $C_2H_6$  was measured from  $143^\circ$  to  $280^\circ$  abs. by differential measurement of thermal cond. with  $C_2H_6$ . The results are precise enough to det. the part of the molal heat due to the hindered rotation of the 2 Me groups. The depth of the potential energy curve is detd. to about 20%.

G. M. Murphy

**The heats of dilution of aqueous solutions of zinc, cadmium and copper sulfates and sulfuric acid at  $25^\circ$ .** R. Lange, J. Monheim and A. L. Robinson. *J. Am. Chem. Soc.* 55, 4733-44 (1933); cf. *C. A.* 27, 2088.—Calorimetric data are given on aq.  $H_2SO_4$  from 0.05 to 0.00005 *M* and on aq.  $CdSO_4$ ,  $ZnSO_4$  and  $CuSO_4$  from 1 to 0.00005 *M*. From these data are calcd. the relative partial molal heat contents of the solvent and solute. Addnl. heat effects accompanying the diln. of very dil. solns. due to the displacement of the equil.  $H_2O = H^+ + OH^-$  are discussed.

F. D. Rossini

**The heats of formation of binary liquid solutions from their liquid components.** J. J. Coleman and Frank E. H. Germann. *J. Chem. Physics* 1, 847-51 (1933).—The empirical equation  $\Delta H = N_1(1 - N_1)(\alpha + \beta \gamma N_1)$ , in which  $\Delta H$  is the heat of formation per mol. of soln. from its liquid components,  $N_1$  is the mol. fraction of one of the components, and  $\alpha$ ,  $\beta$  and  $\gamma$  are consts. or functions of temp., accords with the data for 59 systems.

F. D. R.

**The thermodynamic constants of iodine monochloride, iodine monobromide and bromine monochloride in carbon tetrachloride solutions.** Charles M. Blair, Jr., and Don M. Yost. *J. Am. Chem. Soc.* 55, 4489-96 (1933).—The following exptl. data were obtained: the vapor pressures of ICl and of  $Cl_2$  above their resp.  $CCl_4$  solns.; the heats of soln. of  $I_2$  and of  $Br_2$  in  $CCl_4$ ; the heats of formation of ICl, IBr and  $BrCl$  in  $CCl_4$ . From these and other data were calcd.  $\Delta F^\circ$ ,  $\Delta H^\circ$  and  $S^\circ$  for  $I_2$ ,  $Br_2$ ,  $Cl_2$ , ICl, IBr and  $BrCl$ , each in soln. in  $CCl_4$ .

### 3--SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

W. ALBERT NOYES, JR.

**Matter and spatiality.** M. v. Laue. *Scientia* 54, 402-12(1933).—A discussion, chiefly concerning at. dimensions and structure. L. E. Gilson

**Non-relativistic theory of the continuous x-ray spectrum.** Fritz Sauter. *Ann. Physik* 18, 486-96(1933).—Previous treatments suffer from the defect of over-simplification of the problem in order to employ rigorous methods of solution. S. avoids this objection by relying on perturbation methods (Born-Dirac collision theory and Dirac radiation theory). The method yields the correct results and is applicable to potential fields of any given form. S. also indicates the limits of applicability of the results. Calvin Brous

**Theory of complex electronic collisions.** L. Goldstein. *J. phys. radium* [7], 4, 576-93(1933).—Math. treatment of complex, inelastic collisions in which at least 2 at. electrons take part. L. B. Steiner

**Experimental proof of the spin-conservation principle in atomic collision.** R. Döpel and K. Gailer. *Physik. Z.* 34, 827-31(1933).—By collision of He upon Hg there is obtained triplet excitation of the Hg without triplet excitation of the He. As this disagrees with results to be expected from the electron-spin-conservation principle one is forced either to give up that principle or to alter the present picture so that it may continue to serve. G. M. E.

**Ionization function of argon through argon-atom beams of less than one hundred ion-volt-equivalent.** Otto Beeck. *Physik. Z.* 34, 840-1(1933).—A discharge method has been worked out for producing and measuring fairly const. beams of atoms or ions in their own gases. For A the function is  $N = 4.5 - 6.5$  at  $0^\circ$  and 1 mm. Hg. Gregg M. Evans

**Quantitative study of the collisions of electrons with atoms.** Robert B. Brode. *Rev. Modern Physics* 5, 257-79(1933).—A survey of expts. dealing with probabilities of collision, excitation, ionization and scattering. A theoretical treatment is given in agreement with the exptl. results. A. B. F. Duncan
